Before you Begin

This topic covers the prerequisites and limitations related to using the NITRO APIs.

Prerequisites

To use NITRO, you must have a basic understanding of the Citrix ADC appliance and you must make sure that the client application has one of the following:

- Access to a Citrix ADC appliance.
- To use REST APIs through HTTP, you must have a system to generate HTTP or HTTPS requests (payload in JSON format) to the Citrix ADC appliance. You can use any programming language or tool.
- For Java clients, you must have a system where Java Development Kit (JDK) 1.5 or later is available. The JDK can be downloaded from http://www.oracle.com/technetwork/java/javase/downloads/index.html.

  The NITRO library (available in <NITRO_SDK_HOME>/lib) must be installed on the client path. For installation instructions, read the <NITRO_SDK_HOME>/README.txt file.
- For .NET clients, you must have a system with .NET framework 3.5 or later installed. The .NET framework can be downloaded from http://www.microsoft.com/downloads/en/default.aspx.

  The NITRO library (available in <NITRO_SDK_HOME>/lib) must be installed on the client path. For installation instructions, read the <NITRO_SDK_HOME>/README.txt file.
- For Python clients, you must have a system with Python 2.7 or above version.

  The NITRO library (available in <NITRO_SDK_HOME>/lib) must be installed on the client path. For installation instructions, read the <NITRO_SDK_HOME>/README.txt file.

Obtaining the NITRO SDK Package

The NITRO package is available as a tar file on the Downloads page of the configuration utility of the Citrix ADC appliance. You must download and untar the file to a folder on your local system. This folder is referred to as \<NITRO_SDK_HOME\> in this documentation.

The folder contains the NITRO libraries in the lib subfolder. The libraries must be added to the client application classpath to access NITRO functionality. The \<NITRO_SDK_HOME\> folder also provides samples and documentation that can help you understand the NITRO SDK.

Limitations

The section lists the Citrix ADC operations that cannot be performed by using NITRO API.

`Note:` These operations can be performed on the Citrix ADC CLI or the GUI.

- install API and diff API on nsconfig resource
- UI-internal APIs (update, unset, and get)
- show ns info
- shutdown
- Application firewall API
- importwsdl
- importcustom
- importxmlschema
- importxmlerrorpage
- importhtmlerrorpage
- rmcustom
- rmxmlschema
- rmxmlerrorpage
- rmhtmlerrorpage
- CLI-specific API
- scp
- configaudit
- show defaults
- show permission
- batch
- source

NITRO Changes Across Releases

Some NITRO API have changed across releases. This topic details information which can help you avoid compatibility issues in your application.

Changes made from 13.0-52.24 -> 13.0-7631

- `Changes across NITRO flavors`

  The NITRO API changes that were made in release build 13.0-76.31 when compared with release build 13.0-52.24.

> `Note:` Resources and attributes related to Cisco RISE feature have been removed.

TYPE OF CHANGE	RESOURCE	METHOD/ ATTRIBUTE	REMARKS
Attribute removed	vpnvserver	analyticsprofile	In 13.0-76.31 and later builds, multiple analytics profiles can be associated. vpnvserver_analyticsprofile_binding resource has been added for this purpose.
Attribute removed	appfwprofile	autodeployrule	-
Attribute removed	appflowparam	aaainsight	If API Gateway license and feature are enabled, transactions with content-type as application/json are

TYPE OF CHANGE	RESOURCE	METHOD/ ATTRIBUTE	REMARKS
			included in the appflow records by default.
Attribute type changed	policyevaluation	pitoffsetlengtharray	Attribute type has changed from integer to double.

Changes made from 12.1-48.13 -> 13.0-5224

- `Changes across NITRO flavors`

  The NITRO changes that were made in release 13.0-52.24 when compared with release 12.1-48.13.

TYPE OF CHANGE	RESOURCE	METHOD/ ATTRIBUTE	REMARKS
Attribute removed	rnat	rnatip2	In 12.1 and earlier releases, for creating or updating ACL based RNAT resources, `natip2` attribute was used. This has been changed to `natip` attribute for making it consistent with network based RNAT resources, get and update.
Attribute type changed	rnat	redirectport	Data type for `redirectport` attribute is changed from boolean to integer.

TYPE OF CHANGE	RESOURCE	METHOD/ ATTRIBUTE	REMARKS
Attribute missing in method	rnat	clear(), redirectport, natip	`redirectport` and `natip` attributes are removed from clear() operation. Also, the `clear()` operation is deprecated, Use `delete()` operation instead.
Attribute missing in method	rnat	unset(), ownergroup, redirectport	-
Attribute missing in method	Authenticationpushservice	POST/PUT, namespace	The `namespace` attribute is set to a constant value of `https://mfa.cloud.com`. This attribute cannot be modified.
Attribute removed	vpnvserver	policy, priority, gotopriorityexpression	These attributes are removed from `vpnvserver` resource because these attributes are related to `policy binding`.

- `Changes specific to NITRO SDKs`

  The SDK-specific changes that were made in release 13.0-52.24 when compared with release 12.1-48.13.

TYPE OF CHANGE	CLASS	METHOD/ ATTRIBUTE	REMARKS
Method removed	systemfile	(systemfile[]) get(nitro_service session),	These methods were not useful because `filelocation`

TYPE OF CHANGE	CLASS	METHOD/ ATTRIBUTE	REMARKS
		(systemfile[]) get(options option, nitro_service session), (systemfile) get(String filename, nitro_service session)	was always a required attribute in fetching system files.
Attribute type changed	nsconnectiontable	irs, iss	Data type changed from `Integer` to `Double`.
Method removed	nsvpxparam	(nsvpxparam) get(nitro_service session)	With cluster support for `nsvpxparam`, the `get()` method returns an array instead of single entity.
Method removed	nsconfig	(base_response) save(nitro_service session)	Alternate method - 'base_response save(nitro_service client, nsconfig resource)'
Attribute type changed	appfwprofile	postbodylimit	datatype changed from uint? to long?

Changes made from 12.0-57.24 -> 12.1-4813

- `Changes across NITRO flavors`

  The NITRO changes that were made in release 12.1-48.13 when compared with release 12.0-57.24.

TYPE OF CHANGE	RESOURCE	METHOD/ ATTRIBUTE	REMARKS
Attribute removed	nsicapprofile	insertxserverip, insertxclientip, sendreqinresmod, insertxauthuseruri, onservererrorresponse	-
Attribute removed	lsnclient	td	“td” is applicable to lsnclientonly in conjunction with network/network6. This attribute is now a part of lsnclient_network_binding and lsclient_netwrok6_binding resources.
Attribute removed	nspartition_stats	minbandwidth	minbandwidth setting on the partition is deprecated.
Attribute removed	cloudparameter	verifyurl	This attribute is renamed to activationcode.
Attribute removed	appfwprofile_safeobject_binding	expression	This attribute is renamed to as_expression.

- `Changes specific to NITRO SDKs`

  The SDK-specific changes that were made in release 12.1-48.13 when compared with release 12.0-57.24.

TYPE OF CHANGE	CLASS	METHOD/ ATTRIBUTE	REMARKS
Method removed	nsacls	(base_response) renumber(nitro_service session)	Alternate method - (base_response)renumber(nitro_service client, nsacls resource)
Method removed	nsacls	(base_response) clear(nitro_service session)	Alternate method - (base_response)clear(nitro_service client, nsacls resource)
Method removed	nsacls	(base_response) apply(nitro_service session)	Alternate method - (base_response)apply(nitro_service client, nsacls resource)
Method removed	nsacls6	(base_response) renumber(nitro_service session)	Alternate method - (base_response)renumber(nitro_service client, nsacls6 resource)
Method removed	nsacls6	(base_response) clear(nitro_service session)	Alternate method - (base_response)clear(nitro_service client, nsacls6 resource)
Method removed	nsacls6	(base_response) apply(nitro_service session)	Alternate method - (base_response)apply(nitro_service client, nsacls6 resource)

Changes made from 11.1-53.3 -> 12.0-48x

- `Changes across NITRO flavors`

  The NITRO changes that were made in release 12.0-48.x when compared with release 11.1-53.3.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Resource removed	vpath, vpathparam	ALL	All resources and parameters related to vpath feature.
Attribute removed	l3param	-	Icmperrgenerate This attribute is related to vpath for which the support is removed in 12.0.
Attribute removed	qos_stats	-	ipcpe2qosfailedrate **Note**: Some of the counters under this resource are removed. For new definitions, see http://docs.citrix.com/en-us/netscaler/12/nitro-api/nitro-rest/api-reference/statistics/qos/qos.html
Attribute removed	vrid_interface_binding	-	trackifnum New resources (vrid_trackifnum_binding and vrid6_trackifnum_binding) are introduced to deal with track interfaces.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Attribute removed	vrid_interface_binding	-	ifaces is replaced with ifnum. Previously, ifaces parameter was used in the response and ifnum was used in the input. Now both POST and GET are consistent and use the same attribute name.
Attribute removed	sslprofile_sslciphersuite_binding	-	cipheraliasname cipheraliasname is a redundant parameter. The required information is provided by ciphername parameter.
Attribute removed	nslicense	-	Ispooledlicensing Ispooledlicensing Is replaced with a new parameter licensingmode which returns if the license of "Local".html"Pooled".html"CICO" type.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Attribute removed	lbmonitor_sslcertkey_binding	DELETE	crlcheck

- `Changes specific to NITRO SDKs`

  The SDK-specific changes that were made in release 12.0-48.x when compared with release 11.1-53.3.

TYPE OF CHANGE	CLASS	METHOD/ ATTRIBUTE	REMARKS
Attribute type changed	pcpmap	pcpprotocol	Datatype changed from double to string.
Class removed	mediaclassification_stats	-	-
Method removed	vxlan_iptunnel_binding	add(vxlan_iptunnel_binding obj, nitro_service session) delete(vxlan_iptunnel_binding obj, nitro_service session)	Feature is deprecated, use bridgetable with broadcast mac option.
Method removed	inatsession_stats	get(inatsession obj, nitro_service session)	-

Changes Made from 10.5 57.x -> 110

> `Note:`

> XML APIs are deprecated from NetScaler release 10.5 onwards.

`All NITRO Flavors - Changes from 10.5 57.x to 11.0`

The NITRO changes that were made in release 11.0 when compared with release 10.5 Build 57.x.

TYPE OF CHANGE	RESOURCE	ATTRIBUTE
Attribute removed	nstrace	doruntimemerge
Attribute removed	nstrace	tcpdump
Attribute removed	cacheobject	force

`NITRO SDKs - Changes from 10.5-57.x to 11.0`

The SDK-specific changes that were made in release 11.0 when compared with release 10.5 Build 57.x.

TYPE OF CHANGE	CLASS	METHOD	REPLACE WITH
Attribute missing in method	cacheobject	(base_response) flush(cacheobject obj, nitro_service session) 'force' attribute missing in this method.	-
Method missing	clustersync	(base_response) Force(clustersync obj, nitro_service session)	(base_response) Force(nitro_service session)

TYPE OF CHANGE	CLASS	METHOD	REPLACE WITH
Method missing	shutdown	(base_response) Shutdown(shutdown obj, nitro_service session)	(base_response) Shutdown(nitro_service session)
Method missing	systemfile	(systemfile) get(systemfile obj, nitro_service session)	-
Method missing	sslfips	(base_response) reset(sslfips obj, nitro_service session)	(base_response) reset(nitro_service session)

Changes made from 9.3 -> 10.1 or 105

`Note.` No changes are introduced from release 10.1 to release 10.5. Therefore, you should not face any compatibility issues when migrating from release 10.1 to 10.5.

`All NITRO Flavors - Changes from 9.3 to 10.1/10.5`

The NITRO changes that were made in release 10.1/10.5 when compared with release 9.3.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Resource removed	lbmonitor_lbmetrictable_binding Replaced with the resource 'lbmonitor_metric_binding'.	-	-

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Method removed	vserver	GET Perform the GET operation on specific virtual server types such as lb/cr/cs.	-
Method removed	filterpolicy	POST with 'action=unset' This method is removed as unsetting the attributes('action') of a policy makes it invalid.	-
Method removed	auditsyslogpolicy	POST with 'action=unset' This method is removed as unsetting the attributes('action') of a policy makes it invalid.	-
Method removed	auditnslogpolicy	POST with 'action=unset' This method is removed as unsetting the attributes('action') of	-

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
		a policy makes it invalid.	
Method removed	authorizationpolicy	POST with 'action=unset' This method is removed as unsetting the attributes('action') of a policy makes it invalid.	-
Return-type changed	snmpengineid	GET Return type changed to an array.	-
Return-type changed	nshostname	GET Return type changed to an array.	-
Attribute-type changed	appfwpolicy_lbvserver_binding	-	activepolicy Data type changed from Boolean to Integer.
Attribute-type changed	appfwpolicy_appfwglobal_binding	-	activepolicy Data type changed from Boolean to Integer.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Attribute-type changed	vlan	-	portbitmap Data type changed from uint to ulong.
Attribute-type changed	vlan	-	tagbitmap Data type changed from uint to ulong.
Attribute removed	policypatset_pattern_binding	-	indextype This attribute is moved to 'policypatset' resource as this attribute is applicable at patset level.
Attribute removed	system_stats	-	powersupply1failure Replaced with 'powersupply1status'. Note: Change is applicable from release 9.3 Build 65.8.
Attribute removed	system_stats	-	powersupply2failure Replaced with 'powersupply2status'.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
			Note: Change is applicable from release 9.3 Build 65.8.
Attribute removed	server_servicegroup_binding	-	servicetype Replaced with 'svctype'.
Attribute removed	server_service_binding	-	servicetype Replaced with 'svctype'.
Attribute removed	crvserver	-	hits Hits are calculated per policy binding hence moved this parameter to binding resources.
Attribute removed	crvserver	-	dstvsvr Replaced with 'destinationvserver'.
Attribute removed	crvserver	-	destvserver Replaced with 'domain'.
Attribute removed	crvserver	-	dnsvserver Replaced with 'dnsvservername'.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Attribute removed	appflowpolicylabel	-	type Replaced with 'policylabeltype'.
Attribute removed	sslcipher	-	ciphgrpals Replaced with 'ciphergroupname'.
Attribute removed	csvserver_cspolicy_binding	-	targetvserver Replaced with 'targetlbvserver'. Note: This change is applicable for the 'sslcipher_*_binding' resources also.
Attribute removed	csvserver_cspolicy_binding	-	targetvserver Replaced with 'targetlbvserver'.
Attribute removed	rewriteaction	-	allow_unsafe_pi1, allow_unsafe_pi Replaced with 'bypassSafetyCheck'.
Attribute removed	nsconfig	-	nwfwmode Marked as a hidden attribute.

`NITRO SDKs - Changes from 9.3 to 10.1/10.5`

The SDK-specific changes that were made in release 10.1/10.5 when compared with release 9.3.

TYPE OF CHANGE	CLASS	METHOD	REPLACE WITH
Class removed	Routerbgp	-	This class is removed as all router configurations are deprecated in 9.2.
Method signature changed	dnsptrrec	get(dnsptrrec obj, nitro_service session)	get(nitro_service session, String reversedomain)
Method signature changed	dnsaddrec	get(dnsaddrec obj, nitro_service session)	get(nitro_service session, String hostname)
Method signature changed	dnsnsrec	get(dnsnsrec obj, nitro_service session)	get(nitro_service session, String domain)
Method signature changed	snmpengineid	unset(nitro_service session, String[] args)	unset(nitro_service session, snmpengineid resource, String[] args)
Method signature changed	arp	arp.get(nitro_service session, String ipaddress)	arp.get(nitro_service session, arp resource)
Method signature changed	nsip	get(nitro_service session, String ipaddress)	get(nitro_service client, nsip resource)

TYPE OF CHANGE	CLASS	METHOD	REPLACE WITH
Method signature changed	nsip6	get(nitro_service session, String ipv6address)	get(nitro_service session, nsip6 resource)
Method signature changed	dnsmxrec	dnsmxrec.get(dnsmxrec obj, nitro_service session)	dnsmxrec[] get(nitro_service service, dnsmxrec_args args)
Method Missing	authenticationnegotiatepolicy	(base_response) unset(nitro_service session, String[] args, String name)' is missing in	-
Method missing	authenticationnegotiatepolicy	(base_response) unset(authenticationnegotiatepolicy obj, nitro_service session, String[] args)	-
Attribute missing in method	nsconfig	(base_response) update(nsconfig obj, nitro_service session) 'nwfwmode' attribute is missing in this method.	-

Performing Basic Citrix ADC Operations

This section covers procedures for performing the following basic Citrix ADC operations using NITRO APIs.

- Log on to a Citrix ADC Appliance
- Log on to a Citrix ADC appliance that has two factor authentication configured for system users
- Enable Citrix ADC Features and Modes
- Save Citrix ADC Configurations
- Kill a system Session
- Disconnect from the Citrix ADC Appliance

Log on to a Citrix ADC Appliance

The first step towards using NITRO is to establish a session with the Citrix ADC appliance and then authenticate the session by using the Citrix ADC administrator's credentials.

Some points to note with regards to session timeout:

- When restricted timeout param is enabled, NITRO, by default, uses the timeout value that is configured for the logged in user. You can customize this value but it must be limited to the value specified for the user. If no value is specified for the user, the default timeout value of 15 minutes is used.
- When restricted timeout param is not enabled, NITRO uses the default value of 30 minutes as session timeout.
- `Using REST APIs through HTTP`

  You must specify the username and password in the login object. The session ID that is created must be specified in the request header of all further operations in the session.

`Notes:`

- You must have a user account on the appliance to log on to it. The configuration operations that you can perform are limited by the administrative roles assigned to your account.

- To ensure secure communication, use the HTTPS protocol in NITRO requests.
- Instead of creating a NITRO session, you can log on to the Citrix ADC appliance while performing individual operations. To do this, you must specify the username and password in the request header of the NITRO request as follows:
  - X-NITRO-USER:<username\>
  - X-NITRO-PASS:<password\>
  - Content-Type:application/json

For example, to connect and create a session with a Citrix ADC appliance with NSIP address 10.102.29.60 by using the HTTP protocol:

- `Request`

  `HTTP Method:` POST

`URL:` http://10.102.29.60/nitro/v1/config/login

`Request Headers:` Content-Type:application/json

`Request Payload:`

```
{

    "login":

    {

    "username":"admin",

    "password":"verysecret"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

```
Set-Cookie:NITRO_AUTH_TOKEN=<tokenvalue>;

path=/nitro/v1
```

- `Using REST APIs through SDKs`

  You must create an object of the com.citrix.netscaler.nitro.service.nitro_service class by specifying the Citrix ADC IP (NSIP) address and the protocol to connect to the appliance (HTTP or HTTPS). You then use this object and log on to the appliance by specifying the user name and the password of the Citrix ADC administrator.

`Note:`

- For the python SDK, the package path is of the form nssrc.com.citrix.netscaler...
- You must have a user account on that appliance. The configuration operations that you perform are limited by the administrative roles assigned to your account.

The following sample code establishes a session with a Citrix ADC appliance with IP address 10.102.29.60 by using the HTTPS protocol and also sets a session timeout period (in seconds) of 60 minutes.

`Java - Sample code to establish session`

```
//Specify the Citrix ADC appliance IP address and protocol

nitro_service ns_session = new nitro_service("10.102.29.60","https");

//Specify the login credentials

ns_session.login("admin","verysecret",3600);
```

`.NET - Sample code to establish session`

```
//Specify the Citrix ADC appliance IP address and protocol

nitro_service ns_session = new nitro_service("10.102.29.60","https");
```

```
//Specify the login credentials

ns_session.login("admin","verysecret",3600);
```

`Python - Sample code to establish session`

```
# Specify the Citrix ADC appliance IP address and protocol

ns_session = nitro_service("10.102.29.60","https")

# Specify the login credentials

ns_session.login("admin","verysecret",3600)
```

Disable SSL Checks

When using HTTPS, you must make sure that the root CA is added to the truststore. By default, NITRO validates the SSL certificate and verifies the hostname.

- `Using REST APIs through SDKs`

  Disable these validations as shown in the following sample codes.

`Java - Sample code for disabling SSL checks`

```
ns_session.set_certvalidation(false);

ns_session.set_hostnameverification(false);
```

`.NET - Sample code for disabling SSL checks`

```
ns_session.certvalidation = false;

ns_session.hostnameverification = false;
```

`Python - Sample code for disabling SSL checks`

```
ns_session.certvalidation = false
```

Log on to a Citrix ADC appliance that has two factor authentication configured for system users

Two factor authentication is a security mechanism where a Citrix ADC appliance authenticates a system user at two authenticator levels. The appliance grants access to the user only after successful validation of passwords by both levels of authentication.

For information about configuring two factor authentication for system users by using Citrix ADC CLI or GUI, see Two factor authentication for system users.

Steps to log on to a Citrix ADC appliance that has two factor authentication configured

1. Send user credentials for the first level authentication
2. Send user credentials for the second level authentication

Send user credentials for the first level authentication

You use the `login` API object to send the username and first password to the Citrix ADC appliance for first level authentication.

The Citrix ADC appliance responds with a session (token) ID, error code, a next factor login message, and other details. The error code and next factor login message indicates that a second level authentication is required to complete the login process.

Request structure

REQUEST FIELD	VALUE
HTTP Method	`POST`

REQUEST FIELD	VALUE
URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login`
Request Headers	`Content-Type: application/x-www-form-urlencoded`
Request Payload	`{"login":{"username":"<username>","password":"<first password>"}}`

Send user credentials for the second level authentication

You use the `loginnextfactorresponse` API object to send the following information to the Citrix ADC appliance for second level authentication.

- Second password (next factor password)
- Session ID (received as part of first level authentication)

The Citrix ADC appliance responds with an error code, a message, and other details. An error code of `0` and a message of `Done` indicate that the two factor authentication process is completed with success. The session ID received must be specified in the request header of all further operations in the session.

Request structure

REQUEST FIELD	VALUE
HTTP Method	`POST`
URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/loginnextfactorresponse`
Request Headers	`Content-Type: application/x-www-form-urlencoded`
Request Payload	`{"loginnextfactorresponse":{"nextfactorpassword":"<second password>","sessionid":"<session id>"}}`

Sample configuration

STEPS	CURL REQUESTS	RESPONSE
Send user credentials for the first level authentication	`curl -X POST -H "Content-Type:application/json" http://10.102.29.30/nitro/v1/config/login -d '{"login":{"username":"exampleusername","password":"examplepassword"}}'`	`{"errorcode": 3816, "message": "Nextfactor Login [singleauth_password]", "severity": "ERROR", "sessionid":"##73EF2C4487554615539D52FDAAF5D1"}`
Send user credentials for the second level authentication	`curl -X POST -H "Content-Type:application/json" http://192.0.0.33/nitro/v1/config/loginnextfactorresponse -d '{"loginnextfactorresponse":{"nextfactorpassword":"examplesecondpassword"},"sessionid":"##73EF2C4487554615539D52FDAAF5D1"}'`	`{ "errorcode": 0, "message": "Done", "severity": "NONE", "sessionid": "##73EF2C4487554615539D52FDAAF5D1" }`

Enabling Citrix ADC Features and Modes

Some Citrix ADC features and modes are disabled by default and therefore must be enabled before they can be configured. To enable a Citrix ADC feature or mode, specify the action as "enable" in the URL query string, and in the request payload, specify the feature or mode to be enabled.

- `Using REST APIs through HTTP`

  To disable a feature or mode, in the URL query string, specify the action as "disable".

For example, to enable the load balancing and content switching features:

- `Request`

`HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsfeature?action=enable

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{
    "nsfeature":
    {
        "feature":
        [
            "LB",
            "CS"
        ]
    }
}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

To enable the L2 and fast ramp modes:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsmode?action=enable

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{
    "nsmode":
    {
        "mode":
        [
            "L2",
            "FR"
        ]
    }
}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Saving Citrix ADC Configurations

To make sure that the configurations persist on rebooting the appliance, you must save the Citrix ADC configurations. To save the configurations, specify the action as "save" in the URL query string.

- `Using REST APIs through HTTP`

  To save the configurations:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconfig?action=save

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "nsconfig":

    {}

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Killing a System Session

A Citrix ADC administrator can kill any system session by specifying the action as "kill" in the URL query string and by specifying the required system session ID in the request payload.

- `Using REST APIs through HTTP`

  For example, to kill a system session that has ID as 311:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemsession?action=kill

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{
    "systemsession":
    {
    "sid":"311"
    }
}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Disconnecting from the Citrix ADC Appliance

Before disconnecting (logging out) from the Citrix ADC appliance, make sure that you have saved the Citrix ADC configurations.

- `Using REST APIs through HTTP`

  To logout of the Citrix ADC appliance:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/logout

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "logout":{}

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Performing Citrix ADC Resource Operations

Citrix ADC resources are organized into a set of packages or namespaces. Each package or namespace corresponds to a Citrix ADC feature. For example, all load-balancing related resources, such as load balancing virtual server, load balancing group, and load balancing monitor are available in com.citrix.netscaler.nitro.resource.config.lb.

Similarly, all application firewall related resources, such as application firewall policy and application firewall archive are available in com.citrix.netscaler.nitro.resource.config.appfw.

Each Citrix ADC resource is represented by a class. For example, the class that represents a load balancing virtual server is called lbvserver (in com.citrix.netscaler.nitro.resource.config.lb). The state of a resource is represented by properties of a class. You can get and set the properties of the class.

The setter and getter properties are always executed locally on the client. They do not involve any network interaction with the NITRO web service. All properties have basic simple types: integer, long, boolean, and string.

Adding a Citrix ADC Resource

This topic covers adding a Citrix ADC resource by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To create a new resource (for example, an lbvserver) on the appliance, specify the resource name and other related arguments in the specific resource object.

For example, to create an load balancing virtual server named MyFirstLbVServer:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "lbvserver":

    {

    "name":"MyFirstLbVServer",

    "servicetype":"http"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To create a new resource, instantiate the resource class, configure the resource by setting its properties locally, and then upload the new resource instance to the Citrix ADC appliance.

The following sample code creates a load balancing virtual server.

`Java - Sample code to add a Citrix ADC resource`

```
//Create an instance of the lbvserver class

lbvserver new_lbvserver_obj = new lbvserver();

//Set the properties of the resource locally
```

```
new_lbvserver_obj.set_name("MyFirstLbVServer");
new_lbvserver_obj.set_ipv46("10.102.29.88");
new_lbvserver_obj.set_port(88);
new_lbvserver_obj.set_servicetype("HTTP");
new_lbvserver_obj.set_lbmethod("ROUNDROBIN");

//Upload the resource to Citrix ADC

lbvserver.add(ns_session,new_lbvserver_obj);
```

`.NET - Sample code to add a Citrix ADC resource`

```
//Create an instance of the lbvserver class

lbvserver new_lbvserver_obj = new lbvserver();

//Set the properties of the resource locally

new_lbvserver_obj.name = "MyFirstLbVServer";
new_lbvserver_obj.ipv46 = "10.102.29.88";
new_lbvserver_obj.port = 88;
new_lbvserver_obj.servicetype = "HTTP";
```

```
new_lbvserver_obj.lbmethod = "ROUNDROBIN";

//Upload the resource to Citrix ADC

lbvserver.add(ns_session,new_lbvserver_obj);
```

`Python - Sample code to add a Citrix ADC resource`

```

# Create an instance of the lbvserver class

new_lbvserver_obj = lbvserver()

# Set the properties of the resource locally

new_lbvserver_obj.name = "MyFirstLbVServer"

new_lbvserver_obj.ipv46 = "10.102.29.88"

new_lbvserver_obj.port = 88

new_lbvserver_obj.servicetype = "HTTP"

new_lbvserver_obj.lbmethod = "ROUNDROBIN"

# Upload the resource to CItrix ADC

```

```
lbvserver.add(ns_session, new_lbvserver_obj)
```

Enabling a Citrix ADC Resource

This topic covers enabling a Citrix ADC resource by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To enable a resource on the Citrix ADC appliance, specify the action as "enable" in the URL query string, and in the request payload, specify the resource to be enabled. To disable a resource, in the URL query string, specify the action as "disable".

For example, to enable a load balancing virtual server named MyFirstLbVServer.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?action=enable

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "lbvserver":

    {

    "name":"MyFirstLbVServer"

    }

}
```

- `Response`

`HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To enable a resource, invoke the enable() method and to disable, invoke the disable() method.

The following sample code enables a load balancing virtual server named lb_vip.

`Java - Sample code to enable a Citrix ADC resource`

```
lbvserver obj = new lbvserver();

obj.set_name("lb_vip");

lbvserver.enable(ns_session, obj);
```

`.NET - Sample code to enable a Citrix ADC resource`

```
lbvserver obj = new lbvserver();

obj.name = "lb_vip";

lbvserver.enable(ns_session, obj);
```

`Python - Sample code to enable a Citrix ADC resource`

```
obj = lbvserver()
```

```
obj.name = "lb_vip"

lbvserver.enable(ns_session, obj)
```

Retrieving Properties of Citrix ADC Resources

This topic covers retrieving properties of a Citrix ADC resource by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  NITRO provides multiple approaches using which you can retrieve resources and their relevant details. The following table explains each of these approaches with the required URL.

Retrieving all details of all resources of a specific type	In the URL, specify the type of resource for which you want to retrieve the details. For example, to retrieve all details of load balancing virtual servers available on a Citrix ADC appliance. http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver
Retrieving all details of a specific resource	In the URL, specify the name of resource for which you want to retrieve the details. For example, to retrieve all details of a load balancing virtual server named MyFirstLbVServer: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver/MyFirstLbVServer
Retrieving summary or detailed view of resources	In the URL, use the "view" query parameter to specify whether you want to view the

	summary (mandatory parameters) or detail (all parameters). For example, to view the mandatory parameters for all load balancing virtual servers: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?view=summary Note: By default, the retrieved results are displayed in detail view (?view=detail).
Retrieving all details of resources that have multiple unique identifiers	In the URL, specify the type of resource and use the "args" query parameter to specify the unique attributes and the values for those attributes. For example, to get the application firewall profiles that have unique identifiers "name" and "starturl" as appfw1 and aa respectively. http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile?args=name:appfw1,starturl:aa
Retrieving specific details of all resources of a specific type	In the URL, specify the type of the resource and use the "attrs" query parameter to specify the resource details that you want to retrieve. For example, to retrieve the "name" and "lbmethod" of all load balancing virtual servers: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?attrs=name,lbmethod
Retrieving specific details of a specific resource	In the URL, specify the type and name of the resource and use the "attrs" query parameter

	to specify the resource details that you want to retrieve. For example, to retrieve the "name" and "lbmethod" of a load balancing virtual server named "MyFirstLbVServer": http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver/MyFirstLbVServer?attrs=name,lbmethod
Filtering the retrieved resources	In the URL, specify the type of resource and use the "filter" query parameter to specify the attribute(s) and the value(s) of the attributes. The resources fetched will be filtered based on the filter criteria. Note: The filter query parameter supports the use of PCRE regular expressions. For example, to filter the load balancing virtual servers where the "lbmethod" is ROUNDROBIN. http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?filter=lbmethod:ROUNDROBIN
Retrieving resources in paginated manner	If the request is likely to result in a large number of resources, you can divide the results into pages and retrieve them page by page (paginated). For example, if you are retrieving all the 53 load balancing virtual servers of a Citrix ADC appliance, instead of retrieving all 53 in one response, you can configure the results to be divided into 6 pages each having 10 results. In the URL, specify the name of the resource and use the following query parameters:

	• "pageno" - The page number to be displayed. • "pagesize" - The number of resources to be displayed in each page. For example, to retrieve the load balancing virtual servers in a paginated form, first get a count (using the "count" query parameter shown in below row) of the load balancing virtual servers. Then, accordingly specify the number of results for each page and then specify the page number to be displayed. http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?pagesize=10&pageno=3

For example, to retrieve only the name and load balancing method of all load balancing virtual servers on a Citrix ADC.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?attrs=name,lbmethod

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{
    lbvserver:
    {
        name: "test",
        lbmethod: "LEASTCONNECTION"
    }
    {
        name: "test1",
        lbmethod: "LEASTCONNECTION"
    }
}
```

- `Using REST APIs through SDKs`

  To retrieve the properties of a resource, you retrieve the resource object from the Citrix ADC appliance. Once the object is retrieved, you can extract the required properties of the resource locally, without further network traffic.

The following sample code retrieves the details of a load balancing virtual server.

`Java - Sample code to get details of resource`

```
//Retrieve the resource object from the Citrix ADC

new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer");

//Extract the properties of the resource from the object locally
```

```
System.out.println(new_lbvserver_obj.get_name());

System.out.println(new_lbvserver_obj.get_servicetype());
```

`.NET - Sample code to get details of resource`

```
//Retrieve the resource object from the Citrix ADC

new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer");

//Extract the properties of the resource from the object locally

Console.WriteLine(new_lbvserver_obj.name);

Console.WriteLine(new_lbvserver_obj.servicetype);
```

`Python - Sample code to get details of resource`

```

# Retrieve the resource object from the CItrix ADC

new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer")

# Extract the properties of the resource from the object locally

print(new_lbvserver_obj.name)
```

```
print(new_lbvserver_obj.servicetype)
```

Filtering Results

This topic covers retrieving filtered information of a resource by using REST APIs through SDKs.

- `Using REST APIs through SDKs`

  You can also retrieve resources by specifying a filter on the value of their properties by using the com.citrix.netscaler.nitro.util.filtervalue class.

For example, you can retrieve all the load balancing virtual servers that have their port set to 80 and servicetype to HTTP.

`Java - Sample code to get filtered results`

```
filtervalue[] filter = new filtervalue[2];

filter[0] = new filtervalue("port","80");

filter[1] = new filtervalue("servicetype","HTTP");

lbvserver[] result = lbvserver.get_filtered(ns_session,filter);
```

`.NET - Sample code to get filtered results`

```
filtervalue[] filter = new filtervalue[2];

filter[0] = new filtervalue("port","80");

filter[1] = new filtervalue("servicetype","HTTP");

lbvserver[] result = lbvserver.get_filtered(ns_session,filter);
```

`Python - Sample code to get filtered results`

```
filter_params = []

      filter_params = [ filtervalue() for _ in range(2)]
```

```
filter_params[0] = filtervalue("servicetype","HTTP")

filter_params[1] = filtervalue("port","80")

result = lbvserver.get_filtered(ns_session1, filter_params)
```

Retrieving Statistics of Citrix ADC Resources

The Citrix ADC appliance collects statistics about the usage of its features and the corresponding resources. NITRO can retrieve these statistics. Not all Citrix ADC features and resources have statistic objects associated with them.

- `Using REST APIs through HTTP`

  To get statistics of a feature, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/\<feature_name\>.

To get statistics of a resource, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/\<resource_type\>/\<resource_name\>.

To get statistics of the services and service groups that are bound to a load balancing virtual server, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/\<name\>?statbindings=yes*.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/MyFirstLbVServer

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Payload:`

```
{

    "lbvserver":

    [

        {

            "name":"MyFirstLbVServer",

            "establishedconn":0,

            "vslbhealth":0,

            "primaryipaddress":"0.0.0.0",

            ...
```

```
        }

    ]

}
```

To get statistics of the bound entities, use statbindings=yes. For example, to get the statistics of the services that are bound to a load balancing virtual server named MyFirstLbVServer.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/MyFirstLbVServer?statbindings=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status code on success:` 200 OK

`HTTP Status code on failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{

"lbvserver": [{

    "name": "MyFirstLbVServer",

    "sortorder": "descending",

    "vsvrsurgecount": "0",

    "establishedconn": "0",

    ...

    "service": [{

        "name": "s1",

        "throughput": "0",

        "throughputrate": 0,
```

```
        "avgsvrttfb": "0",

        "primaryipaddress": "1.2.3.5",

        "primaryport": 80,

        "servicetype": "HTTP",

        "state": "DOWN",

            "totalrequests": "0",

            "requestsrate": 0,

            ...

            }]
    }]

}
```

- `Using REST APIs through SDKs`

The Citrix ADC appliance collects statistics about the usage of its features and the corresponding resources. You can retrieve these statistics by using NITRO API. The statistics APIs are available in different packages from the configuration APIs.

For example, the API to retrieve statistics of the load balancing virtual server are available in com.citrix.netscaler.nitro.resource.stat.lb.

`Note.`

- For the python SDK, the package path is of the form nssrc.com.citrix.netscaler.....
- Not all Citrix ADC features and resources have statistic objects associated with them.

The following sample code retrieves the statistics of a load balancing virtual server and displays some of the statistics returned.

`Java - Sample code to get feature statistics`

```
lbvserver_stats stats =
lbvserver_stats.get(ns_session,"MyFirstLbVServer");

System.out.println(stats.get_curclntconnections());

System.out.println(stats.get_deferredreqrate());
```

`.NET - Sample code to get feature statistics`

```
lbvserver_stats stats =
lbvserver_stats.get(ns_session,"MyFirstLbVServer");

Console.WriteLine(stats.curclntconnections);

Console.WriteLine(stats.deferredreqrate);
```

`Python - Sample code to get feature statistics`

```
stats = lbvserver_stats.get(ns_session,"MyFirstLbVServer")

print(stats.curclntconnections)

print(stats.deferredreqrate)
```

Retrieving Statistics of Citrix ADC Resources

The Citrix ADC appliance collects statistics about the usage of its features and the corresponding resources. NITRO can retrieve these statistics. Not all Citrix ADC features and resources have statistic objects associated with them.

- `Using REST APIs through HTTP`

  To get statistics of a feature, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/\<feature_name\>.

To get statistics of a resource, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/\<resource_type\>/\<resource_name\>.

To get statistics of the services and service groups that are bound to a load balancing virtual server, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/\<name\>?statbindings=yes*.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/MyFirstLbVServer

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Payload:`

```
{

    "lbvserver":

    [

        {

            "name":"MyFirstLbVServer",

            "establishedconn":0,

            "vslbhealth":0,

            "primaryipaddress":"0.0.0.0",

            ...
```

```
        }

    ]

}
```

To get statistics of the bound entities, use statbindings=yes. For example, to get the statistics of the services that are bound to a load balancing virtual server named MyFirstLbVServer.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/MyFirstLbVServer?statbindings=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status code on success:` 200 OK

`HTTP Status code on failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{

"lbvserver": [{

    "name": "MyFirstLbVServer",

    "sortorder": "descending",

    "vsvrsurgecount": "0",

    "establishedconn": "0",

    ...

    "service": [{

        "name": "s1",

        "throughput": "0",

        "throughputrate": 0,
```

```
        "avgsvrttfb": "0",

        "primaryipaddress": "1.2.3.5",

        "primaryport": 80,

        "servicetype": "HTTP",

        "state": "DOWN",

            "totalrequests": "0",

            "requestsrate": 0,

            ...

            }]
    }]

}
```

- `Using REST APIs through SDKs`

The Citrix ADC appliance collects statistics about the usage of its features and the corresponding resources. You can retrieve these statistics by using NITRO API. The statistics APIs are available in different packages from the configuration APIs.

For example, the API to retrieve statistics of the load balancing virtual server are available in com.citrix.netscaler.nitro.resource.stat.lb.

`Note:`

- For the python SDK, the package path is of the form nssrc.com.citrix.netscaler.....
- Not all Citrix ADC features and resources have statistic objects associated with them.

The following sample code retrieves the statistics of a load balancing virtual server and displays some of the statistics returned.

`Java - Sample code to get feature statistics`

```
lbvserver_stats stats =
lbvserver_stats.get(ns_session,"MyFirstLbVServer");

System.out.println(stats.get_curclntconnections());

System.out.println(stats.get_deferredreqrate());
```

`.NET - Sample code to get feature statistics`

```
lbvserver_stats stats =
lbvserver_stats.get(ns_session,"MyFirstLbVServer");

Console.WriteLine(stats.curclntconnections);

Console.WriteLine(stats.deferredreqrate);
```

`Python - Sample code to get feature statistics`

```
stats = lbvserver_stats.get(ns_session,"MyFirstLbVServer")

print(stats.curclntconnections)

print(stats.deferredreqrate)
```

Updating a Citrix ADC Resource

You can modify the properties of a resource after creating it.

Some properties in some Citrix ADC resources are not allowed to be modified after creation. The port number or the service type (protocol) of a load balancing virtual server or a service, are examples of such properties. Even though the update method appears to succeed, these properties retain their original values on the appliance.

- `Using REST APIs through HTTP`

  To update the details of an existing resource on the Citrix ADC appliance, specify the name of the resource in the URL, and in the request payload,within the specific resource object, specify the name and the updated details of the resource.

For example, to change the load balancing method to ROUNDROBIN and update the comment property for a load balancing virtual server named MyFirstLbVServer:

- `Request`

  `HTTP Method:` PUT

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver/MyFirstLbVServer

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "lbvserver":

    {

        "name":"MyFirstLbVServer",

        "lbmethod":"ROUNDROBIN",

        "comment":"Updated comments"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To update the properties of a resource, instantiate the resource class, specify the name of the resource to be updated, configure the resource by updating its properties locally, and then upload the updated resource instance to the Citrix ADC appliance.

The following sample code updates the service type and load balancing method of a load balancing virtual server.

`Java - Sample code to update a Citrix ADC resource`

```
//Create an instance of the lbvserver class

lbvserver update_lb = new lbvserver();
```

```
//Specify the name of the lbvserver to be updated

update_lb.set_name("MyFirstLbVServer");

//Specify the updated service type and lb method

update_lb.set_servicetype("https");
update_lb.set_lbmethod("LEASTRESPONSETIME");

//Upload the resource to Citrix ADC

lbvserver.update(ns_session,update_lb);
```

`.NET - Sample code to update a Citrix ADC resource`

```
//Create an instance of the lbvserver class

lbvserver update_lb = new lbvserver();

//Specify the name of the lbvserver to be updated

update_lb.name = "MyFirstLbVServer";
```

```
//Specify the updated service type and lb method

update_lb.servicetype = "https";

update_lb.lbmethod = "LEASTRESPONSETIME";

//Upload the resource to Citrix ADC

lbvserver.update(ns_session, update_lb);
```

`Python - Sample code to update a Citrix ADC resource`

```
# Create an instance of the lbvserver class

update_lb = lbvserver()

# Specify the name of the lbvserver to be updated

update_lb.name = "MyFirstLbVServer"

# Specify the updated service type and lb method

update_lb.servicetype = "https"
```

```
update_lb.lbmethod = "LEASTRESPONSETIME"

# Upload the resource to the CItrix ADC

lbvserver.update(ns_session, update_lb)
```

Binding Citrix ADC Resources

Citrix ADC resources form relationships with each other through the process of binding. This is how services are associated with a load balancing virtual server, or how policies are bound to a load balancing virtual server. Each binding relationship is represented by its own object.

A binding resource has properties representing the name of each Citrix ADC resource in the binding relationship. It can also have other properties related to that relationship (for example, the weight of the binding between an lbvserver resource and a service resource).

- `Using REST APIs through HTTP`

  To bind one Citrix ADC resource to another, you must instantiate the appropriate binding class (for example, to bind a service to a load balancing virtual server, you must instantiate the lbvserver_service_binding class) and add it to the Citrix ADC configuration (by using the static add() method on this class).

To unbind a resource, use the DELETE method and specify an "args" query string parameter in the URL that contains the attribute name and value in the relationship resource that designates the secondary resource.

The following example binds a service named svc_prod to a load balancing virtual server named MyFirstLbVServer and specify a weight for the binding.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/lbvserver_service_binding

`Request Headers:` Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

`Request Payload:`

```
{

"lbvserver_service_binding":

    {

    "servicename":"svc_prod",

    "weight":"20",

    "name":"MyFirstLbVServer"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx \<string \> (for general HTTP errors) or 5xx \<string \> (for Citrix-ADC-specific errors). The response payload provides details of the error.

The following example binds a policy to a policy label.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/authenticationpolicylabel_authenticationpolicy_binding

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"authenticationpolicylabel_authenticationpolicy_binding":

    {

    "policyname":"p1",

    "priority":"100",

    "gotopriorityexpression":"END",

    "labelname":"pl1"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

The following example unbinds the service svc_prod from the load balancing virtual server MyFirstLbVServer.

- `Request`

  `HTTP Method:` DELETE

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_service_binding/MyFirstLbVServer?args=servicename:svc_prod

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To bind one Citrix ADC resource to another, you must instantiate the appropriate binding class (for example, to bind a service to a load balancing virtual server, you must instantiate the lbvserver_service_binding class) and add it to the Citrix ADC configuration (by using the static add() method on this class).

To unbind a resource from another, invoke the delete() method from the resource binding class, by passing the name of the two resources.

The following sample code binds a service to a load balancing virtual server, by specifying a certain weight for the binding.

`Java - Sample code for binding`

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();

bindObj.set_name("MyFirstLbVServer");

bindObj.set_servicename("svc_prod");

bindObj.set_weight(20);

lbvserver_service_binding.add(ns_session,bindObj);
```

`.NET - Sample code for binding`

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();

bindObj.name = "MyFirstLbVServer";

bindObj.servicename = "svc_prod";

bindObj.weight = 20;

lbvserver_service_binding.add(ns_session,bindObj);
```

`Python - Sample code for binding`

```
bindObj = lbvserver_service_binding()

bindObj.name = "MyFirstLbVServer"

bindObj.servicename = "svc_prod"

bindObj.weight = 20

lbvserver_service_binding.add(ns_session, bindObj)
```

The following code sample unbinds a service from a server.

`Java - Sample Code for unbinding`

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();

bindObj.set_name("MyFirstLbVServer");

bindObj.set_servicename("svc_prod");

lbvserver_service_binding.delete(ns_session,bindObj);
```

`.NET - Sample code for unbinding`

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();

bindObj.name("MyFirstLbVServer");

bindObj.servicename("svc_prod");

lbvserver_service_binding.delete(ns_session,bindObj);
```

`Python - Sample code for unbinding`

```
bindObj = lbvserver_service_binding()

bindObj.name = "MyFirstLbVServer"

bindObj.servicename = "svc_prod"
```

```
lbvserver_service_binding.delete(ns_session, bindObj)
```

Globally Binding Citrix ADC Resources

Some Citrix ADC resources can be bound globally to affect the whole system. For example, a compression policy can be bound to an load balancing virtual server, in which case the policy affects only the traffic on that load balancing virtual server. However, if bound globally, it can affect any traffic on the appliance, regardless of which virtual servers handle the traffic.

The names of NITRO resources that can be used to bind resources globally have the pattern *\<featurename \>global_\<resourcetype \>_binding*. For example, the object *aaaglobal_aaapreauthenticationpolicy_binding* is used to bind preauthentication policies globally.

- `Using REST APIs through HTTP`

  The following example binds the policy named preautpol1 globally at priority 200.

- `Request`

  `HTTP Method:` POST

`URL:`

http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding/preautpol1

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"aaaglobal_aaapreauthenticationpolicy_binding":

    {

    "policy":"preautpol1",
```

```
    "priority":"200"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

The following example unbinds the policy named preautpol1.

- `Request`

  `HTTP Method:` DELETE

`URL:`

http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding?args=policy:preautpol1

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code creates a preauthentication action and a preauthentication policy that uses that action, and then binds the policy globally at priority 200.

Java - Sample code

```
aaapreauthenticationaction preauth_act1;

aaapreauthenticationpolicy preauth_pol1;

aaaglobal_aaapreauthenticationpolicy_binding glob_binding;

preauth_act1 = new aaapreauthenticationaction();

preauth_act1.set_name("preauth_act1");

preauth_act1.set_preauthenticationaction("ALLOW");

aaapreauthenticationaction.add(ns_session,preauth_act1);

preauth_pol1 = new aaapreauthenticationpolicy();

preauth_pol1.set_name("preauth_pol1");

preauth_pol1.set_rule("CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS");

preauth_pol1.set_reqaction("preauth_act1");
```

```
aaapreauthenticationpolicy.add(ns_session,preauth_pol1);

 glob_binding = new aaaglobal_aaapreauthenticationpolicy_binding();

glob_binding.set_policy("preauth_pol1");

glob_binding.set_priority(200);

aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session,glob_binding);
```

`.NET - Sample code`

```
aaapreauthenticationaction preauth_act1;

aaapreauthenticationpolicy preauth_pol1;

aaaglobal_aaapreauthenticationpolicy_binding glob_binding;

preauth_act1 = new aaapreauthenticationaction();

preauth_act1.name = "preauth_act1";
```

```
preauth_act1.preauthenticationaction = "ALLOW";

aaapreauthenticationaction.add(ns_session, preauth_act1);

preauth_pol1 = new aaapreauthenticationpolicy();

preauth_pol1.name = "preauth_pol1";

preauth_pol1.rule = "CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS";

preauth_pol1.reqaction = "preauth_act1";

aaapreauthenticationpolicy.add(ns_session, preauth_pol1);

glob_binding = new aaaglobal_aaapreauthenticationpolicy_binding();

glob_binding.policy = "preauth_pol1";

glob_binding.priority = 200;

aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session,glob_binding);
```

Python - Sample code

```
preauth_act1 = aaapreauthenticationaction()

preauth_act1.name = "preauth_act1"

preauth_act1.preauthenticationaction = "ALLOW"

aaapreauthenticationaction.add(ns_session, preauth_act1)

preauth_pol1 = aaapreauthenticationpolicy()

preauth_pol1.name = "preauth_pol1"

preauth_pol1.rule = "CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS"

preauth_pol1.reqaction = "preauth_act1"

aaapreauthenticationpolicy.add(ns_session, preauth_pol1)

glob_binding = aaaglobal_aaapreauthenticationpolicy_binding()

glob_binding.policy = "preauth_pol1"
```

```
glob_binding.priority = 200

aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session, glob_binding)
```

Deleting a Citrix ADC Resource

The usage of the delete operation depends on the unique identifiers (UIDs) of the resource being deleted.

Deleting Resource with Single UID. To delete a Citrix ADC resource that can be identified by a single identifier, specify the resource name. Deleting Resource with Multiple UIDs. To delete a Citrix ADC resource that is identified using multiple identifiers, use the "args" query parameter to specify the unique attributes along with their values.

- `Using REST APIs through HTTP`

  The following example deletes a load balancing virtual server named MyFirstLbVServer.

- `Request`

  `HTTP Method:` DELETE

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver/MyFirstLbVServer

`Request Header:` Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

The following example deletes a resource with multiple UIDs. Consider a SNIP (10.102.29.71) that belongs to two traffic domains (TDs) 123 and 110. To delete the SNIP from one of the traffic domains, specify the IP address and the relevant TD in the URL as follows:

- `Request`

  `HTTP Method:` DELETE

`URL:`

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip?args=ipaddress:10.102.29.71,td:123

`Request Header:` Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To delete an existing resource, invoke the static method delete() on the resource class, by passing the name of the resource.

The following sample code deletes a load balancing virtual server with name MyFirstLbVServer.

`Java - Sample code to delete a Citrix ADC resource`

```
lbvserver remove_lb = new lbvserver();

remove_lb.set_name("MyFirstLbVServer");

lbvserver.delete(ns_session, remove_lb);
```

`.NET - Sample code to delete a Citrix ADC resource`

```
lbvserver remove_lb = new lbvserver();

remove_lb.name("MyFirstLbVServer");

lbvserver.delete(ns_session, remove_lb);
```

`Python - Sample code to delete a Citrix ADC resource`

```
remove_lb = lbvserver()

remove_lb.name = "MyFirstLbVServer"

lbvserver.delete(ns_session, remove_lb)
```

Performing Bulk Operations

You can create, retrieve, update, and delete multiple resources simultaneously and thus minimize network traffic. For example, you can add multiple load balancing virtual servers in the same operation.

To account for the failure of some operations within the bulk operation, NITRO allows you to configure one of the following behaviors while establishing a connection with the appliance.

- `Exit`. When the first error is encountered, the execution stops. The commands that were executed before the error are committed.
- `Rollback`. When the first error is encountered, the execution stops. The commands that were executed before the error are rolled back. Rollback is only supported for add and bind commands.
- `Continue`. All the commands in the list are executed even if some commands fail.
- `Using REST APIs through HTTP`

  To perform a bulk operation, specify the required parameters in the same request payload. You must specify the behavior of the bulk operation in the request header using the X-NITRO-ONERROR parameter.

The following example adds two load balancing virtual servers in one operation. The operation continues even if one of the add operation fails.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "lbvserver":

    [

        {

        "name":"new_lbvserver1",

        "servicetype":"http"

        },

        {

        "name":"new_lbvserver2",

        "servicetype":"http"

        }

    ]

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created for the add operation and 200 OK for the update operation.

`HTTP Status Code on Failure:` 207 Multi Status with error details in the response payload.

The following example enables multiple load balancing virtual servers in the same operation.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?action=enable

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Content-Type:application/json

`Request Payload:`

```
{
            "lbvserver":
    [
        {
            "name":"v1",
        },

        {
            "name":"v2",
        }
    ]
}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created for the add operation and 200 OK for the update operation.

`HTTP Status Code on Failure:` 207 Multi Status with error details in the response payload.

- `Using REST APIs through SDKs`

To perform a bulk operation, you instantiate an array of the resource class, configure the properties of all the instances locally, and then upload all the instances to the Citrix ADC with one command.

The following sample code specifies bulk operation behavior.

`Java - Sample code to specify bulk operation behavior`

```
nitro_service ns_session = new nitro_service("10.102.29.60","http");

ns_session.set_onerror(OnerrorEnum.CONTINUE);

ns_session.login("admin","verysecret");
```

`.NET - Sample code to specify bulk operation behavior`

```
nitro_service ns_session = new nitro_service("10.102.29.60","http");

ns_session.onerror = OnerrorEnum.CONTINUE;

ns_session.login("admin","verysecret");
```

`Python - Sample code to specify bulk operation behavior`

```
ns_session = nitro_service("10.102.29.60","http")

ns_session.onerror = OnerrorEnum.CONTINUE

ns_session.login("admin","verysecret")
```

The following sample code creates two load balancing virtual servers.

`Java - Sample code for bulk creation`

```
//Create an array of lbvserver instances

lbvserver[] lbs = new lbvserver[2];
```

```
//Specify properties of the first lbvserver

lbs[0] = new lbvserver();

lbs[0].set_name("lbvserv1");

lbs[0].set_servicetype("http");

lbs[0].set_ipv46("10.70.136.5");

lbs[0].set_port(80);

//Specify properties of the second lbvserver

lbs[1] = new lbvserver();

lbs[1].set_name("lbvserv2");

lbs[1].set_servicetype("https");

lbs[1].set_ipv46("10.70.136.5");

lbs[1].set_port(443);

//Upload the properties of the two lbvservers to the Citrix ADC

lbvserver.add(ns_session,lbs);
```

`.NET - Sample code for bulk creation`

```
//Create an array of lbvserver instances

lbvserver[] lbs = new lbvserver[2];

//Specify details of first lbvserver

lbs[0] = new lbvserver();

lbs[0].name = "lbvserv1";

lbs[0].servicetype = "http";

lbs[0].ipv46 = "10.70.136.5";

lbs[0].port = 80;

//Specify details of second lbvserver

lbs[1] = new lbvserver();

lbs[1].name = "lbvserv2";

lbs[1].servicetype = "https";

lbs[1].ipv46 = "10.70.136.5";

lbs[1].port = 443;

//upload the details of the lbvservers to the NITRO server
```

```
lbvserver.add(ns_session,lbs);
```

`Python - Sample code for bulk creation`

```
# Create an array of lbvserver instances

lbs = lbvserver[2]

# Specify properties of the first lbvserver

lbs[0] = lbvserver()
lbs[0].name = "lbvserv1"
lbs[0].servicetype = "http"
lbs[0].ipv46 = "10.70.136.5"
lbs[0].port = 80

# Specify properties of the second lbvserver

lbs[1] = lbvserver()
lbs[1].name = "lbvserv2"
lbs[1].servicetype = "https"
lbs[1].ipv46 = "10.70.136.5"
```

```
lbs[1].port = 443

# Upload the properties of the two lbvservers to the CItrix ADC

lbvserver.add(ns_session, lbs)
```

Getting the Count of Citrix ADC Resources

This topic covers getting the count of a type of Citrix ADC resource present in a Citrix ADC appliance by using REST APIs through HTTP.

- `Using REST APIs through HTTP`

  To get a count of a specific resource type, in the URL specify the count query parameter as "yes".

For example, to get a count of all the load balancing virtual servers.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?count=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{
    "lbvserver":
    [
        {
            "__count": 4
        }
    ]
}
```

Renaming a Citrix ADC Resource

This topic covers renaming a Citrix ADC resource by using REST APIs through HTTP.

- `Using REST APIs through HTTP`

  To change the name of an existing resource, specify the action as "rename" in the URL query string, and in the request payload, specify the existing name and the new name.

For example, to change the name of a load balancing virtual server from MyFirstLbVServer to MyServer:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/lbvserver?action=rename

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "lbvserver":

    {

        "name":"MyFirstLbVServer",

        "newname":"MyServer"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Performing File Operations

Citrix ADC operations such as configuring SSL certificates requires the input files to be available locally on the Citrix ADC appliance. NITRO allows you to perform file operations such as uploading files, retrieving files, retrieving file content, and deleting files of types: txt, cert, req, xml, lic, and key.

- `Notes`
  - File size must be less than or equal to 2 MB.
- Use the "BASE64" value for the fileencoding attribute in the request payload. This is the only valid encoding currently supported.
- The filelocation path must be URL encoded. For example, if the path is /nsconfig/ssl, encode the / and use the file location as %2Fnsconfig%2Fssl.

- When uploading a file, make sure that each directory of the file path has the 755 (read, write, execute) permission. For example, to upload a file to the "/nsconfig/ssl.html" directory, the following directories must have the 755 permission: flash (because the "/nsconfig" folder is actually a link to "/flash/nsconfig.html" directory)
  - nsconfig
  - ssl

Uploading a File

To upload a file to the Citrix ADC, specify a name for the file, the location where the file must be created on the Citrix ADC, and the content of the file.

- `Using REST APIs through HTTP`

  For example, to upload a file named cert1.crt in the /nsconfig/ssl/ directory:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemfile

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

        "systemfile":

        {

            "filename": "cert1.crt",

            "filelocation": "/nsconfig/ssl.html",

            "filecontent":"VGhpcyBpcyBteSBmaWxl",

            "fileencoding": "BASE64"
```

```
        }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Retrieving the Files

To retrieve the files from a specific Citrix ADC directory, specify the directory path in the URL.

- `Using REST APIs through HTTP`

  For example, to retrieve the files from the /nsconfig/ssl directory.

- `Request`

  `HTTP Method:` GET

`URL:`

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemfile?args=filelocation:%2Fnsconfig%2Fssl

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{

    "systemfile":

    [

            "filename": "ns-root.key",

            "filelocation": "/nsconfig/ssl",

            "fileaccesstime": "Tue Jan 14 19:27:01 2014",

            "filemodifiedtime": "Tue Nov  5 17:16:00 2013"

        },

        {

        {

            "filename": "ns-root.req",

            "filelocation": "/nsconfig/ssl",

            "fileaccesstime": "Tue Jan 14 19:27:01 2014",

            "filemodifiedtime": "Tue Nov  5 17:16:00 2013"

        }

    ]

}
```

Retrieving Contents of a Specific File

To retrieve the contents of a file, specify the filename and its directory path in the URL.

- `Using REST APIs through HTTP`

  For example, to retrieve the contents of the ns-root.key file from the /nsconfig/ssl directory.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemfile/ns-root.key?args=filelocation:%2Fnsconfig%2Fssl

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:`

200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{

    "systemfile":

    [

        {

            "filename": "ns-root.key",

            "filelocation": "/nsconfig/ssl",
```

```
            "filecontent": "LS0tLS1CRUdJTiBSU0EgUFJJVkFU0tLQo=",

            "fileencoding": "BASE64",

            "fileaccesstime": "Tue Jan 14 19:27:01 2014",

            "filemodifiedtime": "Tue Nov  5 17:16:00 2013"

        }

    ]

}
```

Deleting a File

To delete a file from the Citrix ADC appliance, specify the filename and the directory path in the URL.

- `Using REST APIs through HTTP`

  For example, to delete the ns-root.key file from the /nsconfig/ssl directory.

`Request:`

`HTTP Method:` DELETE

`URL:` https://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemfile/ns-root.key?args=filelocation:%2Fnsconfig%2Fssl

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Use Cases and Samples

This section covers some use case scenarios to certain resources and scenarios. More scenarios will be added in future updates to this section.

Configure basic load balancing on a Citrix ADC VPX appliance

The load balancing feature of a Citrix ADC appliance distributes user requests for web pages and other protected applications across multiple servers that all host (or mirror) the same content. You use load balancing primarily to manage user requests to heavily used applications, preventing poor performance and outages and ensuring that users can access your protected applications. Load balancing also provides fault tolerance; when one server that hosts a protected application becomes unavailable, the feature distributes user requests to the other servers that host the same application.

A load balancing setup includes a load-balancing virtual server and multiple load-balanced application servers. The virtual server receives incoming client requests, uses the load balancing algorithm to select an application server, and forwards the requests to the selected application server.

Consider an example in which Example Corp hosts a site at `www.example.com`. To ensure application availability, the site is hosted on three servers, S1, S2, and S3. A load balancing virtual server, LBVS-1, on a Citrix ADC appliance NS-1 is used to load balance these servers. SVC-1, SVC-2, and SVC-3 are services created on Citrix ADC appliance NS-1 representing S1, S2, and S3.

Before you begin

Before you start configuring load balancing using NITRO REST APIs on a Citrix ADC VPX appliance, make sure that:

- You have deployed a Citrix ADC VPX appliance and the appliance is UP and running in your setup. For more information, see Deploy a Citrix ADC VPX instance.
- You have added a subnet IP (SNIP) address on the Citrix ADC appliance. A Citrix ADC uses a subnet IP (SNIP) address as a source IP address to proxy client connections to servers. For more information, see Configuring Subnet IP Addresses.
- You have a basic understanding of the load balancing feature of a Citrix ADC appliance. For more information, see:
  - Load Balancing
  - Load balance traffic on a Citrix ADC appliance
- You have a basic understading of the Citrix ADC NITRO REST APIs. For more information, see Citrix ADC NITRO API reference.

Configuration steps

Configuring load balancing on a Citrix ADC appliance using NITRO REST APIs consists of the following steps:

1. Create a load balancing virtual server
2. Create load balancing services
3. Bind the services to the load balancing server

Create a load balancing virtual server

A load balancing virtual server is an entity to which a client sends connection requests for a particular load-balanced website or application. A virtual server is represented by an IP address, a port, and a protocol.

To create a load balancing virtual server on a Citrix ADC VPX appliance, you use the Citrix ADC NITRO API `lbvserver` object.

For more information about the `lbvserver` object and its properties, see Citrix NITRO API reference for lbvserver.

Request structure

REQUEST FIELD	VALUE
HTTP Method	`POST`
URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver`
Request Headers	`Content-Type: application/json`

Request Payload	`{ "lbvserver": { "name":"<value>", "servicetype":"<value>", "ipv46": "<value>", "port": "<value>", } }`
	`Example:`
	
	`{ "lbvserver": { "name":"LBVS-1", "servicetype":"HTTP", "ipv46": "203.0.113.10", "port": 443 } }`

Create load balancing services

A service is an entity, which represents a server or an application running on a server. A service identifies the servers IP address, a port, and a protocol.

To create a load balancing service on a Citrix ADC VPX appliance, you use the Citrix ADC NITRO API `service` object.

You must create a service for each server to be load balanced.

For more information about the `service` object and its properties, see Citrix NITRO API reference for service.

Request structure

REQUEST FIELD	VALUE
HTTP Method	`POST`
URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service`
Request Headers	`Content-Type: application/json`

Request Payload	`{"service": { "name": "<service name>", "ip": "<IP address of the server>", "servicetype": "HTTP", "port": 443 }}`
	`Example:`
	
	`{"service": { "name": "SVC-1”, "ip": "192.0.2.10", "servicetype": "HTTP", "port": 443 }}`

Bind the services to the load balancing server

Bind the created services to the load balancing server.

To bind the created services to the load balancing server, you use the Citrix ADC NITRO API `lbvserver_service_binding` object.

For more information about the `lbvserver_service_binding` object and its properties, see Citrix NITRO API reference for lbvserver_service_binding.

Request structure

REQUEST FIELD	VALUE
HTTP Method	`PUT`

REQUEST FIELD	VALUE
URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_service_binding`
Request Headers	`Content-Type: application/json`

Request Payload	`{"lbvserver_service_binding": { "name": "<name of the virtual server>", "servicename": "Name of the service"}}`
	`Example:`
	
	`{"lbvserver_service_binding": { "name": "LBVS-1”"servicename": "SVC-1"}}`

Sample configuration

STEPS	CURL REQUESTS
Create a load balancing virtual server	`curl -v -X POST -H "Content-Type: application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/lbvserver -d '{ "lbvserver": { "name":"LBVS-EN", "servicetype":"HTTP", "ipv46": "203.0.113.10", "port": 80}'`
Create load balancing services	`curl -v -X POST -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/service -d '{"service": { "name": "SVC-EN-1", "ip": "192.0.2.10", "servicetype": "HTTP", "port": 80 } }'` `curl -v -X POST -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/service`

STEPS	CURL REQUESTS

	`-d '{"service": { "name": "SVC-EN-2", "ip": "192.0.2.30", "servicetype": "HTTP", "port": 80 } }'`
	
	`curl -v -X POST -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/service -d '{"service": { "name": "SVC-EN-3", "ip": "192.0.2.30", "servicetype": "HTTP", "port": 80 } }'`

Bind the services to the load balancing server	`curl -v -X PUT -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/lbvserver_service_binding -d '{"lbvserver_service_binding": { "name": "LBVS-EN", "servicename": "SVC-EN-1", "weight": "1" } }'`

Configure content switching in a Citrix ADC VPX Appliance

In today's complex Web sites, you may want to present different content to different users. For example:

- you may want to allow users from the IP range of a customer or partner to have access to a special Web portal.
- You may want to present content relevant to a specific geographical area to users from that area.
- You may want to present content in different languages to the speakers of those languages.
- You may want to present content tailored to specific devices, such as smartphones, to those who use the devices.

The Citrix ADC content switching feature enables the appliance to distribute client requests across multiple servers on the basis of specific content that you wish to present to those users.

A content switching configuration consists of a content switching virtual server, a load balancing setup consisting of load balancing virtual servers and services, and content switching policies. When a request reaches the content switching virtual server, the virtual server applies the associated content switching policies to that request. After it evaluates the policies, the content switching virtual server routes the request to the appropriate load balancing virtual server, which sends it to the appropriate service.

Consider an example in which Example Corp hosts a site at `www.example.com`. The site is hosted in two languages: English and French. The site in English content is hosted on two servers SVC-EN-1 and SVC-EN-2,and a load balancing virtual server, LBVS-EN, load balances these two servers. Similarly, the site in French content is hosted on two servers SVC-FR-1 and SVC-FR-2, and a load balancing virtual server, LBVS-FR, load balances these two servers. Both the load balancing servers LBVS-EN and LBVS-FR are associated with a content switching virtual server CSVS-1. Two content switching policies CSPOL-EN and CSPOL-FR are also associated with CSVS-1.

When an HTTP request reaches the CSVS-1, CSVS-1 uses the associated policies CSPOL-EN and CSPOL-FR to determine the language used in the request header. Based on the language determined, CSVS-1 routes the request to either LBVS-EN or LBVS-FR, which sends the request to one of its bound load balanced servers.

Before you begin

Before configuring content switching in a Citrix ADC VPX Appliance, make sure that:

- You have deployed a Citrix ADC VPX appliance and the appliance is UP and running in your setup. For more information, see Deploy a Citrix ADC VPX instance.
- You have a basic understanding of the load balancing feature of a Citrix ADC appliance. For more information, see:
  - Load Balancing
  - Load balance traffic on a Citrix ADC appliance
- You have a basic understanding of the content switching feature of a Citrix ADC appliance. For more information, see:
  - Content switching concept

- Configuring basic content switching

- You have a basic understading of the Citrix ADC NITRO REST APIs. For more information, see Citrix ADC NITRO API reference.

Configuration steps

Configuring content switching in a Citrix ADC appliance consists of the following steps:

1. Create a content switching virtual server
2. Create load balancing virtual servers
3. Create load balancing services
4. Bind the services to the load balancing servers
5. Create content switching policies
6. Bind content switching policies and load balancing virtual servers to the content switching virtual server

Create a content switching virtual server

To create a content switching virtual server, you use the `csvserver` NITRO API object. For more information about the csvserver object and its properties, see Citrix NITRO API reference for csvserver.

Curl request

```
curl -X POST -H "Content-Type: application/json" -u <username>:<password>
 http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver

-d '{"csvserver": { "name":"<value>", "servicetype":"<value>",
"ipv46":"<value>", "port":<value>}}'
```

Create load balancing virtual servers

To create a load balancing virtual server, you use the `lbvserver` NITRO API object.

For more information about the lbvserver object and its properties, see Citrix NITRO API reference for lbvserver.

Curl request

```
curl -v -X POST  -H "Content-Type: application/json" -u
<username>:<password> http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/
config/lbvserver -d '{ "lbvserver": { "name":"<value>",
 "servicetype":"<value>", "ipv46": "<value>", "port":<value>}'
```

Create load balancing services

To create a load balancing service, you use the `service` NITRO API object. You must create a service for each server to be load balanced.

For more information about the service object and its properties, see Citrix NITRO API reference for service.

Curl request

```
curl -v -X POST -H "Content-Type:application/json" -u
<username>:<password> http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/
config/service -d '{"service": { "name":"<value>", "ip":"<value>",
"servicetype":"<value>", "port":"<value>" } }'
```

Bind the services to the load balancing servers

To bind the created services to the load balancing servers, you use the `lbvserver_service_binding` NITRO API object.

For more information about the lbvserver_service_binding object and its properties, see Citrix NITRO API reference for lbvserver_service_binding.

Curl request

```
curl -v -X PUT -H "Content-Type:application/json" -u <username>:<password>
http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/
lbvserver_service_binding -d '{"lbvserver_service_binding":
{ "name":"<value>", "servicename":"<value>", "weight":"<value>" } }'
```

Create content switching policies

To create a content switching policy, you use the `cspolicy` NITRO API object.

For more information about the cspolicy object and its properties, see Citrix NITRO API reference for cspolicy.

Curl request

```
curl -v -X POST -H "Content-Type:application/json" -u
<username>:<password> http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/
config/cspolicy -d '{"cspolicy": { "policyname":"<value>",
"rule":"<value>" }' }'
```

Bind content switching policies and load balancing virtual servers to the content switching virtual server

To bind content switching policies and load balancing virtual servers to the content switching virtual server, you use the `csvserver_cspolicy_binding` NITRO API object.

For more information about the csvserver_cspolicy_binding object and its properties, see Citrix NITRO API reference for csvserver_cspolicy_binding.

Curl request

```
curl -v -X PUT -H "Content-Type:application/json" -u <username>:<password>
http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/
csvserver_cspolicy_binding -d '{"csvserver_cspolicy_binding": { "name":
"<value>", "policyname": "<value>", "targetlbvserver": "<value>",
"priority": "<value>" } }'
```

Sample configuration

STEPS	CURL REQUESTS
Create a content switching virtual server	`curl -X POST -H "Content-Type: application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/csvserver-d '{"csvserver": { "name": "CSVS-1", "servicetype": "HTTP", "ipv46": "203.0.113.5", "port": 80}}'`
Create load balancing virtual servers	`curl -v -X POST -H "Content-Type: application/json" -u`

STEPS	CURL REQUESTS
	`nsroot:examplepassword http://192.0.0.33//nitro/v1/config/lbvserver -d '{ "lbvserver": { "name":"LBVS-EN", "servicetype":"HTTP", "ipv46": "203.0.113.10", "port": 80}'` `curl -v -X POST -H "Content-Type: application/json" -u nsroot:examplepassword http://192.0.0.33//nitro/v1/config/lbvserver -d '{ "lbvserver": { "name":"LBVS-FR", "servicetype":"HTTP", "ipv46": "203.0.113.20", "port": 80}'`

Create load balancing services	`curl -v -X POST -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/service -d '{"service": { "name": "SVC-EN-1", "ip": "192.0.2.10", "servicetype": "HTTP", "port": 80 } }'`
	`curl -v -X POST -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/service -d '{"service": { "name": "SVC-EN-2", "ip": "192.0.2.20", "servicetype": "HTTP", "port": 80 } }`
	
	`curl -v -X POST -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/service -d '{"service": { "name": "SVC-FR-1", "ip": "192.0.2.30",`

STEPS	CURL REQUESTS

	`"servicetype": "HTTP", "port": 80 } }'`
	
	`curl -v -X POST -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/service -d '{"service": { "name": "SVC-FR-2", "ip": "192.0.2.40", "servicetype": "HTTP", "port": 80 } }`

Bind the services to the load balancing servers	`curl -v -X PUT -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/lbvserver_service_binding -d '{"lbvserver_service_binding": { "name": "LBVS-EN", "servicename": "SVC-EN-1", "weight": "1" } }'`
	`curl -v -X PUT -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/lbvserver_service_binding -d '{"lbvserver_service_binding": { "name": "LBVS-EN", "servicename": "SVC-EN-2", "weight": "1" } }'`
	
	`curl -v -X PUT -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/lbvserver_service_binding -d '{"lbvserver_service_binding":`

STEPS	CURL REQUESTS

	`{ "name": "LBVS-FR", "servicename": "SVC-FR-1", "weight": "1" } }'`
	
	`curl -v -X PUT -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/lbvserver_service_binding -d '{"lbvserver_service_binding": { "name": "LBVS-FR", "servicename": "SVC-FR-2", "weight": "1" } }'`

Create content switching policies	`curl -v -X POST -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/cspolicy -d '{"cspolicy": { "policyname": "CSPOL-EN", "rule": "HTTP.REQ.URL.PATH_AND_QUERY.CONTAINS(\"en-us\")" } }'` `curl -v -X POST -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/cspolicy -d '{"cspolicy": { "policyname": "CSPOL-FR", "rule": "HTTP.REQ.URL.PATH_AND_QUERY.CONTAINS(\"fr\")" } }'`
Bind content switching policies and load balancing virtual servers to the content switching virtual server	`curl -v -X PUT -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/csvserver_cspolicy_binding -d '{"csvserver_cspolicy_binding": { "name": "CSVS-1", "policyname": "CSPOL-EN", "targetlbvserver": "LBVS-EN", "priority": "10" } }'`

STEPS	CURL REQUESTS
	`curl -v -X PUT -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/csvserver_cspolicy_binding -d '{"csvserver_cspolicy_binding": { "name": "CSVS-1", "policyname": "CSPOL-FR", "targetlbvserver": "LBVS-FR", "priority": "20" } }'`

Log HTTP requests where the response is HTTP 5xx (server error)

In some scenarios in a Citrix ADC load balancing set up, a web server responds with a 5xx error code when it is unable to handle the request for reasons such as invalid requests, temporary overloading, or server maintenance. For example:

- 502 Bad Gateway. The server is acting as a gateway or proxy and received an invalid response from the upstream server.
- 503 Service Unavailable. The server is currently unavailable. The servers might be overloaded or down for maintenance.
- 504 Gateway Time-out. The server is acting as a gateway or proxy and did not receive a timely response from the upstream server.

You can log the HTTP requests for which the server responded with an HTTP 5xx error. You can then analyse these HTTP requests in a testing set up to troubleshoot the issues in server. To log the HTTP requests for which the server responded with an HTTP 5xx error, you must create an audit message action, create a rewrite policy and, associate the audit message action to the the rewrite policy. Then, you must bind the rewrite policy to the load balancing virtual server.

The Citrix ADC appliance uses the rewrite policy to identify the HTTP requests, for which the server responded with an HTTP 5xx error, in to the load balancing configuration. Then the appliance log these HTTP requests in a format defined in the audit message action.

Before you begin

Before configuring a Citrix ADC appliance to log HTTP requests, for which the server responded with an HTTP 5xx error, make sure that:

- You have deployed a Citrix ADC VPX appliance and the appliance is UP and running in your setup. For more information, see Deploy a Citrix ADC VPX instance.
- You have added a subnet IP (SNIP) address on the Citrix ADC appliance. A Citrix ADC uses a subnet IP (SNIP) address as a source IP address to proxy client connections to servers. For more information, see Configuring Subnet IP Addresses.
- You have added an HTTP load balancing configuration in the Citrix ADC appliance. For more information about load balancing configuration, see:
  - Load Balancing
  - Load balance traffic on a Citrix ADC appliance
- You have already configured audit logging (SYSLOG or NSLOG) in the Citrix ADC appliance.
  - Enabled `userdefinedauditlog` option in the related audit action server entity.
  - Bound the related audit policy to system global.

  For more information about Citrix ADC audit logging, see:
  - Audit logging concept
  - Configure Citrix ADC audit logging
- You have a basic understading of the Citrix ADC NITRO REST APIs. For more information, see Citrix ADC NITRO API reference.

Configuration steps

Configuring a Citrix ADC appliance to log HTTP requests, for which the server responded with an HTTP 5xx error, consists of the following steps:

1. Create an audit message action
2. Create a rewrite policy and specify the audit message action
3. Bind the rewrite policy to the load balancing virtual server

Create an audit message action

To create an audit message action, you use the `auditmessageaction` NITRO API object.

For more information about the auditmessageaction object and its properties, see Citrix NITRO API reference for auditmessageaction.

Curl request

```
curl -X POST -H "Content-Type: application/json" -u <username>:<password>
http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditmessageaction -d
'{ "auditmessageaction": { "name":"<value>", "loglevel":"<value>",
"stringbuilderexpr":"<value>" }}'
```

Create a rewrite policy and specify the audit message action

To create a rewrite policy and specify the audit message action, you use the `rewritepolicy` NITRO API object.

For more information about the rewritepolicy object and its properties, see Citrix NITRO API reference for rewritepolicy.

Curl request

```
curl -v -X POST  -H "Content-Type: application/json" -u
<username>:<password> http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/
config/rewritepolicy -d '{ "rewritepolicy": { "name":"<value>",
"rule":"<value>", "action":"<value>", "logaction":"<value>"}'
```

Bind the rewrite policy to the load balancing virtual server

To bind the rewrite policy to the load balancing virtual server, you use the `lbvserver_rewritepolicy_binding` NITRO API object.

For more information about the lbvserver_rewritepolicy_binding object and its properties, see Citrix NITRO API reference for lbvserver_rewritepolicy_binding.

Curl request

```
curl -v -X PUT -H "Content-Type:application/json" -u <username>:<password>
http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/
lbvserver_rewritepolicy_binding -d '{ "lbvserver_rewritepolicy_binding":
{ "name":"<value>", "policyname":"<value>", "priority":"<value>",
"gotopriorityexpression":"<value>", "bindpoint":"<value>" } }'
```

Sample configuration

STEPS	CURL REQUESTS
Create an audit message action	`curl -X POST -H "Content-Type: application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/auditmessageaction -d '{"auditmessageaction": { "name":"ADT-MSG-ACN-LOG-5XX", "loglevel":"WARNING", "stringbuilderexpr": ""\"Received \" + HTTP.RES.STATUS + \" response for URL : \" + HTTP.REQ.URL.HTTP_URL_SAFE""}}'`
Create a rewrite policy and specify the audit message action	`curl -v -X POST -H "Content-Type: application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/rewritepolicy -d '{ "rewritepolicy": { "name":"RWRT-POL-LOG-5XX", "rule":"HTTP.RES.IS_SERVER_ERROR", "action":"NOREWRITE", "logaction":"ADT-MSG-ACN-LOG-5XX"}'`
Bind the rewrite policy to the load balancing virtual server	`curl -v -X PUT -H "Content-Type:application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/lbvserver_rewritepolicy_binding -d '{ "lbvserver_rewritepolicy_binding": { "name":"LBVS-1", "policyname":"RWRT-POL-LOG-5XX", "priority": "100", "gotopriorityexpression": "END", "bindpoint": "RESPONSE" } }'`

Log transactions from a specific client in a load balancing configuration

You can log transactions from a specific client to analyse them to find any trends and metrics. This information can then be used to optimize the settings in the Citrix ADC and servers to improve efficiency in processing the client requests.

To log transactions from a specific client in a load balancing configuration, you must create an audit message action, create a rewrite policy and, associate the audit message action to the the rewrite policy. Then, you must bind the rewrite policy to the load balancing virtual server.

The Citrix ADC appliance uses the rewrite policy to identify transactions related to a specific client in a load balancing configuration. Then the appliance log these transactions in a format defined in the audit message action.

Before you begin

Before configuring a Citrix ADC appliance to log transactions from a specific client, make sure that:

- You have deployed a Citrix ADC VPX appliance and the appliance is UP and running in your setup. For more information, see Deploy a Citrix ADC VPX instance.
- You have a basic understanding of the load balancing feature of a Citrix ADC appliance. For more information, see:
  - Load Balancing
  - Load balance traffic on a Citrix ADC appliance
- You have already configured audit logging (SYSLOG or NSLOG) in the Citrix ADC appliance.
  - Enabled `userdefinedauditlog` option in the related audit action server entity.
  - Bound the related audit policy to system global.

  For more information about Citrix ADC audit logging, see:
  - Audit logging concept
  - Configure Citrix ADC audit logging
- You have a basic understading of the Citrix ADC NITRO REST APIs. For more information, see Citrix ADC NITRO API reference.

Configuration steps

Configuring a Citrix ADC appliance to log transactions from a specific client, consists of the following steps:

1. Create an audit message action
2. Create a rewrite policy and specify the audit message action
3. Bind the rewrite policy to the load balancing virtual server

Create an audit message action

To create an audit message action, you use the `auditmessageaction` NITRO API object.

For more information about the auditmessageaction object and its properties, see Citrix NITRO API reference for auditmessageaction.

Curl request

```
curl -X POST -H "Content-Type: application/json" -u <username>:<password>
http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditmessageaction -d
'{ "auditmessageaction": { "name":"<value>", "loglevel":"<value>",
"stringbuilderexpr":"<value>" }}'
```

Create a rewrite policy and specify the audit message action

To create a rewrite policy and specify the audit message action, you use the `rewritepolicy` NITRO API object.

For more information about the rewritepolicy object and its properties, see Citrix NITRO API reference for rewritepolicy.

Curl request

```
curl -v -X POST  -H "Content-Type: application/json" -u
<username>:<password> http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/
config/rewritepolicy -d '{ "rewritepolicy": { "name":"<value>",
"rule":"<value>", "action":"<value>", "logaction":"<value>"}'
```

Bind the rewrite policy to the load balancing virtual server

To bind the rewrite policy to the load balancing virtual server, you use the `lbvserver_rewritepolicy_binding` NITRO API object.

For more information about the lbvserver_rewritepolicy_binding object and its properties, see Citrix NITRO API reference for lbvserver_rewritepolicy_binding.

Curl request

```
curl -v -X PUT -H "Content-Type:application/json" -u <username>:<password>
http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/
lbvserver_rewritepolicy_binding -d '{ "lbvserver_rewritepolicy_binding":
{ "name":"<value>", "policyname":"<value>", "priority":"<value>",
"gotopriorityexpression":"<value>", "bindpoint":"<value>" } }'
```

Sample configuration

STEPS	CURL REQUESTS											
Create an audit message action	`curl -X POST -H "Content-Type: application/json" -u nsroot:exam	Client IP: "+CLIENT.IP.SRC+"	Client TCP Source Port: "+CLIENT.TCP.SRCPORT+"	Client TCP Destination Port: "+CLIENT.TCP.DSTPORT+"	LBVSERVER NAME: "+HTTP.REQ.LB_VSERVER.NAME+"	LBVSERVER IP: "+CLIENT.IP.DST+"	Server IP: "+SERVER.IP.DST+"	Server port: "+SERVER.TCP.DSTPORT+"	HTTP Request Method: "+HTTP.REQ.METHOD+"	HOST NAME: "+HTTP.REQ.HOSTNAME+"	URL: "+HTTP.REQ.URL+"	Response Code: "+HTTP.RES.STATUS""}}'`

Disable a load balancing service in a Citrix ADC VPX Appliance

Network outages such as system upgrades or hardware maintenance of servers are scheduled at regular intervals. During this time, you must disable the Citrix ADC load balancing services representing these servers,

You can perform a hard shutdown or graceful shutdown of a service. Hard shutdown disables a service immediately disrupting any established sessions and any transactions in progress, which may result in data loss. Hard shutdown changes the state of the service to DOWN.

Graceful shutdown disables a service after a wait time or after all the current active client connections are closed by either the server or the client. Graceful shutdown first changes the state of the service to Transition Out of Service (TROFS) state till the wait time is over or all the active connections are closed, after which the state changes to DOWN.

Often, however, you cannot estimate the amount of time needed for all the connections to a service to complete the existing transactions. If a transaction is unfinished when the wait time expires, shutting down the service may result in data loss. In this case, you can specify the *graceful* option, so that the service is disabled only when all the current active client connections are closed by either the server or the client. See the following table for behavior if you specify a wait time in addition to graceful option.

Persistence is maintained according to the specified method even if you enable graceful shutdown. The system continues to serve all the persistent clients, including new connections from the clients, unless the service is marked DOWN during the graceful shutdown state as a result of the checks made by a monitor.

The following table describes the functionality of graceful shutdown of a service for different combinations of graceful and wait time values.

GRACEFUL	WAIT TIME	DESCRIPTION
Enabled	Specified	Service is shut down after the last of the current active client connections is served, even if the wait time has not expired. The appliance checks the status of the connections once every second. If the wait time expires, any open sessions are closed.
Disabled	Specified	Service is shut down only after the wait time expires, even if all established connections are served before expiration.
Enabled	Not specified	Service is shut down only after the last of the previously established connections is served, regardless of the time taken to serve the last connection.
Disabled	Not specified	No graceful shutdown. Service is shut down

GRACEFUL	WAIT TIME	DESCRIPTION
		immediately after the disable option is chosen or the disable command is issued. (The default wait time is zero seconds.)

Before you begin

Before you disable a load balancing service in a Citrix ADC VPX Appliance, make sure that:

- You have deployed a Citrix ADC VPX appliance and the appliance is UP and running in your setup. For more information, see Deploy a Citrix ADC VPX instance.
- You have a basic understanding of the load balancing feature of a Citrix ADC appliance. For more information, see:
- Load Balancing
- Load balance traffic on a Citrix ADC appliance
- You have an understanding of the following concepts related to a load balancing service:
  - various states of a load balancing service. For more information, Load balance service states.
  - Graceful shutdown of a load balancing service. For more information, Graceful shutdown of services.
- You have a basic understanding of the Citrix ADC NITRO REST APIs. For more information, see Citrix ADC NITRO API reference.

Steps to disable a load balancing service in a Citrix ADC VPX Appliance

To disable a load balance service in a Citrix ADC appliance, you use the *service* NITRO API object with action as *disable*. Optionally, for graceful shutdown of the service, set one or both of the following properties in the request payload:

NAME	DESCRIPTION
graceful	Shut down gracefully, not accepting any new connections, and disabling the service when all of its connections are closed.

NAME	DESCRIPTION
	Default value: NO Possible values: YES, NO
delay	Wait time, in seconds, allocated to the Citrix ADC for a graceful shutdown of the service. During this period, new requests are sent to the service only for clients who already have persistent sessions on the appliance. Requests from new clients are load balanced among other available services. After the delay time expires, no requests are sent to the service, and the service is marked as unavailable (OUT OF SERVICE). Default value: 0

For more information about the *service* object and its properties, see Citrix NITRO API reference for service.

Request components

REQUEST FIELD	VALUE
HTTP Method	`POST`
URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service?action=disable`
Request Headers	`Content-Type: application/json`

Request Payload	`{"service": {"name":<value>,"delay":<value>,"graceful":<value>}}`
	Example:
	
	`{"service":{"name": "SVC-1”,"graceful": “Yes”}}`

Curl request

Use the following curl command syntax to disable a service in a Citrix ADC appliance:

```
curl -X POST -H "Content-Type: application/json" -u <username>:<password>
 http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service?
action=disable -d '{"service": {"name": "<value>","graceful": "<value>",
"delay": "<value>"}}'
```

Examples

EXAMPLE DESCRIPTION	CURL REQUEST
Perform a graceful shutdown of a service named SVC-1 in a Citrix ADC appliance, which has the NSIP address of 192.0.0.33.	`curl -X POST -H "Content-Type: application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/service?action=disable -d '{"service": {"name": "SVC-1", "graceful": "Yes"}}'`
Perform a hard shutdown of a service named SVC-1 in a Citrix ADC appliance, which has the NSIP address of 192.0.0.33.	`curl -X POST -H "Content-Type: application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/service?action=disable -d '{"service": {"name": "SVC-1}}'`

Retrieve firmware and licensing information for a Citrix ADC VPX Appliance

Citrix supports NITRO REST APIs for retrieving firmware and licensing information for a Citrix ADC appliance. The firmware information includes the version and build number of the firmware running on the appliance. The licensing information includes the list of available ADC features, and the type and mode of the license used in the appliance.

Before you begin

Before you find firmware and licencing information for a Citrix ADC appliance, make sure that:

- You have deployed a Citrix ADC VPX appliance and the appliance is UP and running in your setup. For more information, see Deploy a Citrix ADC VPX instance.

- You have a basic understanding of Citrix ADC Licenses. For more information, see:
  - Citrix ADC Licensing
  - Manage Citrix ADC licenses using Citrix ADM

Retrieve firmware information for a Citrix ADC appliance

You use the _nsversion_NITRO API object to find information about the firmware running on a Citrix ADC appliance,.The Citrix ADC appliance responds with the version and build number of the firmware running on the appliance.

For more information about the _nsversion_object and its properties, see Citrix NITRO API reference for nsversion.

Request components

REQUEST FIELD	VALUE
HTTP Method	`GET`
URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsversion`
Request Headers	`Content-Type: application/json`

Curl request

```
curl -X GET -H "Content-Type: application/json" -u nsroot:examplepassword
 http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsversion
```

Retrieve licensing information for a Citrix ADC appliance

You use the *nslicense* NITRO API object to find information about the licenses on a Citrix ADC appliance.

The Citrix ADC appliance responds with the following information:

- List of ADC features available (marked as *true*) or not (marked as *false*) in the appliance
- `modelid`. This attribute represents different numbers for two types of licenses.
  - `Bandwidth licenses`. Specifies the throughput bandwidth licensed for this appliance. For example, for 20 Gbps, modelid: 20000

  - `vCPU licenses`. Specifies number of vCPUs licensed for this appliance. For example, for 4 vCPU, modelid: 4 vCPUs

- `licensingmode.` Thisattribute represents the mode of the license for this appliance:
  - Local
  - Pooled
  - CICO
  - EXPRESS
  - CPU
  - CPU-Local

For more information about the *nslicense* object and its properties, see Citrix NITRO API reference for nslicense.

Request components

REQUEST FIELD	VALUE
HTTP Method	`GET`

URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslicense`
	or
	
	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslicense?attrs=modelid,licensingmode`

Request Headers	`Content-Type: application/json`

Curl request

Use the following curl command syntax to find detailed licensing information for a Citrix ADC appliance:

```
curl -X GET -H "Content-Type: application/json" -u
<username>:<examplepassword>  http://<Citrix-ADC-IP-address(NSIP)>/nitro/
v1/config/nslicense
```

Use the following curl command syntax to find licensing information limited to modelid and licensing mode attributes:

```
curl -X GET -H "Content-Type: application/json" -u nsroot:examplepassword
 http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslicense?
attrs=modelid,licensingmode
```

Retrieve expiry information about SSL certificates in a Citrix ADC VPX Appliance

A typical deployment of a Citrix ADC appliance contains multiple load balancing configurations that process SSL transactions. SSL certificates bound to these configurations can expire at different times. You can retrieve the expiry information about SSL certificates in a Citrix ADC VPX Appliance. The expiry information helps you in renewing the SSL certificates on time.

Before you begin

Before youretrieve expiry information about SSL certificates in a Citrix ADC VPX Appliance, make sure that:

- You have deployed a Citrix ADC VPX appliance and the appliance is UP and running in your setup. For more information, see Deploy a Citrix ADC VPX instance.
- You have a basic understanding of SSL certificates in a Citrix ADC appliance. For more information, see: SSL certificates.

Steps to retrieve expiry information about SSL certificates in a Citrix ADC VPX Appliance

You use the *sslcertkey* NITRO API object to retrieve expiry information about the SSL certificates in a Citrix ADC appliance.

The Citrix ADC appliance responds with the following expiry information along with other details about SSL certificates in the appliance:

- `daystoexpiration`. This attribute represents thedays remaining for a SSL certificate to expire.

For more information about the *sslcertkey* object and its properties, see Citrix NITRO API reference for sslcertkey.

Request components

REQUEST FIELD	VALUE
HTTP Method	`GET`

URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey`
	or
	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?attrs=certkey,cert,key,daystoexpiration`

Request Headers	`Content-Type: application/json`

Curl request

Use the following curl command syntax to retrieve detailed information about SSL certificates in a Citrix ADC appliance:

```
curl -X GET -H "Content-Type: application/json" -u
<username>:<examplepassword>  http://<Citrix-ADC-IP-address(NSIP)>/nitro/
v1/config/sslcertkey
```

Use the following curl command syntax to retrieve only the expiry information about SSL certificates in a Citrix ADC appliance:

```
curl -X GET -H "Content-Type: application/json" -u nsroot:examplepassword
 http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?
attrs=certkey,cert,key,daystoexpiration
```

Example

EXAMPLE DESCRIPTION	CURL REQUEST	RESPONSE PAYLOAD
Retrieve only the expiry information about SSL certificates in a Citrix ADC	`curl -X GET -H "Content-Type: application/json" -u`	{ "errorcode": 0,

EXAMPLE DESCRIPTION	CURL REQUEST	RESPONSE PAYLOAD

appliance, which has Citrix ADC IP address (NSIP) of 192.0.0.33.	`nsroot:examplepassword` `http://192.0.0.33/nitro/v1/config/sslcertkey?attrs=certkey,cert,key,daystoexpiration`	"message": "Done",
		"severity": "NONE",
		"sslcertkey": [
		{
		"certkey": "ns-server-certificate",
		"cert": "ns-server.cert",
		"key": "ns-server.key",
		"daystoexpiration": 5509
		},
		{
		"certkey": "serverrsa_2048",
		"cert": "complete/server/server_rsa_2048.pem",
		"key": "complete/server/server_rsa_2048.ky",
		"daystoexpiration": 5652
		}
		]
		}

Performing a packet trace on a Citrix ADC VPX appliance

A Citrix ADC appliance provides a NITRO API object called `nstrace` to get a dump of the packets that are received and sent out by the appliance. The API stores the packets in trace files.

You can use these files to debug problems in the flow of packets in the Citrix ADC appliance. The trace files must be viewed with the Wireshark application.

Some salient aspects of the `nstrace` NITRO API object are:

- Can be configured to trace packets selectively by using classic expressions and default expressions.
- Can capture the trace in multiple formats: ns trace format (`.cap`) and TCP dump format (`.pcap`).

Before you begin

Before performing a packet trace on a Citrix ADC VPX appliance, note the following points:

- Make sure that you have deployed a Citrix ADC VPX appliance and the appliance is UP and running in your setup. For more information, see Deploy a Citrix ADC VPX instance.
- Make sure that you have a basic understanding of the `nstrace` feature of a Citrix ADC appliance. For more information, see:
  - How to record a packet trace on Citrix ADC.
- Make sure that you have a basic understanding of the Citrix ADC NITRO REST APIs. For more information, see Citrix ADC NITRO API reference.
- `nstrace` NITRO API is not available in the Java, C#, and Python SDKs.

Best practices

On a Citrix ADC appliance handling high volume of traffic per second, capturing traffic is a very resource intensive process. The impact to resources is mainly in terms of the CPU and the disk space. Disk space impact can be reduced by using filtering expressions. However, the impact on the CPU remains and sometimes causes a slight increase as the appliance now needs to process packets according to the filter before capturing them.

The best practices about packet tracing are:

- The duration for which the trace is run must be as limited as possible when you still ensure the packets of interest are captured.
- Schedule the tracing activity to happen at a time when the number of users (and hence the traffic) is greatly reduced, such as during off hours.

Steps for performing a packet trace

Performing a packet trace on a Citrix ADC VPX appliance consists of the following steps:

1. Start recording a packet trace
2. Retrieve the current state information of the packet trace recording
3. Stop recording a packet trace

Start recording a packet trace

To start recording a packet trace, you use the `nstrace` NITRO API object with action as `start`.

Packet traces are recorded in files in the `/var/nstrace/<date-timestamp>` directory of the appliance. The packet trace file name is of the form `nstrace<id>.cap`, where `id` is always 1 for a standalone appliance. In other words, packet trace file with the same name `nstrace1.cap` is always generated for a standalone appliance.

For more information about the `nstrace` object and its properties, see Citrix NITRO API reference for nstrace.

Request components

REQUEST FIELD	VALUE
HTTP Method	`POST`
URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstrace?action=start`
Request Headers	`Content-Type: application/json`

Request Payload	`{"nstrace":{"size":<value>, "mode":<value>, ... }}`
	Example:
	
	`{"nstrace":{"size":0}}`

Curl request

```
curl -X POST -H "Content-Type: application/json" -u nsroot:examplepassword
http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstrace?action=start
 -d '{"nstrace":{"size":<value>, "mode":<value>, ... }}'
```

Example

```
curl -X POST -H "Content-Type: application/json" -u nsroot:examplepassword
http://192.0.0.33/nitro/v1/config/nstrace?action=start  -d '{"nstrace":
{"size":0}}'
```

Retrieve the current state information of the packet trace recording

To retrieve the current state information of the packet trace recording, you use the `nstrace` NITRO API object along with HTTP method as `GET`.

The Citrix ADC appliance responds with the following information:

- `state`. This attribute shows the current state information of the packet trace recording. Possible values: RUNNING, STOPPED
- Other attributes settings that are used in the current packet trace recording in running state. If the packet trace recording is not running(state shown as STOPPED), default settings are shown for the attributes.

For more information about the `nstrace` object and its properties, see Citrix NITRO API reference for nstrace.

Request components

REQUEST FIELD	VALUE
HTTP Method	`GET`
URL	`http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstrace`
Request Headers	`Content-Type: application/json`

Curl request

```
curl -X GET -H "Content-Type: application/json" -u nsroot:examplepassword
http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstrace
```

Examples

EXAMPLE DESCRIPTION	CURL REQUEST	RESPONSE PAYLOAD

Retrieve the current state information and other attribute settings of the packet trace recording in a Citrix ADC appliance, which has Citrix ADC IP address (NSIP) of 192.0.0.33.	`curl -X GET -H "Content-Type: application/json" -u nsroot:examplepassword http://192.0.0.33/nitro/v1/config/nstrace`	{
		"errorcode": 0,
		"message": "Done",
		"severity": "NONE",
		"nstrace": {
		"state": "RUNNING",
		"scope": "LOCAL",
		"tracelocation": "/var/nstrace/18Feb2021_20_08_25/...",

```

Example

```
curl -X POST -H "Content-Type: application/json" -u nsroot:examplepassword
   -d '{"nstrace":{}}'
```

miscellaneous use cases

This section covers some miscellaneous use cases.

Managing a Citrix ADC Cluster

For managing clusters, you can add or remove a cluster instance or an individual node and perform a few other instance or node operations such as viewing instance or node properties. You can also configure the cluster IP address. Other cluster-management tasks include joining a Citrix ADC appliance to the cluster and configuring a linkset. For detailed information and best practices, see Clustering.

Cluster Instance Operations

This topic covers cluster instance operations by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

All operations on a cluster instance must be performed on the clusterinstance object.

For example, to create a cluster instance with ID 1, connect to the Citrix ADC appliance that you are first adding to the cluster.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "clusterinstance":

    {

    "clid":1,

    "preemption":"ENABLED"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.cluster.clusterinstance class provides APIs to manage a cluster instance.

The following sample code creates a cluster instance with ID 1.

`Java - Sample code to create a cluster instance`

```
clusterinstance new_cl_inst_obj = new clusterinstance();

//Set the properties of the cluster instance locally

new_cl_inst_obj.set_clid(1);

new_cl_inst_obj.set_preemption("ENABLED");

//Upload the cluster instance

clusterinstance.add(ns_session,new_cl_inst_obj);
```

`.NET - Sample code to create a cluster instance`

```
clusterinstance new_cl_inst_obj = new clusterinstance();

//Set the properties of the cluster instance locally

new_cl_inst_obj.clid = 1;

new_cl_inst_obj.preemption = "ENABLED";
```

```
//Upload the cluster instance

clusterinstance.add(ns_session,new_cl_inst_obj);
```

`Python - Sample code to create a cluster instance`

```
new_cl_inst_obj = clusterinstance()

# Set the properties of the cluster instance locally

new_cl_inst_obj.clid = 1

# Upload the cluster instance

clusterinstance.add(ns_session, new_cl_inst_obj)
```

Cluster Node Operations

This topic covers cluster node operations by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  All operations on a cluster node must be performed on the clusternode object. For example, to add a Citrix ADC appliance with NSIP address 10.102.29.60 to the cluster.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternode

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"clusternode":

    {

    "nodeid":1,

    "ipaddress":"10.102.29.60",

    "state":"ACTIVE",

    "backplane":"1/1/2"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

The com.citrix.netscaler.nitro.resource.config.cluster.clusternode class provides APIs to manage cluster nodes.

The following sample code adds a cluster node with NSIP address 10.102.29.60.

`Java - Sample code to add a cluster node`

```
clusternode new_cl_node_obj = new clusternode();
```

```
//Set the properties of the cluster node locally

new_cl_node_obj.set_nodeid(0);

new_cl_node_obj.set_ipaddress("10.102.29.60");

new_cl_node_obj.set_state("ACTIVE");

new_cl_node_obj.set_backplane("0/1/1");

//Upload the cluster node

clusternode.add(ns_session,new_cl_node_obj);
```

`.NET - Sample code to add a cluster node`

```
clusternode new_cl_node_obj = new clusternode();

//Set the properties of the cluster node locally

new_cl_node_obj.nodeid = 0;

new_cl_node_obj.ipaddress = "10.102.29.60";
```

```
new_cl_node_obj.state = "ACTIVE";

new_cl_node_obj.backplane = "0/1/1";

//Upload the cluster node

clusternode.add(ns_session,new_cl_node_obj);
```

`Python - Sample code to add a cluster node`

```
new_cl_node_obj = clusternode()

# Set the properties of the cluster node locally

new_cl_node_obj.nodeid = 0

new_cl_node_obj.ipaddress = "10.102.29.60"

new_cl_node_obj.state = "ACTIVE"

new_cl_node_obj.backplane = "0/1/1"

# Upload the cluster node
```

```
clusternode.add(ns_session, new_cl_node_obj)
```

Add a Cluster IP Address

This topic covers adding a cluster IP address by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To define a cluster IP address, specify the required parameters in the nsip object. For example, to configure a cluster IP address.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"nsip":

    {

    "ipaddress":"10.102.29.61",

    "netmask":"255.255.255.255",

    "type":"CLIP"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.ns.nsip class provides the add() API to configure an IP address. To configure the IP address as a cluster IP address, you must specify the type as CLIP.

The following sample code configures a cluster IP address on Citrix ADC appliance with IP address 10.102.29.60.

`Java - Sample code to add a cluster IP address`

```
nsip new_nsip_obj = new nsip();

//Set the properties locally

new_nsip_obj.set_ipaddress("10.102.29.61");

new_nsip_obj.set_netmask("255.255.255.255");

new_nsip_obj.set_type("CLIP");

//Upload the cluster node
```

```
nsip.add(ns_session,new_nsip_obj);
```

`.NET - Sample code to add a cluster IP address`

```
nsip new_nsip_obj = new nsip();

//Set the properties locally

new_nsip_obj.ipaddress = "10.102.29.61";

new_nsip_obj.netmask = "255.255.255.255";

new_nsip_obj.type = "CLIP";

//Upload the cluster node

nsip.add(ns_session,new_nsip_obj);
```

`Python - Sample code to add a cluster IP address`

```
new_nsip_obj = nsip()

# Set the properties locally

new_nsip_obj.ipaddress = "10.102.29.61"
```

```
new_nsip_obj.netmask = "255.255.255.255"

new_nsip_obj.type = "CLIP"

# Upload the cluster node

nsip.add(ns_session, new_nsip_obj)
```

Add a Spotted IP Address

This topic covers adding a spotted IP address by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To configure an IP address as spotted, specify the required parameters in the nsip object. This configuration must be done on the cluster IP address.

For example, to configure a spotted SNIP address on a node with ID 1.

- `Request`

  `HTTP Method:` POST

`URL:` http://<cluster-ip-address\>/nitro/v1/config/nsip

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"nsip":

    {

    "ipaddress":"10.102.29.77",

    "netmask":"255.255.255.0",

    "type":"SNIP",

    "ownernode":1

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.ns.nsip class provides the add() API to configure an IP address. To configure the IP address as spotted, you must specify the ID of the node that must own the IP address. This configuration must be done on the cluster IP address.

The following sample code configures a spotted SNIP address on a node with ID 1.

`Java - Sample code to configure a spotted IP address`

```
nsip new_nsip_obj = new nsip();

//Set the properties locally
```

```
new_nsip_obj.set_ipaddress("10.102.29.77");

new_nsip_obj.set_netmask("255.255.255.0");

new_nsip_obj.set_type("SNIP");

new_nsip_obj.set_ownernode(1);

//Upload the cluster node

nsip.add(ns_session,new_nsip_obj);
```

`.NET - Sample code to configure a spotted IP address`

```
nsip new_nsip_obj = new nsip();

//Set the properties locally

new_nsip_obj.ipaddress = "10.102.29.77";

new_nsip_obj.netmask = "255.255.255.0";

new_nsip_obj.type = "SNIP";
```

```
new_nsip_obj.ownernode = 1;

//Upload the cluster node

nsip.add(ns_session,new_nsip_obj);
```

`Python - Sample code to configure a spotted IP address`

```
# Add a spotted IP address

new_nsip_obj = nsip()

# Set the properties locally

new_nsip_obj.ipaddress = "10.102.29.77"

new_nsip_obj.netmask = "255.255.255.0"

new_nsip_obj.type = "SNIP"

new_nsip_obj.ownernode = 1
```

```
# Upload the cluster node

nsip.add(ns_session, new_nsip_obj)
```

Join Citrix ADC Appliance to Cluster

This topic covers adding a Citrix ADC appliance to a cluster by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To join an appliance to a cluster, specify the required parameters in the cluster object. For example, to join a Citrix ADC appliance to a cluster.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cluster

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"cluster":

    {

    "clip":"10.102.29.61",

    "password":"verysecret"

    }
```

```
}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.cluster.cluster class provides the join() API to join a Citrix ADC appliance to the cluster. You must specify the cluster IP address and the nsroot password of the configuration coordinator.

The following sample code joins a Citrix ADC appliance to a cluster.

`Java - Sample code to join an appliance to a cluster`

```
cluster new_cl_obj = new cluster();

//Set the properties of the cluster  locally

new_cl_obj.set_clip("10.102.29.61");

new_cl_obj.set_password("verysecret");

//Upload the cluster

cluster.add(ns_session,new_cl_obj);
```

`.NET - Sample code to join an appliance to a cluster`

```
cluster new_cl_obj = new cluster();

//Set the properties of the cluster locally

new_cl_obj.clip = "10.102.29.61";

new_cl_obj.password = "verysecret";

//Upload the cluster node

cluster.add(ns_session,new_cl_node_obj);
```

`Python - Sample code to join an appliance to a cluster`

```
new_cl_obj = cluster()

# Set the properties of the cluster locally

new_cl_obj.clip = "10.102.29.61"

new_cl_obj.password = "verysecret"

# Upload the cluster
```

```
cluster.add(ns_session, new_cl_obj)
```

Linkset Operations

This topic covers some linkset operations by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To configure a linkset, do the following:

Create a linkset by specifying the required parameters in the linkset object. For example, to add a linkset LS/1:

`Request:`

`HTTP Method:` POST

`URL:` http://<cluster-ip-address\>/nitro/v1/config/linkset

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

- `Request Payload`

  ```
  
  ```

{ "linkset": { "id":"LS/1" } }

```
-   `Response`

    `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx &lt;string&gt; (for general HTTP
errors) or 5xx &lt;string&gt; (for Citrix-ADC-specific errors). The
```

```
response payload provides details of the error.

Bind the required interfaces to the linkset by specifying the interfaces
in the linkset_interface_binding object.For example, to bind interfaces
1/1/2 and 2/1/2 to linkset LS/1.

-  `Request`

    `HTTP Method:` PUT

`URL:` http://\&lt;cluster-ip-address\>/nitro/v1/config/
linkset_interface_binding/LS%2F1?action=bind

`Note.` The linkset name (LS/1), must be URL encoded as LS%2F1.

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\&lt;tokenvalue>

Content-Type:application/json

`Request Payload:`

```json

{
```
```

```
"linkset_interface_binding":

    {

    "id":"LS/1",

    "ifnum":"1/1/2 2/1/2"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 Ok

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.network.linkset class provides the APIs to manage linksets.

To configure a linkset, do the following:

1. Add a linkset by invoking the add() method of the linkset class.
2. Bind the interfaces to the linkset using the add() method of the linkset_interface_binding class.

The following sample code creates a linkset LS/1 and bind interfaces 1/1/2 and 2/1/2 to it.

`Java - Sample code to configure linksets`

```
linkset new_linkset_obj = new linkset();

new_linkset_obj.set_id("LS/1");

linkset.add(ns_session,new_linkset_obj);
```

```
//Bind the interfaces to the linkset

linkset_interface_binding new_linkif_obj = new
linkset_interface_binding();

new_linkif_obj.set_id("LS/1");

new_linkif_obj.set_ifnum("1/1/2 2/1/2");

linkset_interface_binding.add(ns_session,new_linkif_obj);
```

`.NET - Sample code to configure linksets`

```
linkset new_linkset_obj = new linkset();

new_linkset_obj.id = "LS/1";

linkset.add(ns_session,new_linkset_obj);

//Bind the interfaces to the linkset

linkset_interface_binding new_linkif_obj = new
linkset_interface_binding();
```

```
new_linkif_obj.id = "LS/1";

new_linkif_obj.ifnum = "1/1/2 2/1/2";

linkset_interface_binding.add(ns_session,new_linkif_obj);
```

`Python - Sample code to configure linksets`

```
# Create a new linkset

new_linkset_obj = linkset()

new_linkset_obj.id = "LS/1"

linkset.add(ns_session, new_linkset_obj)

# Bind the interfaces to the linkset

new_linkif_obj = linkset_interface_binding()

new_linkif_obj.id = "LS/1"
```

```
new_linkif_obj.ifnum = "1/1/2 2/1/2"

linkset_interface_binding.add(ns_session, new_linkif_obj)
```

Configuring Admin Partitions

To create an admin partition, you must perform a set of operations on the default partition. To understand this procedure, let us consider a company that has two departments each of which has an application that requires the Citrix ADC functionality. The Citrix ADC admin wants to have a different partition for each department so that there is isolation of users and configurations. For detailed information and best practices, see Admin Partitions.

Creating an Admin Partition

While creating an admin partition, you must also specify the system resources that must be allocated to that partition.

- `Using REST APIs through HTTP`

  The following example creates an admin partition named partition-dept1.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartition

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"nspartition":

{
```

```
    "partitionname":"partition-dept1",

    "maxbandwidth":"10240",

    "minbandwidth":"10240",

    "maxconn":"1024",

    "maxmemlimit":"10"

}

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code creates an admin partition named partition-dept1.

`Java - Sample code to create an admin partition`

```
nspartition nspartitionObject = new nspartition();

nspartitionObject.set_partitionname("partition-dept1");

nspartitionObject.set_maxbandwidth(10240);

nspartitionObject.set_maxconn(1024);
```

```
nspartitionObject.set_maxmemlimit(10);

nspartitionObject.set_minbandwidth(1240);

base_response result = nspartition.add(nitroService, nspartitionObject);
```

`.NET - Sample code to create an admin partition`

```
nspartition nspartitionObject = new nspartition();

nspartitionObject.partitionname = "partition-dept1";

nspartitionObject.maxbandwidth = 10240;

nspartitionObject.maxconn = 1024;

nspartitionObject.maxmemlimit = 10;

nspartitionObject.minbandwidth = 1240;

base_response result = nspartition.add(nitroService, nspartitionObject);
```

`Python - Sample code to create an admin partition`

```
nspartitionObject = nspartition()

nspartitionObject.partitionname = "partition-dept1"

nspartitionObject.maxbandwidth = 10240

nspartitionObject.maxconn = 1024

nspartitionObject.maxmemlimit = 10

nspartitionObject.minbandwidth = 1240

result = nspartition.add(nitroService, nspartitionObject)
```

Associating Users with Partitions

Associate the appropriate users with the partition.

- `Using REST APIs through HTTP`

  The following example associates user1 to a partition named partition-dept1.

- `Request`

  `HTTP Method:` PUT

`URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/systemuser_nspartition_binding/user1

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "systemuser_nspartition_binding":

    {

    "username":"user1",

    "partitionname":"partition-dept1"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code associates "user1" to a partition named "partition-dept1".

`Java - Sample code for associating user with partition`

```
systemuser_nspartition_binding systemuser_nspartition_binding_object = new
systemuser_nspartition_binding();

systemuser_nspartition_binding_object.set_partitionname("partition-
dept1");

systemuser_nspartition_binding_object.set_username("user1");
```

```
base_response result = systemuser_nspartition_binding.add(nitroService,
systemuser_nspartition_binding_object);
```

`.NET - Sample code for associating user with partition`

```
systemuser_nspartition_binding systemuser_nspartition_binding_object = new
systemuser_nspartition_binding();

systemuser_nspartition_binding_object.partitionname = "partition-dept1";

systemuser_nspartition_binding_object.username = "user1";

base_response result = systemuser_nspartition_binding.add(nitroService,
systemuser_nspartition_binding_object);
```

`Python - Sample code for associating user with partition`

```
systemuser_nspartition_binding_object =  systemuser_nspartition_binding()

systemuser_nspartition_binding_object.partitionname = "partition-dept1"

systemuser_nspartition_binding_object.username = "user1"

result = systemuser_nspartition_binding.add(nitroService,
systemuser_nspartition_binding_object)
```

Specifying Command Policy for Partition Users

Associate an appropriate command policy to the admin partition user.

- `Using REST APIs through HTTP`

  The following example associates the command policy partition-admin to user1.

- `Request`

  `HTTP Method:` PUT

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemuser_systemcmdpolicy_binding/user1

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "systemuser_systemcmdpolicy_binding":

    {

    "username":"user1",

    "policyname":"partition-admin",

    "priority":"1"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code associates the command policy "partition-admin" to "user1".

`Java - Sample code to specify command policy for partition user`

```
systemuser_systemcmdpolicy_binding binding_object = new
systemuser_systemcmdpolicy_binding();

binding_object.set_username("user1");

binding_object.set_policyname("partition-admin");

binding_object.set_priority(1);

base_response result =
systemuser_systemcmdpolicy_binding.add(nitroService,binding_object);
```

`.NET - Sample code to specify command policy for partition user`

```
systemuser_systemcmdpolicy_binding binding_object = new
systemuser_systemcmdpolicy_binding();

binding_object.username = "user1";

binding_object.policyname = "partition-admin";

binding_object.priority = 1;
```

```
base_response result =
systemuser_systemcmdpolicy_binding.add(nitroService,binding_object);
```

`Python - Sample code to specify command policy for partition user`

```
binding_object = systemuser_systemcmdpolicy_binding()

binding_object.username = "user1"

binding_object.policyname = "partition-admin"

binding_object.priority = 1

result =
systemuser_systemcmdpolicy_binding.add(nitroService,binding_object)
```

Specifying the Admin Partition VLAN or Bridgegroup

Specify the VLANs or bridgegroups to be associated with the partition. This step ensures network isolation of the traffic. Traffic received on the interfaces of the VLAN or bridgegroup is isolated from the traffic of other partitions.

- `Using REST APIs through HTTP`

  The following example specifies a VLAN for an admin partition.

- `Request`

  `HTTP Method:` PUT

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartition_vlan_binding/partition-dept1

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "nspartition_vlan_binding":

    {

    "partitionname":"partition-dept1",

    "vlan":"2"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code specifies a VLAN for an admin partition.

`Java - Sample Code to specify the VLAN`

```
nspartition_vlan_binding nspartition_vlan_binding_object = new
nspartition_vlan_binding();

nspartition_vlan_binding_object.set_vlan(2);
```

```
nspartition_vlan_binding_object.set_partitionname("partition-dept1");

base_response result = nspartition_vlan_binding.add(nitroService,
nspartition_vlan_binding_object);
```

`.NET - Sample code to specify the VLAN`

```
nspartition_vlan_binding nspartition_vlan_binding_object = new
nspartition_vlan_binding();

nspartition_vlan_binding_object.vlan = 2;

nspartition_vlan_binding_object.partitionname = "partition-dept1";

base_response result = nspartition_vlan_binding.add(nitroService,
nspartition_vlan_binding_object);
```

`Python - Sample code to specify the VLAN`

```
nspartition_vlan_binding_object = nspartition_vlan_binding()

nspartition_vlan_binding_object.vlan = 2

nspartition_vlan_binding_object.partitionname = "partition-dept1"
```

```
result = nspartition_vlan_binding.add(nitroService,
nspartition_vlan_binding_object)
```

Switching Partitions

If you are associated with multiple admin partitions, you can switch to the required partition.

- `Using REST APIs through HTTP`

  The following example shows how to switch from current partition to a partition named partition-dept2.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartition?action=Switch

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "nspartition":

    {

    "partitionname":"partition-dept2"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code switches from current partition to a partition named "partition-dept2".

`Java - Sample code to switch partitions`

```
nspartition nspartitionObject = new nspartition();

vnspartitionObject.set_partitionname("partition-dept2");

base_response result = nspartition.Switch(nitroService,
nspartitionObject);
```

`.NET - Sample code to switch partitions`

```
nspartition nspartitionObject = new nspartition();

nspartitionObject.partitionname = "partition-dept2";

base_response result = nspartition.Switch(nitroService,
nspartitionObject);
```

`Python - Sample code to switch partitions`

```
nspartitionObject = nspartition()

nspartitionObject.partitionname = "partition-dept2"
```

```
result = nspartition.Switch(nitroService, nspartitionObject)
```

Managing AppExpert Applications

The following sections talks about exporting and importing an AppExpert application using NITRO APIs.

Exporting an AppExpert Application

This topic covers exporting an AppExpert application by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To export an AppExpert application, specify the parameters needed for the export operation in the apptemplateinfo object. Optionally, you can specify basic information about the AppExpert application template, such as the author of the configuration, a summary of the template functionality, and the template version number, in the template_info object. This information is stored as part of the template file that is created.

For example, to export an AppExpert application named MyApp1.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/apptemplateinfo?action=export

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "apptemplateinfo":

    {

        "appname":"MyApp1",
```

```
        "apptemplatefilename":"BizAp.xml",
        "template_info":
        {
            "templateversion_major":"2",
            "templateversion_minor":"1",
            "author":"XYZ",
            "introduction":"Intro",
            "summary":"Summary"
        }
    }
}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To export an AppExpert application, you must do the following:

1. Instantiate the com.citrix.netscaler.nitro.resource.config.app.application class.

   `Note.` For the python SDK, the package path is of the form nssrc.com.citrix.netscaler.....
2. Configure the properties of the AppExpert locally.
3. Export the AppExpert application.

The following samples export an AppExpert application named MyApp1.

`JAVA - sample code to export an AppExpert application`

```
application myapp = new application();

myapp.set_appname("MyApp1");

myapp.set_apptemplatefilename("myapp_template");

application.export(ns_session,myapp);
```

`.NET - sample code to export an AppExpert application`

```
application myapp = new application();

myapp.appname = "MyApp1";

myapp.apptemplatefilename = "myapp_template";

application.export(ns_session,myapp);
```

`Python - sample code to export an AppExpert application`

```
myapp = application()

myapp.appname = "MyApp1"

myapp.apptemplatefilename = "myapp_template"

application.export(ns_session, myapp)
```

Importing an AppExpert Application

This topic covers importing an AppExpert application by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To import an AppExpert application, specify the parameters needed for the import operation in the apptemplateinfo object.

For example, to import an AppExpert application named MyApp1.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/apptemplateinfo?action=import

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"apptemplateinfo":

{

    "apptemplatefilename":"BizAp.xml",

    "deploymentfilename":"BizAp_deployment.xml",

    "appname":"MyApp1"

}

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

To import an AppExpert application by specifying different deployment settings.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/apptemplateinfo?action=import

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "apptemplateinfo":

    {

    "apptemplatefilename":"BizAp.xml",

    "appname":"Myapp2",

    "deploymentinfo":

    {

        "appendpoint":

        [

            {

                "ipv46":"11.2.3.8",

                "port":80,

                "servicetype":"HTTP"

            }

        ],

        "service":

        [

            {

                "ip":"12.3.3.15",

                "port":80,
```

```
                "servicetype":"SSL"
            },
            {
                "ip":"14.5.5.16",
                "port":443,
                "servicetype":"SSL"
            }
        ]
    }
    }
}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To import an AppExpert application, you must do the following:

1. Instantiate the com.citrix.netscaler.nitro.resource.config.app.application class.

   `Note`. For the python SDK, the package path is of the form nssrc.com.citrix.netscaler.....
2. Configure the properties of the AppExpert locally.
3. Import the AppExpert application.

The following samples import an AppExpert application named MyApp1.

`Java - sample code to import an AppExpert application`

```
application myapp = new application();

myapp.set_appname("MyApp1");

myapp.set_apptemplatefilename("myapp_template");

application.Import(ns_session,myapp);
```

`.NET - sample code to import an AppExpert application`

```
application myapp = new application();

myapp.appname = "MyApp1";

myapp.apptemplatefilename = "myapp_template";

application.Import(ns_session,myapp);
```

`Python - sample code to import an AppExpert application`

```
myapp = application()

myapp.appname = "MyApp1"

myapp.apptemplatefilename = "myapp_template"

application.Import(ns_session, myapp)
```

Automate Citrix ADC Upgrade and Downgrade with a Single API

You can use the "install" API to automate not just installation, but also an upgrade or a downgrade of the build on a Citrix ADC appliance. You can specify a local or remote location for the build file.

- `Using REST APIs through HTTP`

  For example, the following information describes a downgrade to Citrix ADC release 10.5 build 46, using a local build file:

- `Request`

  `HTTP Method:` POST

`URL:` http://<NSIP\>/nitro/v1/config/install

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue \>

Content-Type: application/json

`Request Payload:`

```
{

“install”:

{

        “url”: “file:///var/tagma/build_tagma_46_nc.tgz”

    }

}
```

- `Response`

  `HTTP status Code on Success:`

201 Created

209 Citrix ADC specific warning

`Note.` when “y” option is not specified and warning is enabled, API returns “1120 - The configuration must be saved and the system rebooted for these settings to take effect” message in X-NITRO-WARNING.

`HTTP Status Code on Failure:` 599 Citrix ADC specific error

- `Additional parameters available in the install API request payload`
  - “y”:“true” - This option enables reboot on successful loading of kernel.
- “L”:“true” - This option enables the callhome feature.

`Supported formats for the "url" parameter (specifies the location of the tar.gz file for the build)`

- http://:@host/path/to/file
- https://:@host/path/to/file
- sftp://:@host/path/to/file
- scp://:@host/path/to/file
- ftp://:@host/path/to/file
- file://path/to/file
- `Possible errors`
  - Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.

Handle Multiple NITRO Calls in a Single Request

You can use the "macroapi" API to create, update, and delete multiple resources simultaneously, and thereby minimize network traffic. For example, multiple load-balancing virtual servers can be added in a single API.

To account for the failure of some operations within the bulk operation, NITRO allows configuring one of the following behaviors.

- `EXIT`. When the first error is encountered, execution stops. The commands that were executed before the error are committed.
- `ROLLBACK`. When the first error is encountered, execution stops. The commands that were executed before the error are rolled back. Rollback is supported for add and bind commands only.
- `CONTINUE`. All the commands in the request are executed even if some commands fail.

You must specify the behavior of the bulk operation in the request header, by using the X-NITRO-ONERROR parameter.

- `Advantages`

  Heterogeneous resources can be configured with a single API. For example, multiple load balancing virtual servers and multiple services can be created, and services can be bound to load balancing virtual servers in a single API.

- `Limitations`

  Only homogenous operation is supported in this API. For example, multiple load balancing virtual servers can be created but cannot be updated or deleted in the same API. “rollback” is supported only on “add” and “bind” operations.

- `Using REST APIs through HTTP`

  To add multiple load balancing resources in a single request:

- `Request`

  `HTTP Method:` POST

`URL:` http://<NSIP\>/nitro/v1/config/macroapi

`Request Headers:`

Content-Type: application/json

Cookie: NITRO_AUTH_TOKEN=<tokenvalue>

X-NITRO-ONERROR: exit

`Request Payload:`

```
{

"lbvserver":[

{"name":"lbv1","servicetype":"http"},

{"name":"lbv2","servicetype":"http"}

],

"serviceGroup": [

{ "servicegroupname": "sg1", "servicetype": "HTTP" },

{ "servicegroupname": "sg2", "servicetype": "HTTP" }

],

"lbvserver_servicegroup_binding":[

{ "name":"lbv1", "servicegroupname":"sg1" },
```

```
{ "name":"lbv2", "servicegroupname":"sg2" }

]

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created for the add operation and 200 OK for the update operation.

`HTTP Status Code on Failure:` 207 Multi Status with error details in the response payload. For more information, see Error Handling.

For deleting multiple resources using macroapi, use POST HTTP method with query parameter “action=remove” in the URI.

Update service group with desired member set seamlessly using Desired State API

One of the most frequently modified configurations on a Citrix ADC appliance is service group member set. Depending on the scale requirements or runtime changes to application servers, the service group member configuration on the appliance must be updated. In large scale and dynamically changing deployments, there might be a delay in updating the appliance configuration.

Desired State API solves this problem by accepting the intended member set for a service group in a single API, thereby effectively updating the configuration. Using Desired State API, you can:

- Provide a list of service group members in a single PUT request on “servicegroup_servicegroupmemberlist_binding” resource.
- Provide their weight and state (optional) in that PUT request.
- Effectively synchronize the appliance configuration with deployment changes around application servers.

The Citrix ADC appliance compares the requested desired member set with the configured member set. Then, it automatically binds the new members and unbinds the members that are not present in the request.

To enable graceful unbind of the service group members, set the `autodisablegraceful` and `autodisabledelay` parameters on the service group resource. When these parameters are set, the members are unbound gracefully as specified in the configuration and not immediately. For more information on graceful unbind, see Configure a desired set of service group members for a service group in one NITRO API call.

Advantages of Desired State API

The following are some of the advantages of using the Desired State API.

- Better performance because a single API is used to bind and unbind multiple service group members.
    - Desired State API is better than macroapi for service group member changes, as one can perform only either bulk bind or bulk unbind but not both in single macroapi API.
    - Also, Desired State API implementation is driven inside the Citrix ADC Packet Engine which enhances performance.
- Synchronize deployment changes to Citrix ADC appliance in large scale deployments, such as Cloud Native deployments.

In large scale and highly dynamic deployments (for example Kubernetes, OpenShift, Pivotal), the challenge is to keep the appliance configuration up-to-date with the rate of change of deployments to accurately serve the application traffic.

In such deployments, controllers (Ingress or E-W Controller) are responsible for updating ADC configuration. In Kubernetes, whenever there are changes to deployment, kube-api server sends the effective set of endpoints through ‘Endpoints event’ to the controller. The controller uses the Read-Delta-Modify approach where it performs the following:

- Fetches the currently configured endpoint set (service group member set of a service group) for the service undergoing the change from ADC appliance.
- Compares the configured endpoint set with the set in the received event.
- Binds the new endpoints (service group members), or unbinds the deleted endpoints.

Because the rate of change and the size of services is high in this environment, this configuration method is not efficient and might delay configuration updates.

`Notes:`

- Support for Desired State API is available only for HA deployments.
- Support for Desired State API within macroapi is supported from release Citrix ADC 13.0 build 52.24.
- Desired State API within macroapi does not support rollback operation.
- The service group on which Desired State API is being used must have the Autoscale parameter set to “API.” Otherwise, Desired State NITRO API returns the “Operation not permitted” error.
- You can only bind IP address based services using Desired State API, Domain Name based services are not allowed.

Payloads

Request

`HTTP Method:` PUT `Request Headers:` Content-Type: application/json Cookie: NITRO_AUTH_TOKEN=`<tokenvalue>` URL: `http://<nsip>/nitro/v1/config/servicegroup_servicegroupmemberlist_binding/activesvcgrp`

`Request Payload:`

```
{

"servicegroup_servicegroupmemberlist_binding":

{

"servicegroupname":"activesvcgrp",

"members":

[

{ "ip":"10.112.123.17", "port":80, "weight":1},

{ "ip":"10.112.123.18", "port":8080, "weight":1},

{ "ip":"10.112.123.19", "port":80, "weight":1}

]
```

```
}

}
```

Response

`Success Case:`

`Headers:` HTTP/1.1 200 Ok `Payload:` NULL

`Failure Case` `Headers:` HTTP/1.1 207 Multi Status `Payload:` If there are validation failures, NITRO API returns an error with message indicating the problem with the request payload. For example,

```
{

"errorcode": 1110,

"message": "Invalid IP address [127.0.02]",

"severity": "ERROR"

}
```

If there are runtime failures (for example memory allocation failures), the ADC appliance might not be able to create all the desired member sets. In such cases, the NITRO API returns an error with `failedmembers` parameter listing the set of members which are not created. The recommendation is to retry the operation after some timeout. If the error persists, check the appliance memory and take action accordingly.

```
{

            “errorcode”:1442,

            “message”: “Failed to bind some servicegroup members”,

            “severity”: “ERROR”,

            “servicegroupmember_servicegroupmemberlist_binding”:

              {
```

```
                “servicegroupname”:”foo”,

                “failedmembers”:

                [

                            { "ip":"10.112.123.17", "port":8080,
"weight":1},

                            { "ip":"10.112.123.19", "port":80,
"weight":1}

                ]

              }

}
```

Simplify Management Operations with an Idempotent API

You can add or update Citrix ADC resources seamlessly, with a single API. Previously, an attempt to add a resource that was already configured, or to update a resource that was not yet configured, caused an error.

If you enable the “idempotent” query parameter (“idempotent=yes”) in any POST request, NITRO executes the request in an idempotent manner. An idempotent HTTP method is an HTTP method that can be called many times without different results, and POST is desinged as a non-idempotent method.

`Note.` Use POST request with “idempotent” option if you are unsure whether the resource in the request exists on Citrix ADC or not.

This API hides the inconsistencies between parameter lists of POST and PUT operations. For some NITRO resources, certain parameters are accepted only on PUT not in POST, or vice versa. By using this idempotent API, you can overcome such challenges.

- `Limitations`

  If a resource is already configured and you try to add the same resource again, the resource is "updated," but the arguments already present are not unset. For example, if a load balancing virtual server named "V1" is configured to use the round robin load balancing method, and you

try to ADD an lbvserver named "V1" without specifying a value for "lbmethod" in the request, the Citrix ADC appliance does not unset "lbmethod" to its default value of "leastconnection."

- `Using REST APIs through HTTP`

  In the following example, “preferredntpserver” is allowed only in PUT, but when given in POST request with idempotent=yes, NITRO internally adds the ntpserver and updates it with given properties.

- `Request`

  `HTTP Method:` POST

`URL:` http://<NSIP\>/nitro/v1/config/ntpserver?idempotent=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type: application/json

`Request Payload:`

```
{

“ntpserver”:{“servername”:“ntp1”,“minpoll”:“4,  “preferredntpserver”:
“yes”}

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Retrieve Bindings in Bulk

This topic covers retrieving bindings information in bulk by using REST APIs through HTTP.

- `Using REST APIs through HTTP`

  You can use a bulk GET API to fetch bindings of all the entities of a given entity type.

For example, you can fetch bindings of all the load balancing virtual servers in one call instead of by using multiple GET by "name" calls. In the examples below, the Citrix ADC appliance has the following configuration.

- add lb vserver lbv1 http
- add lb vserver lbv2 http
- add service svc1 10.20.30.40 http 80
- add servicegroup sg1 http
- bind lb vserver lbv1 svc1
- bind lb vserver lbv1 sg1
- bind lb vserver lbv2 svc1
- bind lb vserver lbv2 sg1

`Example - To fetch bindings of all lbvservers, in a single NITRO API`

- `Request`

  `HTTP Method:` GET

`URL:` http://<NSIP\>/nitro/v1/config/lbvserver_binding?bulkbindings=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Accept: application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:` Content-Type:application/json

`Response Payload:`

```
{

"errorcode":0,

"message":"Done",

"severity":"NONE",

"lbvserver_binding":[

{

    "name":"lbv1",

    "lbvserver_service_binding":[

    {

        "name":"lbv1",

        "servicename":"svc1",
```

```
        "stateflag":"536936451",

        "ipv46":"10.20.30.40",

        "port":80,

        "servicetype":"HTTP",

        "curstate":"DOWN",

        "weight":"1",

        "dynamicweight":"0",

        "cookieipport":"",

        "vserverid":"mcw1",

        "vsvrbindsvcip":"10.20.30.40",

        "vsvrbindsvcport":80,
```

```
        "preferredlocation":""

    }

    ],

    "lbvserver_servicegroup_binding":[

    {

        "name":"lbv1",

        "servicegroupname":"sg1",

        "stateflag":"536936464",

        "servicename":"sg1"

    }

    ]
```

```
},

{

    "name":"lbv2",

    "lbvserver_service_binding":[

    {

        "name":"lbv2",

        "servicename":"svc1",

        "stateflag":"536936451",

        "ipv46":"10.20.30.40",

        "port":80,

        "servicetype":"HTTP",
```

```
        "curstate":"DOWN",

        "weight":"1",

        "dynamicweight":"0",

        "cookieipport":"",

        "vserverid":"mcw2",

        "vsvrbindsvcip":"10.20.30.40",

        "vsvrbindsvcport":80,

        "preferredlocation":""

    }

    ],

    "lbvserver_servicegroup_binding":[
```

```
    {

        "name":"lbv2",

        "servicegroupname":"sg1",

        "stateflag":"536936464",

        "servicename":"sg1"

    }

    ]

}

]

}
```

`Example - To fetch only “service” bindings of all lbvservers`

- `Request`

`HTTP Method:` GET

`URL:` http://<NSIP\>/nitro/v1/config/lbvserver_service_binding?bulkbindings=yes

`Request Header:` Content-Type:application/json

- `Response`

  `Response Payload:`

```
{

"errorcode":0,

"message":"Done",

"severity":"NONE",

"lbvserver_service_binding":[

    {

        "name":"lbv1",

        "servicename":"svc1",

        "stateflag":"536936451",
```

```
        "ipv46":"10.20.30.40",

        "port":80,

        "servicetype":"HTTP",

        "curstate":"DOWN",

        "weight":"1",

        "dynamicweight":"0",

        "cookieipport":"",

        "vserverid":"mcw1",

        "vsvrbindsvcip":"10.20.30.40",

        "vsvrbindsvcport":80,

        "preferredlocation":""
```

```
    },

    {

        "name":"lbv2",

        "servicename":"svc1",

        "stateflag":"536936451",

        "ipv46":"10.20.30.40",

        "port":80,

        "servicetype":"HTTP",

        "curstate":"DOWN",

        "weight":"1",

        "dynamicweight":"0",
```

```
        "cookieipport":"",

        "vserverid":"mcw2",

        "vsvrbindsvcip":"10.20.30.40",

        "vsvrbindsvcport":80,

        "preferredlocation":""

    }

    ]

}
```

View Individual Counter Information

This topic viewing individual counter information by using REST APIs through HTTP.

- `Using REST APIs through HTTP`

  To view global counters that are not otherwise shown by the Citrix ADC CLI or the GUI, you can now use the following URL format.

`URL`: http://<NSIP\>/nitro/v1/stat/nsglobalcntr?args=counters:\<counter1\>;\<counter2\>

Previously, these counter values could be viewed only through the “nsconmsg” Shell command.

`Note.` You can view only global counters of type ULONG and only up to 12 counters in a single request.

- `Example`

  This example shows how to view the individual counters http_tot_Requests and http_tot_Responses. Enter the details in the system or tool that you are using to generate HTTP or HTTPS requests.

- `Request`

  `HTTP Method:` GET

`URL:` http://<NSIP\>/nitro/v1/stat/nsglobalcntr?args=counters:http_tot_Requests;http_tot_Responses

- `Response`

```
{

"errorcode": 0,

"message": "Done",

"severity": "NONE",

"nsglobalcntr":

    {

    "http_tot_Requests": "5783",

    "http_tot_Responses": "5783"

    }

}
```

Prevent XSS and CSRF Attacks by Disabling Basic Authentication

As an administrator or a root user, you can now prevent users from making API calls after using basic authentication (such as one-time credentials) to log on. You can use this feature to prevent Cross-Site Scripting (XSS), Cross-Site Request Forgery (CSRF), and other types of attacks.

- `Procedure for Disabling Basic Authentication`

  Use the following formats to enter the details in the system or tool that you are using to generate HTTP or HTTPS requests.

- `Using REST APIs through HTTP`

  - `Request`

  `URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/systemparameter

`HTTP Method:` PUT

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "systemparameter":{ "basicauth":"disabled",}

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

After you disable the basic authentication, access to Citrix ADC through the one-time password is denied and an error message is displayed.

- `Example`

This example shows what happens if you make any API call after basic authentication has been disabled.

- `Request`

  `URL:` http://10.102.201.159/nitro/v1/config/lbvserver

`HTTP Method:` GET

After you make a GET call, the a logon screen appears. If you click `Log In` after entering the logon credentials, then you get the following response, which shows an error message.

- `Response`

```
{"errorcode": 1244,"message": "Authentication Failed: Use of Basic
Authentication is Disabled.","severity": "ERROR"

}
```

Error and Exception Handling

This section covers error handling support for NITRO APIs and exception handling support for SDKs.

Error Handling for NITRO APIs

In case of a failed request, NITRO provides the required information through the HTTP status code and in the response header and response payload.

- Error in a Single Resource Operation
- Error in a Bulk Operations
- Warnings
- `Error in a Single Resource Operation`

  The response of a single erroneous operation is as follows:

- `Response`

  `HTTP Status Code:` 4xx \<string\> (for general HTTP errors) or 5xx \<string\> (for Citrix-ADC-specific errors)

`Response Header:` Content-Type:application/json

`Response Payload:`

```
{

    errorcode: <Error code>,

    message: "<Error message>",

    severity: "ERROR"

}
```

- `Error in a Bulk Operation`

When there is a failure in one of the bulk operations, the response payload gives a combination of success and failure (depends on the value set for X-NITRO-ONERROR in the request header).

- `Response`

  `HTTP Status Code:` 207 Multi Status

`Response Header:` Content-Type:application/json

`Response Payload when X-NITRO-ONERROR is set to continue:`

When the first operation fails, the request is not terminated. The response payload shows the error details of the failed operation and the success status of the other operations.

```
{

    "errorcode": 1243,

    "message": "Bulk operation failed",

    "severity": "ERROR",

    "response":

    [

        {

            "errorcode": 273,

            "message": "Resource already exists",

            "severity": "ERROR"

        },

        {

            "errorcode": 0,

            "message": "Done",

            "severity": "NONE"
```

```
        }
    ]
}
```

`Response Payload when X-NITRO-ONERROR is set to exit:`

When the first operation fails, the request is terminated. The response payload only shows the error details of the failed operation.

```
{
    "errorcode": 1243,
    "message": "Bulk operation failed",
    "severity": "ERROR",
    "response":
    [
        {
            "errorcode": 273,
            "message": "Resource already exists",
            "severity": "ERROR"
        }
    ]
}
```

- `Warnings in NITRO Operations`

Warnings can be captured by specifying the "warning" query parameter as "yes" when performing any NITRO operation. For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/llbvserver?warning=yes

If there are any warnings, the response is as follows:

- `Response`

  `HTTP Status Code:` 209 X-NITRO-WARNING

`Response Header:` X-NITRO-WARNING →1067 - Feature(s) not enabled

Exception Handling Support for SDKs

The status of a NITRO request is captured in the com.citrix.netscaler.nitro.exception.nitro_exception class. This class provides the following details of the exception:

- `Session ID`. The session in which the exception occurred.
- `Severity`. The severity of the exception: error or warning. By default, only errors are captured. To capture warnings, you must set the warning flag to true, while connecting to the appliance.
- `Error code`. The status of the NITRO request. An error code of 0 indicates that the NITRO request is successful. A non-zero error code indicates an error in processing the NITRO request.
- `Error message`. Provides a brief description of the exception.

For a list of error codes, see the errorlisting.html file available in the \<NITRO_SDK_HOME\>/doc/api_reference folder.

API Reference

This documentation provides details of all operations that can be performed on the NetScaler appliance by using the REST API.

- Configuration
- Statistics
- Error Messages

Configuration

The configuration API is arranged in a logical groups of objects. Choose an appropriate group to find more details.

NAME	DESCRIPTION
AAA	Authentication, authorization, and accounting service configuration.
Adm	ADM related configuration.
Analytics	Analytics configuration.
App	Application
Appflow	AppFlow configuration.
Application Firewall	Application Firewall configuration.
Appqoe	Application Level Quality of Experience configuration

NAME	DESCRIPTION
Audit	Audit configuration.
Authentication	Authentication configuration.
Authorization	Authorization configuration. Authorization services check which resources users are authorized to access, and grant permissions accordingly.
Autoscale	AutoScale configuration.
Azure	Azure configuration
Basic	Basic system configuration.
Bfd	Bidirectional Forwarding Detection
Bot	Bot Management.
Integrated Caching	Integrated Caching Configuration. The Integrated Caching feature is used to cache static and dynamic web application data.
Cloud	Citrix ADC as SD proxy Configuration and cloud discovery commands.
Cluster	Cluster commands.
Compression	Compression configuration. The system's feature for compressing HTTP responses to compression-aware browsers.

NAME	DESCRIPTION
CI	Content Inspection
Cache Redirection	Cache redirection configuration. The cache redirection feature can transparently redirect cacheable HTTP requests to a cache and send non-cacheable or dynamic HTTP requests to the origin server. A cache stores or caches frequently requested web content and serves such web content to a client on behalf of the origin servers, alleviating the load on the origin server farm.
Content Switching	Content Switching configuration. Content Switching feature that enables you to direct traffic to servers on the basis of content.
Db	All the commands associated with database user
Domain Name Service	Domain Name Service(DNS) configuration.
HTTP DoS Protection	HTTP DOS protection configuration.
Front-end-optimization	Front end optimization configuration. The system's feature to optimize Web content for performance.
Filter	Filter configuration. Protection from malicious attacks can be achieved for web sites at the content level with the system's content filtering feature. When this feature is enabled, the system inspects every incoming

NAME	DESCRIPTION
	request with the user-configured rules based on any HTTP URL or headers.
Global Server Load Balancing	Global Server Load Balancing (GSLB) configuration. GSLB feature ensures that client requests are directed to a best performing site available in a global enterprise and distributed Internet environment.
High Availability	High-availability commands.
Ica	ICA configuration.
Ipsec	IPSEC configuration.
Ipsecalg	IPSECALG configuration.
Load Balancing	Load Balancing configuration. The load balancing methods manage the selection of an appropriate physical server in a server farm.
LLDP	Link Layer Discovery Protocol.
Lsn	Large Scale NAT commands
Network	Networking commands.
NS	System/Global level configuration.

NAME	DESCRIPTION
NTP	NTP configuration.
Pcp	Port Control Protocol Configuration.
Policy	Policy configuration.
Priority Queuing	Priority Queuing configuration. Priority Queuing ensures that key customer web sites get the timely responses they need. System provides priority-based queuing, which provides different levels of service to customers.
Protocol	Protocol Configuration.
Rdp	RDP configuration.
Reputation	Reputation services configuration.
Responder	Responder configuration.
Rewrite	Rewrite configuration.
Router	Router configuration.
Sure Connect	SureConnect configuration. SureConnect allows the system to deliver alternate content to clients when the system is under heavy load for the original URL. The original content will be served to the client,

NAME	DESCRIPTION
	automatically, after an estimated delay period.
Smpp	All the commands associated with SMPP.
SNMP	SNMP(Simple Network Management Protocol) configuration.
Spillover	Spillover policies and actions.
SSL	SSL Configuration
Stream	Stream configuration.
Subscriber	Subscriber configuration
System	System configuration.
Traffic Management	TM session/policy configuration.
Transform	URL Transformation configuration.
Tunnel	SSL VPN Tunnel Configuration.
Ulfd	ULFD server configuration.
Urlfiltering	URL Filtering feature is used control access to webpages based on category.
User	User protocol configuration.

NAME	DESCRIPTION
Utility	Utilities.
VideoOptimization	Video optimization feature is used to show (i) the stats of different media types that are being served by the Citrix ADC and (ii) the details of optimization applied on ABR videos
SSL VPN	Virtual Private Network configuration.
Wf	Web Front configuration.
WebInterface	Web Interface configuration.
Xm	XenMobile deployment configuration.

aaa

AAA

Authentication, authorization, and accounting service configuration.

NAME	DESCRIPTION
aaacertparams	Configuration for certificate parameter
aaaglobal_aaapreauthenticationpolicy_binding	Binding object showing the aaapreauthenticationpolicy that can be bound to aaaglobal
aaaglobal_authenticationnegotiateaction_binding	Binding object showing the authenticationnegotiateaction that can be bound to aaaglobal

NAME	DESCRIPTION
aaaglobal_binding	Binding object showing the resources that can be bound to aaaglobal
aaagroup	Configuration for AAA group
aaagroup_aaauser_binding	Binding object showing the aaauser that can be bound to aaagroup
aaagroup_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to aaagroup
aaagroup_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to aaagroup
aaagroup_authorizationpolicy_binding	Binding object showing the authorizationpolicy that can be bound to aaagroup
aaagroup_binding	Binding object showing the resources that can be bound to aaagroup
aaagroup_intranetip6_binding	Binding object showing the intranetip6 that can be bound to aaagroup
aaagroup_intranetip_binding	Binding object showing the intranetip that can be bound to aaagroup
aaagroup_tmsessionpolicy_binding	Binding object showing the tmsessionpolicy that can be bound to aaagroup

NAME	DESCRIPTION
aaagroup_vpnintranetapplication_binding	Binding object showing the vpnintranetapplication that can be bound to aaagroup
aaagroup_vpnsessionpolicy_binding	Binding object showing the vpnsessionpolicy that can be bound to aaagroup
aaagroup_vpntrafficpolicy_binding	Binding object showing the vpntrafficpolicy that can be bound to aaagroup
aaagroup_vpnurl_binding	Binding object showing the vpnurl that can be bound to aaagroup
aaagroup_vpnurlpolicy_binding	Binding object showing the vpnurlpolicy that can be bound to aaagroup
aaakcdaccount	Configuration for Kerberos constrained delegation account
aaaldapparams	Configuration for LDAP parameter
aaaotpparameter	Configuration for AAA otpparameter
aaaparameter	Configuration for AAA parameter
aaapreauthenticationaction	Configuration for pre authentication action
aaapreauthenticationparameter	Configuration for pre authentication parameter
aaapreauthenticationpolicy	Configuration for pre authentication policy

NAME	DESCRIPTION
aaapreauthenticationpolicy_aaaglobal_binding	Binding object showing the aaaglobal that can be bound to aaapreauthenticationpolicy
aaapreauthenticationpolicy_binding	Binding object showing the resources that can be bound to aaapreauthenticationpolicy
aaapreauthenticationpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to aaapreauthenticationpolicy
aaaradiusparams	Configuration for RADIUS parameter
aaasession	Configuration for active connection
aaassoprofile	Configuration for aaa sso profile
aaatacacsparams	Configuration for tacacs parameters
aaauser	Configuration for AAA user
aaauser_aaagroup_binding	Binding object showing the aaagroup that can be bound to aaauser
aaauser_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to aaauser
aaauser_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to aaauser

NAME	DESCRIPTION
aaauser_authorizationpolicy_binding	Binding object showing the authorizationpolicy that can be bound to aaauser
aaauser_binding	Binding object showing the resources that can be bound to aaauser
aaauser_intranetip6_binding	Binding object showing the intranetip6 that can be bound to aaauser
aaauser_intranetip_binding	Binding object showing the intranetip that can be bound to aaauser
aaauser_tmsessionpolicy_binding	Binding object showing the tmsessionpolicy that can be bound to aaauser
aaauser_vpnintranetapplication_binding	Binding object showing the vpnintranetapplication that can be bound to aaauser
aaauser_vpnsessionpolicy_binding	Binding object showing the vpnsessionpolicy that can be bound to aaauser
aaauser_vpntrafficpolicy_binding	Binding object showing the vpntrafficpolicy that can be bound to aaauser
aaauser_vpnurl_binding	Binding object showing the vpnurl that can be bound to aaauser
aaauser_vpnurlpolicy_binding	Binding object showing the vpnurlpolicy that can be bound to aaauser

aaacertparams

Configuration for certificate parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
usernamefield	<String>	Read-write	Client certificate field that contains the username, in the format <field>:<subfield>. .
groupnamefield	<String>	Read-write	Client certificate field that specifies the group, in the format <field>:<subfield>.
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Maximum length = 64
twofactor	<String>	Read-only	The state of the two-factor authentication. Possible values = ON, OFF

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaacertparams

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaacertparams":{
```

```
        "usernamefield":<String_value>,

        "groupnamefield":<String_value>,

        "defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaacertparams? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaacertparams":{

        "usernamefield":true,

        "groupnamefield":true,

        "defaultauthenticationgroup":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaacertparams

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaacertparams": [ {

      "twofactor":<String_value>,

      "usernamefield":<String_value>,

      "groupnamefield":<String_value>,

      "defaultauthenticationgroup":<String_value>

}]}
```

aaaglobal_aaapreauthenticationpolicy_binding

Binding object showing the aaapreauthenticationpolicy that can be bound to aaaglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority of the bound policy.
policy	<String>	Read-write	Name of the policy to be unbound. Minimum length = 1
builtin	<String[]>	Read-write	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
bindpolicytype	<Double>	Read-only	Bound policy type.
__count	<Double>	Read-only	count parameter

Operations

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"aaaglobal_aaapreauthenticationpolicy_binding":{

      "policy":<String_value>,

      "priority":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding?**args=policy: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaaglobal_aaapreauthenticationpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding?**pagesize=#no;pageno=#no**

Use this query-parameter to get the aaaglobal_aaapreauthenticationpolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaaglobal_aaapreauthenticationpolicy_binding": [ {
```

```
        "priority":<Double_value>,

        "policy":<String_value>,

        "builtin":<String[]_value>,

        "bindpolicytype":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaaglobal_aaapreauthenticationpolicy_binding": [ {

      "priority":<Double_value>,

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaaglobal_authenticationnegotiateaction_binding": [ { "__count":
"#no"} ] }
```

aaaglobal_binding

Binding object which returns the resources bound to aaaglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aaaglobal_authenticationnegotiateaction_binding	<aaaglobal_authenticationnegotiateaction_binding[]>	Read-write	authenticationnegotiateaction that can be bound to aaaglobal.
aaaglobal_aaapreauthenticationpolicy_binding	<aaaglobal_aaapreauthenticationpolicy_binding[]>	Read-write	aaapreauthentication policy that can be bound to aaaglobal.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaaglobal_binding": [ {

      "aaaglobal_authenticationnegotiateaction_binding":<aaaglobal_authent
icationnegotiateaction_binding[]_value>,

      "aaaglobal_aaapreauthenticationpolicy_binding":<aaaglobal_aaapreauth
enticationpolicy_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/aaaglobal_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaaglobal_binding": [ {

      "aaaglobal_authenticationnegotiateaction_binding":<aaaglobal_authent

enticationpolicy_binding[]_value>

}]}
```

aaagroup

Configuration for AAA group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupname	<String>	Read-write	Name for the group. Must begin with a letter, number, or the underscore character (_), and must consist

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the group is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my aaa group" or 'my aaa group'). Minimum length = 1
weight	<Double>	Read-write	Weight of this group with respect to other configured aaa groups (lower the number higher the weight). Default value: 0 Minimum value = 0 Maximum value = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
loggedin	<Boolean>	Read-write	Display only the group members who are currently logged in. If there are large number of sessions, this command may provide partial details.
__count	<Double>	Read-only	count parameter

Operations

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaagroup":{

<b>      "groupname":<String_value>,

</b>      "weight":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup/ groupname_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup? **args=groupname: <String_value> ,loggedin: <Boolean_value>**

Use this query-parameter to get aaagroup resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of aaagroup resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup? **view=summary**

Use this query-parameter to get the summary output of aaagroup resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup? **pagesize=#no;pageno=#no**

Use this query-parameter to get the aaagroup resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaagroup": [ {

groupname:<String_value>,loggedin:<Boolean_value>      "weight":<Double_va
lue>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup/ groupname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup/ groupname_value<String> ?
attrs=property-name1,property-name2

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup/ groupname_value<String> ?
view=summary

Use this query-parameter to get the summary output of aaagroup resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaagroup": [ {

groupname:<String_value>,loggedin:<Boolean_value>      "weight":<Double_va
lue>

}]}
```

```
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaagroup": [ { "__count": "#no"} ] }
```

aaagroup_aaauser_binding

Binding object showing the aaauser that can be bound to aaagroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: - If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy with the next higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: - The expression is invalid. - The expression evaluates to a priority number that is numerically lower than the current policy's priority. - The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			85 does not exist in the policy label.
username	<String>	Read-write	The user name.
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/aaagroup_aaauser_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"aaagroup_aaauser_binding":{

<b>      "groupname":<String_value>,

</b>      "username":<String_value>,

      "gotopriorityexpression":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_aaauser_binding/ groupname_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_aaauser_binding/ groupname_value<String> ? **args=username: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_aaauser_binding/ groupname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_aaauser_binding/ groupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaagroup_aaauser_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_aaauser_binding/ groupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the aaagroup_aaauser_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaagroup_aaauser_binding": [ {

      "gotopriorityexpression":<String_value>,

      "username":<String_value>,

      "groupname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_aaauser_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_aaauser_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"aaagroup_authorizationpolicy_binding":{

<b>      "groupname":<String_value>,

</b>      "policy":<String_value>,

      "priority":<Double_value>,

      "type":<String_value>,

      "gotopriorityexpression":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_authorizationpolicy_binding/groupname_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_authorizationpolicy_binding/groupname_value<String> ? **args=policy: <String_value> ,type: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_authorizationpolicy_binding/ groupname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_authorizationpolicy_binding/ groupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaagroup_authorizationpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_authorizationpolicy_binding/ groupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the aaagroup_authorizationpolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaagroup_authorizationpolicy_binding": [ {

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "policy":<String_value>,

      "type":<String_value>,

      "groupname":<String_value>,

      "acttype":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_authorizationpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_authorizationpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaagroup_authorizationpolicy_binding": [ {

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "policy":<String_value>,

      "groupname":<String_value>,

      "acttype":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_authorizationpolicy_binding/groupname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"aaagroup_authorizationpolicy_binding": [ { "__count": "#no"} ] }
```

aaagroup_binding

Binding object which returns the resources bound to aaagroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupname	<String>	Read-write	Name of the group. Minimum length = 1
aaagroup_auditnslogpolicy_binding	<aaagroup_auditnslogpolicy_binding[]>	Read-only	auditnslogpolicy that can be bound to aaagroup.
aaagroup_intranetip6_binding	<aaagroup_intranetip6_binding[]>	Read-only	intranetip6 that can be bound to aaagroup.
aaagroup_vpnsessionpolicy_binding	<aaagroup_vpnsessionpolicy_binding[]>	Read-only	vpnsessionpolicy that can be bound to aaagroup.
aaagroup_vpnurlpolicy_binding	<aaagroup_vpnurlpolicy_binding[]>	Read-only	vpnurlpolicy that can be bound to aaagroup.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aaagroup_intranetip_binding	<aaagroup_intranetip_binding[]>	Read-only	intranetip that can be bound to aaagroup.
aaagroup_aaauser_binding	<aaagroup_aaauser_binding[]>	Read-only	aaauser that can be bound to aaagroup.
aaagroup_vpntrafficpolicy_binding	<aaagroup_vpntrafficpolicy_binding[]>	Read-only	vpntrafficpolicy that can be bound to aaagroup.
aaagroup_vpnintranetapplication_binding	<aaagroup_vpnintranetapplication_binding[]>	Read-only	vpnintranetapplication that can be bound to aaagroup.
aaagroup_authorizationpolicy_binding	<aaagroup_authorizationpolicy_binding[]>	Read-only	authorizationpolicy that can be bound to aaagroup.
aaagroup_auditsyslogpolicy_binding	<aaagroup_auditsyslogpolicy_binding[]>	Read-only	auditsyslogpolicy that can be bound to aaagroup.
aaagroup_vpnurl_binding	<aaagroup_vpnurl_binding[]>	Read-only	vpnurl that can be bound to aaagroup.
aaagroup_tmsessionpolicy_binding	<aaagroup_tmsessionpolicy_binding[]>	Read-only	tmsessionpolicy that can be bound to aaagroup.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_binding/ groupname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaagroup_binding": [ {

      "groupname":<String_value>,

      "aaagroup_vpntrafficpolicy_binding":<aaagroup_vpntrafficpolicy_binding[]_value>,

      "aaagroup_authorizationpolicy_binding":<aaagroup_authorizationpolicy_binding[]_value>,

      "aaagroup_intranetip_binding":<aaagroup_intranetip_binding[]_value>,

      "aaagroup_vpnurlpolicy_binding":<aaagroup_vpnurlpolicy_binding[]_value>,

      "aaagroup_intranetip6_binding":<aaagroup_intranetip6_binding[]_value>,

      "aaagroup_auditnslogpolicy_binding":<aaagroup_auditnslogpolicy_binding[]_value>,

      "aaagroup_vpnurl_binding":<aaagroup_vpnurl_binding[]_value>,

      "aaagroup_auditsyslogpolicy_binding":<aaagroup_auditsyslogpolicy_binding[]_value>,

      "aaagroup_aaauser_binding":<aaagroup_aaauser_binding[]_value>,

      "aaagroup_tmsessionpolicy_binding":<aaagroup_tmsessionpolicy_binding[]_value>,

      "aaagroup_vpnsessionpolicy_binding":<aaagroup_vpnsessionpolicy_binding[]_value>,

      "aaagroup_vpnintranetapplication_binding":<aaagroup_vpnintranetapplication_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

cation_binding[]_value>

}]}
```

aaagroup_intranetip6_binding

Binding object showing the intranetip6 that can be bound to aaagroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
intranetip6	<String>	Read-write	The Intranet IP6(s) bound to the group.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: - If the expression evaluates to a higher

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: - The expression is invalid. - The expression evaluates to a priority number that is numerically lower than the current policy's priority. - The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
numaddr	<Double>	Read-write	Numbers of ipv6 address bound starting with intranetip6.
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
__count	<Double>	Read-write	count parameter

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the priority of the policy. A lower number indicates a higher priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
policy	<String>	Read-write	The policy name.
type	<String>	Read-write	Bindpoint to which the policy is bound. Default value: REQUEST

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = REQUEST, UDP_REQUEST, DNS_REQUEST, ICMP_REQUEST
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/aaagroup_tmsessionpolicy_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"aaagroup_tmsessionpolicy_binding":{

<b>      "groupname":<String_value>,

</b>      "policy":<String_value>,

      "priority":<Double_value>,

      "type":<String_value>,

      "gotopriorityexpression":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_tmsessionpolicy_binding/groupname_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_tmsessionpolicy_binding/groupname_value<String> ? **args=policy: <String_value> ,type: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_tmsessionpolicy_binding/groupname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_tmsessionpolicy_binding/groupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaagroup_tmsessionpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_tmsessionpolicy_binding/ groupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the aaagroup_tmsessionpolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaagroup_tmsessionpolicy_binding": [ {

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "policy":<String_value>,

        "type":<String_value>,

        "groupname":<String_value>,

        "acttype":<Double_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_tmsessionpolicy_binding/groupname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"aaagroup_tmsessionpolicy_binding": [ { "__count": "#no"} ] }
```

aaagroup_vpnintranetapplication_binding

Binding object showing the vpnintranetapplication that can be bound to aaagroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the number to which it

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluates determines the next policy to evaluate, as follows: - If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: - The expression is invalid. - The expression evaluates to a priority number that is numerically lower than the current policy's priority. - The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
intranetapplication	<String>	Read-write	Bind the group to the specified intranet VPN application.
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_vpntrafficpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_vpntrafficpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaagroup_vpntrafficpolicy_binding": [ {

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "policy":<String_value>,

      "type":<String_value>,

      "groupname":<String_value>,

      "acttype":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaagroup_vpntrafficpolicy_binding/ groupname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"aaagroup_vpntrafficpolicy_binding": [ { "__count": "#no"} ] }
```

aaagroup_vpnurlpolicy_binding

Binding object showing the vpnurlpolicy that can be bound to aaagroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the priority of the policy. A lower number indicates a higher priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: - If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the policy with the next

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: - The expression is invalid. - The expression evaluates to a priority number that is numerically lower than the current policy's priority. - The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policy	<String>	Read-write	The policy name.
type	<String>	Read-write	Bindpoint to which the policy is bound. Default value: REQUEST Possible values = REQUEST, UDP_REQUEST, DNS_REQUEST, ICMP_REQUEST
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/aaagroup_vpnurlpolicy_binding

aaakcdaccount

Configuration for Kerberos constrained delegation account resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
kcdaccount	<String>	Read-write	The name of the KCD account. Minimum length = 1
keytab	<String>	Read-write	The path to the keytab file. If specified other parameters in this command need not be given.
realmstr	<String>	Read-write	Kerberos Realm.
delegateduser	<String>	Read-write	Username that can perform kerberos constrained delegation.
kcdpassword	<String>	Read-write	Password for Delegated User.
usercert	<String>	Read-write	SSL Cert (including private key) for Delegated User.
cacert	<String>	Read-write	CA Cert for UserCert or when doing PKINIT backchannel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
userrealm	<String>	Read-write	Realm of the user.
enterpriserealm	<String>	Read-write	Enterprise Realm of the user. This should be given only in certain KDC deployments where KDC expects Enterprise username instead of Principal Name.
servicespn	<String>	Read-write	Service SPN. When specified, this will be used to fetch kerberos tickets. If not specified, Citrix ADC will construct SPN using service fqdn.
principle	<String>	Read-only	SPN extracted from keytab file.
kcdspn	<String>	Read-only	Host SPN extracted from keytab file.
__count	<Double>	Read-only	count parameter

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaakcdaccount? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaakcdaccount": [ { "__count": "#no"} ] }
```

aaaldapparams

Configuration for LDAP parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of your LDAP server.
serverport	<Integer>	Read-write	Port number on which the LDAP server listens for connections. Default value: 389

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1
authtimeout	<Double>	Read-write	Maximum number of seconds that the Citrix ADC waits for a response from the LDAP server. Default value: 3 Minimum value = 1
ldapbase	<String>	Read-write	Base (the server and location) from which LDAP search commands should start. If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com.
ldapbinddn	<String>	Read-write	Complete distinguished name (DN) string used for binding to the LDAP server.
ldapbinddnpassword	<String>	Read-write	Password for binding to the LDAP server. Minimum length = 1
ldaploginname	<String>	Read-write	Name attribute that the Citrix ADC uses to query the external LDAP server or an Active Directory.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
searchfilter	<String>	Read-write	String to be combined with the default LDAP user search string to form the value to use when executing an LDAP search. For example, the following values: vpnallowed=true, ldaploginame=""sa maccount"" when combined with the user-supplied username ""bob"", yield the following LDAP search string: ""(; (vpnallowed=true) (samaccount=bob)"" . Minimum length = 1
groupattrname	<String>	Read-write	Attribute name used for group extraction from the LDAP server.
subattributename	<String>	Read-write	Subattribute name used for group extraction from the LDAP server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sectype	<String>	Read-write	Type of security used for communications between the Citrix ADC and the LDAP server. For the PLAINTEXT setting, no encryption is required. Default value: TLS Possible values = PLAINTEXT, TLS, SSL
svrtype	<String>	Read-write	The type of LDAP server. Default value: AAA_LDAP_SERVER_TYPE_DEFAULT Possible values = AD, NDS
ssonameattribute	<String>	Read-write	Attribute used by the Citrix ADC to query an external LDAP server or Active Directory for an alternative username. This alternative username is then used for single sign-on (SSO).
passwdchange	<String>	Read-write	Accept password change requests.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
nestedgroupextraction	<String>	Read-write	Queries the external LDAP server to determine whether the specified group belongs to another group. Default value: OFF Possible values = ON, OFF
maxnestinglevel	<Double>	Read-write	Number of levels up to which the system can query nested LDAP groups. Default value: 2 Minimum value = 2
groupnameidentifier	<String>	Read-write	LDAP-group attribute that uniquely identifies the group. No two groups on one LDAP server can have the same group name identifier.
groupsearchattribute	<String>	Read-write	LDAP-group attribute that designates the parent group of the specified group. Use this attribute to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			search for a group's parent group.
groupsearchsubattribute	<String>	Read-write	LDAP-group subattribute that designates the parent group of the specified group. Use this attribute to search for a group's parent group.
groupsearchfilter	<String>	Read-write	Search-expression that can be specified for sending group-search requests to the LDAP server.
defaultauthenticationgroup	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Maximum length = 64
groupauthname	<String>	Read-only	To associate AAA users with an AAA group, use the command "bind AAA group ... -username ...". You can bind different policies to each AAA group. Use the command

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"bind AAA group ... -policy ...".
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

aaaparameter

Configuration for AAA parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
enablestaticpagecaching	<String>	Read-write	The default state of VPN Static Page caching. If nothing is specified, the default value is set to YES. Default value: YES Possible values = YES, NO
enableenhancedauthfeedback	<String>	Read-write	Enhanced auth feedback provides more information to the end user about the reason for an authentication failure. The default value is set to NO. Default value: NO Possible values = YES, NO
defaultauthtype	<String>	Read-write	The default authentication server type. Default value: LOCAL Possible values = LOCAL, LDAP, RADIUS, TACACS, CERT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxaaausers	<Double>	Read-write	Maximum number of concurrent users allowed to log on to VPN simultaneously. Minimum value = 1
maxloginattempts	<Double>	Read-write	Maximum Number of login Attempts. Minimum value = 1
failedlogintimeout	<Double>	Read-write	Number of minutes an account will be locked if user exceeds maximum permissible attempts. Minimum value = 1
aaadnatip	<String>	Read-write	Source IP address to use for traffic that is sent to the authentication server.
enablesessionstickiness	<String>	Read-write	Enables/Disables stickiness to authentication servers. Default value: NO Possible values = YES, NO
aaasessionloglevel	<String>	Read-write	Audit log level, which specifies the types of events to log for cli executed commands. Available values function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DEFAULT_LOGLEVEL_AAA Possible values = EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG
aaadloglevel	<String>	Read-write	AAAD log level, which specifies the types of AAAD events to log in nsvpn.log. Available values function as follows: * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. Default value: INFORMATIONAL Possible values = EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG
dynaddr	<String>	Read-write	Set by the DHCP client when the IP address was fetched dynamically. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ftmode	<String>	Read-write	First time user mode determines which configuration options are shown by default when logging in to the GUI. This setting is controlled by the GUI. Default value: ON Possible values = ON, HA, OFF
maxsamldeflatesize	<Double>	Read-write	This will set the maximum deflate size in case of SAML Redirect binding.
persistentloginattempts	<String>	Read-write	Persistent storage of unsuccessful user login attempts. Default value: DISABLED Possible values = ENABLED, DISABLED
pwdexpirynotificationdays	<Double>	Read-write	This will set the threshold time in days for password expiry notification. Default value is 0, which means no notification is sent.
maxkbquestions	<Double>	Read-write	This will set maximum number of Questions to be asked for KB Validation. Default

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value is 2, Max Value is 6. Minimum value = 2 Maximum value = 6
loginencryption	<String>	Read-write	Parameter to encrypt login information for nFactor flow. Default value: DISABLED Possible values = ENABLED, DISABLED
samesite	<String>	Read-write	SameSite attribute value for Cookies generated in AAATM context. This attribute value will be appended only for the cookies which are specified in the builtin patset ns_cookies_samesite. Possible values = None, LAX, STRICT
apitokencache	<String>	Read-write	Option to enable/disable API cache feature. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tokenintrospectionint erval	<Double>	Read-write	Frequency at which a token must be verified at the Authorization Server (AS) despite being found in cache.
builtin	<String[]>	Read-only	Flag to determine if aaa param is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

aaapreauthenticationaction

Configuration for pre authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the preauthentication action. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after preauthentication action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my aaa action" or 'my aaa action'). Minimum length = 1
preauthenticationaction	<String>	Read-write	Allow or deny logon after endpoint analysis (EPA) results. Possible values = ALLOW, DENY
killprocess	<String>	Read-write	String specifying the name of a process to be terminated by the endpoint analysis (EPA) tool.
deletefiles	<String>	Read-write	String specifying the path(s) and name(s) of the files to be deleted by the endpoint analysis (EPA) tool.
defaultepagroup	<String>	Read-write	This is the default group that is chosen when the EPA check succeeds. Maximum length = 64
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaapreauthenticationaction":{

<b>      "name":<String_value>,

</b>      "preauthenticationaction":<String_value>,

      "killprocess":<String_value>,

      "deletefiles":<String_value>,

      "defaultepagroup":<String_value>
```

```
}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaapreauthenticationaction":{
```

```
<b>      "name":<String_value>,

</b>      "preauthenticationaction":<String_value>,

      "killprocess":<String_value>,

      "deletefiles":<String_value>,

      "defaultepagroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaapreauthenticationaction":{

<b>      "name":<String_value>,

</b>      "killprocess":true,

      "deletefiles":true,
```

```
        "defaultepagroup":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of aaapreauthenticationaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction? **view=summary**

Use this query-parameter to get the summary output of aaapreauthenticationaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction?
pagesize=#no;pageno=#no

Use this query-parameter to get the aaapreauthenticationaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaapreauthenticationaction": [ {

      "name":<String_value>,

      "preauthenticationaction":<String_value>,

      "killprocess":<String_value>,

      "deletefiles":<String_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>,

      "defaultepagroup":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of aaapreauthenticationaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaapreauthenticationaction": [ {

      "name":<String_value>,

      "preauthenticationaction":<String_value>,

      "killprocess":<String_value>,

      "deletefiles":<String_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>,

      "defaultepagroup":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationaction? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaapreauthenticationaction": [ { "__count": "#no"} ] }
```

aaapreauthenticationparameter

Configuration for pre authentication parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
preauthenticationaction	<String>	Read-write	Deny or allow login on the basis of end point analysis results. Possible values = ALLOW, DENY
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, to be evaluated by the EPA tool.
killprocess	<String>	Read-write	String specifying the name of a process to be terminated by the EPA tool.
deletefiles	<String>	Read-write	String specifying the path(s) to and name(s) of the files to be deleted by the EPA tool, as a string of between 1 and 1023 characters.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationparameter

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaapreauthenticationparameter":{

      "preauthenticationaction":<String_value>,

      "rule":<String_value>,

      "killprocess":<String_value>,

      "deletefiles":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationparameter? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaapreauthenticationparameter":{

      "rule":true,

      "preauthenticationaction":true,

      "killprocess":true,

      "deletefiles":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationparameter

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaapreauthenticationparameter": [ {

      "preauthenticationaction":<String_value>,

      "rule":<String_value>,

      "killprocess":<String_value>,

      "deletefiles":<String_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>

}]}
```

aaapreauthenticationpolicy

Configuration for pre authentication policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the preauthentication policy. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the preauthentication policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, defining connections that match the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqaction	<String>	Read-write	Name of the action that the policy is to invoke when a connection matches the policy. Minimum length = 1
hits	<Double>	Read-only	No of hits.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

policy_aaaglobal_binding[]_value>

}]}
```

aaapreauthenticationpolicy_vpnvserver_binding

Binding object showing the vpnvserver that can be bound to aaapreauthenticationpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the preauthentication policy whose properties you want to view. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ aaapreauthenticationpolicy_vpnvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationpolicy_vpnvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaapreauthenticationpolicy_vpnvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationpolicy_vpnvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the aaapreauthenticationpolicy_vpnvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaapreauthenticationpolicy_vpnvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ aaapreauthenticationpolicy_vpnvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/aaapreauthenticationpolicy_vpnvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaapreauthenticationpolicy_vpnvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ aaapreauthenticationpolicy_vpnvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"aaapreauthenticationpolicy_vpnvserver_binding": [ { "__count":
"#no"} ] }
```

aaaradiusparams

Configuration for RADIUS parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of your RADIUS server. Minimum length = 1
serverport	<Integer>	Read-write	Port number on which the RADIUS server listens for connections. Default value: 1812 Minimum value = 1
authtimeout	<Double>	Read-write	Maximum number of seconds that the Citrix ADC waits for a response from the RADIUS server. Default value: 3 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
radkey	<String>	Read-write	The key shared between the RADIUS server and clients. Required for allowing the Citrix ADC to communicate with the RADIUS server. Minimum length = 1
radnasip	<String>	Read-write	Send the Citrix ADC IP (NSIP) address to the RADIUS server as the Network Access Server IP (NASIP) part of the Radius protocol. Possible values = ENABLED, DISABLED
radnasid	<String>	Read-write	Send the Network Access Server ID (NASID) for your Citrix ADC to the RADIUS server as the nasid part of the Radius protocol.
radvendorid	<Double>	Read-write	Vendor ID for RADIUS group extraction. Minimum value = 1
radattributetype	<Double>	Read-write	Attribute type for RADIUS group extraction.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1
radgroupsprefix	<String>	Read-write	Prefix string that precedes group names within a RADIUS attribute for RADIUS group extraction.
radgroupseparator	<String>	Read-write	Group separator string that delimits group names within a RADIUS attribute for RADIUS group extraction.
passencoding	<String>	Read-write	Enable password encoding in RADIUS packets that the Citrix ADC sends to the RADIUS server. Default value: mschapv2 Possible values = pap, chap, mschapv1, mschapv2
ipvendorid	<Double>	Read-write	Vendor ID attribute in the RADIUS response. If the attribute is not vendor-encoded, it is set to 0.
ipattributetype	<Double>	Read-write	IP attribute type in the RADIUS response. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
accounting	<String>	Read-write	Configure the RADIUS server state to accept or refuse accounting messages. Possible values = ON, OFF
pwdvendorid	<Double>	Read-write	Vendor ID of the password in the RADIUS response. Used to extract the user password. Minimum value = 1
pwdattributetype	<Double>	Read-write	Attribute type of the Vendor ID in the RADIUS response. Minimum value = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Maximum length = 64
callingstationid	<String>	Read-write	Send Calling-Station-ID of the client to the RADIUS server. IP Address of the client is sent as its Calling-Station-ID. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
authservretry	<Double>	Read-write	Number of retry by the Citrix ADC before getting response from the RADIUS server. Default value: 3 Minimum value = 1 Maximum value = 10
authentication	<String>	Read-write	Configure the RADIUS server state to accept or refuse authentication messages. Default value: ON Possible values = ON, OFF
tunnelendpointclientip	<String>	Read-write	Send Tunnel Endpoint Client IP address to the RADIUS server. Default value: DISABLED Possible values = ENABLED, DISABLED
groupauthname	<String>	Read-only	To associate AAA users with an AAA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			group, use the command "bind AAA group ... -username ...". You can bind different policies to each AAA group. Use the command "bind AAA group ... -policy ...".
ipaddress	<String>	Read-only	IP Address.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

Operations

```

aaasession

Configuration for active connection resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name of the AAA user. Minimum length = 1
groupname	<String>	Read-write	Name of the AAA group. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
iip	<String>	Read-write	IP address or the first address in the intranet IP range. Minimum length = 1
netmask	<String>	Read-write	Subnet mask for the intranet IP range. Minimum length = 1
sessionkey	<String>	Read-write	Show aaa session associated with given session key. Minimum length = 1 Maximum length = 127
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
all	<Boolean>	Read-write	Terminate all active AAA-TM/VPN sessions.
publicip	<String>	Read-only	Client's public IP address.
publicport	<Integer>	Read-only	Client's public port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-only	Citrix ADC's IP address.
port	<Integer>	Read-only	Citrix ADC's port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
privateip	<String>	Read-only	Client's private/ mapped IP address.
privateport	<Integer>	Read-only	Client's private/ mapped port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
destip	<String>	Read-only	Destination IP address.
destport	<Integer>	Read-only	Destination port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
intranetip	<String>	Read-only	Specifies the Intranet IP.
intranetip6	<String>	Read-only	Specifies the Intranet IP6.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
peid	<Double>	Read-only	Core id of the session owner.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- KILL

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

KILL

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaasession? **action=kill**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaasession":{

      "username":<String_value>,

      "groupname":<String_value>,

      "iip":<String_value>,

      "netmask":<String_value>,

      "sessionkey":<String_value>,

      "all":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaasession

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/aaasession? **args=username: <String_value> ,groupname: <String_value> ,iip: <String_value> ,netmask: <String_value> ,sessionkey: <String_value> ,nodeid: <Double_value>**

Use this query-parameter to get aaasession resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/aaasession? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaasession? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of aaasession resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/aaasession? **view=summary**

Use this query-parameter to get the summary output of aaasession resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaasession? **pagesize=#no;pageno=#no**

Use this query-parameter to get the aaasession resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

aaassoprofile

Configuration for aaa sso profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SSO Profile. Must begin with an ASCII alphabetic or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after a SSO Profile is created. The following requirement applies only to the NetScaler CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
username	<String>	Read-write	Name for the user. Must begin with a letter, number, or the underscore (_) character, and must contain only alphanumeric, hyphen (-), period (.), hash (#), space ( ), at (@), equal (=), colon (:), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore characters. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my group" or 'my group'). Minimum length = 1
password	<String>	Read-write	Password with which the user logs on. Required for Single sign on to external server. Minimum length = 1
__count	<Double>	Read-only	count parameter

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/aaassoprofile/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/aaassoprofile/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of aaassoprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaassoprofile": [ {

      "name":<String_value>,

      "username":<String_value>,

      "password":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaassoprofile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "aaassoprofile": [ { "__count": "#no"} ] }
```

aaatacacsparams

Configuration for tacacs parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of your TACACS+ server. Minimum length = 1
serverport	<Integer>	Read-write	Port number on which the TACACS+ server listens for connections. Default value: 49 Minimum value = 1
authtimeout	<Double>	Read-write	Maximum number of seconds that the Citrix ADC waits for a response from the TACACS+ server. Default value: 3 Minimum value = 1
tacacssecret	<String>	Read-write	Key shared between the TACACS+ server and clients. Required for allowing the Citrix ADC to communicate with the TACACS+ server. Minimum length = 1
authorization	<String>	Read-write	Use streaming authorization on the TACACS+ server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
accounting	<String>	Read-write	Send accounting messages to the TACACS+ server. Possible values = ON, OFF
auditfailedcmds	<String>	Read-write	The option for sending accounting messages to the TACACS+ server. Possible values = ON, OFF
groupattrname	<String>	Read-write	TACACS+ group attribute name.Used for group extraction on the TACACS+ server.
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Maximum length = 64
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaatacacsparams

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaatacacsparams":{

      "serverip":<String_value>,

      "serverport":<Integer_value>,

      "authtimeout":<Double_value>,

      "tacacssecret":<String_value>,

      "authorization":<String_value>,

      "accounting":<String_value>,

      "auditfailedcmds":<String_value>,

      "groupattrname":<String_value>,

      "defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaatacacsparams? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"aaatacacsparams":{

      "serverip":true,

      "serverport":true,

      "authtimeout":true,

      "tacacssecret":true,

      "authorization":true,

      "accounting":true,

      "auditfailedcmds":true,

      "groupattrname":true,

      "defaultauthenticationgroup":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaatacacsparams

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

  }]}
```

aaauser

Configuration for AAA user resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name for the user. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the user is added. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my aaa user" or "my aaa user"). Minimum length = 1
password	<String>	Read-write	Password with which the user logs on. Required for any user account that does not exist on an external authentication server. If you are not using an external authentication server, all user accounts must have a password. If you are using an external authentication server, you must provide a password for local user accounts that do not exist on the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication server. Minimum length = 1
loggedin	<Boolean>	Read-write	Show whether the user is logged in or not.
__count	<Double>	Read-only	count parameter

```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaauser

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/aaauser? **args=username: <String_value> ,loggedin: <Boolean_value>**

Use this query-parameter to get aaauser resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/aaauser? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaauser? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of aaauser resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/aaauser? **view=summary**

Use this query-parameter to get the summary output of aaauser resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaauser? **pagesize=#no;pageno=#no**

Use this query-parameter to get the aaauser resources in chunks.

HTTP Method: GET

Request Headers:

{ "aaauser": [ { "__count": "#no"} ] }
```

aaauser_aaagroup_binding

Binding object showing the aaagroup that can be bound to aaauser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User account to which to bind the policy. Minimum length = 1
groupname	<String>	Read-write	The group name.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the final goto is anything other than END, the current policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: - If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: - The expression is invalid. - The expression evaluates to a priority number that is numerically lower

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			than the current policy's priority. - The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
__count	<Double>	Read-write	count parameter

bulkbindings=yes

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaauser_auditnslogpolicy_binding": [ {

      "priority":<Double_value>,

      "username":<String_value>,

      "gotopriorityexpression":<String_value>,

      "policy":<String_value>,

      "type":<String_value>,

      "acttype":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaauser_auditnslogpolicy_binding/ username_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"aaauser_auditnslogpolicy_binding": [ { "__count": "#no"} ] }
```

aaauser_auditsyslogpolicy_binding

Binding object showing the auditsyslogpolicy that can be bound to aaauser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the priority of the policy. A lower number indicates a higher priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies max priority is 64000. .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 2147483647
username	<String>	Read-write	User account to which to bind the policy. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number to which it evaluates determines the next policy to evaluate, as follows: - If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: - The expression is invalid. - The expression evaluates to a priority number that is numerically lower than the current policy's priority. - The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
policy	<String>	Read-write	The policy Name.
type	<String>	Read-write	Bindpoint to which the policy is bound. Default value: REQUEST Possible values = REQUEST, UDP_REQUEST, DNS_REQUEST, ICMP_REQUEST
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/aaauser_auditsyslogpolicy_binding

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaauser_intranetip6_binding/ username_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaauser_intranetip6_binding/ username_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaauser_intranetip6_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaauser_intranetip6_binding/ username_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the aaauser_intranetip6_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaauser_intranetip6_binding": [ {

      "intranetip6":<String_value>,
```

```
        "username":<String_value>,

        "gotopriorityexpression":<String_value>,

        "numaddr":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaauser_intranetip6_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/aaauser_intranetip6_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaauser_intranetip6_binding": [ {

      "intranetip6":<String_value>,

      "username":<String_value>,

      "gotopriorityexpression":<String_value>,

      "numaddr":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaauser_intranetip6_binding/ username_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"aaauser_intranetip6_binding": [ { "__count": "#no"} ] }
```

aaauser_intranetip_binding

Binding object showing the intranetip that can be bound to aaauser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
intranetip	<String>	Read-write	The Intranet IP bound to the user.
username	<String>	Read-write	User account to which to bind the policy. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: - If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: - The expression is invalid. - The expression evaluates to a priority number that is numerically lower than the current policy's priority. - The expression evaluates

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
netmask	<String>	Read-write	The netmask for the Intranet IP.
__count	<Double>	Read-write	count parameter

Operations

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/aaauser_intranetip_binding

      "type":<String_value>,

      "gotopriorityexpression":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaauser_vpnsessionpolicy_binding/ username_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/aaauser_vpnsessionpolicy_binding/ username_value<String> ? **args=policy: <String_value> ,type: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaauser_vpnsessionpolicy_binding/ username_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/aaauser_vpnsessionpolicy_binding/ username_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaauser_vpnsessionpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/aaauser_vpnsessionpolicy_binding/ username_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the aaauser_vpnsessionpolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaauser_vpnsessionpolicy_binding": [ {

      "priority":<Double_value>,

      "username":<String_value>,

      "gotopriorityexpression":<String_value>,

      "type":<String_value>,

      "acttype":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaauser_vpnsessionpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/aaauser_vpnsessionpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "aaauser_vpnsessionpolicy_binding": [ {

      "priority":<Double_value>,

      "username":<String_value>,

      "gotopriorityexpression":<String_value>,

      "policy":<String_value>,

      "type":<String_value>,

      "acttype":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/aaauser_vpnsessionpolicy_binding/ username_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"aaauser_vpnsessionpolicy_binding": [ { "__count": "#no"} ] }
```

aaauser_vpntrafficpolicy_binding

Binding object showing the vpntrafficpolicy that can be bound to aaauser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the priority of the policy. A lower number indicates a higher priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies max priority is 64000. . Minimum value = 0 Maximum value = 2147483647

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User account to which to bind the policy. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: - If the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: - The expression is invalid. - The expression evaluates to a priority number that is numerically lower than the current policy's priority. - The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
policy	<String>	Read-write	The policy Name.
type	<String>	Read-write	Bindpoint to which the policy is bound. Default value: REQUEST Possible values = REQUEST, UDP_REQUEST, DNS_REQUEST, ICMP_REQUEST
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"aaauser_vpnurl_binding": [ { "__count": "#no"} ] }
```

adm

Adm

ADM related configuration.

NAME	DESCRIPTION
admparameter	Configuration for ADM parameter

admparameter

Configuration for ADM parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
autoconnect	<String>	Read-write	Parameter to enable/disable ADM auto register daemon and mastools. Default value: ENABLED Possible values = ENABLED, DISABLED

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/admparameter

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"admparameter":{
      "autoconnect":<String_value>
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/admparameter? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"admparameter":{
      "autoconnect":true
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/admparameter

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "admparameter": [ {

      "autoconnect":<String_value>

}]}
```

analytics

Analytics

Analytics configuration.

NAME	DESCRIPTION
analyticsglobal_analyticsprofile_binding	Binding object showing the analyticsprofile that can be bound to analyticsglobal
analyticsglobal_binding	Binding object showing the resources that can be bound to analyticsglobal
analyticsprofile	Configuration for Analytics profile

analyticsglobal_analyticsprofile_binding

Binding object showing the analyticsprofile that can be bound to analyticsglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
analyticsprofile	<String>	Read-write	Name of the analytics profile bound.
__count	<Double>	Read-write	count parameter

analyticsprofile

Configuration for Analytics profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the analytics profile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow profile" or 'my appflow profile'). Minimum length = 1 Maximum length = 127
collectors	<String>	Read-write	The collector can be an IP, an appflow collector name, a service or a vserver. If IP is specified, the transport is considered as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			logstream and default port of 5557 is taken. If collector name is specified, the collector properties are taken from the configured collector. If service is specified, the configured service is assumed as the collector. If vserver is specified, the services bound to it are considered as collectors and the records are load balanced. Minimum length = 1
type	<String>	Read-write	This option indicates what information needs to be collected and exported. Possible values = global, webinsight, tcpinsight, securityinsight, videoinsight, hdxinsight, gatewayinsight, timeseries, lsninsight, botinsight, CIinsight
httpclientsidemeasurements	<String>	Read-write	On enabling this option, the Citrix ADC will insert a javascript into the HTTP response to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			collect the client side page-timings and will send the same to the configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
httppagetracking	<String>	Read-write	On enabling this option, the Citrix ADC will link the embedded objects of a page together. Default value: DISABLED Possible values = ENABLED, DISABLED
httpurl	<String>	Read-write	On enabling this option, the Citrix ADC will log the URL in appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
httphost	<String>	Read-write	On enabling this option, the Citrix ADC will log the Host header in appflow records.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
httpmethod	<String>	Read-write	On enabling this option, the Citrix ADC will log the method header in appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
httpreferer	<String>	Read-write	On enabling this option, the Citrix ADC will log the referer header in appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
httpuseragent	<String>	Read-write	On enabling this option, the Citrix ADC will log User-Agent header. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
httpcookie	<String>	Read-write	On enabling this option, the Citrix ADC will log cookie header. Default value: DISABLED Possible values = ENABLED, DISABLED
httplocation	<String>	Read-write	On enabling this option, the Citrix ADC will log location header. Default value: DISABLED Possible values = ENABLED, DISABLED
urlcategory	<String>	Read-write	On enabling this option, the Citrix ADC will send the URL category record. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
allhttpheaders	<String>	Read-write	On enabling this option, the Citrix ADC will log all the request and response headers. Default value: DISABLED Possible values = ENABLED, DISABLED
httpcontenttype	<String>	Read-write	On enabling this option, the Citrix ADC will log content-length header. Default value: DISABLED Possible values = ENABLED, DISABLED
httpauthentication	<String>	Read-write	On enabling this option, the Citrix ADC will log Authentication header. Default value: DISABLED Possible values = ENABLED, DISABLED
httpvia	<String>	Read-write	On enabling this option, the Citrix ADC will Via header.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
httpxforwardedforheader	<String>	Read-write	On enabling this option, the Citrix ADC will log X-Forwarded-For header. Default value: DISABLED Possible values = ENABLED, DISABLED
httpsetcookie	<String>	Read-write	On enabling this option, the Citrix ADC will log set-cookie header. Default value: DISABLED Possible values = ENABLED, DISABLED
httpsetcookie2	<String>	Read-write	On enabling this option, the Citrix ADC will log set-cookie2 header. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
httpdomainname	<String>	Read-write	On enabling this option, the Citrix ADC will log domain name. Default value: DISABLED Possible values = ENABLED, DISABLED
httpurlquery	<String>	Read-write	On enabling this option, the Citrix ADC will log URL Query. Default value: DISABLED Possible values = ENABLED, DISABLED
tcpburstreporting	<String>	Read-write	On enabling this option, the Citrix ADC will log TCP burst parameters. Default value: ENABLED Possible values = ENABLED, DISABLED
cqareporting	<String>	Read-write	On enabling this option, the Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADC will log TCP CQA parameters. Default value: DISABLED Possible values = ENABLED, DISABLED
integratedcache	<String>	Read-write	On enabling this option, the Citrix ADC will log the Integrated Caching appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
grpcstatus	<String>	Read-write	On enabling this option, the Citrix ADC will log the gRPC status headers. Default value: DISABLED Possible values = ENABLED, DISABLED
outputmode	<String>	Read-write	This option indicates the format of REST API POST body. It depends on the consumer of the analytics data.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: avro, Possible values = avro, prometheus, influx
metrics	<String>	Read-write	This option indicates the whether metrics should be sent to the REST collector. Default value: DISABLED Possible values = ENABLED, DISABLED
events	<String>	Read-write	This option indicates the whether events should be sent to the REST collector. Default value: DISABLED Possible values = ENABLED, DISABLED
auditlogs	<String>	Read-write	This option indicates the whether auditlog should be sent to the REST collector. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aaainsight	<String>	Read-write	On enabling this option, the Citrix ADC will send the AAA Insight record. Default value: ENABLED Possible values = ENABLED, DISABLED
refcnt	<Double>	Read-only	The number of references to the profile.
__count	<Double>	Read-only	count parameter

Operations

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/analyticsprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/analyticsprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/analyticsprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of analyticsprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/analyticsprofile? **view=summary**

Use this query-parameter to get the summary output of analyticsprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/analyticsprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the analyticsprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/analyticsprofile/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/analyticsprofile/ name_value<String> ?
attrs=property-name1,property-name2

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/analyticsprofile/ name_value<String> ?
view=summary

Use this query-parameter to get the summary output of analyticsprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/analyticsprofile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "analyticsprofile": [ { "__count": "#no"} ] }
```

app

App

Application

NAME	DESCRIPTION
application	Configuration for application

application

Configuration for application resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
apptemplatefilename	<String>	Read-write	Name of the AppExpert application template file.
appname	<String>	Read-write	Name to assign to the application on the Citrix ADC. If you do not provide a name, the appliance assigns the application the name of the template file.
deploymentfilename	<String>	Read-write	Name of the deployment file.

Operations

(click to see Properties)

- IMPORT
- EXPORT
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/application? **action=Import**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"application":{

<b>      "apptemplatefilename":<String_value>,

</b>      "appname":<String_value>,

      "deploymentfilename":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

EXPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/application? **action=export**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"application":{

<b>      "appname":<String_value>,

</b>      "apptemplatefilename":<String_value>,
```

```
        "deployementfilename":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/application

Query-parameters:

args= appname:<String_value>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

appflow

Appflow

AppFlow configuration.

NAME	DESCRIPTION
appflowaction	Configuration for AppFlow action

NAME	DESCRIPTION
appflowaction_analyticsprofile_binding	Binding object showing the analyticsprofile that can be bound to appflowaction
appflowaction_binding	Binding object showing the resources that can be bound to appflowaction
appflowcollector	Configuration for AppFlow collector
appflowglobal_appflowpolicy_binding	Binding object showing the appflowpolicy that can be bound to appflowglobal
appflowglobal_binding	Binding object showing the resources that can be bound to appflowglobal
appflowparam	Configuration for AppFlow parameter
appflowpolicy	Configuration for AppFlow policy
appflowpolicy_appflowglobal_binding	Binding object showing the appflowglobal that can be bound to appflowpolicy
appflowpolicy_appflowpolicylabel_binding	Binding object showing the appflowpolicylabel that can be bound to appflowpolicy
appflowpolicy_binding	Binding object showing the resources that can be bound to appflowpolicy
appflowpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to appflowpolicy

NAME	DESCRIPTION
appflowpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to appflowpolicy
appflowpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to appflowpolicy
appflowpolicylabel	Configuration for AppFlow policy label
appflowpolicylabel_appflowpolicy_binding	Binding object showing the appflowpolicy that can be bound to appflowpolicylabel
appflowpolicylabel_binding	Binding object showing the resources that can be bound to appflowpolicylabel

appflowaction

Configuration for AppFlow action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow action" or 'my appflow action').
collectors	<String[]>	Read-write	Name(s) of collector(s) to be associated with the AppFlow action. Minimum length = 1
clientsidemeasurements	<String>	Read-write	On enabling this option, the Citrix ADC will collect the time required to load and render the mainpage on the client. Default value: DISABLED Possible values = ENABLED, DISABLED
pagetracking	<String>	Read-write	On enabling this option, the Citrix ADC will start tracking the page for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			waterfall chart by inserting a NS_ESNS cookie in the response. Default value: DISABLED Possible values = ENABLED, DISABLED
webinsight	<String>	Read-write	On enabling this option, the Citrix ADC will send the webinsight records to the configured collectors. Default value: ENABLED Possible values = ENABLED, DISABLED
securityinsight	<String>	Read-write	On enabling this option, the Citrix ADC will send the security insight records to the configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
botinsight	<String>	Read-write	On enabling this option, the Citrix ADC will send the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bot insight records to the configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
ciinsight	<String>	Read-write	On enabling this option, the Citrix ADC will send the ContentInspection Insight records to the configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
videoanalytics	<String>	Read-write	On enabling this option, the Citrix ADC will send the videoinsight records to the configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
distributionalgorithm	<String>	Read-write	On enabling this option, the Citrix ADC will distribute records among the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			collectors. Else, all records will be sent to all the collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
metricslog	<Boolean>	Read-write	If only the stats records are to be exported, turn on this option.
transactionlog	<String>	Read-write	Log ANOMALOUS or ALL transactions. Default value: ALL Possible values = ALL, ANOMALOUS
comment	<String>	Read-write	Any comments about this action. In the CLI, if including spaces between words, enclose the comment in quotation marks. (The quotation marks are not required in the configuration utility.). Maximum length = 256
newname	<String>	Read-write	New name for the AppFlow action. Must begin with an ASCII alphabetic or underscore (_)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow action" or 'my appflow action'). Minimum length = 1
hits	<Double>	Read-only	The number of times the action has been taken.
referencecount	<Double>	Read-only	The number of references to the action.
description	<String>	Read-only	Description of the action.
__count	<Double>	Read-only	count parameter

Content-Type:application/json

Request Payload:

```
{"appflowaction":{

<b>      "name":<String_value>,

</b><b>      "newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appflowaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appflowaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appflowaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appflowaction? **view=summary**

Use this query-parameter to get the summary output of appflowaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appflowaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appflowaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appflowaction": [ {

      "name":<String_value>,

      "hits":<Double_value>,

filter

http:// <netscaler-ip-address> /nitro/v1/config/appflowaction_analyticsprofile_binding/name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appflowaction_analyticsprofile_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appflowaction_analyticsprofile_binding/name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appflowaction_analyticsprofile_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appflowaction_analyticsprofile_binding": [ {

      "name":<String_value>,

      "analyticsprofile":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowaction_analyticsprofile_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appflowaction_analyticsprofile_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appflowaction_analyticsprofile_binding": [ {

      "name":<String_value>,

      "analyticsprofile":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowaction_analyticsprofile_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"appflowaction_analyticsprofile_binding": [ { "__count": "#no"} ] }
```

appflowaction_binding

Binding object which returns the resources bound to appflowaction.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the action about which to display information.
appflowaction_analyticsprofile_binding	<appflowaction_analyticsprofile_binding[]>	Read-only	analyticsprofile that can be bound to appflowaction.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowaction_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appflowaction_binding": [ {

      "name":<String_value>,

      "appflowaction_analyticsprofile_binding":<appflowaction_analyticspro
file_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowaction_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appflowaction_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appflowaction_binding": [ {

      "name":<String_value>,

      "appflowaction_analyticsprofile_binding":<appflowaction_analyticspro
file_binding[]_value>
```

```
}]}
```

appflowcollector

Configuration for AppFlow collector resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the collector. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Only four collectors can be configured. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my appflow collector" or 'my appflow collector'). Minimum length = 1 Maximum length = 127
ipaddress	<String>	Read-write	IPv4 address of the collector.
port	<Integer>	Read-write	Port on which the collector listens.
netprofile	<String>	Read-write	Netprofile to associate with the collector. The IP address defined in the profile is used as the source IP address for AppFlow traffic for this collector. If you do not set this parameter, the Citrix ADC IP (NSIP) address is used as the source IP address. Maximum length = 128
transport	<String>	Read-write	Type of collector: either logstream or ipfix or rest. Default value: ipfix, Possible values = ipfix, logstream, rest

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the collector. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at(@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow coll" or 'my appflow coll'). Minimum length = 1
state	<String>	Read-only	Appflow collector state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
__count	<Double>	Read-only	count parameter

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowcollector

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appflowcollector? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appflowcollector? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appflowcollector resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appflowcollector? **view=summary**

Use this query-parameter to get the summary output of appflowcollector resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appflowcollector? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appflowcollector resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appflowcollector": [ {

      "name":<String_value>,

      "ipaddress":<String_value>,

```

appflowglobal_appflowpolicy_binding

Binding object showing the appflowpolicy that can be bound to appflowglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the AppFlow policy.
labelname	<String>	Read-write	Name of the label to invoke if the current policy evaluates to TRUE.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority.
type	<String>	Read-write	Global bind point for which to show detailed information about the policies bound to the bind point. Possible values = REQ_OVERRIDE, REQ_DEFAULT, OVERRIDE, DEFAULT, OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DEFAULT, MSSQL_REQ_OVERRIDE, MSSQL_REQ_DEFAULT, MYSQL_REQ_OVERRIDE, MYSQL_REQ_DEFAULT, ICA_REQ_OVERRIDE, ICA_REQ_DEFAULT, ORACLE_REQ_OVERRIDE, ORACLE_REQ_DEFAULT
labeltype	<String>	Read-write	Type of policy label to invoke. Specify vserver for a policy label associated with a virtual server, or policylabel for a user-defined policy label. Possible values = vserver, policylabel
flowtype	<Double>	Read-only	Flow type of the bound AppFlow policy.
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

```

appflowparam

Configuration for AppFlow parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
templaterefresh	<Double>	Read-write	Refresh interval, in seconds, at which to export the template data. Because data transmission is in UDP, the templates must be resent at regular intervals. Default value: 600 Minimum value = 60 Maximum value = 3600
appnamerefresh	<Double>	Read-write	Interval, in seconds, at which to send Appnames to the configured collectors. Appname refers to the name of an entity (virtual server, service, or service group) in the Citrix ADC. Default value: 600 Minimum value = 60 Maximum value = 3600
flowrecordinterval	<Double>	Read-write	Interval, in seconds, at which to send flow records to the configured collectors. Default value: 60 Minimum value = 60

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 3600
securityinsightrecordinterval	<Double>	Read-write	Interval, in seconds, at which to send security insight flow records to the configured collectors. Default value: 600 Minimum value = 60 Maximum value = 3600
udppmtu	<Double>	Read-write	MTU, in bytes, for IPFIX UDP packets. Default value: 1472 Minimum value = 128 Maximum value = 1472
httpurl	<String>	Read-write	Include the http URL that the Citrix ADC received from the client. Default value: DISABLED Possible values = ENABLED, DISABLED
aaausername	<String>	Read-write	Enable AppFlow AAA Username logging.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
httpcookie	<String>	Read-write	Include the cookie that was in the HTTP request the appliance received from the client. Default value: DISABLED Possible values = ENABLED, DISABLED
httpreferer	<String>	Read-write	Include the web page that was last visited by the client. Default value: DISABLED Possible values = ENABLED, DISABLED
httpmethod	<String>	Read-write	Include the method that was specified in the HTTP request that the appliance received from the client. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
httphost	<String>	Read-write	Include the host identified in the HTTP request that the appliance received from the client. Default value: DISABLED Possible values = ENABLED, DISABLED
httpuseragent	<String>	Read-write	Include the client application through which the HTTP request was received by the Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
clienttrafficonly	<String>	Read-write	Generate AppFlow records for only the traffic from the client. Default value: NO Possible values = YES, NO
httpcontenttype	<String>	Read-write	Include the HTTP Content-Type header sent from the server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to the client to determine the type of the content sent. Default value: DISABLED Possible values = ENABLED, DISABLED
httpauthorization	<String>	Read-write	Include the HTTP Authorization header information. Default value: DISABLED Possible values = ENABLED, DISABLED
httpvia	<String>	Read-write	Include the httpVia header which contains the IP address of proxy server through which the client accessed the server. Default value: DISABLED Possible values = ENABLED, DISABLED
httpxforwardedfor	<String>	Read-write	Include the httpXForwardedFor header, which contains the original IP Address of the client using a proxy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server to access the server. Default value: DISABLED Possible values = ENABLED, DISABLED
httplocation	<String>	Read-write	Include the HTTP location headers returned from the HTTP responses. Default value: DISABLED Possible values = ENABLED, DISABLED
httpsetcookie	<String>	Read-write	Include the Set-cookie header sent from the server to the client in response to a HTTP request. Default value: DISABLED Possible values = ENABLED, DISABLED
httpsetcookie2	<String>	Read-write	Include the Set-cookie header sent from the server to the client in response to a HTTP request. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
connectionchaining	<String>	Read-write	Enable connection chaining so that the client server flows of a connection are linked. Also the connection chain ID is propagated across Citrix ADCs, so that in a multi-hop environment the flows belonging to the same logical connection are linked. This id is also logged as part of appflow record. Default value: DISABLED Possible values = ENABLED, DISABLED
httpdomain	<String>	Read-write	Include the http domain request to be exported. Default value: DISABLED Possible values = ENABLED, DISABLED
skipcacheredirection httptransaction	<String>	Read-write	Skip Cache http transaction. This HTTP transaction is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specific to Cache Redirection module. In Case of Cache Miss there will be another HTTP transaction initiated by the cache server. Default value: DISABLED Possible values = ENABLED, DISABLED
identifiername	<String>	Read-write	Include the stream identifier name to be exported. Default value: DISABLED Possible values = ENABLED, DISABLED
identifiersessionname	<String>	Read-write	Include the stream identifier session name to be exported. Default value: DISABLED Possible values = ENABLED, DISABLED
observationdomainid	<Double>	Read-write	An observation domain groups a set of Citrix ADCs based on deployment: cluster, HA etc. A unique Observation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Domain ID is required to be assigned to each such group. Default value: 0 Minimum value = 1000
observationdomainname	<String>	Read-write	Name of the Observation Domain defined by the observation domain ID. Maximum length = 127
subscriberawareness	<String>	Read-write	Enable this option for logging end user MSISDN in L4/L7 appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
subscriberidobfuscation	<String>	Read-write	Enable this option for obfuscating MSISDN in L4/L7 appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
subscriberidobfuscationalgo	<String>	Read-write	Algorithm(MD5 or SHA256) to be used for obfuscating MSISDN. Default value: MD5 Possible values = MD5, SHA256
gxsessionreporting	<String>	Read-write	Enable this option for Gx session reporting. Default value: DISABLED Possible values = ENABLED, DISABLED
securityinsighttraffic	<String>	Read-write	Enable/disable the feature individually on appflow action. Default value: DISABLED Possible values = ENABLED, DISABLED
cacheinsight	<String>	Read-write	Flag to determine whether cache records need to be exported or not. If this flag is true and IC is enabled, cache records are exported instead of L7 HTTP records. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
videoinsight	<String>	Read-write	Enable/disable the feature individually on appflow action. Default value: DISABLED Possible values = ENABLED, DISABLED
httpquerywithurl	<String>	Read-write	Include the HTTP query segment along with the URL that the Citrix ADC received from the client. Default value: DISABLED Possible values = ENABLED, DISABLED
urlcategory	<String>	Read-write	Include the URL category record. Default value: DISABLED Possible values = ENABLED, DISABLED
lsnlogging	<String>	Read-write	On enabling this option, the Citrix ADC will send the Large Scale Nat(LSN) records to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
cqareporting	<String>	Read-write	TCP CQA reporting enable/disable knob. Default value: DISABLED Possible values = ENABLED, DISABLED
emailaddress	<String>	Read-write	Enable AppFlow user email-id logging. Default value: DISABLED Possible values = ENABLED, DISABLED
usagerecordinterval	<Double>	Read-write	On enabling this option, the NGS will send bandwidth usage record to configured collectors. Default value: 0 Minimum value = 0 Maximum value = 7200

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
websaasappusagereporting	<String>	Read-write	On enabling this option, NGS will send data used by Web/saas app at the end of every HTTP transaction to configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
metrics	<String>	Read-write	Enable Citrix ADC Stats to be sent to the Telemetry Agent. Default value: DISABLED Possible values = ENABLED, DISABLED
events	<String>	Read-write	Enable Events to be sent to the Telemetry Agent. Default value: DISABLED Possible values = ENABLED, DISABLED
auditlogs	<String>	Read-write	Enable Auditlogs to be sent to the Telemetry Agent.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
observationpointid	<Double>	Read-write	An observation point ID is identifier for the NetScaler from which appflow records are being exported. By default, the NetScaler IP is the observation point ID. Minimum value = 1
distributedtracing	<String>	Read-write	Enable generation of the distributed tracing templates in the Appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
disttracingsamplingrate	<Double>	Read-write	Sampling rate for Distributed Tracing. Default value: 0 Minimum value = 0 Maximum value = 100
tcpattackcounterinterval	<Double>	Read-write	Interval, in seconds, at which to send tcp attack counters to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the configured collectors. If 0 is configured, the record is not sent. Default value: 0 Minimum value = 0 Maximum value = 3600
logstreamovernsip	<String>	Read-write	To use the Citrix ADC IP to send Logstream records instead of the SNIP. Default value: DISABLED Possible values = ENABLED, DISABLED
aaainsight	<String>	Read-write	Enable/Disable AAA insights. Default value: ENABLED Possible values = ENABLED, DISABLED
builtin	<String[]>	Read-only	Flag to determine if the appflow param is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
tcpburstreporting	<String>	Read-only	TCP burst reporting enable/disable knob. Default value: ENABLED Possible values = ENABLED, DISABLED
tcpburstreportingthreshold	<Double>	Read-only	TCP burst reporting threshold. Default value: 1500 Minimum value = 10 Maximum value = 5000

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

appflowpolicy

Configuration for AppFlow policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policy" or 'my appflow policy').
rule	<String>	Read-write	Expression or other value against which the traffic is evaluated. Must be a Boolean expression. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Name of the action to be associated with this policy.
undefaction	<String>	Read-write	Name of the appflow action to be associated with this policy when an undef event occurs.
comment	<String>	Read-write	Any comments about this policy.
newname	<String>	Read-write	New name for the policy. Must begin with an ASCII alphabetic or underscore (_)character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policy" or 'my appflow policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of policy UNDEF hits.
description	<String>	Read-only	Description of the policy.
builtin	<String[]>	Read-only	Flag to determine if policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

filter

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appflowpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy? **view=summary**

Use this query-parameter to get the summary output of appflowpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appflowpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appflowpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "action":<String_value>,

      "undefaction":<String_value>,
```

```
        "hits":<Double_value>,

        "undefhits":<Double_value>,

        "description":<String_value>,

        "comment":<String_value>,

        "builtin":<String[]_value>,

        "feature":<String_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of appflowpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appflowpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "action":<String_value>,

      "undefaction":<String_value>,

      "undefhits":<Double_value>,

      "description":<String_value>,

      "comment":<String_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appflowpolicy": [ { "__count": "#no"} ] }
```

appflowpolicylabel

Configuration for AppFlow policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the AppFlow policy label. Must begin with an ASCII alphabetic or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policylabel" or 'my appflow policylabel'). Minimum length = 1
policylabeltype	<String>	Read-write	Type of traffic evaluated by the policies bound to the policy label. Default value: HTTP Possible values = HTTP, OTHERTCP
newname	<String>	Read-write	New name for the policy label. Must begin with an ASCII alphabetic or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policylabel" or 'my appflow policylabel'). Minimum length = 1
numpol	<Double>	Read-only	Number of polices bound to the policy label.
hits	<Double>	Read-only	Number of times the policy label was invoked.
policyname	<String>	Read-only	Name of the AppFlow policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label to be invoked. Possible values = vserver, policylabel
invoke_labelname	<String>	Read-only	Name of the label to invoke if the current policy evaluates to TRUE.
flowtype	<Double>	Read-only	Flowtype of the bound AppFlow policy.
description	<String>	Read-only	Description of the policylabel.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- RENAME
- GET (ALL)
- GET

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appflowpolicylabel":{

<b>      "labelname":<String_value>,

</b>      "policylabeltype":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel/ labelname_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel? **action=rename**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appflowpolicylabel":{

<b>      "labelname":<String_value>,

</b><b>      "newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appflowpolicylabel resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel? **view=summary**

Use this query-parameter to get the summary output of appflowpolicylabel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appflowpolicylabel resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appflowpolicylabel": [ {

      "labelname":<String_value>,

      "policylabeltype":<String_value>,

      "numpol":<Double_value>,

      "hits":<Double_value>,

      "policyname":<String_value>,
```

```
        "priority":<Double_value>,

        "gotopriorityexpression":<String_value>,

        "labeltype":<String_value>,

        "invoke_labelname":<String_value>,

        "flowtype":<Double_value>,

        "description":<String_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel/ labelname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel/ labelname_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel/ labelname_value<String> ?**view=summary**

Use this query-parameter to get the summary output of appflowpolicylabel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appflowpolicylabel": [ {

      "labelname":<String_value>,

      "numpol":<Double_value>,

      "hits":<Double_value>,

      "policyname":<String_value>,

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "invoke_labelname":<String_value>,

      "flowtype":<Double_value>,

      "description":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicylabel? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appflowpolicylabel": [ { "__count": "#no"} ] }
```

appflowpolicylabel_appflowpolicy_binding

Binding object showing the appflowpolicy that can be bound to appflowpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
policyname	<String>	Read-write	Name of the AppFlow policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the policy label to which to bind the policy. Minimum length = 1
invoke_labelname	<String>	Read-write	Name of the label to invoke if the current policy evaluates to TRUE.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority.
labeltype	<String>	Read-write	Type of policy label to be invoked. Possible values = vserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appflowpolicy_appflowglobal_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy_appflowglobal_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"appflowpolicy_appflowglobal_binding": [ { "__count": "#no"} ] }
```

appflowpolicy_appflowpolicylabel_binding

Binding object showing the appflowpolicylabel that can be bound to appflowpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the policy about which to display detailed information.
priority	<Double>	Read-only	Specifies the priority of the policy.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, policylabel
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy_appflowpolicylabel_binding/name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy_appflowpolicylabel_binding/name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appflowpolicy_appflowpolicylabel_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy_appflowpolicylabel_binding/name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appflowpolicy_appflowpolicylabel_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appflowpolicy_appflowpolicylabel_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appflowpolicy_appflowpolicylabel_binding

NAME	DESCRIPTION
appfwarchive	Configuration for archive
appfwconfidfield	Configuration for configured confidential form fields
appfwcustomsettings	Configuration for application firewall custom settings XML configuration
appfwfieldtype	Configuration for application firewall form field type

NAME	DESCRIPTION
appfwglobal_appfwpolicy_binding	Binding object showing the appfwpolicy that can be bound to appfwglobal
appfwglobal_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to appfwglobal
appfwglobal_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to appfwglobal
appfwglobal_binding	Binding object showing the resources that can be bound to appfwglobal
appfwhtmlerrorpage	Configuration for HTML error page
appfwjsoncontenttype	Configuration for JSON content type
appfwjsonerrorpage	Configuration for JSON error page
appfwlearningdata	Configuration for learning data
appfwlearningsettings	Configuration for learning settings
appfwmultipartformcontenttype	Configuration for Multipart form content type
appfwpolicy	Configuration for application firewall policy
appfwpolicy_appfwglobal_binding	Binding object showing the appfwglobal that can be bound to appfwpolicy

NAME	DESCRIPTION
appfwpolicy_appfwpolicylabel_binding	Binding object showing the appfwpolicylabel that can be bound to appfwpolicy
appfwpolicy_binding	Binding object showing the resources that can be bound to appfwpolicy
appfwpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to appfwpolicy
appfwpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to appfwpolicy
appfwpolicylabel	Configuration for application firewall policy label
appfwpolicylabel_appfwpolicy_binding	Binding object showing the appfwpolicy that can be bound to appfwpolicylabel
appfwpolicylabel_binding	Binding object showing the resources that can be bound to appfwpolicylabel
appfwpolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to appfwpolicylabel
appfwprofile	Configuration for application firewall profile
appfwprofile_binding	Binding object showing the resources that can be bound to appfwprofile
appfwprofile_cmdinjection_binding	Binding object showing the cmdinjection that can be bound to appfwprofile

NAME	DESCRIPTION
appfwprofile_contenttype_binding	Binding object showing the contenttype that can be bound to appfwprofile
appfwprofile_cookieconsistency_binding	Binding object showing the cookieconsistency that can be bound to appfwprofile
appfwprofile_creditcardnumber_binding	Binding object showing the creditcardnumber that can be bound to appfwprofile
appfwprofile_crosssitescripting_binding	Binding object showing the crosssitescripting that can be bound to appfwprofile
appfwprofile_csrftag_binding	Binding object showing the csrftag that can be bound to appfwprofile
appfwprofile_denyurl_binding	Binding object showing the denyurl that can be bound to appfwprofile
appfwprofile_excluderescontenttype_binding	Binding object showing the excluderescontenttype that can be bound to appfwprofile
appfwprofile_fieldconsistency_binding	Binding object showing the fieldconsistency that can be bound to appfwprofile
appfwprofile_fieldformat_binding	Binding object showing the fieldformat that can be bound to appfwprofile
appfwprofile_fileuploadtype_binding	Binding object showing the fileuploadtype that can be bound to appfwprofile

NAME	DESCRIPTION
appfwprofile_jsondosurl_binding	Binding object showing the jsondosurl that can be bound to appfwprofile
appfwprofile_jsonsqlurl_binding	Binding object showing the jsonsqlurl that can be bound to appfwprofile
appfwprofile_jsonxssurl_binding	Binding object showing the jsonxssurl that can be bound to appfwprofile
appfwprofile_logexpression_binding	Binding object showing the logexpression that can be bound to appfwprofile
appfwprofile_safeobject_binding	Binding object showing the safeobject that can be bound to appfwprofile
appfwprofile_sqlinjection_binding	Binding object showing the sqlinjection that can be bound to appfwprofile
appfwprofile_starturl_binding	Binding object showing the starturl that can be bound to appfwprofile
appfwprofile_trustedlearningclients_binding	Binding object showing the trustedlearningclients that can be bound to appfwprofile
appfwprofile_xmlattachmenturl_binding	Binding object showing the xmlattachmenturl that can be bound to appfwprofile
appfwprofile_xmldosurl_binding	Binding object showing the xmldosurl that can be bound to appfwprofile

NAME	DESCRIPTION
appfwprofile_xmlsqlinjection_binding	Binding object showing the xmlsqlinjection that can be bound to appfwprofile
appfwprofile_xmlvalidationurl_binding	Binding object showing the xmlvalidationurl that can be bound to appfwprofile
appfwprofile_xmlwsiurl_binding	Binding object showing the xmlwsiurl that can be bound to appfwprofile
appfwprofile_xmlxss_binding	Binding object showing the xmlxss that can be bound to appfwprofile
appfwsettings	Configuration for AS settings
appfwsignatures	Configuration for application firewall signatures XML configuration
appfwtransactionrecords	Configuration for Application firewall transaction record
appfwurlencodedformcontenttype	Configuration for Urlencoded form content type
appfwwsdl	Configuration for WSDL file
appfwxmlcontenttype	Configuration for XML Content type
appfwxmlerrorpage	Configuration for xml error page
appfwxmlschema	Configuration for XML schema

appfwarchive

Configuration for archive resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of tar archive. Minimum length = 1 Maximum length = 31
target	<String>	Read-write	Path to the file to be exported. Minimum length = 1 Maximum length = 2047
src	<String>	Read-write	Indicates the source of the tar archive file as a URL of the form <protocol>://<host>[:<port>][/<path>] <protocol> is http or https. <host> is the DNS name or IP address of the http or https server. <port> is the port number of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server. If omitted, the default port for http or https will be used. <path> is the path of the file on the server. Import will fail if an https server requires client certificate authentication. . Minimum length = 1 Maximum length = 2047
comment	<String>	Read-write	Comments associated with this archive. Maximum length = 128
response	<String>	Read-only	.

Operations

(click to see Properties)

- GET (ALL)
- EXPORT
- IMPORT

- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

EXPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwarchive? **action=export**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwarchive":{

<b>      "name":<String_value>,

</b><b>      "target":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwarchive? **action=Import**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwarchive":{

<b>      "src":<String_value>,

</b><b>      "name":<String_value>,

</b>      "comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwarchive/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwarchive

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwarchive": [ {

      "response":<String_value>

}]}
```

appfwconfidfield

Configuration for configured confidential form fields resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fieldname	<String>	Read-write	Name of the form field to designate as confidential. Minimum length = 1
url	<String>	Read-write	URL of the web page that contains the web form. Minimum length = 1
isregex	<String>	Read-write	Method of specifying the form field name. Available settings function as follows: * REGEX. Form field is a regular expression. * NOTREGEX. Form field is a literal string.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NOTREGEX Possible values = REGEX, NOTREGEX
comment	<String>	Read-write	Any comments to preserve information about the form field designation.
state	<String>	Read-write	Enable or disable the confidential field designation. Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

      "state":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwconfidfield? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwconfidfield":{

<b>      "fieldname":<String_value>,

</b><b>      "url":<String_value>,

</b>      "comment":true,

      "isregex":true,

      "state":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwconfidfield

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwconfidfield? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwconfidfield? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appfwconfidfield resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwconfidfield? **view=summary**

Use this query-parameter to get the summary output of appfwconfidfield resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwconfidfield? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwconfidfield resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwconfidfield": [ {

      "fieldname":<String_value>,

      "url":<String_value>,

      "isregex":<String_value>,
```

```
        "comment":<String_value>,

        "state":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwconfidfield? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwconfidfield": [ { "__count": "#no"} ] }
```

appfwcustomsettings

Configuration for application firewall custom settings XML configuration resource.

Properties

(click to see Operations)

- EXPORT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

EXPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwcustomsettings? **action=export**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwcustomsettings":{

<b>      "name":<String_value>,

</b><b>      "target":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

appfwfieldtype

Configuration for application firewall form field type resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the field type. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the field type is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my field type" or 'my field type'). Minimum length = 1
regex	<String>	Read-write	PCRE - format regular expression defining the characters and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			length allowed for this field type. Minimum length = 1
priority	<Double>	Read-write	Positive integer specifying the priority of the field type. A lower number specifies a higher priority. Field types are checked in the order of their priority numbers. Minimum value = 0 Maximum value = 64000
comment	<String>	Read-write	Comment describing the type of field that this field type is intended to match.
nocharmaps	<Boolean>	Read-write	will not show internal field types added as part of FieldFormat learn rules deployment.
builtin	<String[]>	Read-only	Flag to determine if fieldtype is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwfieldtype

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwfieldtype? **args=name: <String_value> ,nocharmaps: <Boolean_value>**

Use this query-parameter to get appfwfieldtype resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwfieldtype? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwfieldtype? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appfwfieldtype resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwfieldtype? **view=summary**

Use this query-parameter to get the summary output of appfwfieldtype resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwfieldtype? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwfieldtype resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwfieldtype": [ {

name:<String_value>,nocharmaps:<Boolean_value>      "regex":<String_value>
,

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwfieldtype": [ { "__count": "#no"} ] }
```

appfwglobal_appfwpolicy_binding

Binding object showing the appfwpolicy that can be bound to appfwglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the policy.
labelname	<String>	Read-write	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
state	<String>	Read-write	Enable or disable the binding to activate or deactivate the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This is applicable to classic policies only. Possible values = ENABLED, DISABLED
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
type	<String>	Read-write	Bind point to which to policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, NONE
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = reqvserver, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flowtype	<Double>	Read-only	flowtype of the bound application firewall policy.
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
policytype	<String>	Read-only	. Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/appfwglobal_appfwpolicy_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"appfwglobal_appfwpolicy_binding":{

<b>      "policyname":<String_value>,

</b><b>      "priority":<Double_value>,

</b>      "state":<String_value>,

      "gotopriorityexpression":<String_value>,
```

```
        "type":<String_value>,

        "invoke":<Boolean_value>,

        "labeltype":<String_value>,

        "labelname":<String_value>

  }}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwglobal_appfwpolicy_binding

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwglobal_appfwpolicy_binding? **args= policyname:<String_value>, type: <String_value> ,priority: <Double_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwglobal_appfwpolicy_binding

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwglobal_appfwpolicy_binding? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwglobal_appfwpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwglobal_appfwpolicy_binding? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwglobal_appfwpolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwglobal_appfwpolicy_binding": [ {

      "priority":<Double_value>,

      "globalbindtype":<String_value>,
```

```
        "policyname":<String_value>,

        "labelname":<String_value>,

        "state":<String_value>,

        "gotopriorityexpression":<String_value>,

        "type":<String_value>,

        "invoke":<Boolean_value>,

        "labeltype":<String_value>,

        "flowtype":<Double_value>,

        "numpol":<Double_value>,

        "policytype":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwglobal_appfwpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwglobal_appfwpolicy_binding?
bulkbindings=yes

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwglobal_appfwpolicy_binding": [ {

      "priority":<Double_value>,

      "globalbindtype":<String_value>,

      "policyname":<String_value>,

      "labelname":<String_value>,

      "state":<String_value>,

      "gotopriorityexpression":<String_value>,

      "type":<String_value>,

      "invoke":<Boolean_value>,

      "labeltype":<String_value>,

      "flowtype":<Double_value>,

      "numpol":<Double_value>,

      "policytype":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwglobal_appfwpolicy_binding? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwglobal_appfwpolicy_binding": [ { "__count": "#no"} ] }
```

appfwglobal_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to appfwglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the policy.
labelname	<String>	Read-write	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
state	<String>	Read-write	Enable or disable the binding to activate or deactivate the policy. This is applicable to classic policies only. Possible values = ENABLED, DISABLED
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the final goto is anything other than END, the current policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: - If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends.

An UNDEF event is triggered if:

- The expression is invalid.
- The expression evaluates to a priority number that is smaller than the current policy's priority number.

- The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.

  Possible values = REQ_OVERRIDE, REQ_DEFAULT, NONE

- reqvserver. Invoke the unnamed policy label associated with the specified request virtual server.
- policylabel. Invoke the specified user-defined policy label.

  Possible values = reqvserver, policylabel

  Possible values = Classic Policy, Advanced Policy

```

appfwhtmlerrorpage

Configuration for HTML error page resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the XML error object to remove. Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL (protocol, host, path, and name) for the location at which

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to store the imported HTML error object. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
comment	<String>	Read-write	Any comments to preserve information about the HTML error object. Maximum length = 128
overwrite	<Boolean>	Read-write	Overwrite any existing HTML error object of the same name.
response	<String>	Read-only	.

Operations

(click to see Properties)

- DELETE
- GET (ALL)
- GET
- IMPORT
- CHANGE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwhtmlerrorpage/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwhtmlerrorpage? **action=Import**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwhtmlerrorpage":{

<b>      "src":<String_value>,

</b><b>      "name":<String_value>,

</b>      "comment":<String_value>,

      "overwrite":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CHANGE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwhtmlerrorpage? **action=update**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwhtmlerrorpage":{

<b>      "name":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwhtmlerrorpage

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwhtmlerrorpage": [ {

      "name":<String_value>,

      "response":<String_value>,

      "src":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwhtmlerrorpage/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwhtmlerrorpage/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwhtmlerrorpage/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of appfwhtmlerrorpage resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwhtmlerrorpage": [ {

      "name":<String_value>,

      "response":<String_value>,

      "src":<String_value>

}]}
```

appfwjsoncontenttype

Configuration for JSON content type resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jsoncontenttypevalue	<String>	Read-write	Content type to be classified as JSON. Minimum length = 1
isregex	<String>	Read-write	Is json content type a regular expression?. Default value: NOTREGEX

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = REGEX, NOTREGEX
builtin	<String[]>	Read-only	Flag to determine if jsoncontenttype is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

Content-Type:application/json

Request Payload:

```
{"appfwjsoncontenttype":{

<b>      "jsoncontenttypevalue":<String_value>,

</b>      "isregex":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwjsoncontenttype/ jsoncontenttypevalue_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwjsoncontenttype

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwjsoncontenttype? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwjsoncontenttype? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appfwjsoncontenttype resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwjsoncontenttype? **view=summary**

Use this query-parameter to get the summary output of appfwjsoncontenttype resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwjsoncontenttype? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwjsoncontenttype resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwjsoncontenttype": [ {

      "jsoncontenttypevalue":<String_value>,

      "isregex":<String_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>
```

```
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwjsoncontenttype/ jsoncontenttypevalue_value<String>

Query-parameters:

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwlearningsettings

HTTP Method: PUT

Request Headers:

appfwmultipartformcontenttype

Configuration for Multipart form content type resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
multipartformcontenttypevalue	<String>	Read-write	Content type to be classified as multipart form. Minimum length = 1
isregex	<String>	Read-write	Is multipart_form content type a regular expression?. Default value: NOTREGEX Possible values = REGEX, NOTREGEX
builtin	<String[]>	Read-only	Flag to determine if multipart form contenttype is built-in or not.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwmultipartformcontenttype

appfwpolicy

Configuration for application firewall policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with a letter, number, or the underscore character \(_\), and must contain only letters, numbers, and the hyphen \(-\), period \(.\) pound \(#\), space \(\), at (@), equals \(=\), colon \(:\), and underscore characters. Can be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks \(for example, "my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy" or 'my policy'\). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or a Citrix ADC expression, that the policy uses to determine whether to filter the connection through the application firewall with the designated profile.
profilename	<String>	Read-write	Name of the application firewall profile to use if the policy matches. Minimum length = 1
comment	<String>	Read-write	Any comments to preserve information about the policy for later reference.
logaction	<String>	Read-write	Where to log information for connections that match this policy.
newname	<String>	Read-write	New name for the policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION

- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwpolicy":{

<b>      "name":<String_value>,

</b><b>      "rule":<String_value>,

</b><b>      "profilename":<String_value>,

</b>      "comment":<String_value>,

      "logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwpolicy":{

<b>      "name":<String_value>,

</b>      "rule":<String_value>,

      "profilename":<String_value>,
```

```
      "comment":<String_value>,

      "logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwpolicy":{

<b>      "name":<String_value>,

</b>      "comment":true,

      "logaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy? **action=rename**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwpolicy":{

<b>      "name":<String_value>,

</b><b>      "newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appfwpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy? **view=summary**

Use this query-parameter to get the summary output of appfwpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwpolicy": [ {
      "name":<String_value>,
      "rule":<String_value>,
      "profilename":<String_value>,
      "hits":<Double_value>,
      "undefhits":<Double_value>,
      "comment":<String_value>,
      "logaction":<String_value>,
      "policytype":<String_value>,
      "builtin":<String[]_value>,
      "feature":<String_value>
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of appfwpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "profilename":<String_value>,

      "hits":<Double_value>,

      "undefhits":<Double_value>,

      "comment":<String_value>,

      "logaction":<String_value>,

      "policytype":<String_value>,
```

```
        "builtin":<String[]_value>,

        "feature":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwpolicy": [ { "__count": "#no"} ] }
```

appfwpolicylabel

Configuration for application firewall policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the policy label is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy label" or 'my policy label').
policylabeltype	<String>	Read-write	Type of transformations allowed by the policies bound to the label. Always http_req for application firewall policy labels.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = http_req
newname	<String>	Read-write	The new name of the application firewall policylabel. Minimum length = 1
numpol	<Double>	Read-only	Number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
priority	<Double>	Read-only	Positive integer specifying the priority of the policy. A lower number specifies a higher priority. Must be unique within a group of policies that are bound to the same bind point or label. Policies are evaluated in the order of their priority numbers.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label to invoke if the current policy evaluates to TRUE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and the invoke parameter is set. Available settings function as follows: * reqvserver. Invoke the unnamed policy label associated with the specified request virtual server. * policylabel. Invoke the specified user-defined policy label. Possible values = reqvserver, policylabel
invoke_labelname	<String>	Read-only	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
description	<String>	Read-only	Description of the policylabel.
policytype	<String>	Read-only	. Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

```

appfwpolicylabel_appfwpolicy_binding

Binding object showing the appfwpolicy that can be bound to appfwpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Positive integer specifying the priority of the policy. A lower number specifies a higher priority. Must be unique within a group of policies that are bound to the same bind point or label. Policies are evaluated in the order of their priority numbers.
policyname	<String>	Read-write	Name of the application firewall policy to bind to the policy label.
labelname	<String>	Read-write	Name of the application firewall policy label.
invoke_labelname	<String>	Read-write	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
labeltype	<String>	Read-write	Type of policy label to invoke if the current policy evaluates to TRUE and the invoke parameter is set. Available settings function as follows: - reqvserver. Invoke the unnamed policy label associated with the specified request virtual server. - policylabel. Invoke the specified user-defined policy label. Possible values = reqvserver, policylabel
__count	<Double>	Read-write	count parameter

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicylabel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwpolicylabel_binding": [ {

      "labelname":<String_value>,

      "appfwpolicylabel_appfwpolicy_binding":<appfwpolicylabel_appfwpolicy
```

```
_binding[]_value>,

      "appfwpolicylabel_policybinding_binding":<appfwpolicylabel_policybin
ding_binding[]_value>

}]}
```

appfwpolicylabel_policybinding_binding

Binding object showing the policybinding that can be bound to appfwpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Positive integer specifying the priority of the policy. A lower number specifies a higher priority. Must be unique within a group of policies that are bound to the same bind point or label. Policies are evaluated in the order of their priority numbers.
policyname	<String>	Read-write	Name of the application firewall policy to bind to the policy label.
labelname	<String>	Read-write	Name of the application firewall policy label.
invoke_labelname	<String>	Read-write	Name of the policy label to invoke if the current policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
labeltype	<String>	Read-write	Type of policy label to invoke if the current policy evaluates to TRUE and the invoke parameter is set. Available settings function as follows: - reqvserver. Invoke the unnamed policy label associated with the specified request virtual server. - policylabel. Invoke

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the specified user-defined policy label. Possible values = reqvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *`

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicylabel_policybinding_binding/ labelname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicylabel_policybinding_binding/ labelname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwpolicylabel_policybinding_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicylabel_policybinding_binding/ labelname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwpolicylabel_policybinding_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwpolicylabel_policybinding_binding": [ {

      "priority":<Double_value>,

      "policyname":<String_value>,

      "labelname":<String_value>,

      "invoke_labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "invoke":<Boolean_value>,

      "labeltype":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicylabel_policybinding_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicylabel_policybinding_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwpolicylabel_policybinding_binding": [ {

      "priority":<Double_value>,

      "policyname":<String_value>,

      "labelname":<String_value>,

      "invoke_labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "invoke":<Boolean_value>,

      "labeltype":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicylabel_policybinding_binding/ labelname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"appfwpolicylabel_policybinding_binding": [ { "__count": "#no"} ] }
```

appfwpolicy_appfwglobal_binding

Binding object showing the appfwglobal that can be bound to appfwpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the policy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the policy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy_lbvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy_lbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwpolicy_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy_lbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwpolicy_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwpolicy_lbvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Integer_value>,

      "labelname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy_lbvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwpolicy_lbvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Integer_value>,

      "labelname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwpolicy_lbvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"appfwpolicy_lbvserver_binding": [ { "__count": "#no"} ] }
```

appfwprofile

Configuration for application firewall profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the profile. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			characters. Cannot be changed after the profile is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my profile" or 'my profile'). Minimum length = 1
defaults	<String>	Read-write	Default configuration to apply to the profile. Basic defaults are intended for standard content that requires little further configuration, such as static web site content. Advanced defaults are intended for specialized content that requires significant specialized configuration, such as heavily scripted or dynamic content. CLI users: When adding an application firewall

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			profile, you can set either the defaults or the type, but not both. To set both options, create the profile by using the add appfw profile command, and then use the set appfw profile command to configure the other option. Possible values = basic, advanced
starturlaction	<String[]>	Read-write	One or more Start URL actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -startURLaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -startURLaction none". Possible values = none, block, learn, log, stats
infercontenttypexmlpayloadaction	<String[]>	Read-write	One or more infer content type payload actions. Available settings function as follows: * Block - Block connections that have mismatch in content-type header and payload.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Log - Log connections that have mismatch in content-type header and payload. The mismatched content-type in HTTP request header will be logged for the request. * Stats - Generate statistics when there is mismatch in content-type header and payload. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -inferContentTypeXMLPayloadAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -inferContentTypeXMLPayloadAction none". Please note "none" action

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cannot be used with any other action type. Possible values = block, log, stats, none
contenttypeaction	<String[]>	Read-write	One or more Content-type actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-contentTypeaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -contentTypeaction none". Possible values = none, block, learn, log, stats
inspectcontenttypes	<String[]>	Read-write	One or more InspectContentType lists. * application/x-www-form-urlencoded * multipart/form-data * text/x-gwt-rpc CLI users: To enable, type "set appfw profile -InspectContentTypes" followed by the content types to be inspected. Possible values = none, application/x-www-form-urlencoded,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			multipart/form-data, text/x-gwt-rpc
starturlclosure	<String>	Read-write	Toggle the state of Start URL Closure. Default value: OFF Possible values = ON, OFF
denyurlaction	<String[]>	Read-write	One or more Deny URL actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. NOTE: The Deny URL check takes precedence over the Start URL check. If you enable blocking for the Deny URL check, the application

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			firewall blocks any URL that is explicitly blocked by a Deny URL, even if the same URL would otherwise be allowed by the Start URL check. CLI users: To enable one or more actions, type "set appfw profile -denyURLaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -denyURLaction none". Possible values = none, block, log, stats
refererheadercheck	<String>	Read-write	Enable validation of Referer headers. Referer validation ensures that a web form that a user sends to your web site originally came from your web site, not an outside attacker.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Although this parameter is part of the Start URL check, referer validation protects against cross-site request forgery (CSRF) attacks, not Start URL attacks. Default value: OFF Possible values = OFF, if_present, AlwaysExceptStart URLs, AlwaysExceptFirstRequest
cookieconsistencyaction	<String[]>	Read-write	One or more Cookie Consistency actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -cookieConsistency Action" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -cookieConsistency Action none". Default value: none Possible values = none, block, learn, log, stats
cookiehijackingaction	<String[]>	Read-write	One or more actions to prevent cookie hijacking. Available settings function as follows: * Block - Block connections that violate this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. NOTE: Cookie Hijacking feature is not supported for TLSv1.3 CLI users: To enable one or more actions, type "set appfw profile -cookieHijackingAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -cookieHijackingAction none". Default value: none Possible values = none, block, log, stats
cookietransforms	<String>	Read-write	Perform the specified type of cookie transformation.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Available settings function as follows: * Encryption - Encrypt cookies. * Proxying - Mask contents of server cookies by sending proxy cookie to users. * Cookie flags - Flag cookies as HTTP only to prevent scripts on user's browser from accessing and possibly modifying them. CAUTION: Make sure that this parameter is set to ON if you are configuring any cookie transformations. If it is set to OFF, no cookie transformations are performed regardless of any other settings. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
cookieencryption	<String>	Read-write	Type of cookie encryption. Available settings function as follows: * None - Do not encrypt cookies. * Decrypt Only - Decrypt encrypted cookies, but do not encrypt cookies. * Encrypt Session Only - Encrypt session cookies, but not permanent cookies. * Encrypt All - Encrypt all cookies. Default value: none Possible values = none, decryptOnly, encryptSessionOnly, encryptAll
cookieproxying	<String>	Read-write	Cookie proxy setting. Available settings function as follows: * None - Do not proxy cookies. * Session Only - Proxy session cookies by using

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the Citrix ADC session ID, but do not proxy permanent cookies. Default value: none Possible values = none, sessionOnly
addcookieflags	<String>	Read-write	Add the specified flags to cookies. Available settings function as follows: * None - Do not add flags to cookies. * HTTP Only - Add the HTTP Only flag to cookies, which prevents scripts from accessing cookies. * Secure - Add Secure flag to cookies. * All - Add both HTTPOnly and Secure flags to cookies. Default value: none Possible values = none, httpOnly, secure, all

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fieldconsistencyaction	<String[]>	Read-write	One or more Form Field Consistency actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -fieldConsistencyaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-fieldConsistencyAction none". Default value: none Possible values = none, block, learn, log, stats
csrftagaction	<String[]>	Read-write	One or more Cross-Site Request Forgery (CSRF) Tagging actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CLI users: To enable one or more actions, type "set appfw profile -CSRFTagAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -CSRFTagAction none". Default value: none Possible values = none, block, learn, log, stats
crosssitescriptingaction	<String[]>	Read-write	One or more Cross-Site Scripting (XSS) actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -crossSiteScriptingAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -crossSiteScriptingAction none". Possible values = none, block, learn, log, stats
crosssitescriptingtransformunsafehtml	<String>	Read-write	Transform cross-site scripts. This setting configures the application firewall to disable dangerous HTML instead of blocking the request. CAUTION: Make sure that this parameter is set to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ON if you are configuring any cross-site scripting transformations. If it is set to OFF, no cross-site scripting transformations are performed regardless of any other settings. Default value: OFF Possible values = ON, OFF
crosssitescriptingcheckcompleteurls	<String>	Read-write	Check complete URLs for cross-site scripts, instead of just the query portions of URLs. Default value: OFF Possible values = ON, OFF
sqlinjectionaction	<String[]>	Read-write	One or more HTML SQL Injection actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -SQLInjectionAction " followed by the actions to be enabled. To turn off all actions, type "set appfw profile -SQLInjectionAction none". Possible values = none, block, learn, log, stats
cmdinjectionaction	<String[]>	Read-write	Command injection action. Available settings function as follows: * Block - Block connections that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -cmdInjectionAction " followed by the actions to be enabled. To turn off all actions, type "set appfw profile -cmdInjectionAction none". Default value: none Possible values = none, block, log, stats
cmdinjectiontype	<String>	Read-write	Available CMD injection types.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-CMDSplChar : Checks for CMD Special Chars -CMDKeyword : Checks for CMD Keywords -CMDSplCharANDKeyword : Checks for both and blocks if both are found -CMDSplCharORKeyword : Checks for both and blocks if anyone is found. Default value: CMDSplCharANDKeyword Possible values = CMDSplChar, CMDKeyword, CMDSplCharORKeyword, CMDSplCharANDKeyword
sqlinjectiontransformspecialchars	<String>	Read-write	Transform injected SQL code. This setting configures the application firewall to disable SQL special strings instead of blocking the request. Since most SQL servers

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			require a special string to activate an SQL keyword, in most cases a request that contains injected SQL code is safe if special strings are disabled. CAUTION: Make sure that this parameter is set to ON if you are configuring any SQL injection transformations. If it is set to OFF, no SQL injection transformations are performed regardless of any other settings. Default value: OFF Possible values = ON, OFF
sqlinjectiononlycheck fieldswithsqlchars	<String>	Read-write	Check only form fields that contain SQL special strings (characters) for injected SQL code. Most SQL servers require a special string to activate an SQL request, so SQL code without a special string is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			harmless to most SQL servers. Default value: ON Possible values = ON, OFF
sqlinjectiontype	<String>	Read-write	Available SQL injection types. -SQLSplChar : Checks for SQL Special Chars -SQLKeyword : Checks for SQL Keywords -SQLSplCharANDKeyword : Checks for both and blocks if both are found -SQLSplCharORKeyword : Checks for both and blocks if anyone is found. Default value: SQLSplCharANDKeyword Possible values = SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sqlinjectionchecksqlwildchars	<String>	Read-write	Check for form fields that contain SQL wild chars . Default value: OFF Possible values = ON, OFF
fieldformataction	<String[]>	Read-write	One or more Field Format actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of suggested web form fields and field format assignments. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			appfw profile -fieldFormatAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -fieldFormatAction none". Possible values = none, block, learn, log, stats
defaultfieldformattype	<String>	Read-write	Designate a default field type to be applied to web form fields that do not have a field type explicitly assigned to them. Minimum length = 1
defaultfieldformatminlength	<Double>	Read-write	Minimum length, in characters, for data entered into a field that is assigned the default field type. To disable the minimum and maximum length settings and allow data of any length to be entered into the field, set this parameter to zero (0).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 2147483647
defaultfieldformatmaxlength	<Double>	Read-write	Maximum length, in characters, for data entered into a field that is assigned the default field type. Default value: 65535 Minimum value = 1 Maximum value = 2147483647
bufferoverflowaction	<String[]>	Read-write	One or more Buffer Overflow actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -bufferOverflowAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -bufferOverflowAction none". Possible values = none, block, log, stats
bufferoverflowmaxurllength	<Double>	Read-write	Maximum length, in characters, for URLs on your protected web sites. Requests with longer URLs are blocked. Default value: 1024 Minimum value = 0 Maximum value = 65535
bufferoverflowmaxheaderlength	<Double>	Read-write	Maximum length, in characters, for HTTP headers in requests sent to your protected web sites.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Requests with longer headers are blocked. Default value: 4096 Minimum value = 0 Maximum value = 65535
bufferoverflowmaxcookielength	<Double>	Read-write	Maximum length, in characters, for cookies sent to your protected web sites. Requests with longer cookies are blocked. Default value: 4096 Minimum value = 0 Maximum value = 65535
bufferoverflowmaxquerylength	<Double>	Read-write	Maximum length, in bytes, for query string sent to your protected web sites. Requests with longer query strings are blocked. Default value: 1024 Minimum value = 0 Maximum value = 65535
bufferoverflowmaxtotalheaderlength	<Double>	Read-write	Maximum length, in bytes, for the total HTTP header length in requests sent to your protected web sites. The minimum

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value of this and maxHeaderLen in httpProfile will be used. Requests with longer length are blocked. Default value: 24820 Minimum value = 0 Maximum value = 65535
creditcardaction	<String[]>	Read-write	One or more Credit Card actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -creditCardAction"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			followed by the actions to be enabled. To turn off all actions, type "set appfw profile -creditCardAction none". Default value: none Possible values = none, block, learn, log, stats
creditcard	<String[]>	Read-write	Credit card types that the application firewall should protect. Default value: none Possible values = none, visa, mastercard, discover, amex, jcb, dinersclub
creditcardmaxallowed	<Double>	Read-write	This parameter value is used by the block action. It represents the maximum number of credit card numbers that can appear on a web page served by your protected web sites. Pages that contain more credit card numbers are blocked.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 255
creditcardxout	<String>	Read-write	Mask any credit card number detected in a response by replacing each digit, except the digits in the final group, with the letter "X.". Default value: OFF Possible values = ON, OFF
dosecurecreditcardlogging	<String>	Read-write	Setting this option logs credit card numbers in the response when the match is found. Default value: ON Possible values = ON, OFF
streaming	<String>	Read-write	Setting this option converts content-length form submission requests (requests with content-type "application/x-www-form-urlencoded" or "multipart/form-data") to chunked requests when atleast one of the following protections : SQL injection protection,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			XSS protection, form field consistency protection, starturl closure, CSRF tagging is enabled. Please make sure that the backend server accepts chunked requests before enabling this option. Default value: OFF Possible values = ON, OFF
trace	<String>	Read-write	Toggle the state of trace. Default value: OFF Possible values = ON, OFF
requestcontenttype	<String>	Read-write	Default Content-Type header for requests. A Content-Type header can contain 0-255 letters, numbers, and the hyphen (-) and underscore (_) characters. Minimum length = 1 Maximum length = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
responsecontenttype	<String>	Read-write	Default Content-Type header for responses. A Content-Type header can contain 0-255 letters, numbers, and the hyphen (-) and underscore (_) characters. Minimum length = 1 Maximum length = 255
jsonerrorobject	<String>	Read-write	Name to the imported JSON Error Object to be set on application firewall profile. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks \(for example, "my JSON error object" or 'my JSON error object'\). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jsondosaction	<String[]>	Read-write	One or more JSON Denial-of-Service (JsonDoS) actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -JSONDoSAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -JSONDoSAction none". Possible values = none, block, log, stats

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jsonsqlinjectionaction	<String[]>	Read-write	One or more JSON SQL Injection actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -JSONSQLInjection Action" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -JSONSQLInjection Action none". Possible values = none, block, log, stats

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jsonsqlinjectiontype	<String>	Read-write	Available SQL injection types. -SQLSplChar : Checks for SQL Special Chars -SQLKeyword : Checks for SQL Keywords -SQLSplCharANDKeyword : Checks for both and blocks if both are found -SQLSplCharORKeyword : Checks for both and blocks if anyone is found. Default value: SQLSplCharANDKeyword Possible values = SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword
jsonxssaction	<String[]>	Read-write	One or more JSON Cross-Site Scripting actions. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -JSONXssAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -JSONXssAction none". Possible values = none, block, log, stats
xmldosaction	<String[]>	Read-write	One or more XML Denial-of-Service (XDoS) actions.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLDoSAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLDoSAction none".

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = none, block, learn, log, stats
xmlformataction	<String[]>	Read-write	One or more XML Format actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLFormatAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLFormatAction none".

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = none, block, log, stats
xmlsqlinjectionaction	<String[]>	Read-write	One or more XML SQL Injection actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLSQLInjectionAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-XMLSQLInjectionAction none". Possible values = none, block, log, stats
xmlsqlinjectiononlycheckfieldswithsqlchars	<String>	Read-write	Check only form fields that contain SQL special characters, which most SQL servers require before accepting an SQL command, for injected SQL. Default value: ON Possible values = ON, OFF
xmlsqlinjectiontype	<String>	Read-write	Available SQL injection types. -SQLSplChar : Checks for SQL Special Chars -SQLKeyword : Checks for SQL Keywords -SQLSplCharANDKeyword : Checks for both and blocks if both are found -SQLSplCharORKeyword : Checks for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			both and blocks if anyone is found. Default value: SQLSplCharANDKeyword Possible values = SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword
xmlsqlinjectioncheck sqlwildchars	<String>	Read-write	Check for form fields that contain SQL wild chars . Default value: OFF Possible values = ON, OFF
xmlsqlinjectionparse comments	<String>	Read-write	Parse comments in XML Data and exempt those sections of the request that are from the XML SQL Injection check. You must configure the type of comments that the application firewall is to detect and exempt from this security check. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Check all - Check all content. * ANSI - Exempt content that is part of an ANSI (Mozilla-style) comment. * Nested - Exempt content that is part of a nested (Microsoft-style) comment. * ANSI Nested - Exempt content that is part of any type of comment. Default value: checkall Possible values = checkall, ansi, nested, ansinested
xmlxssaction	<String[]>	Read-write	One or more XML Cross-Site Scripting actions. Available settings function as follows: * Block - Block connections that violate this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLXSSAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLXSSAction none". Possible values = none, block, learn, log, stats
xmlwsiaction	<String[]>	Read-write	One or more Web Services Interoperability (WSI) actions. Available settings function as follows: * Block - Block connections that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLWSIAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLWSIAction none". Possible values = none, block, learn, log, stats

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlattachmentaction	<String[]>	Read-write	One or more XML Attachment actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLAttachmentAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-XMLAttachmentAction none". Possible values = none, block, learn, log, stats
xmlvalidationaction	<String[]>	Read-write	One or more XML Validation actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLValidationAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-XMLValidationAction none". Possible values = none, block, log, stats
xmlerrorobject	<String>	Read-write	Name to assign to the XML Error Object, which the application firewall displays when a user request is blocked. Must begin with a letter, number, or the underscore character \(_\), and must contain only letters, numbers, and the hyphen \(-\), period \(.\) pound \(#\), space \(\), at (@), equals \(=\), colon \(:\), and underscore characters. Cannot be changed after the XML error object is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks \(for example, "my XML error object" or 'my XML error object'\). Minimum length = 1
customsettings	<String>	Read-write	Object name for custom settings. This check is applicable to Profile Type: HTML, XML. . Minimum length = 1
signatures	<String>	Read-write	Object name for signatures. This check is applicable to Profile Type: HTML, XML. . Minimum length = 1
xmlsoapfaultaction	<String[]>	Read-write	One or more XML SOAP Fault Filtering actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Stats - Generate statistics for this security check. * None - Disable all actions for this security check. * Remove - Remove all violations for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLSOAPFaultAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLSOAPFaultAction none". Possible values = none, block, log, remove, stats
usehtmlerrorobject	<String>	Read-write	Send an imported HTML Error object to a user when a request is blocked, instead of redirecting the user to the designated Error URL. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
errorurl	<String>	Read-write	URL that application firewall uses as the Error URL. Minimum length = 1
htmlerrorobject	<String>	Read-write	Name to assign to the HTML Error Object. Must begin with a letter, number, or the underscore character \(_\), and must contain only letters, numbers, and the hyphen \(-\), period \(.\) pound \(#\), space \(\), at (@), equals \(=\), colon \(:\), and underscore characters. Cannot be changed after the HTML error object is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks \(for example, "my HTML error object" or 'my HTML error object'\). Minimum length = 1
logeverypolicyhit	<String>	Read-write	Log every profile match, regardless of security checks results. Default value: OFF Possible values = ON, OFF
stripcomments	<String>	Read-write	Strip HTML comments. This check is applicable to Profile Type: HTML. . Default value: OFF Possible values = ON, OFF
striphtmlcomments	<String>	Read-write	Strip HTML comments before forwarding a web page sent by a protected web site in response to a user request. Default value: none Possible values = none, all, exclude_script_tag

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
stripxmlcomments	<String>	Read-write	Strip XML comments before forwarding a web page sent by a protected web site in response to a user request. Default value: none Possible values = none, all
exemptclosureurlsfromsecuritychecks	<String>	Read-write	Exempt URLs that pass the Start URL closure check from SQL injection, cross-site script, field format and field consistency security checks at locations other than headers. Default value: ON Possible values = ON, OFF
defaultcharset	<String>	Read-write	Default character set for protected web pages. Web pages sent by your protected web sites in response to user requests are assigned this character set if the page does not already specify a character set. The character sets supported by the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			application firewall are: * iso-8859-1 (English US) * big5 (Chinese Traditional) * gb2312 (Chinese Simplified) * sjis (Japanese Shift-JIS) * euc-jp (Japanese EUC-JP) * iso-8859-9 (Turkish) * utf-8 (Unicode) * euc-kr (Korean). Minimum length = 1 Maximum length = 31
dynamiclearning	<String[]>	Read-write	One or more security checks. Available options are as follows: * SQLInjection - Enable dynamic learning for SQLInjection security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* CrossSiteScripting - Enable dynamic learning for CrossSiteScripting security check. * fieldFormat - Enable dynamic learning for fieldFormat security check. * None - Disable security checks for all security checks. CLI users: To enable dynamic learning on one or more security checks, type "set appfw profile -dynamicLearning" followed by the security checks to be enabled. To turn off dynamic learning on all security checks, type "set appfw profile -dynamicLearning none". Possible values = none, SQLInjection, CrossSiteScripting, fieldFormat,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			startURL, cookieConsistency, fieldConsistency, CSRFtag, ContentType
postbodylimit	<Double>	Read-write	Maximum allowed HTTP post body size, in bytes. Maximum supported value is 10GB. Default value: 20000000
postbodylimitaction	<String[]>	Read-write	One or more Post Body Limit actions. Available settings function as follows: * Block - Block connections that violate this security check. Must always be set. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. CLI users: To enable one or more actions, type "set appfw profile -PostBodyLimitAction block" followed by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the other actions to be enabled. Possible values = block, log, stats
postbodylimitsignature	<Double>	Read-write	Maximum allowed HTTP post body size for signature inspection for location HTTP_POST_BODY in the signatures, in bytes. Note that the changes in value could impact CPU and latency profile. Default value: 2048
fileuploadmaxnum	<Double>	Read-write	Maximum allowed number of file uploads per form-submission request. The maximum setting (65535) allows an unlimited number of uploads. Default value: 65535 Minimum value = 0 Maximum value = 65535
canonicalizehtmlresponse	<String>	Read-write	Perform HTML entity encoding for any special characters in responses sent by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			your protected web sites. Default value: ON Possible values = ON, OFF
enableformtagging	<String>	Read-write	Enable tagging of web form fields for use by the Form Field Consistency and CSRF Form Tagging checks. Default value: ON Possible values = ON, OFF
sessionlessfieldconsistency	<String>	Read-write	Perform sessionless Field Consistency Checks. Default value: OFF Possible values = OFF, ON, postOnly
sessionlessurlclosure	<String>	Read-write	Enable session less URL Closure Checks. This check is applicable to Profile Type: HTML. . Default value: OFF Possible values = ON, OFF
semicolonfieldseparator	<String>	Read-write	Allow ';' as a form field separator in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			URL queries and POST form bodies. . Default value: OFF Possible values = ON, OFF
excludefileuploadfromchecks	<String>	Read-write	Exclude uploaded files from Form checks. Default value: OFF Possible values = ON, OFF
sqlinjectionparsecomments	<String>	Read-write	Parse HTML comments and exempt them from the HTML SQL Injection check. You must specify the type of comments that the application firewall is to detect and exempt from this security check. Available settings function as follows: * Check all - Check all content. * ANSI - Exempt content that is part of an ANSI (Mozilla-style) comment. * Nested - Exempt content that is part of a nested

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(Microsoft-style) comment. * ANSI Nested - Exempt content that is part of any type of comment. Possible values = checkall, ansi, nested, ansinested
invalidpercenthandling	<String>	Read-write	Configure the method that the application firewall uses to handle percent-encoded names and values. Available settings function as follows: * apache_mode - Apache format. * asp_mode - Microsoft ASP format. * secure_mode - Secure format. Default value: secure_mode Possible values = apache_mode, asp_mode, secure_mode
type	<String[]>	Read-write	Application firewall profile type, which

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			controls which security checks and settings are applied to content that is filtered with the profile. Available settings function as follows: * HTML - HTML-based web sites. * XML - XML-based web sites and services. * JSON - JSON-based web sites and services. * HTML XML (Web 2.0) - Sites that contain both HTML and XML content, such as ATOM feeds, blogs, and RSS feeds. * HTML JSON - Sites that contain both HTML and JSON content. * XML JSON - Sites that contain both XML and JSON content.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* HTML XML JSON - Sites that contain HTML, XML and JSON content. Default value: HTML Possible values = HTML, XML, JSON
checkrequestheaders	<String>	Read-write	Check request headers as well as web forms for injected SQL and cross-site scripts. Default value: OFF Possible values = ON, OFF
inspectquerycontenttypes	<String[]>	Read-write	Inspect request query as well as web forms for injected SQL and cross-site scripts for following content types. Possible values = HTML, XML, JSON, OTHER
optimizepartialreqs	<String>	Read-write	Optimize handle of HTTP partial requests i.e. those with range headers. Available settings are as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ON - Partial requests by the client result in partial requests to the backend server in most cases. * OFF - Partial requests by the client are changed to full requests to the backend server. Default value: ON Possible values = ON, OFF
urldecoderequestcookies	<String>	Read-write	URL Decode request cookies before subjecting them to SQL and cross-site scripting checks. Default value: OFF Possible values = ON, OFF
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
percentdecoderecursively	<String>	Read-write	Configure whether the application firewall should use percentage recursive decoding.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ON Possible values = ON, OFF
multipleheaderaction	<String[]>	Read-write	One or more multiple header actions. Available settings function as follows: * Block - Block connections that have multiple headers. * Log - Log connections that have multiple headers. * KeepLast - Keep only last header when multiple headers are present. CLI users: To enable one or more actions, type "set appfw profile -multipleHeaderAction" followed by the actions to be enabled. Possible values = block, keepLast, log, none

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rfcprofile	<String>	Read-write	Object name of the rfc profile. Minimum length = 1
fileuploadtypesaction	<String[]>	Read-write	One or more file upload types actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -fileUploadTypeAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -fileUploadTypeAction none".

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = none, block, log, stats
verboseloglevel	<String>	Read-write	Detailed Logging Verbose Log Level. Default value: pattern Possible values = pattern, patternPayload, patternPayloadHeader
archivename	<String>	Read-write	Source for tar archive. Minimum length = 1 Maximum length = 31
relaxationrules	<Boolean>	Read-write	Import all appfw relaxation rules.
importprofilename	<String>	Read-write	Name of the profile which will be created/updated to associate the relaxation rules. Maximum length = 31
matchurlstring	<String>	Read-write	Match this action url in archived Relaxation Rules to replace. Maximum length = 2047

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
replaceurlstring	<String>	Read-write	Replace matched url string with this action url string while restoring Relaxation Rules. Maximum length = 2047
overwrite	<Boolean>	Read-write	Purge existing Relaxation Rules and replace during import.
augment	<Boolean>	Read-write	Augment Relaxation Rules during import.
state	<String>	Read-only	Enabled. Possible values = ENABLED, DISABLED
learning	<String>	Read-only	Profile level learning option that overrides the protection level learning. Available settings are as follows: * ON - Honor all protection level learn settings. * OFF - Avoids learning for this profile for all protections ignoring protection level learn setting.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ON Possible values = ON, OFF
csrftag	<String>	Read-only	The web form originating URL.
builtin	<Boolean>	Read-only	Indicates that a profile is a built-in entity.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT
- RESTORE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile

```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RESTORE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile? **action=restore**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwprofile":{

<b>      "archivename":<String_value>,

</b>      "relaxationrules":<Boolean_value>,

      "importprofilename":<String_value>,

      "matchurlstring":<String_value>,

      "replaceurlstring":<String_value>,

      "overwrite":<Boolean_value>,

      "augment":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appfwprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile? **view=summary**

Use this query-parameter to get the summary output of appfwprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwprofile": [ { "__count": "#no"} ] }
```

appfwprofile_binding

Binding object which returns the resources bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the application firewall profile. Minimum length = 1
appfwprofile_xmlattachmenturl_binding	<appfwprofile_xmlattachmenturl_binding[]>	Read-only	xmlattachmenturl that can be bound to appfwprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appfwprofile_excluderescontenttype_binding	<appfwprofile_excluderescontenttype_binding[]>	Read-only	excluderescontenttype that can be bound to appfwprofile.
appfwprofile_crosssitescripting_binding	<appfwprofile_crosssitescripting_binding[]>	Read-only	crosssitescripting that can be bound to appfwprofile.
appfwprofile_jsonsqlurl_binding	<appfwprofile_jsonsqlurl_binding[]>	Read-only	jsonsqlurl that can be bound to appfwprofile.
appfwprofile_xmlwsiurl_binding	<appfwprofile_xmlwsiurl_binding[]>	Read-only	xmlwsiurl that can be bound to appfwprofile.
appfwprofile_xmldosurl_binding	<appfwprofile_xmldosurl_binding[]>	Read-only	xmldosurl that can be bound to appfwprofile.
appfwprofile_fieldconsistency_binding	<appfwprofile_fieldconsistency_binding[]>	Read-only	fieldconsistency that can be bound to appfwprofile.
appfwprofile_fileuploadtype_binding	<appfwprofile_fileuploadtype_binding[]>	Read-only	fileuploadtype that can be bound to appfwprofile.
appfwprofile_sqlinjection_binding	<appfwprofile_sqlinjection_binding[]>	Read-only	sqlinjection that can be bound to appfwprofile.
appfwprofile_safeobject_binding	<appfwprofile_safeobject_binding[]>	Read-only	safeobject that can be bound to appfwprofile.
appfwprofile_jsonxssurl_binding	<appfwprofile_jsonxssurl_binding[]>	Read-only	jsonxssurl that can be bound to appfwprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appfwprofile_logexpression_binding	<appfwprofile_logexpression_binding[]>	Read-only	logexpression that can be bound to appfwprofile.
appfwprofile_denyurl_binding	<appfwprofile_denyurl_binding[]>	Read-only	denyurl that can be bound to appfwprofile.
appfwprofile_trustedlearningclients_binding	<appfwprofile_trustedlearningclients_binding[]>	Read-only	trustedlearningclients that can be bound to appfwprofile.
appfwprofile_cmdinjection_binding	<appfwprofile_cmdinjection_binding[]>	Read-only	cmdinjection that can be bound to appfwprofile.
appfwprofile_csrftag_binding	<appfwprofile_csrftag_binding[]>	Read-only	csrftag that can be bound to appfwprofile.
appfwprofile_starturl_binding	<appfwprofile_starturl_binding[]>	Read-only	starturl that can be bound to appfwprofile.
appfwprofile_cookieconsistency_binding	<appfwprofile_cookieconsistency_binding[]>	Read-only	cookieconsistency that can be bound to appfwprofile.
appfwprofile_xmlsqlinjection_binding	<appfwprofile_xmlsqlinjection_binding[]>	Read-only	xmlsqlinjection that can be bound to appfwprofile.
appfwprofile_creditcardnumber_binding	<appfwprofile_creditcardnumber_binding[]>	Read-only	creditcardnumber that can be bound to appfwprofile.
appfwprofile_jsondosurl_binding	<appfwprofile_jsondosurl_binding[]>	Read-only	jsondosurl that can be bound to appfwprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appfwprofile_xmlxss_binding	<appfwprofile_xmlxss_binding[]>	Read-only	xmlxss that can be bound to appfwprofile.
appfwprofile_fieldformat_binding	<appfwprofile_fieldformat_binding[]>	Read-only	fieldformat that can be bound to appfwprofile.
appfwprofile_contenttype_binding	<appfwprofile_contenttype_binding[]>	Read-only	contenttype that can be bound to appfwprofile.
appfwprofile_xmlvalidationurl_binding	<appfwprofile_xmlvalidationurl_binding[]>	Read-only	xmlvalidationurl that can be bound to appfwprofile.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

appfwprofile_cmdinjection_binding

Binding object showing the cmdinjection that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
as_value_type_cmd	<String>	Read-write	Type of the relaxed web form value. Possible values = Keyword, SpecialString
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
alertonly	<String>	Read-write	Send SNMP alert?.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
isvalueregex_cmd	<String>	Read-write	Is the web form field/ header/cookie value a regular expression?. Possible values = REGEX, NOTREGEX
as_scan_location_cmd	<String>	Read-write	Location of command injection exception - form field, header or cookie. Possible values = FORMFIELD, HEADER, COOKIE
cmdinjection	<String>	Read-write	Name of the relaxed web form field/ header/cookie.
isregex_cmd	<String>	Read-write	Is the relaxed web form field name/ header/cookie a regular expression?. Possible values = REGEX, NOTREGEX
formactionurl_cmd	<String>	Read-write	The web form action URL.
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
as_value_expr_cmd	<String>	Read-write	The web form/ header/cookie value expression.
__count	<Double>	Read-write	count parameter

Operations

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/appfwprofile_cmdinjection_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"appfwprofile_cmdinjection_binding":{

<b>      "name":<String_value>,

</b>      "cmdinjection":<String_value>,

      "formactionurl_cmd":<String_value>,

      "isregex_cmd":<String_value>,
```

```
        "as_scan_location_cmd":<String_value>,

        "as_value_type_cmd":<String_value>,

        "as_value_expr_cmd":<String_value>,

        "isvalueregex_cmd":<String_value>,

        "comment":<String_value>,

        "state":<String_value>,

        "isautodeployed":<String_value>

  }}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_cmdinjection_binding/name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_cmdinjection_binding/name_value<String> ? **args=cmdinjection: <String_value> ,formactionurl_cmd: <String_value> ,as_scan_location_cmd: <String_value> ,as_value_type_cmd: <String_value> ,as_value_expr_cmd: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_cmdinjection_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_cmdinjection_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwprofile_cmdinjection_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_cmdinjection_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile_cmdinjection_binding resources in chunks.

HTTP Method: GET

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
creditcardnumberurl	<String>	Read-write	The url for which the list of credit card

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			numbers are needed to be bypassed from inspection.
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
creditcardnumber	<String>	Read-write	The object expression that is to be excluded from safe commerce check.
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/appfwprofile_creditcardnumber_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"appfwprofile_creditcardnumber_binding":{

<b>      "name":<String_value>,

</b>      "comment":<String_value>,

      "state":<String_value>,

      "creditcardnumber":<String_value>,

      "creditcardnumberurl":<String_value>,

      "isautodeployed":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_creditcardnumber_binding/name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_creditcardnumber_binding/ name_value<String> ? **args=creditcardnumber: <String_value> ,creditcardnumberurl: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_creditcardnumber_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_creditcardnumber_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwprofile_creditcardnumber_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_creditcardnumber_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile_creditcardnumber_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_creditcardnumber_binding": [ {

      "creditcardnumberurl":<String_value>,

      "state":<String_value>,

      "name":<String_value>,

      "creditcardnumber":<String_value>,

      "alertonly":<String_value>,

      "isautodeployed":<String_value>,

      "comment":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_creditcardnumber_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_creditcardnumber_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_creditcardnumber_binding": [ {

      "creditcardnumberurl":<String_value>,

      "state":<String_value>,

      "name":<String_value>,

      "creditcardnumber":<String_value>,

      "alertonly":<String_value>,

      "isautodeployed":<String_value>,

      "comment":<String_value>
```

```
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_creditcardnumber_binding/name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"appfwprofile_creditcardnumber_binding": [ { "__count": "#no"} ] }
```

appfwprofile_crosssitescripting_binding

Binding object showing the crosssitescripting that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crosssitescripting	<String>	Read-write	The web form field name.
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
isregex_xss	<String>	Read-write	Is the web form field name a regular expression?. Possible values = REGEX, NOTREGEX
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
formactionurl_xss	<String>	Read-write	The web form action URL.
alertonly	<String>	Read-write	Send SNMP alert?.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
as_value_expr_xss	<String>	Read-write	The web form value expression.
as_scan_location_xss	<String>	Read-write	Location of cross-site scripting exception - form field, header, cookie or URL. Possible values = FORMFIELD, HEADER, COOKIE, URL
as_value_type_xss	<String>	Read-write	The web form value type. Possible values = Tag, Attribute, Pattern
isvalueregex_xss	<String>	Read-write	Is the web form field value a regular expression?. Possible values = REGEX, NOTREGEX
__count	<Double>	Read-write	count parameter

```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_denyurl_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_denyurl_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_denyurl_binding": [ {

      "state":<String_value>,

      "denyurl":<String_value>,

      "name":<String_value>,
```

```
        "alertonly":<String_value>,

        "isautodeployed":<String_value>,

        "comment":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_denyurl_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"appfwprofile_denyurl_binding": [ { "__count": "#no"} ] }
```

appfwprofile_excluderescontenttype_binding

Binding object showing the excluderescontenttype that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
excluderescontenttype	<String>	Read-write	A regular expression that represents the content type of the response that are to be excluded from inspection.
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
__count	<Double>	Read-write	count parameter

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_fileuploadtype_binding/name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_fileuploadtype_binding/name_value<String> ? **args=fileuploadtype: <String_value> ,as_fileuploadtypes_url: <String_value> ,filetype: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_fileuploadtype_binding/name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_fileuploadtype_binding/name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwprofile_fileuploadtype_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_fileuploadtype_binding/name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile_fileuploadtype_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_fileuploadtype_binding": [ {

      "state":<String_value>,

      "as_fileuploadtypes_url":<String_value>,

      "name":<String_value>,

      "alertonly":<String_value>,

      "filetype":<String[]_value>,

      "fileuploadtype":<String_value>,

      "isregex_fileuploadtypes_url":<String_value>,

      "isautodeployed":<String_value>,

      "comment":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_fileuploadtype_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_fileuploadtype_binding?
bulkbindings=yes

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_fileuploadtype_binding": [ {

      "state":<String_value>,

      "as_fileuploadtypes_url":<String_value>,

      "name":<String_value>,

      "alertonly":<String_value>,

      "filetype":<String[]_value>,

      "fileuploadtype":<String_value>,

      "isregex_fileuploadtypes_url":<String_value>,

      "isautodeployed":<String_value>,

      "comment":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_fileuploadtype_binding/name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"appfwprofile_fileuploadtype_binding": [ { "__count": "#no"} ] }
```

appfwprofile_jsondosurl_binding

Binding object showing the jsondosurl that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jsonmaxarraylengthcheck	<String>	Read-write	State if JSON Max array value count check is ON or OFF.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
jsonmaxdocumentlengthcheck	<String>	Read-write	State if JSON Max document length check is ON or OFF. Possible values = ON, OFF
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
jsonmaxcontainerdepth	<Double>	Read-write	Maximum allowed nesting depth of JSON document. JSON allows one to nest the containers (object and array) in any order to any depth. This check protects against documents that have excessive depth of hierarchy. Default value: 5 Minimum value = 0 Maximum value = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jsonmaxobjectkeylengthcheck	<String>	Read-write	State if JSON Max object key length check is ON or OFF. Possible values = ON, OFF
jsondosurl	<String>	Read-write	The URL on which we need to enforce the specified JSON denial-of-service (JSONDoS) attack protections. An JSON DoS configuration consists of the following items: - URL. PCRE-format regular expression for the URL. - Maximum-document-length-check toggle. ON to enable this check, OFF to disable it. - Maximum document length. Positive integer representing the maximum length of the JSON document. - Maximum-container-depth-check toggle. ON to enable, OFF to disable. - Maximum container depth. Positive integer representing the maximum container depth of the JSON document. -

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum-object-key-count-check toggle. ON to enable, OFF to disable. - Maximum object key count. Positive integer representing the maximum allowed number of keys in any of the JSON object. - Maximum-object-key-length-check toggle. ON to enable, OFF to disable. - Maximum object key length. Positive integer representing the maximum allowed length of key in any of the JSON object. - Maximum-array-value-count-check toggle. ON to enable, OFF to disable. - Maximum array value count. Positive integer representing the maximum allowed number of values in any of the JSON array. - Maximum-string-length-check toggle. ON to enable, OFF to disable. - Maximum string length. Positive integer representing the maximum length of string in JSON.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 2047
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
jsonmaxarraylength	<Double>	Read-write	Maximum array length in the any of JSON object. This check protects against arrays having large lengths. Default value: 10000 Minimum value = 0 Maximum value = 2147483647
jsonmaxdocumentlength	<Double>	Read-write	Maximum document length of JSON document, in bytes. Default value: 20000000 Minimum value = 0 Maximum value = 2147483647
jsonmaxobjectkeycountcheck	<String>	Read-write	State if JSON Max object key count check is ON or OFF. Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jsonmaxobjectkeylength	<Double>	Read-write	Maximum key length in the any of JSON object. This check protects against objects that have large keys. Default value: 128 Minimum value = 0 Maximum value = 2147483647
jsonmaxobjectkeycount	<Double>	Read-write	Maximum key count in the any of JSON object. This check protects against objects that have large number of keys. Default value: 10000 Minimum value = 0 Maximum value = 2147483647
jsonmaxstringlengthcheck	<String>	Read-write	State if JSON Max string value count check is ON or OFF. Possible values = ON, OFF
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
jsonmaxcontainerdepthcheck	<String>	Read-write	State if JSON Max depth check is ON or OFF. Possible values = ON, OFF
jsonmaxstringlength	<Double>	Read-write	Maximum string length in the JSON. This check protects against strings that have large length. Default value: 1000000 Minimum value = 0 Maximum value = 2147483647
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/appfwprofile_jsondosurl_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{
"appfwprofile_jsondosurl_binding":{
<b>      "name":<String_value>,
</b>      "comment":<String_value>,
      "state":<String_value>,
      "jsondosurl":<String_value>,
      "jsonmaxcontainerdepthcheck":<String_value>,
      "jsonmaxcontainerdepth":<Double_value>,
      "jsonmaxdocumentlengthcheck":<String_value>,
      "jsonmaxdocumentlength":<Double_value>,
      "jsonmaxobjectkeycountcheck":<String_value>,
      "jsonmaxobjectkeycount":<Double_value>,
      "jsonmaxobjectkeylengthcheck":<String_value>,
      "jsonmaxobjectkeylength":<Double_value>,
      "jsonmaxarraylengthcheck":<String_value>,
      "jsonmaxarraylength":<Double_value>,
      "jsonmaxstringlengthcheck":<String_value>,
      "jsonmaxstringlength":<Double_value>,
      "isautodeployed":<String_value>
}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsondosurl_binding/ name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsondosurl_binding/ name_value<String> ? **args=jsondosurl: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsondosurl_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsondosurl_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwprofile_jsondosurl_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsondosurl_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile_jsondosurl_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_jsondosurl_binding": [ {

      "jsonmaxarraylengthcheck":<String_value>,

      "jsonmaxdocumentlengthcheck":<String_value>,

      "state":<String_value>,

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsonxssurl_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwprofile_jsonxssurl_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsonxssurl_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile_jsonxssurl_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_jsonxssurl_binding": [ {

      "state":<String_value>,
```

```
        "name":<String_value>,

        "alertonly":<String_value>,

        "jsonxssurl":<String_value>,

        "isautodeployed":<String_value>,

        "comment":<String_value>

  }]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsonxssurl_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsonxssurl_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_jsonxssurl_binding": [ {

      "state":<String_value>,

      "name":<String_value>,

      "alertonly":<String_value>,

      "jsonxssurl":<String_value>,

      "isautodeployed":<String_value>,

      "comment":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_jsonxssurl_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"appfwprofile_jsonxssurl_binding": [ { "__count": "#no"} ] }
```

appfwprofile_logexpression_binding

Binding object showing the logexpression that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
as_logexpression	<String>	Read-write	LogExpression to log when violation happened on appfw profile. Maximum length = 1500
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
logexpression	<String>	Read-write	Name of LogExpression object.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
__count	<Double>	Read-write	count parameter

Operations

- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/appfwprofile_logexpression_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"appfwprofile_logexpression_binding":{

<b>      "name":<String_value>,

appfwprofile_safeobject_binding

Binding object showing the safeobject that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxmatchlength	<Double>	Read-write	Maximum match length for a Safe Object expression.
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
safeobject	<String>	Read-write	Name of the Safe Object.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
as_expression	<String>	Read-write	A regular expression that defines the Safe Object.
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
action	<String[]>	Read-write	Safe Object action types. (BLOCK | LOG | STATS | NONE). Possible values = none, block, log, remove, stats, xout
__count	<Double>	Read-write	count parameter

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/appfwprofile_starturl_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"appfwprofile_starturl_binding":{

<b>      "name":<String_value>,

</b>      "starturl":<String_value>,

      "comment":<String_value>,

      "state":<String_value>,

      "isautodeployed":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_starturl_binding/ name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_starturl_binding/ name_value<String> ? **args=starturl: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_starturl_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_starturl_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwprofile_starturl_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_starturl_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile_starturl_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_starturl_binding": [ {

      "state":<String_value>,

      "name":<String_value>,

      "alertonly":<String_value>,

appfwprofile_xmldosurl_binding

Binding object showing the xmldosurl that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlmaxelementdepthcheck	<String>	Read-write	State if XML Max element depth check is ON or OFF. Possible values = ON, OFF
xmlmaxfilesize	<Double>	Read-write	Specify the maximum size of XML messages. Protects against overflow attacks. Minimum value = 0 Maximum value = 1000000000
xmlmaxnamespaceurilength	<Double>	Read-write	Specify the longest URI of any XML namespace. Protects against overflow attacks.
xmldosurl	<String>	Read-write	XML DoS URL regular expression length.
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
xmlsoaparraycheck	<String>	Read-write	State if XML SOAP Array check is ON or OFF. Possible values = ON, OFF
xmlmaxelementnamelengthcheck	<String>	Read-write	State if XML Max element name length check is ON or OFF.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
xmlmaxelementscheck	<String>	Read-write	State if XML Max elements check is ON or OFF. Possible values = ON, OFF
xmlmaxentityexpansions	<Double>	Read-write	Specify maximum allowed number of entity expansions. Protects aganist Entity Expansion Attack.
xmlmaxattributes	<Double>	Read-write	Specify maximum number of attributes per XML element. Protects against overflow attacks.
xmlmaxfilesizecheck	<String>	Read-write	State if XML Max file size check is ON or OFF. Possible values = ON, OFF
xmlmaxchardatalength	<Double>	Read-write	Specify the maximum size of CDATA. Protects against overflow attacks and large quantities of unparsed data within XML messages. Minimum value = 0 Maximum value = 1000000000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlmaxnamespacescheck	<String>	Read-write	State if XML Max namespaces check is ON or OFF. Possible values = ON, OFF
xmlmaxnamespaces	<Double>	Read-write	Specify maximum number of active namespaces. Protects against overflow attacks.
xmlmaxattributenamelengthcheck	<String>	Read-write	State if XML Max attribute name length check is ON or OFF. Possible values = ON, OFF
xmlblockdtd	<String>	Read-write	State if XML DTD is ON or OFF. Protects against recursive Document Type Declaration (DTD) entity expansion attacks. Also, SOAP messages cannot have DTDs in messages. . Possible values = ON, OFF
xmlmaxattributevaluelength	<Double>	Read-write	Specify the longest value of any XML attribute. Protects against overflow attacks.
xmlmaxelementdepth	<Double>	Read-write	Maximum nesting (depth) of XML elements. This check

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			protects against documents that have excessive hierarchy depths.
xmlmaxelementnamelength	<Double>	Read-write	Specify the longest name of any element (including the expanded namespace) to protect against overflow attacks.
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
xmlblockpi	<String>	Read-write	State if XML Block PI is ON or OFF. Protects resources from denial of service attacks as SOAP messages cannot have processing instructions (PI) in messages. Possible values = ON, OFF
xmlmaxelementchildrencheck	<String>	Read-write	State if XML Max element children check is ON or OFF. Possible values = ON, OFF
xmlmaxelements	<Double>	Read-write	Specify the maximum number of XML elements allowed. Protects

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			against overflow attacks.
xmlmaxentityexpansionscheck	<String>	Read-write	State if XML Max Entity Expansions Check is ON or OFF. Possible values = ON, OFF
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
xmlmaxnamespaceurilengthcheck	<String>	Read-write	State if XML Max namespace URI length check is ON or OFF. Possible values = ON, OFF
xmlmaxentityexpansiondepthcheck	<String>	Read-write	State if XML Max Entity Expansions Depth Check is ON or OFF. Possible values = ON, OFF
xmlmaxattributevaluelengthcheck	<String>	Read-write	State if XML Max atribute value length is ON or OFF. Possible values = ON, OFF
xmlmaxsoaparraysize	<Double>	Read-write	XML Max Total SOAP Array Size. Protects against SOAP Array Abuse attack. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 1000000000
xmlmaxentityexpansiondepth	<Double>	Read-write	Specify maximum entity expansion depth. Protects aganist Entity Expansion Attack.
xmlmaxnodescheck	<String>	Read-write	State if XML Max nodes check is ON or OFF. Possible values = ON, OFF
xmlmaxattributenamelength	<Double>	Read-write	Specify the longest name of any XML attribute. Protects against overflow attacks.
xmlmaxchardatalengthcheck	<String>	Read-write	State if XML Max CDATA length check is ON or OFF. Possible values = ON, OFF
xmlminfilesizecheck	<String>	Read-write	State if XML Min file size check is ON or OFF. Possible values = ON, OFF
xmlmaxelementchildren	<Double>	Read-write	Specify the maximum number of children allowed per XML element. Protects against overflow attacks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlminfilesize	<Double>	Read-write	Enforces minimum message size. Minimum value = 0 Maximum value = 1000000000
xmlmaxnodes	<Double>	Read-write	Specify the maximum number of XML nodes. Protects against overflow attacks.
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
xmlmaxattributescheck	<String>	Read-write	State if XML Max attributes check is ON or OFF. Possible values = ON, OFF
xmlmaxsoaparrayrank	<Double>	Read-write	XML Max Individual SOAP Array Rank. This is the dimension of the SOAP array.
xmlblockexternalentities	<String>	Read-write	State if XML Block External Entities

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Check is ON or OFF. Protects against XML External Entity (XXE) attacks that force applications to parse untrusted external entities (sources) in XML documents. Possible values = ON, OFF
__count	<Double>	Read-write	count parameter

Response Payload:

```
{"appfwprofile_xmldosurl_binding": [ { "__count": "#no"} ] }
```

appfwprofile_xmlsqlinjection_binding

Binding object showing the xmlsqlinjection that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
as_scan_location_xmlsql	<String>	Read-write	Location of SQL injection exception - XML Element or Attribute. Possible values = ELEMENT, ATTRIBUTE
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
xmlsqlinjection	<String>	Read-write	Exempt the specified URL from the XML SQL injection check. An XML SQL injection exemption (relaxation) consists of the following items: - Name. Name to exempt, as a string or a PCRE-format regular expression. - ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string. - Location. ELEMENT if the injection is located in an XML element, ATTRIBUTE if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			located in an XML attribute.
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
isregex_xmlsql	<String>	Read-write	Is the XML SQL Injection exempted field name a regular expression?. Possible values = REGEX, NOTREGEX
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
__count	<Double>	Read-write	count parameter

Operations

- ADD
- DELETE
- GET
- GET (ALL)

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/appfwprofile_xmlsqlinjection_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"appfwprofile_xmlsqlinjection_binding":{

<b>      "name":<String_value>,

</b>      "comment":<String_value>,

      "state":<String_value>,

      "xmlsqlinjection":<String_value>,

      "isregex_xmlsql":<String_value>,

      "as_scan_location_xmlsql":<String_value>,

      "isautodeployed":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlsqlinjection_binding/name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlsqlinjection_binding/name_value<String> ? **args=xmlsqlinjection: <String_value> ,as_scan_location_xmlsql: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlsqlinjection_binding/name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlsqlinjection_binding/name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwprofile_xmlsqlinjection_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlsqlinjection_binding/name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile_xmlsqlinjection_binding resources in chunks.

Response Payload:

```
{"appfwprofile_xmlsqlinjection_binding": [ { "__count": "#no"} ] }
```

appfwprofile_xmlvalidationurl_binding

Binding object showing the xmlvalidationurl that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Enabled.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
xmlwsdl	<String>	Read-write	WSDL object for soap request validation.
xmlendpointcheck	<String>	Read-write	Modifies the behaviour of the Request URL validation w.r.t. the Service URL. If set to ABSOLUTE, the entire request URL is validated with the entire URL mentioned in Service of the associated WSDL. eg: Service URL: http://example.org/ExampleService, Request URL: http//example.com/ExampleService would FAIL the validation. If set to RELAIVE, only the non-hostname part of the request URL is validated against the non-hostname part of the Service URL. eg: Service URL: http://example.org/ExampleService, Request URL: http//example.com/ExampleService

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			would PASS the validation. Possible values = ABSOLUTE, RELATIVE
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
xmlvalidateresponse	<String>	Read-write	Validate response message. Possible values = ON, OFF
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
xmlvalidationurl	<String>	Read-write	XML Validation URL regular expression.
xmlresponseschema	<String>	Read-write	XML Schema object for response validation.
xmlvalidatesoapenvelope	<String>	Read-write	Validate SOAP Evelope only. Possible values = ON, OFF
xmlrequestschema	<String>	Read-write	XML Schema object for request validation .
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
xmladditionalsoapheaders	<String>	Read-write	Allow addtional soap headers. Possible values = ON, OFF
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
__count	<Double>	Read-write	count parameter

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlwsichecks	<String>	Read-write	Specify a comma separated list of relevant WS-I rule IDs. (R1140, R1141).
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
xmlwsiurl	<String>	Read-write	XML WS-I URL regular expression length.
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED, NOTAUTODEPLOYED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/appfwprofile_xmlwsiurl_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{
"appfwprofile_xmlwsiurl_binding":{
<b>      "name":<String_value>,
</b>      "comment":<String_value>,
      "state":<String_value>,
      "xmlwsiurl":<String_value>,
      "xmlwsichecks":<String_value>,
      "isautodeployed":<String_value>
}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlwsiurl_binding/ name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlwsiurl_binding/ name_value<String> ? **args=xmlwsiurl: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlwsiurl_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlwsiurl_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwprofile_xmlwsiurl_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlwsiurl_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile_xmlwsiurl_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_xmlwsiurl_binding": [ {

      "xmlwsichecks":<String_value>,

      "name":<String_value>,

      "xmlwsiurl":<String_value>,

      "state":<String_value>,

      "isautodeployed":<String_value>,
```

```
      "comment":<String_value>,

      "alertonly":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlwsiurl_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlwsiurl_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwprofile_xmlwsiurl_binding": [ {
```

```
        "xmlwsichecks":<String_value>,

        "name":<String_value>,

        "xmlwsiurl":<String_value>,

        "state":<String_value>,

        "isautodeployed":<String_value>,

        "comment":<String_value>,

        "alertonly":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwprofile_xmlwsiurl_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"appfwprofile_xmlwsiurl_binding": [ { "__count": "#no"} ] }
```

appfwprofile_xmlxss_binding

Binding object showing the xmlxss that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
alertonly	<String>	Read-write	Send SNMP alert?. Possible values = ON, OFF
as_scan_location_xmlxss	<String>	Read-write	Location of XSS injection exception - XML Element or Attribute. Possible values = ELEMENT, ATTRIBUTE
isregex_xmlxss	<String>	Read-write	Is the XML XSS exempted field name a regular expression?.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = REGEX, NOTREGEX
isautodeployed	<String>	Read-write	Is the rule auto deployed by dynamic profile ?. Possible values = AUTODEPLOYED, NOTAUTODEPLOYED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
xmlxss	<String>	Read-write	Exempt the specified URL from the XML cross-site scripting (XSS) check. An XML cross-site scripting exemption (relaxation) consists of the following items: - URL. URL to exempt, as a string or a PCRE-format regular expression. - ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string. - Location. ELEMENT if the attachment is located in an XML element, ATTRIBUTE if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			located in an XML attribute.
__count	<Double>	Read-write	count parameter

appfwsettings

Configuration for AS settings resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
defaultprofile	<String>	Read-write	Profile to use when a connection does not match any policy. Default setting is APPFW_BYPASS, which sends unmatched connections back to the Citrix ADC without attempting to filter them further. Default value: APPFW_BYPASS Minimum length = 1
undefaction	<String>	Read-write	Profile to use when an application firewall policy evaluates to undefined (UNDEF). An UNDEF event indicates an internal error condition. The APPFW_BLOCK built-in profile is the default setting. You can specify a different built-in or user-created profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			as the UNDEF profile. Default value: APPFW_BLOCK Minimum length = 1
sessiontimeout	<Double>	Read-write	Timeout, in seconds, after which a user session is terminated. Before continuing to use the protected web site, the user must establish a new session by opening a designated start URL. Default value: 900 Minimum value = 1 Maximum value = 65535
learnratelimit	<Double>	Read-write	Maximum number of connections per second that the application firewall learning engine examines to generate new relaxations for learning-enabled security checks. The application firewall drops any connections above this limit from the list of connections used

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by the learning engine. Default value: 400 Minimum value = 1 Maximum value = 1000
sessionlifetime	<Double>	Read-write	Maximum amount of time (in seconds) that the application firewall allows a user session to remain active, regardless of user activity. After this time, the user session is terminated. Before continuing to use the protected web site, the user must establish a new session by opening a designated start URL. Default value: 0 Minimum value = 0 Maximum value = 2147483647
sessioncookiename	<String>	Read-write	Name of the session cookie that the application firewall uses to track user sessions. Must begin with a letter or number, and can consist of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from 1 to 31 letters, numbers, and the hyphen (-) and underscore (_) symbols. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cookie name" or 'my cookie name'). Minimum length = 1
clientiploggingheader	<String>	Read-write	Name of an HTTP header that contains the IP address that the client used to connect to the protected web site or service.
importsizelimit	<Double>	Read-write	Cumulative total maximum number of bytes in web forms imported to a protected web site. If a user attempts to upload files with a total byte count higher than the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified limit, the application firewall blocks the request. Default value: 134217728 Minimum value = 1 Maximum value = 268435456
signatureautoupdate	<String>	Read-write	Flag used to enable/disable auto update signatures. Default value: OFF Possible values = ON, OFF
signatureurl	<String>	Read-write	URL to download the mapping file from server. Default value: https://s3.amazonaws.com/NSAppFwSignatures/SignaturesMapping.xml
cookiepostencryptprefix	<String>	Read-write	String that is prepended to all encrypted cookie values. Minimum length = 1
logmalformedreq	<String>	Read-write	Log requests that are so malformed that application firewall

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parsing doesn't occur. Default value: ON Possible values = ON, OFF
geolocationlogging	<String>	Read-write	Enable Geo-Location Logging in CEF format logs. Default value: OFF Possible values = ON, OFF
ceflogging	<String>	Read-write	Enable CEF format logs. Default value: OFF Possible values = ON, OFF
entitydecoding	<String>	Read-write	Transform multibyte (double- or half-width) characters to single width characters. Default value: OFF Possible values = ON, OFF
useconfigurablesecretkey	<String>	Read-write	Use configurable secret key in AppFw operations. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessionlimit	<Double>	Read-write	Maximum number of sessions that the application firewall allows to be active, regardless of user activity. After the max_limit reaches, No more user session will be created . Default value: 100000 Minimum value = 0 Maximum value = 500000
malformedreqaction	<String[]>	Read-write	flag to define action on malformed requests that application firewall cannot parse. Possible values = none, block, log, stats
centralizedlearning	<String>	Read-write	Flag used to enable/ disable ADM centralized learning. Default value: OFF Possible values = ON, OFF
learning	<String>	Read-only	Global learning option that overrides the profile level learning.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Available settings are as follows: * ON - Honor all profile level learn settings. * OFF - Avoids learning for all profiles ignoring profile level learn setting. Default value: ON Possible values = ON, OFF
builtin	<String[]>	Read-only	Flag to determine if application firewall settings is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwsignatures/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwsignatures? **action=Import**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwsignatures":{

<b>      "src":<String_value>,

</b><b>      "name":<String_value>,

</b>      "xslt":<String_value>,

      "comment":<String_value>,

      "overwrite":<Boolean_value>,

      "merge":<Boolean_value>,

      "preservedefactions":<Boolean_value>,

      "sha1":<String_value>,

      "vendortype":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CHANGE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwsignatures? **action=update**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwsignatures":{

<b>      "name":<String_value>,

</b>      "mergedefault":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwsignatures

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwsignatures": [ {
      "name":<String_value>,
      "response":<String_value>,
      "src":<String_value>
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwsignatures/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwsignatures/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwsignatures/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of appfwsignatures resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwsignatures": [ {

      "name":<String_value>,

      "response":<String_value>,

      "src":<String_value>

}]}
```

appfwtransactionrecords

Configuration for Application firewall transaction record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
httptransactionid	<Double>	Read-only	The http transaction identifier.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
packetengineid	<Integer>	Read-only	The packet engine identifier.
appfwsessionid	<String>	Read-only	The session identifier set by the Application Firewall to track the user session.
profilename	<String>	Read-only	Application Firewall profile name.
url	<String>	Read-only	Request URL.
clientip	<String>	Read-only	The IP address of client.
destip	<String>	Read-only	The IP address of destination.
starttime	<String>	Read-only	Conveys time at which request processing started.
endtime	<String>	Read-only	Conveys time at which request processing end.
requestcontentlength	<Integer>	Read-only	The content length of request.
requestyields	<Double>	Read-only	The number of times yielded during request processing to send heart beat packets.
requestmaxprocessingtime	<Double>	Read-only	The maximum processing time across yields during request processing.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
responsecontentlength	<Integer>	Read-only	The content length of response.
responseyields	<Double>	Read-only	The number of times yielded during response processing to send heart beat packets.
responsemaxprocessingtime	<Double>	Read-only	The maximum processing time across yields during response processing.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwtransactionrecords

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/appfwtransactionrecords? **args=nodeid: <Double_value>**

Use this query-parameter to get appfwtransactionrecords resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwtransactionrecords? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appfwtransactionrecords? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appfwtransactionrecords resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwtransactionrecords? **view=summary**

Use this query-parameter to get the summary output of appfwtransactionrecords resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appfwtransactionrecords?
pagesize=#no;pageno=#no

Use this query-parameter to get the appfwtransactionrecords resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwtransactionrecords": [ {

nodeid:<Double_value>      "httptransactionid":<Double_value>,

      "packetengineid":<Integer_value>,

      "appfwsessionid":<String_value>,

      "profilename":<String_value>,
```

```
        "url":<String_value>,

        "clientip":<String_value>,

        "destip":<String_value>,

        "starttime":<String_value>,

        "endtime":<String_value>,

        "requestcontentlength":<Integer_value>,

        "requestyields":<Double_value>,

        "requestmaxprocessingtime":<Double_value>,

        "responsecontentlength":<Integer_value>,

        "responseyields":<Double_value>,

        "responsemaxprocessingtime":<Double_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwtransactionrecords? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwtransactionrecords": [ { "__count": "#no"} ] }
```

appfwurlencodedformcontenttype

Configuration for Urlencoded form content type resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
urlencodedformcontenttypevalue	<String>	Read-write	Content type to be classified as urlencoded form. Minimum length = 1
isregex	<String>	Read-write	Is urlencoded form content type a regular expression?. Default value: NOTREGEX Possible values = REGEX, NOTREGEX
builtin	<String[]>	Read-only	Flag to determine if urlencoded form contenttype is built-in or not. Possible values = MODIFIABLE, DELETABLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

        "builtin":<String[]_value>,

        "feature":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwurlencodedformcontenttype? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwurlencodedformcontenttype": [ { "__count": "#no"} ] }
```

appfwwsdl

Configuration for WSDL file resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the WSDL file to remove. Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL (protocol, host, path, and name) of the WSDL file to be imported is stored. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
comment	<String>	Read-write	Any comments to preserve information about the WSDL. Maximum length = 128
overwrite	<Boolean>	Read-write	Overwrite any existing WSDL of the same name.
response	<String>	Read-only	.

Operations

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwxmlcontenttype": [ { "__count": "#no"} ] }
```

appfwxmlerrorpage

Configuration for xml error page resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Indicates name of the imported xml error page to be removed. Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL (protocol, host, path, and name) for the location at which to store the imported XML error object. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate authentication for access. Minimum length = 1 Maximum length = 2047
comment	<String>	Read-write	Any comments to preserve information about the XML error object. Maximum length = 128
overwrite	<Boolean>	Read-write	Overwrite any existing XML error object of the same name.
response	<String>	Read-only	.

Operations

(click to see Properties)

- DELETE
- GET (ALL)
- GET
- IMPORT
- CHANGE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwxmlerrorpage/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwxmlerrorpage? **action=Import**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwxmlerrorpage":{

<b>      "src":<String_value>,

</b><b>      "name":<String_value>,

</b>      "comment":<String_value>,

      "overwrite":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CHANGE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwxmlerrorpage? **action=update**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appfwxmlerrorpage":{

<b>      "name":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwxmlerrorpage

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appfwxmlerrorpage": [ {
```

```
        "name":<String_value>,

        "response":<String_value>,

        "src":<String_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appfwxmlerrorpage/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appfwxmlerrorpage/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/appfwxmlerrorpage/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of appfwxmlerrorpage resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "appfwxmlerrorpage": [ {

      "name":<String_value>,

      "response":<String_value>,

      "src":<String_value>

}]}
```

appfwxmlschema

Configuration for XML schema resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the XML Schema object to remove. Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL (protocol, host, path, and file name) for the location at which to store the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			imported XML Schema. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
comment	<String>	Read-write	Any comments to preserve information about the XML Schema object. Maximum length = 128
overwrite	<Boolean>	Read-write	Overwrite any existing XML Schema object of the same name.
response	<String>	Read-only	.

Operations

appqoe

Appqoe

Application Level Quality of Experience configuration

NAME	DESCRIPTION
appqoeaction	Configuration for AppQoS action
appqoecustomresp	Configuration for AppQoE custom response page
appqoeparameter	Configuration for QOS parameter
appqoepolicy	Configuration for AppQoS policy
appqoepolicy_binding	Binding object showing the resources that can be bound to appqoepolicy
appqoepolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to appqoepolicy

appqoeaction

Configuration for AppQoS action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the AppQoE action. Must begin with a letter, number, or the underscore symbol (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), and colon

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(:) characters. This is a mandatory argument.
priority	<String>	Read-write	Priority for queuing the request. If server resources are not available for a request that matches the configured rule, this option specifies a priority for queuing the request until the server resources are available again. If priority is not configured then Lowest priority will be used to queue the request. Possible values = HIGH, MEDIUM, LOW, LOWEST
respondwith	<String>	Read-write	Responder action to be taken when the threshold is reached. Available settings function as follows: ACS - Serve content from an alternative content service Threshold : maxConn or delay

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NS - Serve from the Citrix ADC (built-in response) Threshold : maxConn or delay. Possible values = ACS, NS
customfile	<String>	Read-write	name of the HTML page object to use as the response. Minimum length = 1
altcontentsvcname	<String>	Read-write	Name of the alternative content service to be used in the ACS. Minimum length = 1 Maximum length = 127
altcontentpath	<String>	Read-write	Path to the alternative content service to be used in the ACS. Minimum length = 4 Maximum length = 127
polqdepth	<Double>	Read-write	Policy queue depth threshold value. When the policy queue size (number of requests queued for the policy binding this action is attached to)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			increases to the specified polqDepth value, subsequent requests are dropped to the lowest priority level. Minimum value = 0 Maximum value = 4294967294
priqdepth	<Double>	Read-write	Queue depth threshold value per priorirty level. If the queue size (number of requests in the queue of that particular priorirty) on the virtual server to which this policy is bound, increases to the specified qDepth value, subsequent requests are dropped to the lowest priority level. Minimum value = 0 Maximum value = 4294967294
maxconn	<Double>	Read-write	Maximum number of concurrent connections that can be open for requests that matches with rule. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 4294967294
delay	<Double>	Read-write	Delay threshold, in microseconds, for requests that match the policy's rule. If the delay statistics gathered for the matching request exceed the specified delay, configured action triggered for that request, if there is no action then requests are dropped to the lowest priority level. Minimum value = 1 Maximum value = 599999999
dostrigexpression	<String>	Read-write	Optional expression to add second level check to trigger DoS actions. Specifically used for Analytics based DoS response generation.
dosaction	<String>	Read-write	DoS Action to take when vserver will be considered under DoS attack and corresponding rule matches. Mandatory if AppQoE actions are to be used for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DoS attack prevention. Possible values = SimpleResponse, HICResponse
tcpprofile	<String>	Read-write	Bind TCP Profile based on L2/L3/L7 parameters. Minimum length = 1 Maximum length = 127
retryonreset	<String>	Read-write	Retry on TCP Reset. Default value: NO Possible values = YES, NO
numretries	<Double>	Read-write	Retry count. Default value: 3 Minimum value = 0 Maximum value = 7
hits	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

      "numretries":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appqoeaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appqoeaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appqoeaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appqoeaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appqoeaction? **view=summary**

Use this query-parameter to get the summary output of appqoeaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appqoeaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appqoeaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

```
{"appqoecustomresp":{

<b>      "name":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appqoecustomresp

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/appqoecustomresp? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/appqoecustomresp? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appqoecustomresp resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/appqoecustomresp? **view=summary**

Use this query-parameter to get the summary output of appqoecustomresp resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/appqoecustomresp? **pagesize=#no;pageno=#no**

Use this query-parameter to get the appqoecustomresp resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appqoecustomresp": [ {
```

```
        "name":<String_value>,

        "src":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/appqoecustomresp? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appqoecustomresp": [ { "__count": "#no"} ] }
```

appqoeparameter

Configuration for QOS parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessionlife	<Double>	Read-write	Time, in seconds, between the first time and the next time the AppQoE alternative content window is displayed. The alternative content window is displayed only once during a session for the same browser accessing a configured URL, so this parameter determines the length of a session. Default value: 300 Minimum value = 1 Maximum value = 4294967294
avgwaitingclient	<Double>	Read-write	average number of client connections, that can sit in service waiting queue. Default value: 1000000 Minimum value = 0 Maximum value = 4294967294
maxaltrespbandwidth	<Double>	Read-write	maximum bandwidth which will determine whether to send alternate content response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 100 Minimum value = 1 Maximum value = 4294967294
dosattackthresh	<Double>	Read-write	average number of client connection that can queue up on vserver level without triggering DoS mitigation module. Default value: 2000 Minimum value = 0 Maximum value = 4294967294

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appqoeparameter

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appqoeparameter":{

      "sessionlife":<Double_value>,

      "avgwaitingclient":<Double_value>,

      "maxaltrespbandwidth":<Double_value>,

      "dosattackthresh":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appqoeparameter? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appqoeparameter":{

      "sessionlife":true,

      "avgwaitingclient":true,

      "maxaltrespbandwidth":true,

      "dosattackthresh":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appqoeparameter

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appqoeparameter": [ {

      "sessionlife":<Double_value>,

      "avgwaitingclient":<Double_value>,

      "maxaltrespbandwidth":<Double_value>,

      "dosattackthresh":<Double_value>

}]}
```

appqoepolicy

Configuration for AppQoS policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	. Minimum length = 1
rule	<String>	Read-write	Expression or name of a named expression, against which the request is evaluated. The policy is applied if the rule evaluates to true.
action	<String>	Read-write	Configured AppQoE action to trigger. Minimum length = 1
hits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

```

appqoepolicy_binding

Binding object which returns the resources bound to appqoepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	. Minimum length = 1
appqoepolicy_lbvserver_binding	<appqoepolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to appqoepolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appqoepolicy_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appqoepolicy_binding": [ {

      "name":<String_value>,

      "appqoepolicy_lbvserver_binding":<appqoepolicy_lbvserver_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appqoepolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/appqoepolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appqoepolicy_binding": [ {

      "name":<String_value>,

      "appqoepolicy_lbvserver_binding":<appqoepolicy_lbvserver_binding[]_value>
```

```
}]}
```

appqoepolicy_lbvserver_binding

Binding object showing the lbvserver that can be bound to appqoepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	. Minimum length = 1
boundto	<String>	Read-write	The name of the entity to which the policy is bound.
bindpriority	<Double>	Read-only	Specifies the binding of the policy. use only in display.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

auditsyslogpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to auditsyslogpolicy
auditsyslogpolicy_rnatglobal_binding	Binding object showing the rnatglobal that can be bound to auditsyslogpolicy
auditsyslogpolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to auditsyslogpolicy

NAME	DESCRIPTION
auditsyslogpolicy_tmglobal_binding	Binding object showing the tmglobal that can be bound to auditsyslogpolicy
auditsyslogpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to auditsyslogpolicy
auditsyslogpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to auditsyslogpolicy

auditmessageaction

Configuration for message action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the audit message action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the message action is added.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my message action" or 'my message action'). Minimum length = 1
loglevel	<String>	Read-write	Audit log level, which specifies the severity level of the log message being generated.. The following loglevels are valid: * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. Possible values = EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG
stringbuilderexpr	<String>	Read-write	Default-syntax expression that defines the format and content of the log message.
logtonewnslog	<String>	Read-write	Send the message to the new nslog.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
bypasssafetycheck	<String>	Read-write	Bypass the safety check and allow unsafe expressions. Default value: NO Possible values = YES, NO
loglevel1	<String>	Read-only	. Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG, NONE
hits	<Double>	Read-only	The number of times the action has been taken.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Double>	Read-only	The number of references to the action.
__count	<Double>	Read-only	count parameter

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"auditmessageaction":{

<b>      "name":<String_value>,

</b><b>      "loglevel":<String_value>,

</b><b>      "stringbuilderexpr":<String_value>,

</b>      "logtonewnslog":<String_value>,

      "bypasssafetycheck":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"auditmessageaction":{

<b>      "name":<String_value>,

</b>      "loglevel":<String_value>,

      "stringbuilderexpr":<String_value>,

      "logtonewnslog":<String_value>,

      "bypasssafetycheck":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"auditmessageaction":{

<b>      "name":<String_value>,

</b>      "logtonewnslog":true,

      "bypasssafetycheck":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of auditmessageaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction? **view=summary**

Use this query-parameter to get the summary output of auditmessageaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the auditmessageaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditmessageaction": [ {

      "name":<String_value>,
```

```
        "loglevel":<String_value>,

        "loglevel1":<String_value>,

        "stringbuilderexpr":<String_value>,

        "logtonewnslog":<String_value>,

        "bypasssafetycheck":<String_value>,

        "hits":<Double_value>,

        "undefhits":<Double_value>,

        "referencecount":<Double_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of auditmessageaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditmessageaction": [ {

      "name":<String_value>,

      "loglevel":<String_value>,

      "loglevel1":<String_value>,

      "stringbuilderexpr":<String_value>,

      "logtonewnslog":<String_value>,

      "bypasssafetycheck":<String_value>,

      "undefhits":<Double_value>,

      "referencecount":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditmessageaction? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditmessageaction": [ { "__count": "#no"} ] }
```

auditmessages

Configuration for audit message resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
loglevel	<String[]>	Read-write	Audit log level filter, which specifies the types of events to display.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following loglevels are valid: * ALL - All events. * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DEBUG - All events, in extreme detail. Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG
numofmesgs	<Double>	Read-write	Number of log messages to be displayed. Default value: 20 Minimum value = 1 Maximum value = 256
value	<String>	Read-only	The Audit message.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditmessages

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/auditmessages? **args=loglevel: <String _value> ,numofmesgs: <Double_value>**

Use this query-parameter to get auditmessages resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/auditmessages? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/auditmessages? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of auditmessages resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/auditmessages? **view=summary**

Use this query-parameter to get the summary output of auditmessages resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/auditmessages? **pagesize=#no;pageno=#no**

Use this query-parameter to get the auditmessages resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditmessages": [ {
```

```
loglevel:<String[]_value>,numofmesgs:<Double_value>      "value":<String_v
alue>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditmessages? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditmessages": [ { "__count": "#no"} ] }
```

auditnslogaction

Configuration for ns log action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the nslog action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the nslog action is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my nslog action" or 'my nslog action'). Minimum length = 1
serverip	<String>	Read-write	IP address of the nslog server. Minimum length = 1
serverdomainname	<String>	Read-write	Auditserver name as a FQDN. Mutually

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			exclusive with serverIP. Minimum length = 1 Maximum length = 255
domainresolveretry	<Integer>	Read-write	Time, in seconds, for which the Citrix ADC waits before sending another DNS query to resolve the host name of the audit server if the last query failed. Default value: 5 Minimum value = 5 Maximum value = 20939
serverport	<Integer>	Read-write	Port on which the nslog server accepts connections. Minimum value = 1
loglevel	<String[]>	Read-write	Audit log level, which specifies the types of events to log. Available settings function as follows: * ALL - All events. * EMERGENCY - Events that indicate an immediate crisis on the server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. * NONE - No events. Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NOTICE, INFORMATIONAL, DEBUG, NONE
dateformat	<String>	Read-write	Format of dates in the logs. Supported formats are: * MMDDYYYY - U.S. style month/ date/year format. * DDMMYYYY - European style date/month/year format. * YYYYMMDD - ISO style year/ month/date format. Possible values = MMDDYYYY, DDMMYYYY, YYYYMMDD
logfacility	<String>	Read-write	Facility value, as defined in RFC 3164, assigned to the log message. Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix ADC itself, the VPN, or external. Possible values = LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7
tcp	<String>	Read-write	Log TCP messages. Possible values = NONE, ALL
acl	<String>	Read-write	Log access control list (ACL) messages. Possible values = ENABLED, DISABLED
timezone	<String>	Read-write	Time zone used for date and timestamps in the logs. Available settings function as follows: * GMT_TIME. Coordinated Universal Time. * LOCAL_TIME. The server's timezone setting. Possible values = GMT_TIME, LOCAL_TIME

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
userdefinedauditlog	<String>	Read-write	Log user-configurable log messages to nslog. Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria. Possible values = YES, NO
appflowexport	<String>	Read-write	Export log messages to AppFlow collectors. Appflow collectors are entities to which log messages can be sent so that some action can be performed on them. Possible values = ENABLED, DISABLED
lsn	<String>	Read-write	Log the LSN messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
alg	<String>	Read-write	Log the ALG messages. Possible values = ENABLED, DISABLED
subscriberlog	<String>	Read-write	Log subscriber session event information. Possible values = ENABLED, DISABLED
sslinterception	<String>	Read-write	Log SSL Interception event information. Possible values = ENABLED, DISABLED
urlfiltering	<String>	Read-write	Log URL filtering event information. Possible values = ENABLED, DISABLED
contentinspectionlog	<String>	Read-write	Log Content Inspection event information. Possible values = ENABLED, DISABLED
domainresolvenow	<Boolean>	Read-write	Immediately send a DNS query to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resolve the server's domain name.
ip	<String>	Read-only	The resolved IP address of the auditserver.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogaction

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"auditnslogaction":{
```

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogaction? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditnslogaction": [ { "__count": "#no"} ] }
```

auditnslogglobal_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to auditnslogglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 2147483647
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
builtin	<String[]>	Read-write	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
policyname	<String>	Read-write	Name of the audit nslog policy.
numpol	<Double>	Read-only	number of polices bound to label.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/auditnslogglobal_auditnslogpolicy_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"auditnslogglobal_auditnslogpolicy_binding":{

<b>      "policyname":<String_value>,

</b><b>      "priority":<Double_value>,

</b>      "globalbindtype":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogglobal_auditnslogpolicy_binding

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogglobal_auditnslogpolicy_binding?**args=policyname: <String_value> ,globalbindtype: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogglobal_auditnslogpolicy_binding

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogglobal_auditnslogpolicy_binding?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditnslogglobal_auditnslogpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogglobal_auditnslogpolicy_binding?**pagesize=#no;pageno=#no**

Use this query-parameter to get the auditnslogglobal_auditnslogpolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditnslogglobal_auditnslogpolicy_binding": [ {
```

```
        "priority":<Double_value>,

        "globalbindtype":<String_value>,

        "builtin":<String[]_value>,

        "policyname":<String_value>,

        "numpol":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogglobal_auditnslogpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogglobal_auditnslogpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditnslogglobal_auditnslogpolicy_binding": [ {

      "priority":<Double_value>,

      "globalbindtype":<String_value>,

      "builtin":<String[]_value>,

      "policyname":<String_value>,

      "numpol":<Double_value>

}]}
```

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditnslogglobal_binding": [ {

      "auditnslogglobal_auditnslogpolicy_binding":<auditnslogglobal_auditn
slogpolicy_binding[]_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogglobal_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditnslogglobal_binding": [ {

      "auditnslogglobal_auditnslogpolicy_binding":<auditnslogglobal_auditn
slogpolicy_binding[]_value>
```

```
}]}
```

auditnslogparams

Configuration for ns log parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of the nslog server. Minimum length = 1
serverport	<Integer>	Read-write	Port on which the nslog server accepts connections. Minimum value = 1
dateformat	<String>	Read-write	Format of dates in the logs. Supported formats are: * MMDDYYYY - U.S. style month/date/year format. * DDMMYYYY - European style date/month/year format. * YYYYMMDD - ISO style year/month/date format.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MMDDYYYY, DDMMYYYY, YYYYMMDD
loglevel	<String[]>	Read-write	Types of information to be logged. Available settings function as follows: * ALL - All events. * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. * NONE - No events. Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG, NONE
logfacility	<String>	Read-write	Facility value, as defined in RFC 3164, assigned to the log message. Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the Citrix ADC itself, the VPN, or external.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7
tcp	<String>	Read-write	Configure auditing to log TCP messages. Possible values = NONE, ALL
acl	<String>	Read-write	Configure auditing to log access control list (ACL) messages. Possible values = ENABLED, DISABLED
timezone	<String>	Read-write	Time zone used for date and timestamps in the logs. Supported settings are: * GMT_TIME - Coordinated Universal Time. * LOCAL_TIME - Use the server's timezone setting. Possible values = GMT_TIME, LOCAL_TIME
userdefinedauditlog	<String>	Read-write	Log user-configurable log messages to nslog.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria. Possible values = YES, NO
appflowexport	<String>	Read-write	Export log messages to AppFlow collectors. Appflow collectors are entities to which log messages can be sent so that some action can be performed on them. Possible values = ENABLED, DISABLED
lsn	<String>	Read-write	Log the LSN messages. Possible values = ENABLED, DISABLED
alg	<String>	Read-write	Log the ALG messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
subscriberlog	<String>	Read-write	Log subscriber session event information. Possible values = ENABLED, DISABLED
sslinterception	<String>	Read-write	Log SSL Interception event information. Possible values = ENABLED, DISABLED
urlfiltering	<String>	Read-write	Log URL filtering event information. Possible values = ENABLED, DISABLED
contentinspectionlog	<String>	Read-write	Log Content Inspection event information. Possible values = ENABLED, DISABLED
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

 }]}
```

auditnslogpolicy

Configuration for ns log policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the nslog policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my nslog policy" or 'my nslog policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that defines the messages to be logged to the nslog server. Minimum length = 1
action	<String>	Read-write	Nslog server action that is performed when this policy matches. NOTE: An nslog server action must be associated with an nslog audit policy. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced). Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

auditnslogpolicy_aaagroup_binding

Binding object showing the aaagroup that can be bound to auditnslogpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the policy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_aaagroup_binding/name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_aaagroup_binding/name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditnslogpolicy_aaagroup_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_aaagroup_binding/name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the auditnslogpolicy_aaagroup_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditnslogpolicy_aaagroup_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_aaagroup_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_aaagroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditnslogpolicy_aaagroup_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_aaagroup_binding/name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"auditnslogpolicy_aaagroup_binding": [ { "__count": "#no"} ] }
```

auditnslogpolicy_aaauser_binding

Binding object showing the aaauser that can be bound to auditnslogpolicy.

Properties

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditnslogpolicy_binding": [ {

      "name":<String_value>,

      "auditnslogpolicy_systemglobal_binding":<auditnslogpolicy_systemglob
al_binding[]_value>,

      "auditnslogpolicy_aaagroup_binding":<auditnslogpolicy_aaagroup_bindi

```

auditnslogpolicy_csvserver_binding

Binding object showing the csvserver that can be bound to auditnslogpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the policy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_csvserver_binding/name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_csvserver_binding/name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditnslogpolicy_csvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_csvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the auditnslogpolicy_csvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditnslogpolicy_csvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_csvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_csvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditnslogpolicy_csvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_vpnvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_vpnvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditnslogpolicy_vpnvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_vpnvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the auditnslogpolicy_vpnvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditnslogpolicy_vpnvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_vpnvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_vpnvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditnslogpolicy_vpnvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditnslogpolicy_vpnvserver_binding/name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"auditnslogpolicy_vpnvserver_binding": [ { "__count": "#no"} ] }
```

auditsyslogaction

Configuration for system log action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the syslog action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the syslog action is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my syslog action" or 'my syslog action'). Minimum length = 1
serverip	<String>	Read-write	IP address of the syslog server. Minimum length = 1
serverdomainname	<String>	Read-write	SYSLOG server name as a FQDN. Mutually exclusive with serverIP/ lbVserverName. Minimum length = 1 Maximum length = 255
domainresolveretry	<Integer>	Read-write	Time, in seconds, for which the Citrix ADC waits before sending another DNS query to resolve the host name of the syslog server if the last query failed. Default value: 5 Minimum value = 5 Maximum value = 20939
lbvservername	<String>	Read-write	Name of the LB vserver. Mutually exclusive with syslog

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			serverIP/ serverName. Minimum length = 1 Maximum length = 127
serverport	<Integer>	Read-write	Port on which the syslog server accepts connections. Minimum value = 1
loglevel	<String[]>	Read-write	Audit log level, which specifies the types of events to log. Available values function as follows: * ALL - All events. * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. * NONE - No events. Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG, NONE
dateformat	<String>	Read-write	Format of dates in the logs. Supported formats are: * MMDDYYYY. -U.S. style month/ date/year format.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DDMMYYYY - European style date/month/year format. * YYYYMMDD - ISO style year/ month/date format. Possible values = MMDDYYYY, DDMMYYYY, YYYYMMDD
logfacility	<String>	Read-write	Facility value, as defined in RFC 3164, assigned to the log message. Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the Citrix ADC itself, the VPN, or external. Possible values = LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7
tcp	<String>	Read-write	Log TCP messages. Possible values = NONE, ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
acl	<String>	Read-write	Log access control list (ACL) messages. Possible values = ENABLED, DISABLED
timezone	<String>	Read-write	Time zone used for date and timestamps in the logs. Supported settings are: * GMT_TIME. Coordinated Universal time. * LOCAL_TIME. Use the server's timezone setting. Possible values = GMT_TIME, LOCAL_TIME
userdefinedauditlog	<String>	Read-write	Log user-configurable log messages to syslog. Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that meet the other logging criteria. Possible values = YES, NO
appflowexport	<String>	Read-write	Export log messages to AppFlow collectors. Appflow collectors are entities to which log messages can be sent so that some action can be performed on them. Possible values = ENABLED, DISABLED
lsn	<String>	Read-write	Log lsn info. Possible values = ENABLED, DISABLED
alg	<String>	Read-write	Log alg info. Possible values = ENABLED, DISABLED
subscriberlog	<String>	Read-write	Log subscriber session event information. Possible values = ENABLED, DISABLED
transport	<String>	Read-write	Transport type used to send auditlogs to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			syslog server. Default type is UDP. Possible values = TCP, UDP
tcpprofilename	<String>	Read-write	Name of the TCP profile whose settings are to be applied to the audit server info to tune the TCP connection parameters. Minimum length = 1 Maximum length = 127
maxlogdatasizetohold	<Double>	Read-write	Max size of log data that can be held in NSB chain of server info. Default value: 500 Minimum value = 50 Maximum value = 25600
dns	<String>	Read-write	Log DNS related syslog messages. Possible values = ENABLED, DISABLED
contentinspectionlog	<String>	Read-write	Log Content Inspection event information. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
netprofile	<String>	Read-write	Name of the network profile. The SNIP configured in the network profile will be used as source IP while sending log messages. Minimum length = 1 Maximum length = 127
sslinterception	<String>	Read-write	Log SSL Interception event information. Possible values = ENABLED, DISABLED
urlfiltering	<String>	Read-write	Log URL filtering event information. Possible values = ENABLED, DISABLED
domainresolvenow	<Boolean>	Read-write	Immediately send a DNS query to resolve the server's domain name.
ip	<String>	Read-only	The resolved IP address of the syslog server.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

auditsyslogglobal_auditsyslogpolicy_binding

Binding object showing the auditsyslogpolicy that can be bound to auditsyslogglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 2147483647
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
feature	<String>	Read-write	The feature to be checked while applying this config.
builtin	<String[]>	Read-write	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
policyname	<String>	Read-write	Name of the audit syslog policy.
numpol	<Double>	Read-only	number of polices bound to label.
__count	<Double>	Read-only	count parameter

Operations

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditsyslogglobal_auditsyslogpolicy_binding": [ { "__count": "#no"} ] }
```

auditsyslogglobal_binding

Binding object which returns the resources bound to auditsyslogglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
auditsyslogglobal_auditsyslogpolicy_binding	<auditsyslogglobal_auditsyslogpolicy_binding[]>	Read-write	auditsyslogpolicy that can be bound to auditsyslogglobal.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditsyslogglobal_binding": [ {

      "auditsyslogglobal_auditsyslogpolicy_binding":<auditsyslogglobal_aud
itsyslogpolicy_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogglobal_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "auditsyslogglobal_binding": [ {

      "auditsyslogglobal_auditsyslogpolicy_binding":<auditsyslogglobal_aud
itsyslogpolicy_binding[]_value>

}]}
```

auditsyslogparams

Configuration for system log parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of the syslog server. Minimum length = 1
serverport	<Integer>	Read-write	Port on which the syslog server accepts connections. Minimum value = 1
dateformat	<String>	Read-write	Format of dates in the logs. Supported formats are: * MMDDYYYY - U.S. style month/ date/year format. * DDMMYYYY. European style

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-date/month/year format. * YYYYMMDD - ISO style year/ month/date format. Possible values = MMDDYYYY, DDMMYYYY, YYYYMMDD
loglevel	<String[]>	Read-write	Types of information to be logged. Available settings function as follows: * ALL - All events. * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. * NONE - No events. Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG, NONE
logfacility	<String>	Read-write	Facility value, as defined in RFC 3164, assigned to the log message. Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from, such as the Citrix ADC itself, the VPN, or external. Possible values = LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7
tcp	<String>	Read-write	Log TCP messages. Possible values = NONE, ALL
acl	<String>	Read-write	Log access control list (ACL) messages. Possible values = ENABLED, DISABLED
timezone	<String>	Read-write	Time zone used for date and timestamps in the logs. Available settings function as follows: * GMT_TIME - Coordinated Universal Time. * LOCAL_TIME Use the server's timezone setting. Possible values = GMT_TIME, LOCAL_TIME

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
userdefinedauditlog	<String>	Read-write	Log user-configurable log messages to syslog. Setting this parameter to NO causes audit to ignore all user-configured message actions. Setting this parameter to YES causes audit to log user-configured message actions that meet the other logging criteria. Possible values = YES, NO
appflowexport	<String>	Read-write	Export log messages to AppFlow collectors. Appflow collectors are entities to which log messages can be sent so that some action can be performed on them. Possible values = ENABLED, DISABLED
lsn	<String>	Read-write	Log the LSN messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
alg	<String>	Read-write	Log the ALG messages. Possible values = ENABLED, DISABLED
subscriberlog	<String>	Read-write	Log subscriber session event information. Possible values = ENABLED, DISABLED
dns	<String>	Read-write	Log DNS related syslog messages. Possible values = ENABLED, DISABLED
sslinterception	<String>	Read-write	Log SSL Interceptionn event information. Possible values = ENABLED, DISABLED
urlfiltering	<String>	Read-write	Log URL filtering event information. Possible values = ENABLED, DISABLED
contentinspectionlog	<String>	Read-write	Log Content Inspection event ifnormation.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

```

auditsyslogpolicy

Configuration for system log policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the syslog policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my syslog policy" or 'my syslog policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			an expression, that defines the messages to be logged to the syslog server. Minimum length = 1
action	<String>	Read-write	Syslog server action to perform when this policy matches traffic. NOTE: A syslog server action must be associated with a syslog audit policy. Minimum length = 1
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced). Possible values = Classic Policy, Advanced Policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_aaauser_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_aaauser_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditsyslogpolicy_aaauser_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_aaauser_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the auditsyslogpolicy_aaauser_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditsyslogpolicy_aaauser_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_aaauser_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_aaauser_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditsyslogpolicy_aaauser_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_lbvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_lbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditsyslogpolicy_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_lbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the auditsyslogpolicy_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditsyslogpolicy_lbvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_lbvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "auditsyslogpolicy_lbvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/auditsyslogpolicy_lbvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"auditsyslogpolicy_lbvserver_binding": [ { "__count": "#no"} ] }
```

auditsyslogpolicy_rnatglobal_binding

Binding object showing the rnatglobal that can be bound to auditsyslogpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

authenticationcaptchaaction	Configuration for Captcha Action
authenticationcertaction	Configuration for CERT action
authenticationcertpolicy	Configuration for CERT policy
authenticationcertpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationcertpolicy
authenticationcertpolicy_binding	Binding object showing the resources that can be bound to authenticationcertpolicy
authenticationcertpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationcertpolicy
authenticationcertpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationcertpolicy

NAME	DESCRIPTION
authenticationcitrixauthaction	Configuration for Citrix Authentication action
authenticationdfaaction	Configuration for Dfa authentication action
authenticationdfapolicy	Configuration for Dfa authentication policy
authenticationdfapolicy_binding	Binding object showing the resources that can be bound to authenticationdfapolicy
authenticationdfapolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationdfapolicy
authenticationemailaction	Configuration for Email entity
authenticationepaaction	Configuration for epa action
authenticationldapaction	Configuration for LDAP action
authenticationldappolicy	Configuration for LDAP policy
authenticationldappolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationldappolicy
authenticationldappolicy_binding	Binding object showing the resources that can be bound to authenticationldappolicy
authenticationldappolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationldappolicy

NAME	DESCRIPTION
authenticationldappolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationldappolicy
authenticationldappolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationldappolicy
authenticationlocalpolicy	Configuration for LOCAL policy
authenticationlocalpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationlocalpolicy
authenticationlocalpolicy_binding	Binding object showing the resources that can be bound to authenticationlocalpolicy
authenticationlocalpolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationlocalpolicy
authenticationlocalpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationlocalpolicy
authenticationlocalpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationlocalpolicy
authenticationloginschema	
authenticationloginschemapolicy	
authenticationloginschemapolicy_authenticationvserver_binding	
authenticationloginschemapolicy_binding	

NAME	DESCRIPTION
authenticationloginschemapolicy_vpnvserver_binding	
authenticationnegotiateaction	Configuration for Negotiate action
authenticationnegotiatepolicy	Configuration for Negotiate Policy
authenticationnegotiatepolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationnegotiatepolicy
authenticationnegotiatepolicy_binding	Binding object showing the resources that can be bound to authenticationnegotiatepolicy
authenticationnegotiatepolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationnegotiatepolicy
authenticationnegotiatepolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationnegotiatepolicy
authenticationnoauthaction	Configuration for no authentication action
authenticationoauthaction	Configuration for OAuth authentication action
authenticationoauthidppolicy	Configuration for AAA OAuth IdentityProvider (IdP) policy

NAME	DESCRIPTION
authenticationoauthidppolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationoauthidppolicy
authenticationoauthidppolicy_binding	Binding object showing the resources that can be bound to authenticationoauthidppolicy
authenticationoauthidppolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationoauthidppolicy
authenticationoauthidpprofile	Configuration for OAuth Identity Provider (IdP) profile
authenticationpolicy	Configuration for Authentication Policy
authenticationpolicy_authenticationpolicylabel_binding	Binding object showing the authenticationpolicylabel that can be bound to authenticationpolicy
authenticationpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationpolicy
authenticationpolicy_binding	Binding object showing the resources that can be bound to authenticationpolicy
authenticationpolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationpolicy

NAME	DESCRIPTION
authenticationpolicylabel	Configuration for authentication policy label
authenticationpolicylabel_authenticationpolicy_binding	Binding object showing the authenticationpolicy that can be bound to authenticationpolicylabel
authenticationpolicylabel_binding	Binding object showing the resources that can be bound to authenticationpolicylabel
authenticationpushservice	Configuration for Service details for sending push notifications
authenticationradiusaction	Configuration for RADIUS action
authenticationradiuspolicy	Configuration for RADIUS policy
authenticationradiuspolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationradiuspolicy
authenticationradiuspolicy_binding	Binding object showing the resources that can be bound to authenticationradiuspolicy
authenticationradiuspolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationradiuspolicy
authenticationradiuspolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationradiuspolicy
authenticationradiuspolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationradiuspolicy

NAME	DESCRIPTION
authenticationsamlaction	Configuration for AAA Saml action
authenticationsamlidppolicy	Configuration for AAA Saml IdentityProvider (IdP) policy
authenticationsamlidppolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationsamlidppolicy
authenticationsamlidppolicy_binding	Binding object showing the resources that can be bound to authenticationsamlidppolicy
authenticationsamlidppolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationsamlidppolicy
authenticationsamlidpprofile	Configuration for AAA Saml IdentityProvider (IdP) profile
authenticationsamlpolicy	Configuration for AAA Saml policy
authenticationsamlpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationsamlpolicy
authenticationsamlpolicy_binding	Binding object showing the resources that can be bound to authenticationsamlpolicy
authenticationsamlpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationsamlpolicy

NAME	DESCRIPTION
authenticationsamlpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationsamlpolicy
authenticationstorefrontauthaction	Configuration for Storefront authentication action
authenticationtacacsaction	Configuration for TACACS action
authenticationtacacspolicy	Configuration for TACACS policy
authenticationtacacspolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationtacacspolicy
authenticationtacacspolicy_binding	Binding object showing the resources that can be bound to authenticationtacacspolicy
authenticationtacacspolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationtacacspolicy
authenticationtacacspolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationtacacspolicy
authenticationtacacspolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationtacacspolicy
authenticationvserver	Configuration for authentication virtual server
authenticationvserver_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to authenticationvserver

NAME	DESCRIPTION
authenticationvserver_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to authenticationvserver
authenticationvserver_authenticationcertpolicy_binding	Binding object showing the authenticationcertpolicy that can be bound to authenticationvserver
authenticationvserver_authenticationldappolicy_binding	Binding object showing the authenticationldappolicy that can be bound to authenticationvserver
authenticationvserver_authenticationlocalpolicy_binding	Binding object showing the authenticationlocalpolicy that can be bound to authenticationvserver
authenticationvserver_authenticationloginschemapolicy_binding	Binding object showing the authenticationloginschemapolicy that can be bound to authenticationvserver
authenticationvserver_authenticationnegotiatepolicy_binding	Binding object showing the authenticationnegotiatepolicy that can be bound to authenticationvserver
authenticationvserver_authenticationoauthidppolicy_binding	Binding object showing the authenticationoauthidppolicy that can be bound to authenticationvserver
authenticationvserver_authenticationpolicy_binding	Binding object showing the authenticationpolicy that can be bound to authenticationvserver

NAME	DESCRIPTION
authenticationvserver_authenticationradiuspolicy_binding	Binding object showing the authenticationradiuspolicy that can be bound to authenticationvserver
authenticationvserver_authenticationsamlidppolicy_binding	Binding object showing the authenticationsamlidppolicy that can be bound to authenticationvserver
authenticationvserver_authenticationsamlpolicy_binding	Binding object showing the authenticationsamlpolicy that can be bound to authenticationvserver
authenticationvserver_authenticationtacacspolicy_binding	Binding object showing the authenticationtacacspolicy that can be bound to authenticationvserver
authenticationvserver_authenticationwebauthpolicy_binding	Binding object showing the authenticationwebauthpolicy that can be bound to authenticationvserver
authenticationvserver_binding	Binding object showing the resources that can be bound to authenticationvserver
authenticationvserver_cachepolicy_binding	Binding object showing the cachepolicy that can be bound to authenticationvserver
authenticationvserver_cspolicy_binding	Binding object showing the cspolicy that can be bound to authenticationvserver
authenticationvserver_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to authenticationvserver

NAME	DESCRIPTION
authenticationvserver_tmsessionpolicy_binding	Binding object showing the tmsessionpolicy that can be bound to authenticationvserver
authenticationvserver_vpnportaltheme_binding	Binding object showing the vpnportaltheme that can be bound to authenticationvserver
authenticationwebauthaction	Configuration for Web authentication action
authenticationwebauthpolicy	Configuration for Web authentication policy
authenticationwebauthpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationwebauthpolicy
authenticationwebauthpolicy_binding	Binding object showing the resources that can be bound to authenticationwebauthpolicy
authenticationwebauthpolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationwebauthpolicy
authenticationwebauthpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationwebauthpolicy
authenticationwebauthpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationwebauthpolicy

authenticationadfsproxyprofile

Configuration for ADFSProxy Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the adfs proxy profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after the profile is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my push service" or 'my push service'). . Minimum length = 1 Maximum length = 127
username	<String>	Read-write	This is the name of an account in directory that would be used to authenticate trust

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			request from ADC acting as a proxy. Minimum length = 1
password	<String>	Read-write	This is the password of an account in directory that would be used to authenticate trust request from ADC acting as a proxy. Minimum length = 1
serverurl	<String>	Read-write	Fully qualified url of the adfs server. Minimum length = 1
certkeyname	<String>	Read-write	SSL certificate of the proxy that is registered at adfs server for trust. Minimum length = 1
adfstruststatus	<String>	Read-only	Describes status of ADFS trust. Default value: INIT Possible values = INIT, FAILED, ESTABLISHED, ESTABLISHED/ CONFIGURED, ESTABLISHED_RE NEW_SUCCESS, ESTABLISHED_RE NEW_FAILED, RENEWED/ CONFIGURED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationadfsproxyprofile":{

<b>      "name":<String_value>,

</b><b>      "username":<String_value>,

</b><b>      "password":<String_value>,

</b><b>      "serverurl":<String_value>,

</b><b>      "certkeyname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile/name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationadfsproxyprofile":{

<b>      "name":<String_value>,

</b>      "username":<String_value>,

      "password":<String_value>,

      "serverurl":<String_value>,

      "certkeyname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationadfsproxyprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile? **view=summary**

Use this query-parameter to get the summary output of authenticationadfsproxyprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationadfsproxyprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationadfsproxyprofile": [ {

      "name":<String_value>,

      "username":<String_value>,

      "password":<String_value>,

      "serverurl":<String_value>,

      "certkeyname":<String_value>,

      "adfstruststatus":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile/name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of authenticationadfsproxyprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationadfsproxyprofile": [ {

      "name":<String_value>,

      "username":<String_value>,

      "password":<String_value>,
```

```
        "serverurl":<String_value>,

        "certkeyname":<String_value>,

        "adfstruststatus":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationadfsproxyprofile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationadfsproxyprofile": [ { "__count": "#no"} ] }
```

authenticationauthnprofile

Configuration for Authentication profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the authentication profile. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the RADIUS action is added. Minimum length = 1
authnvsname	<String>	Read-write	Name of the authentication vserver at which authentication should be done. Minimum length = 1 Maximum length = 128
authenticationhost	<String>	Read-write	Hostname of the authentication vserver to which user

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must be redirected for authentication. Minimum length = 1 Maximum length = 256
authenticationdomain	<String>	Read-write	Domain for which TM cookie must to be set. If unspecified, cookie will be set for FQDN. Minimum length = 1 Maximum length = 256
authenticationlevel	<Double>	Read-write	Authentication weight or level of the vserver to which this will bound. This is used to order TM vservers based on the protection required. A session that is created by authenticating against TM vserver at given level cannot be used to access TM vserver at a higher level. Minimum value = 0 Maximum value = 255
__count	<Double>	Read-only	count parameter

Response Payload:

```
{ "authenticationauthnprofile": [ { "__count": "#no"} ] }
```

authenticationazurekeyvault

Configuration for Azure Key Vault entity resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new Azure Key Vault profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
vaultname	<String>	Read-write	Name of the Azure vault account as configured in azure portal. Minimum length = 1 Maximum length = 63
clientid	<String>	Read-write	Unique identity of the relying party requesting for authentication. Minimum length = 1
clientsecret	<String>	Read-write	Unique secret string to authorize relying

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			party at authorization server. Minimum length = 1
servicekeyname	<String>	Read-write	Friendly name of the Key to be used to compute signature. Minimum length = 1
signaturealg	<String>	Read-write	Algorithm to be used to sign/verify transactions. Default value: RS256 Possible values = RS256
tokenendpoint	<String>	Read-write	URL endpoint on relying party to which the OAuth token is to be sent. Minimum length = 1
pushservice	<String>	Read-write	Name of the service used to send push notifications. Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the group that is added to user sessions that match current IdP policy. It can be used in policies to identify relying party trust.
refreshinterval	<Double>	Read-write	Interval at which access token in obtained.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 50
tenantid	<String>	Read-write	TenantID of the application. This is usually specific to providers such as Microsoft and usually refers to the deployment identifier.
authentication	<String>	Read-write	If authentication is disabled, otp checks are not performed after azure vault keys are obtained. This is useful to distinguish whether user has registered devices. . Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationazurekeyvault

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationazurekeyvault":{

<b>      "name":<String_value>,

</b><b>      "vaultname":<String_value>,

</b><b>      "clientid":<String_value>,

</b><b>      "clientsecret":<String_value>,

</b><b>      "servicekeyname":<String_value>,

</b>      "signaturealg":<String_value>,

      "tokenendpoint":<String_value>,

      "pushservice":<String_value>,

      "defaultauthenticationgroup":<String_value>,

      "refreshinterval":<Double_value>,

      "tenantid":<String_value>,

      "authentication":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationazurekeyvault/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationazurekeyvault

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationazurekeyvault":{

<b>      "name":<String_value>,

</b>      "vaultname":<String_value>,

      "defaultauthenticationgroup":<String_value>,

      "refreshinterval":<Double_value>,

      "tenantid":<String_value>,

      "authentication":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationazurekeyvault? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationazurekeyvault":{

<b>      "name":<String_value>,

</b>      "signaturealg":true,

      "pushservice":true,

      "defaultauthenticationgroup":true,
```

```
        "refreshinterval":true,

        "authentication":true

  }}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationazurekeyvault

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationazurekeyvault? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationazurekeyvault? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationazurekeyvault resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationazurekeyvault? **view=summary**

Use this query-parameter to get the summary output of authenticationazurekeyvault resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationazurekeyvault?
pagesize=#no;pageno=#no

Use this query-parameter to get the authenticationazurekeyvault resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationazurekeyvault": [ {

      "name":<String_value>,

      "vaultname":<String_value>,

      "clientid":<String_value>,

      "clientsecret":<String_value>,

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationazurekeyvault": [ { "__count": "#no"} ] }
```

authenticationcaptchaaction

Configuration for Captcha Action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new captcha action. Must begin with an ASCII alphanumeric or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the NetScaler CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
serverurl	<String>	Read-write	This is the endpoint at which captcha response is validated.
secretkey	<String>	Read-write	Secret of gateway as established at the captcha source.
sitekey	<String>	Read-write	Sitekey to identify gateway fqdn while loading captcha.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
defaultauthentication group	<String>	Read-write	This is the group that is added to user sessions that match current policy.
__count	<Double>	Read-only	count parameter

authenticationcertaction

Configuration for CERT action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the client cert authentication server profile (action). Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after certifcate action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
twofactor	<String>	Read-write	Enables or disables two-factor authentication. Two factor authentication is client cert authentication followed by password authentication. Default value: OFF Possible values = ON, OFF
usernamefield	<String>	Read-write	Client-cert field from which the username is extracted. Must be set to either ""Subject"" and ""Issuer"" (include both sets of double quotation marks). Format: <field>:<subfield>. Minimum length = 1
groupnamefield	<String>	Read-write	Client-cert field from which the group is extracted. Must be set to either ""Subject"" and ""Issuer"" (include both sets of double quotation marks). Format: <field>:<subfield>.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
__count	<Double>	Read-only	count parameter

- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationcertpolicy":{

<b>      "name":<String_value>,

</b><b>      "rule":<String_value>,
```

```
</b>      "reqaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationcertpolicy":{

<b>      "name":<String_value>,

</b>      "rule":<String_value>,

      "reqaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationcertpolicy":{

<b>      "name":<String_value>,

</b>      "rule":true,

      "reqaction":true
```

```
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationcertpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy? **view=summary**

Use this query-parameter to get the summary output of authenticationcertpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationcertpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationcertpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "reqaction":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of authenticationcertpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationcertpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "reqaction":<String_value>
```

```
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcertpolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationcertpolicy": [ { "__count": "#no"} ] }
```

authenticationcertpolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationcertpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the client cert authentication policy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

authenticationcitrixauthaction

Configuration for Citrix Authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new Citrix Authentication action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the NetScaler CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
authenticationtype	<String>	Read-write	Type of the Citrix Authentication implementation. Default implementation uses Citrix Cloud Connector. Default value: CITRIXCONNECTOR Possible values = CITRIXCONNECTOR, ATHENA
authentication	<String>	Read-write	Authentication needs to be disabled for searching user object without performing authentication.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationcitrixauthaction":{

<b>      "name":<String_value>,

</b>      "authenticationtype":<String_value>,

      "authentication":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationcitrixauthaction":{

<b>      "name":<String_value>,

</b>      "authenticationtype":true,

      "authentication":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationcitrixauthaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction? **view=summary**

Use this query-parameter to get the summary output of authenticationcitrixauthaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationcitrixauthaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationcitrixauthaction": [ {

      "name":<String_value>,

      "authenticationtype":<String_value>,

      "authentication":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of authenticationcitrixauthaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationcitrixauthaction": [ {

      "name":<String_value>,

      "authenticationtype":<String_value>,

      "authentication":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationcitrixauthaction? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationcitrixauthaction": [ { "__count": "#no"} ] }
```

authenticationdfaaction

Configuration for Dfa authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DFA action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the DFA action is added. Minimum length = 1
clientid	<String>	Read-write	If configured, this string is sent to the DFA server as the X-Citrix-Exchange header value.
serverurl	<String>	Read-write	DFA Server URL.
passphrase	<String>	Read-write	Key shared between the DFA server and the Citrix ADC. Required to allow the Citrix ADC to communicate with the DFA server. Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
success	<Double>	Read-only	.
failure	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD

- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfaaction

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationdfaaction":{

<b>      "name":<String_value>,

</b><b>      "clientid":<String_value>,

</b><b>      "serverurl":<String_value>,

</b><b>      "passphrase":<String_value>,

</b>      "defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfaaction/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfaaction

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationdfaaction":{

<b>      "name":<String_value>,

</b>      "clientid":<String_value>,

      "serverurl":<String_value>,

      "passphrase":<String_value>,

      "defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfaaction? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationdfaaction":{

<b>      "name":<String_value>,

</b>      "clientid":true,

      "serverurl":true,

      "defaultauthenticationgroup":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfaaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfaaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfaaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationdfaaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfaaction? **view=summary**

Use this query-parameter to get the summary output of authenticationdfaaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfaaction? **pagesize=#no;pageno=#no**

```

authenticationdfapolicy

Configuration for Dfa authentication policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DFA policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after DFA policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the Web server. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
action	<String>	Read-write	Name of the DFA action to perform if the policy matches. Minimum length = 1
__count	<Double>	Read-only	count parameter

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfapolicy_binding/name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationdfapolicy_binding": [ {

      "name":<String_value>,

      "authenticationdfapolicy_vpnvserver_binding":<authenticationdfapolic
y_vpnvserver_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfapolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfapolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationdfapolicy_binding": [ {

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfapolicy_vpnvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfapolicy_vpnvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationdfapolicy_vpnvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationdfapolicy_vpnvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationdfapolicy_vpnvserver_binding": [ { "__count": "#no"} ] }
```

authenticationemailaction

Configuration for Email entity resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new email action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
username	<String>	Read-write	Username/Clientid/ EmailID to be used to authenticate to the server. Minimum length = 1
password	<String>	Read-write	Password/ Clientsecret to use when authenticating to the server. Minimum length = 1
serverurl	<String>	Read-write	Address of the server that delivers the message. It is fully qualified fqdn such as http(s):// or smtp(s):// for http and smtp protocols respectively. For SMTP, the port number is mandatory like smtps:// smtp.example.com:25. Minimum length = 1
content	<String>	Read-write	Content to be delivered to the user. "$code" string within the content will be replaced with the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			actual one-time-code to be sent.
defaultauthentication group	<String>	Read-write	This is the group that is added to user sessions that match current IdP policy. It can be used in policies to identify relying party trust.
timeout	<Double>	Read-write	Time after which the code expires. Default value: 30
type	<String>	Read-write	Type of the email action. Default type is SMTP. Default value: SMTP Possible values = SMTP, ATHENA
emailaddress	<String>	Read-write	An optional expression that yields user's email. When not configured, user's default mail address would be used. When configured, result of this expression is used as destination email address.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationemailaction

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationemailaction":{

<b>      "name":<String_value>,

</b><b>      "username":<String_value>,

</b><b>      "password":<String_value>,

</b><b>      "serverurl":<String_value>,

</b>      "content":<String_value>,

      "defaultauthenticationgroup":<String_value>,

      "timeout":<Double_value>,

      "type":<String_value>,

      "emailaddress":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationemailaction/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationemailaction

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationemailaction":{

<b>      "name":<String_value>,

</b>      "username":<String_value>,

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationemailaction? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationemailaction":{

<b>      "name":<String_value>,

</b>      "content":true,

      "defaultauthenticationgroup":true,

      "timeout":true,
```

```
        "type":true,

        "emailaddress":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationemailaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationemailaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationemailaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationemailaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationemailaction? **view=summary**

Use this query-parameter to get the summary output of authenticationemailaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationemailaction?
pagesize=#no;pageno=#no

Use this query-parameter to get the authenticationemailaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

authenticationldapaction

Configuration for LDAP action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new LDAP action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the LDAP action is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1
serverip	<String>	Read-write	IP address assigned to the LDAP server. Minimum length = 1
servername	<String>	Read-write	LDAP server name as a FQDN. Mutually exclusive with LDAP IP address. Minimum length = 1
serverport	<Integer>	Read-write	Port on which the LDAP server accepts connections. Default value: 389 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authtimeout	<Double>	Read-write	Number of seconds the Citrix ADC waits for a response from the RADIUS server. Default value: 3 Minimum value = 1
ldapbase	<String>	Read-write	Base (node) from which to start LDAP searches. If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com.
ldapbinddn	<String>	Read-write	Full distinguished name (DN) that is used to bind to the LDAP server. Default: cn=Manager,dc=netscaler,dc=com.
ldapbinddnpassword	<String>	Read-write	Password used to bind to the LDAP server. Minimum length = 1
ldaploginname	<String>	Read-write	LDAP login name attribute. The Citrix ADC uses the LDAP login name to query external LDAP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			servers or Active Directories.
searchfilter	<String>	Read-write	String to be combined with the default LDAP user search string to form the search value. For example, if the search filter "vpnallowed=true" is combined with the LDAP login name "samaccount" and the user-supplied username is "bob", the result is the LDAP search string ""(;(vpnallowed=true)(samaccount=bob)"" (Be sure to enclose the search string in two sets of double quotation marks; both sets are needed.). Minimum length = 1
groupattrname	<String>	Read-write	LDAP group attribute name. Used for group extraction on the LDAP server.
subattributename	<String>	Read-write	LDAP group sub-attribute name. Used for group extraction from the LDAP server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sectype	<String>	Read-write	Type of security used for communications between the Citrix ADC and the LDAP server. For the PLAINTEXT setting, no encryption is required. Default value: PLAINTEXT Possible values = PLAINTEXT, TLS, SSL
svrtype	<String>	Read-write	The type of LDAP server. Default value: AAA_LDAP_SERVER_TYPE_DEFAULT Possible values = AD, NDS
ssonameattribute	<String>	Read-write	LDAP single signon (SSO) attribute. The Citrix ADC uses the SSO name attribute to query external LDAP servers or Active Directories for an alternate username.
authentication	<String>	Read-write	Perform LDAP authentication.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If authentication is disabled, any LDAP authentication attempt returns authentication success if the user is found. CAUTION! Authentication should be disabled only for authorization group extraction or where other (non-LDAP) authentication methods are in use and either bound to a primary list or flagged as secondary. Default value: ENABLED Possible values = ENABLED, DISABLED
requireuser	<String>	Read-write	Require a successful user search for authentication. CAUTION! This field should be set to NO only if usersearch not required [Both username validation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			as well as password validation skipped] and (non-LDAP) authentication methods are in use and either bound to a primary list or flagged as secondary. Default value: YES Possible values = YES, NO
passwdchange	<String>	Read-write	Allow password change requests. Default value: DISABLED Possible values = ENABLED, DISABLED
nestedgroupextraction	<String>	Read-write	Allow nested group extraction, in which the Citrix ADC queries external LDAP servers to determine whether a group is part of another group. Default value: OFF Possible values = ON, OFF
maxnestinglevel	<Double>	Read-write	If nested group extraction is ON, specifies the number

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of levels up to which group extraction is performed. Default value: 2 Minimum value = 2
followreferrals	<String>	Read-write	Setting this option to ON enables following LDAP referrals received from the LDAP server. Default value: OFF Possible values = ON, OFF
maxldapreferrals	<Double>	Read-write	Specifies the maximum number of nested referrals to follow. Default value: 1 Minimum value = 1
referraldnslookup	<String>	Read-write	Specifies the DNS Record lookup Type for the referrals. Default value: A-REC Possible values = A-REC, SRV-REC, MSSRV-REC
mssrvrecordlocation	<String>	Read-write	MSSRV Specific parameter. Used to locate the DNS node to which the SRV record pertains in the domainname. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			domainname is appended to it to form the srv record. Example : For "dc._msdcs", the srv record formed is _ldap._tcp.dc._msdcs.<domainname>.
validateservercert	<String>	Read-write	When to validate LDAP server certs. Default value: NO Possible values = YES, NO
ldaphostname	<String>	Read-write	Hostname for the LDAP server. If -validateServerCert is ON then this must be the host name on the certificate from the LDAP server. A hostname mismatch will cause a connection failure.
groupnameidentifier	<String>	Read-write	Name that uniquely identifies a group in LDAP or Active Directory.
groupsearchattribute	<String>	Read-write	LDAP group search attribute. Used to determine to which groups a group belongs.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupsearchsubattribute	<String>	Read-write	LDAP group search subattribute. Used to determine to which groups a group belongs.
groupsearchfilter	<String>	Read-write	String to be combined with the default LDAP group search string to form the search value. For example, the group search filter ""vpnallowed=true"" when combined with the group identifier ""samaccount"" and the group name ""g1"" yields the LDAP search string ""(;(vpnallowed=true)(samaccount=g1)"". (Be sure to enclose the search string in two sets of double quotation marks; both sets are needed.).
defaultauthenticationgroup	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
attribute1	<String>	Read-write	Expression that would be evaluated to extract attribute1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from the ldap response.
attribute2	<String>	Read-write	Expression that would be evaluated to extract attribute2 from the ldap response.
attribute3	<String>	Read-write	Expression that would be evaluated to extract attribute3 from the ldap response.
attribute4	<String>	Read-write	Expression that would be evaluated to extract attribute4 from the ldap response.
attribute5	<String>	Read-write	Expression that would be evaluated to extract attribute5 from the ldap response.
attribute6	<String>	Read-write	Expression that would be evaluated to extract attribute6 from the ldap response.
attribute7	<String>	Read-write	Expression that would be evaluated to extract attribute7 from the ldap response.
attribute8	<String>	Read-write	Expression that would be evaluated to extract attribute8

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from the ldap response.
attribute9	<String>	Read-write	Expression that would be evaluated to extract attribute9 from the ldap response.
attribute10	<String>	Read-write	Expression that would be evaluated to extract attribute10 from the ldap response.
attribute11	<String>	Read-write	Expression that would be evaluated to extract attribute11 from the ldap response.
attribute12	<String>	Read-write	Expression that would be evaluated to extract attribute12 from the ldap response.
attribute13	<String>	Read-write	Expression that would be evaluated to extract attribute13 from the ldap response.
attribute14	<String>	Read-write	Expression that would be evaluated to extract attribute14 from the ldap response.
attribute15	<String>	Read-write	Expression that would be evaluated to extract attribute15

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from the ldap response.
attribute16	<String>	Read-write	Expression that would be evaluated to extract attribute16 from the ldap response.
attributes	<String>	Read-write	List of attribute names separated by ',' which needs to be fetched from ldap server. Note that preceeding and trailing spaces will be removed. Attribute name can be 127 bytes and total length of this string should not cross 2047 bytes. These attributes have multi-value support separated by ',' and stored as key-value pair in AAA session.
sshpublickey	<String>	Read-write	SSH PublicKey is attribute on AD. This attribute is used to retrieve ssh PublicKey for RBA authentication. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pushservice	<String>	Read-write	Name of the service used to send push notifications. Minimum length = 1
otpsecret	<String>	Read-write	OneTimePassword(OTP) Secret key attribute on AD. This attribute is used to store and retrieve secret key used for OTP check. Minimum length = 1
email	<String>	Read-write	The Citrix ADC uses the email attribute to query the Active Directory for the email id of a user. Default value: mail Maximum length = 128
kbattribute	<String>	Read-write	KnowledgeBasedAuthentication(KBA) attribute on AD. This attribute is used to store and retrieve preconfigured Question and Answer knowledge base used for KBA authentication. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
alternateemailattr	<String>	Read-write	The NetScaler appliance uses the alternateive email attribute to query the Active Directory for the alternative email id of a user. Maximum length = 128
success	<Double>	Read-only	.
failure	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationldapaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldapaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldapaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationldapaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldapaction? **view=summary**

Use this query-parameter to get the summary output of authenticationldapaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldapaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationldapaction resources in chunks.

HTTP Method: GET

Request Headers:

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationldapaction": [ { "__count": "#no"} ] }
```

authenticationldappolicy

Configuration for LDAP policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LDAP policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after LDAP policy is created. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the LDAP server. Minimum length = 1
reqaction	<String>	Read-write	Name of the LDAP action to perform if the policy matches. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE

- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationldappolicy":{

<b>      "name":<String_value>,

</b><b>      "rule":<String_value>,

</b>      "reqaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationldappolicy":{

<b>      "name":<String_value>,

</b>      "rule":<String_value>,

      "reqaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationldappolicy":{

<b>      "name":<String_value>,

</b>      "rule":true,

      "reqaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationldappolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy? **view=summary**

Use this query-parameter to get the summary output of authenticationldappolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy?
pagesize=#no;pageno=#no

Use this query-parameter to get the authenticationldappolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationldappolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "reqaction":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of authenticationldappolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationldappolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "reqaction":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationldappolicy": [ { "__count": "#no"} ] }
```

authenticationldappolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationldappolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the LDAP policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationldappolicy_authenticationvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationldappolicy_authenticationvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationldappolicy_authenticationvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationldappolicy_authenticationvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationldappolicy_authenticationvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationldappolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationldappolicy_authenticationvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationldappolicy_authenticationvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationldappolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationldappolicy_authenticationvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationldappolicy_authenticationvserver_binding": [ { "__count":
"#no"} ] }
```

authenticationldappolicy_binding

Binding object which returns the resources bound to authenticationldappolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the LDAP policy. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authenticationldappolicy_vpnglobal_binding	<authenticationldappolicy_vpnglobal_binding[]>	Read-only	vpnglobal that can be bound to authenticationldappolicy.
authenticationldappolicy_vpnvserver_binding	<authenticationldappolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to authenticationldappolicy.
authenticationldappolicy_systemglobal_binding	<authenticationldappolicy_systemglobal_binding[]>	Read-only	systemglobal that can be bound to authenticationldappolicy.
authenticationldappolicy_authenticationvserver_binding	<authenticationldappolicy_authenticationvserver_binding[]>	Read-only	authenticationvserver that can be bound to authenticationldappolicy.

Operations

(click to see Properties)

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationldappolicy_vpnvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationldappolicy_vpnvserver_binding": [ { "__count": "#no"} ] }
```

authenticationlocalpolicy

Configuration for LOCAL policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the local authentication policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after local policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy').
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to perform the authentication.
reqaction	<String>	Read-only	The name of the RADIUS action the policy uses.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationlocalpolicy":{

<b>      "name":<String_value>,

</b><b>      "rule":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationlocalpolicy":{

<b>      "name":<String_value>,

</b>      "rule":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationlocalpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy? **view=summary**

Use this query-parameter to get the summary output of authenticationlocalpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationlocalpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationlocalpolicy": [ {
      "name":<String_value>,
      "rule":<String_value>,
      "reqaction":<String_value>
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of authenticationlocalpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationlocalpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "reqaction":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationlocalpolicy": [ { "__count": "#no"} ] }
```

authenticationlocalpolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationlocalpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the local authentication policy.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationlocalpolicy_authenticationvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationlocalpolicy_authenticationvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationlocalpolicy_authenticationvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationlocalpolicy_authenticationvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationlocalpolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationlocalpolicy_authenticationvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationlocalpolicy_authenticationvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

```

authenticationlocalpolicy_binding

Binding object which returns the resources bound to authenticationlocalpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the local authentication policy.
authenticationlocalpolicy_vpnvserver_binding	<authenticationlocalpolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to authenticationlocalpolicy.
authenticationlocalpolicy_systemglobal_binding	<authenticationlocalpolicy_systemglobal_binding[]>	Read-only	systemglobal that can be bound to authenticationlocalpolicy.
authenticationlocalpolicy_authenticationvserver_binding	<authenticationlocalpolicy_authenticationvserver_binding[]>	Read-only	authenticationvserver that can be bound to authenticationlocalpolicy.
authenticationlocalpolicy_vpnglobal_binding	<authenticationlocalpolicy_vpnglobal_binding[]>	Read-only	vpnglobal that can be bound to authenticationlocalpolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy_vpnvserver_binding/name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationlocalpolicy_vpnvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy_vpnvserver_binding/name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationlocalpolicy_vpnvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationlocalpolicy_vpnvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy_vpnvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy_vpnvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationlocalpolicy_vpnvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationlocalpolicy_vpnvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationlocalpolicy_vpnvserver_binding": [ { "__count": "#no"} ] }
```

authenticationloginschema

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new login schema. Login schema defines the way login form is rendered. It provides a way to customize the fields that are shown to the user. Must begin with an ASCII alphanumeric or underscore (_)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
authenticationschema	<String>	Read-write	Name of the file for reading authentication schema to be sent for Login Page UI. This file should contain xml definition of elements as per Citrix Forms Authentication Protocol to be able to render login form. If administrator does

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			not want to prompt users for additional credentials but continue with previously obtained credentials, then "noschema" can be given as argument. Please note that this applies only to loginSchemas that are used with user-defined factors, and not the vserver factor. Minimum length = 1
userexpression	<String>	Read-write	Expression for username extraction during login. This can be any relevant advanced policy expression. Minimum length = 1
passwdexpression	<String>	Read-write	Expression for password extraction during login. This can be any relevant advanced policy expression. Minimum length = 1
usercredentialindex	<Double>	Read-write	The index at which user entered username should be stored in session. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 16
passwordcredentialindex	<Double>	Read-write	The index at which user entered password should be stored in session. Minimum value = 1 Maximum value = 16
authenticationstrength	<Double>	Read-write	Weight of the current authentication. Minimum value = 0 Maximum value = 65535
ssocredentials	<String>	Read-write	This option indicates whether current factor credentials are the default SSO (SingleSignOn) credentials. Default value: NO Possible values = YES, NO
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationloginschema

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationloginschema":{

<b>      "name":<String_value>,

</b><b>      "authenticationschema":<String_value>,

</b>      "userexpression":<String_value>,

      "passwdexpression":<String_value>,

      "usercredentialindex":<Double_value>,

      "passwordcredentialindex":<Double_value>,

      "authenticationstrength":<Double_value>,

      "ssocredentials":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationloginschema/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationloginschema

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationloginschema":{

<b>      "name":<String_value>,

authenticationloginschemapolicy

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LoginSchema policy. This is used for selecting parameters for user logon. Must begin with an ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression which is evaluated to choose a profile for authentication. The following requirements apply only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks. Minimum length = 1
action	<String>	Read-write	Name of the profile to apply to requests or connections that match this policy. * NOOP - Do not take any specific action when this policy evaluates to true. This is useful to implicitly go to a different policy set.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* RESET - Reset the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user. Minimum length = 1
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the LoginSchema policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my loginschemapolicy policy" or 'my loginschemapolicy policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefhits	<Double>	Read-only	Number of Undef hits.
builtin	<String[]>	Read-only	Flag to determine if policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

filter

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationloginschemapolicy_authenticationvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationloginschemapolicy_authenticationvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationloginschemapolicy_authenticationvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationloginschemapolicy_authenticationvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationloginschemapolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Double_value>,

      "labelname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationloginschemapolicy_authenticationvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationloginschemapolicy_authenticationvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationloginschemapolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,
```

```
        "activepolicy":<Double_value>,

        "labelname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationloginschemapolicy_authenticationvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationloginschemapolicy_authenticationvserver_binding":
[ { "__count": "#no"} ] }
```

authenticationloginschemapolicy_binding

Binding object which returns the resources bound to authenticationloginschemapolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the LoginSchema policy for which to display detailed information. Minimum length = 1
authenticationloginschemapolicy_vpnvserver_binding	<authenticationloginschemapolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to authenticationloginschemapolicy.
authenticationloginschemapolicy_authenticationvserver_binding	<authenticationloginschemapolicy_authenticationvserver_binding[]>	Read-only	authenticationvserver that can be bound to authenticationloginschemapolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationloginschemapolicy_binding/name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationloginschemapolicy_binding": [ {

      "name":<String_value>,

      "authenticationloginschemapolicy_authenticationvserver_binding":<aut
henticationloginschemapolicy_authenticationvserver_binding[]_value>,

      "authenticationloginschemapolicy_vpnvserver_binding":<authentication
loginschemapolicy_vpnvserver_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationloginschemapolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/authenticationloginschemapolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationloginschemapolicy_binding": [ {

      "name":<String_value>,

      "authenticationloginschemapolicy_authenticationvserver_binding":<aut
henticationloginschemapolicy_authenticationvserver_binding[]_value>,

      "authenticationloginschemapolicy_vpnvserver_binding":<authentication
loginschemapolicy_vpnvserver_binding[]_value>

}]}
```

authenticationloginschemapolicy_vpnvserver_binding

Binding object showing the vpnvserver that can be bound to authenticationloginschemapolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the LoginSchema policy for which to display detailed information. Minimum length = 1
priority	<Double>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
activepolicy	<Double>	Read-only	.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

```

authenticationnegotiateaction

Configuration for Negotiate action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the AD KDC server profile (negotiate action). Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after AD KDC server profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1
domain	<String>	Read-write	Domain name of the service principal that represnts Citrix ADC. Minimum length = 1
domainuser	<String>	Read-write	User name of the account that is mapped with Citrix ADC principal. This can be given along with domain and password when keytab file is not available. If username is given along with keytab file, then that keytab file will be searched for this user's credentials. Minimum length = 1
domainuserpasswd	<String>	Read-write	Password of the account that is mapped to the Citrix ADC principal. Minimum length = 1
ou	<String>	Read-write	Active Directory organizational units (OU) attribute. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
defaultauthenticationgroup	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
keytab	<String>	Read-write	The path to the keytab file that is used to decrypt kerberos tickets presented to Citrix ADC. If keytab is not available, domain/username/password can be specified in the negotiate action configuration. Minimum length = 1
ntlmpath	<String>	Read-write	The path to the site that is enabled for NTLM authentication, including FQDN of the server. This is used when clients fallback to NTLM. Minimum length = 1
kcdspn	<String>	Read-only	Host SPN extracted from keytab file.
__count	<Double>	Read-only	count parameter

authenticationnegotiatepolicy

Configuration for Negotiate Policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the negotiate authentication policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after AD KCD (negotiate) policy is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the AD KCD server. Minimum length = 1
reqaction	<String>	Read-write	Name of the negotiate action to perform if the policy matches. Minimum length = 1
__count	<Double>	Read-only	count parameter

```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationnegotiatepolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnegotiatepolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnegotiatepolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationnegotiatepolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnegotiatepolicy? **view=summary**

Use this query-parameter to get the summary output of authenticationnegotiatepolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnegotiatepolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationnegotiatepolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationnegotiatepolicy": [ {
      "name":<String_value>,
      "rule":<String_value>,
      "reqaction":<String_value>
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationnegotiatepolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnegotiatepolicy/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnegotiatepolicy/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of authenticationnegotiatepolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationnegotiatepolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "reqaction":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationnegotiatepolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationnegotiatepolicy": [ { "__count": "#no"} ] }
```

authenticationnegotiatepolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationnegotiatepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the negotiate policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationnegotiatepolicy_authenticationvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationnegotiatepolicy_authenticationvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationnegotiatepolicy_authenticationvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationnegotiatepolicy_authenticationvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationnegotiatepolicy_authenticationvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationnegotiatepolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,
```

```
      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationnegotiatepolicy_authenticationvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationnegotiatepolicy_authenticationvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationnegotiatepolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationnegotiatepolicy_authenticationvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationnegotiatepolicy_authenticationvserver_binding":
```

```
[ { "__count": "#no"} ] }
```

authenticationnegotiatepolicy_binding

Binding object which returns the resources bound to authenticationnegotiatepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the negotiate policy. Minimum length = 1
authenticationnegotiatepolicy_vpnvserver_binding	<authenticationnegotiatepolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to authenticationnegotiatepolicy.
authenticationnegotiatepolicy_authenticationvserver_binding	<authenticationnegotiatepolicy_authenticationvserver_binding[]>	Read-only	authenticationvserver that can be bound to authenticationnegotiatepolicy.
authenticationnegotiatepolicy_vpnglobal_binding	<authenticationnegotiatepolicy_vpnglobal_binding[]>	Read-only	vpnglobal that can be bound to authenticationnegotiatepolicy.

Operations

```

authenticationnoauthaction

Configuration for no authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new no-authentication action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my action" or 'my action'). Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the group that is added to user sessions that match current policy.
__count	<Double>	Read-only	count parameter

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationnoauthaction":{

<b>      "name":<String_value>,

</b>      "defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationnoauthaction":{

<b>      "name":<String_value>,

</b>      "defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationnoauthaction":{

<b>      "name":<String_value>,

</b>      "defaultauthenticationgroup":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationnoauthaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction? **view=summary**

Use this query-parameter to get the summary output of authenticationnoauthaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationnoauthaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationnoauthaction? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationnoauthaction": [ { "__count": "#no"} ] }
```

authenticationoauthaction

Configuration for OAuth authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the OAuth Authentication action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1
oauthtype	<String>	Read-write	Type of the OAuth implementation. Default value is generic implementation that is applicable for most deployments. Default value: GENERIC Possible values = GENERIC, INTUNE, ATHENA
authorizationendpoint	<String>	Read-write	Authorization endpoint/url to which unauthenticated user will be redirected. Citrix ADC redirects user to this endpoint by adding query parameters including clientid. If this parameter not specified then as default value we take Token Endpoint/URL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value. Please note that Authorization Endpoint or Token Endpoint is mandatory for oauthAction.
tokenendpoint	<String>	Read-write	URL to which OAuth token will be posted to verify its authenticity. User obtains this token from Authorization server upon successful authentication. Citrix ADC will validate presented token by posting it to the URL configured.
idtokendecryptendpoint	<String>	Read-write	URL to which obtained idtoken will be posted to get a decrypted user identity. Encrypted idtoken will be obtained by posting OAuth token to token endpoint. In order to decrypt idtoken, Citrix ADC posts request to the URL configured.
clientid	<String>	Read-write	Unique identity of the client/user who is getting authenticated. Authorization server infers client

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configuration using this ID. Minimum length = 1
clientsecret	<String>	Read-write	Secret string established by user and authorization server. Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
attribute1	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute1.
attribute2	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute2.
attribute3	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute3.
attribute4	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute4.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute5	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute5.
attribute6	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute6.
attribute7	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute7.
attribute8	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute8.
attribute9	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute9.
attribute10	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute10.
attribute11	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute11.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute12	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute12.
attribute13	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute13.
attribute14	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute14.
attribute15	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute15.
attribute16	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute16.
attributes	<String>	Read-write	List of attribute names separated by ',' which needs to be extracted. Note that preceding and trailing spaces will be removed. Attribute name can be 127 bytes and total length of this

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			string should not cross 1023 bytes. These attributes have multi-value support separated by ',' and stored as key-value pair in AAA session.
tenantid	<String>	Read-write	TenantID of the application. This is usually specific to providers such as Microsoft and usually refers to the deployment identifier.
graphendpoint	<String>	Read-write	URL of the Graph API service to learn Enterprise Mobility Services (EMS) endpoints.
refreshinterval	<Double>	Read-write	Interval at which services are monitored for necessary configuration. Default value: 1440
certendpoint	<String>	Read-write	URL of the endpoint that contains JWKs (Json Web Key) for JWT (Json Web Token) verification.
audience	<String>	Read-write	Audience for which token sent by Authorization server is applicable. This is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			typically entity name or url that represents the recipient.
usernamefield	<String>	Read-write	Attribute in the token from which username should be extracted. Minimum length = 1
skewtime	<Double>	Read-write	This option specifies the allowed clock skew in number of minutes that Citrix ADC allows on an incoming token. For example, if skewTime is 10, then token would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
issuer	<String>	Read-write	Identity of the server whose tokens are to be accepted.
userinfourl	<String>	Read-write	URL to which OAuth access token will be posted to obtain user information.
certfilepath	<String>	Read-write	Path to the file that contains JWKs (Json Web Key) for JWT (Json Web Token) verification.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
granttype	<String>	Read-write	Grant type support. value can be code or password. Default value: CODE Possible values = CODE, PASSWORD
authentication	<String>	Read-write	If authentication is disabled, password is not sent in the request. . Default value: ENABLED Possible values = ENABLED, DISABLED
introspecturl	<String>	Read-write	URL to which access token would be posted for validation.
allowedalgorithms	<String[]>	Read-write	Multivalued option to specify allowed token verification algorithms. . Default value: OAUTH_ALG_ALL Possible values = HS256, RS256, RS512
pkce	<String>	Read-write	Option to enable/ disable PKCE flow

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			during authentication. . Default value: ENABLED Possible values = ENABLED, DISABLED
tokenendpointauthmethod	<String>	Read-write	Option to select the variant of token authentication method. This method is used while exchanging code with IdP. . Default value: client_secret_post, Possible values = client_secret_post, client_secret_jwt, private_key_jwt
metadataurl	<String>	Read-write	Well-known configuration endpoint of the Authorization Server. Citrix ADC fetches server details from this endpoint. .
oauthstatus	<String>	Read-only	Describes status information of oauth server. Default value: INIT Possible values = INIT, CERTFETCH, AADFORGRAPH,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			GRAPH, AADFORMDM, MDMINFO, COMPLETE
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthaction

HTTP Method: POST

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationoauthaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthaction? **view=summary**

Use this query-parameter to get the summary output of authenticationoauthaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationoauthaction resources in chunks.

HTTP Method: GET

Request Headers:

authenticationoauthidppolicy

Configuration for AAA OAuth IdentityProvider (IdP) policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the OAuth Identity Provider (IdP) authentication policy. This is used for configuring Citrix ADC as OAuth Identity Provider. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression that the policy uses to determine whether to respond to the specified request. Minimum length = 1
action	<String>	Read-write	Name of the profile to apply to requests or connections that match this policy. Minimum length = 1
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only DROP/RESET actions can be used.
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the OAuth IdentityProvider policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my oauthidppolicy policy" or 'my oauthidppolicy policy'). Minimum length = 1
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which will get evaluated if the current policy rule evaluates to TRUE.
hits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationoauthidppolicy":{

<b>      "name":<String_value>,

</b><b>      "rule":<String_value>,

</b><b>      "action":<String_value>,

</b>      "undefaction":<String_value>,

      "comment":<String_value>,

      "logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationoauthidppolicy":{

<b>      "name":<String_value>,
```

```
</b>      "rule":<String_value>,

      "action":<String_value>,

      "undefaction":<String_value>,

      "comment":<String_value>,

      "logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationoauthidppolicy":{

<b>      "name":<String_value>,

</b>      "undefaction":true,

      "comment":true,
```

```
      "logaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy? **action=rename**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationoauthidppolicy":{

<b>      "name":<String_value>,

</b><b>      "newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationoauthidppolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy? **view=summary**

Use this query-parameter to get the summary output of authenticationoauthidppolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationoauthidppolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationoauthidppolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "action":<String_value>,

      "undefaction":<String_value>,

      "comment":<String_value>,

      "logaction":<String_value>,

      "gotopriorityexpression":<String_value>,

      "hits":<Double_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of authenticationoauthidppolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationoauthidppolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "action":<String_value>,
```

```
        "undefaction":<String_value>,

        "comment":<String_value>,

        "logaction":<String_value>,

        "gotopriorityexpression":<String_value>,

        "hits":<Double_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidppolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationoauthidppolicy": [ { "__count": "#no"} ] }
```

authenticationoauthidppolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationoauthidppolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the OAuth IdentityProvider (IdP) policy for which to display detailed information. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationoauthidppolicy_authenticationvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationoauthidppolicy_authenticationvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationoauthidppolicy_authenticationvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationoauthidppolicy_authenticationvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationoauthidppolicy_authenticationvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationoauthidppolicy_authenticationvserver_binding": [ {

      "name":<String_value>,

      "boundto":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationoauthidppolicy_authenticationvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationoauthidppolicy_authenticationvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

authenticationoauthidpprofile

Configuration for OAuth Identity Provider (IdP) profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new OAuth Identity Provider (IdP) single sign-on profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
clientid	<String>	Read-write	Unique identity of the relying party

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requesting for authentication. Minimum length = 1
clientsecret	<String>	Read-write	Unique secret string to authorize relying party at authorization server. Minimum length = 1
redirecturl	<String>	Read-write	URL endpoint on relying party to which the OAuth token is to be sent. Minimum length = 1
issuer	<String>	Read-write	The name to be used in requests sent from Citrix ADC to IdP to uniquely identify Citrix ADC. Minimum length = 1
configservice	<String>	Read-write	Name of the entity that is used to obtain configuration for the current authentication request. It is used only in Citrix Cloud. Minimum length = 1
audience	<String>	Read-write	Audience for which token is being sent by Citrix ADC IdP. This is typically entity name or url that represents the recipient.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
skewtime	<Double>	Read-write	This option specifies the duration for which the token sent by Citrix ADC IdP is valid. For example, if skewTime is 10, then token would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
defaultauthentication group	<String>	Read-write	This is the group that is added to user sessions that match current IdP policy. It can be used in policies to identify relying party trust.
relyingpartymetadata url	<String>	Read-write	This is the endpoint at which Citrix ADC IdP can get details about Relying Party (RP) being configured. Metadata response should include endpoints for jwks_uri for RP public key(s).
refreshinterval	<Double>	Read-write	Interval at which Relying Party metadata is refreshed. Default value: 50

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
encrypttoken	<String>	Read-write	Option to encrypt token when Citrix ADC IDP sends one. Default value: OFF Possible values = ON, OFF
signatureservice	<String>	Read-write	Name of the service in cloud used to sign the data. This is applicable only if signature if offloaded to cloud. Minimum length = 1
signaturealg	<String>	Read-write	Algorithm to be used to sign OpenID tokens. Default value: RS256 Possible values = RS256, RS512
attributes	<String>	Read-write	Name-Value pairs of attributes to be inserted in idtoken. Configuration format is name=value_expr@@@name2=value2_expr@@@. '@@@' is used as delimiter between Name-Value pairs. name is a literal string whose value is 127 characters

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and does not contain '=' character. Value is advanced policy expression terminated by @@@ delimiter. Last value need not contain the delimiter.
sendpassword	<String>	Read-write	Option to send encrypted password in idtoken. Default value: OFF Possible values = ON, OFF
oauthstatus	<String>	Read-only	Describes status information of oauth idp metadata fetch process. Default value: INIT Possible values = INIT, CERTFETCH, AADFORGRAPH, GRAPH, AADFORMDM, MDMINFO, COMPLETE
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile/name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationoauthidpprofile":{

<b>      "name":<String_value>,

</b>      "clientid":<String_value>,

      "clientsecret":<String_value>,

      "encrypttoken":<String_value>,

      "signatureservice":<String_value>,

      "signaturealg":<String_value>,

      "attributes":<String_value>,

      "sendpassword":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationoauthidpprofile":{

<b>      "name":<String_value>,

</b>      "issuer":true,

      "configservice":true,

      "audience":true,

      "skewtime":true,

      "defaultauthenticationgroup":true,

      "relyingpartymetadataurl":true,

      "refreshinterval":true,

      "encrypttoken":true,

      "signatureservice":true,

      "signaturealg":true,

      "attributes":true,
```

```
      "sendpassword":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationoauthidpprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile? **view=summary**

Use this query-parameter to get the summary output of authenticationoauthidpprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile?
pagesize=#no;pageno=#no

Use this query-parameter to get the authenticationoauthidpprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationoauthidpprofile": [ {

      "name":<String_value>,

      "clientid":<String_value>,

      "clientsecret":<String_value>,

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationoauthidpprofile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationoauthidpprofile": [ { "__count": "#no"} ] }
```

authenticationpolicy

Configuration for Authentication Policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the advance AUTHENTICATION policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after AUTHENTICATION policy is created. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the AUTHENTICATION server.
action	<String>	Read-write	Name of the authentication action to be performed if the policy matches.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the authentication policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
hits	<Double>	Read-only	Number of hits.
description	<String>	Read-only	Description of the policy.
policysubtype	<String>	Read-only	. Possible values = LOCAL, RADIUS, LDAP, TACACS, CERT, NEGOTIATE, SAML, PROFILE, DFA, SAMLIDP, WEBAUTH, OAUTH, NO_AUTHN, EPA, SFAUTH, AZUREVAULT, EMAIL, CAPTCHA
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationpolicy":{

<b>      "name":<String_value>,

</b><b>      "rule":<String_value>,

</b><b>      "action":<String_value>,

</b>      "undefaction":<String_value>,

      "comment":<String_value>,

      "logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationpolicy":{

<b>      "name":<String_value>,

</b>      "rule":<String_value>,

      "action":<String_value>,

      "undefaction":<String_value>,

      "comment":<String_value>,

      "logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationpolicy":{

<b>      "name":<String_value>,

</b>      "undefaction":true,

      "comment":true,

      "logaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy? **action=rename**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationpolicy":{

<b>      "name":<String_value>,
```

```
</b><b>      "newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy? **view=summary**

Use this query-parameter to get the summary output of authenticationpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

authenticationpolicylabel

Configuration for authentication policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the new authentication policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy label" or 'authentication policy label').
type	<String>	Read-write	Type of feature (aaatm or rba) against which to match the policies bound to this policy label. Default value: AAATM_REQ Possible values = AAATM_REQ, RBA_REQ
comment	<String>	Read-write	Any comments to preserve information about this authentication policy label.
loginschema	<String>	Read-write	Login schema associated with authentication policy label. Login schema

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			defines the UI rendering by providing customization option of the fields. If user intervention is not needed for a given factor such as group extraction, a loginSchema whose authentication schema is "noschema" should be used.
newname	<String>	Read-write	The new name of the auth policy label. Minimum length = 1
numpol	<Double>	Read-only	Number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
policyname	<String>	Read-only	Name of the authentication policy to bind to the policy label.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flowtype	<Double>	Read-only	Flowtype of the bound authentication policy.
description	<String>	Read-only	Description of the policylabel.
__count	<Double>	Read-only	count parameter

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationpolicylabel": [ { "__count": "#no"} ] }
```

authenticationpolicylabel_authenticationpolicy_binding

Binding object showing the authenticationpolicy that can be bound to authenticationpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
nextfactor	<String>	Read-write	On success invoke label.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
policyname	<String>	Read-write	Name of the authentication policy to bind to the policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the authentication policy label to which to bind the policy.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/ authenticationpolicylabel_authenticationpolicy_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"authenticationpolicylabel_authenticationpolicy_binding":{

<b>      "labelname":<String_value>,

</b><b>      "policyname":<String_value>,

</b><b>      "priority":<Double_value>,

</b>      "gotopriorityexpression":<String_value>,

      "nextfactor":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationpolicylabel_authenticationpolicy_binding/ labelname_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationpolicylabel_authenticationpolicy_binding/ labelname_value<String> ? **args= policyname:<String_value>, priority: <Double_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationpolicylabel_authenticationpolicy_binding/ labelname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationpolicylabel_authenticationpolicy_binding/ labelname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationpolicylabel_authenticationpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationpolicylabel_authenticationpolicy_binding/ labelname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationpolicylabel_authenticationpolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationpolicylabel_authenticationpolicy_binding": [ {

      "priority":<Double_value>,

      "nextfactor":<String_value>,

      "gotopriorityexpression":<String_value>,

      "policyname":<String_value>,

      "labelname":<String_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationpolicylabel_authenticationpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationpolicylabel_authenticationpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationpolicylabel_authenticationpolicy_binding": [ {

      "priority":<Double_value>,
```

```
        "nextfactor":<String_value>,

        "gotopriorityexpression":<String_value>,

        "policyname":<String_value>,

        "labelname":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationpolicylabel_authenticationpolicy_binding/ labelname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationpolicylabel_authenticationpolicy_binding": [ { "__count": "#no"} ] }
```

authenticationpolicylabel_binding

Binding object which returns the resources bound to authenticationpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the authorization policy label.
authenticationpolicylabel_authenticationpolicy_binding	<authenticationpolicylabel_authenticationpolicy_binding[]>	Read-only	authenticationpolicy that can be bound to authenticationpolicylabel.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy_systemglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationpolicy_systemglobal_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "nextfactor":<String_value>,

      "gotopriorityexpression":<String_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpolicy_systemglobal_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationpolicy_systemglobal_binding": [ { "__count": "#no"} ] }
```

authenticationpushservice

Configuration for Service details for sending push notifications resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the push service. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after the profile is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my push

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service" or 'my push service'). . Minimum length = 1 Maximum length = 127
clientid	<String>	Read-write	Unique identity for communicating with Citrix Push server in cloud. Minimum length = 1
clientsecret	<String>	Read-write	Unique secret for communicating with Citrix Push server in cloud. Minimum length = 1
customerid	<String>	Read-write	Customer id/name of the account in cloud that is used to create clientid/secret pair. Minimum length = 1
refreshinterval	<Double>	Read-write	Interval at which certificates or idtoken is refreshed. Default value: 50
Namespace	<String>	Read-only	This is fully qualified domain name of the notification service in the cloud. If omitted, namespace defaults to https://mfa.cloud.com/. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 63
hubname	<String>	Read-only	Name of the hub within a namespace. This is used to classify different identities within a namespace. Minimum length = 1
servicekey	<String>	Read-only	Key to be used to compute signature necessary for registering to notification service. Minimum length = 1
servicekeyname	<String>	Read-only	Friendly name of the Key to be used to compute signature necessary for registering to notification service. Minimum length = 1
certendpoint	<String>	Read-only	URL of the endpoint that contains JWKs (Json Web Key) for JWT (Json Web Token) verification. This is used at cloud instance that offers push service.
pushservicestatus	<String>	Read-only	Describes status of push service. Default value: INIT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = INIT, CERTFETCH, CCTOKEN, COMPLETE
trustservice	<String>	Read-only	URL of the service that generates tokens for cloud access. Minimum length = 1
pushcloudserverstatus	<String>	Read-only	Describes status of the cloud service that does push. Possible values = UP, DOWN
signingkeyname	<String>	Read-only	Friendly name of the Key to be used to compute signature necessary for accessing notification service. Minimum length = 1
signingkey	<String>	Read-only	Key to be used to compute signature necessary for accessing notification service. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE

- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationpushservice":{

<b>      "name":<String_value>,

</b>      "clientid":<String_value>,

      "clientsecret":<String_value>,

      "customerid":<String_value>,

      "refreshinterval":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationpushservice":{

<b>      "name":<String_value>,

</b>      "clientid":<String_value>,

      "clientsecret":<String_value>,

      "customerid":<String_value>,

      "refreshinterval":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationpushservice":{

<b>      "name":<String_value>,

</b>      "refreshinterval":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationpushservice resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice? **view=summary**

Use this query-parameter to get the summary output of authenticationpushservice resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationpushservice resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationpushservice": [ {

      "name":<String_value>,
```

```
        "Namespace":<String_value>,

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationpushservice? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationpushservice": [ { "__count": "#no"} ] }
```

authenticationradiusaction

Configuration for RADIUS action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the RADIUS action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the RADIUS action is added. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address assigned to the RADIUS server. Minimum length = 1
servername	<String>	Read-write	RADIUS server name as a FQDN. Mutually exclusive with RADIUS IP address. Minimum length = 1
serverport	<Integer>	Read-write	Port number on which the RADIUS server listens for connections. Minimum value = 1
authtimeout	<Double>	Read-write	Number of seconds the Citrix ADC waits for a response from the RADIUS server. Default value: 3 Minimum value = 1
radkey	<String>	Read-write	Key shared between the RADIUS server and the Citrix ADC. Required to allow the Citrix ADC to communicate with the RADIUS server. Minimum length = 1
radnasip	<String>	Read-write	If enabled, the Citrix ADC IP address (NSIP) is sent to the RADIUS server as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the Network Access Server IP (NASIP) address. The RADIUS protocol defines the meaning and use of the NASIP address. Possible values = ENABLED, DISABLED
radnasid	<String>	Read-write	If configured, this string is sent to the RADIUS server as the Network Access Server ID (NASID).
radvendorid	<Double>	Read-write	RADIUS vendor ID attribute, used for RADIUS group extraction. Minimum value = 1
radattributetype	<Double>	Read-write	RADIUS attribute type, used for RADIUS group extraction. Minimum value = 1
radgroupsprefix	<String>	Read-write	RADIUS groups prefix string. This groups prefix precedes the group names within a RADIUS attribute for RADIUS group extraction.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
radgroupseparator	<String>	Read-write	RADIUS group separator string The group separator delimits group names within a RADIUS attribute for RADIUS group extraction.
passencoding	<String>	Read-write	Encoding type for passwords in RADIUS packets that the Citrix ADC sends to the RADIUS server. Default value: pap Possible values = pap, chap, mschapv1, mschapv2
ipvendorid	<Double>	Read-write	Vendor ID of the intranet IP attribute in the RADIUS response. NOTE: A value of 0 indicates that the attribute is not vendor encoded.
ipattributetype	<Double>	Read-write	Remote IP address attribute type in a RADIUS response. Minimum value = 1
accounting	<String>	Read-write	Whether the RADIUS server is currently accepting

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			accounting messages. Possible values = ON, OFF
pwdvendorid	<Double>	Read-write	Vendor ID of the attribute, in the RADIUS response, used to extract the user password. Minimum value = 1
pwdattributetype	<Double>	Read-write	Vendor-specific password attribute type in a RADIUS response. Minimum value = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
callingstationid	<String>	Read-write	Send Calling-Station-ID of the client to the RADIUS server. IP Address of the client is sent as its Calling-Station-ID. Default value: DISABLED Possible values = ENABLED, DISABLED
authservretry	<Double>	Read-write	Number of retry by the Citrix ADC before getting response

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from the RADIUS server. Default value: 3 Minimum value = 1 Maximum value = 10
authentication	<String>	Read-write	Configure the RADIUS server state to accept or refuse authentication messages. Default value: ON Possible values = ON, OFF
tunnelendpointclientip	<String>	Read-write	Send Tunnel Endpoint Client IP address to the RADIUS server. Default value: DISABLED Possible values = ENABLED, DISABLED
ipaddress	<String>	Read-only	IP address.
success	<Double>	Read-only	.
failure	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiusaction? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
  { "authenticationradiusaction": [ { "__count": "#no"} ] }
```

authenticationradiuspolicy

Configuration for RADIUS policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the RADIUS authentication policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after RADIUS policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the RADIUS server.
reqaction	<String>	Read-write	Name of the RADIUS action to perform if the policy matches. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationradiuspolicy":{

<b>      "name":<String_value>,

</b><b>      "rule":<String_value>,

</b>      "reqaction":<String_value>
```

```
}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationradiuspolicy":{
```

```
<b>      "name":<String_value>,

</b>      "rule":<String_value>,

      "reqaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationradiuspolicy":{

<b>      "name":<String_value>,

</b>      "rule":true,

      "reqaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationradiuspolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy? **view=summary**

Use this query-parameter to get the summary output of authenticationradiuspolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationradiuspolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationradiuspolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "reqaction":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of authenticationradiuspolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationradiuspolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "reqaction":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationradiuspolicy": [ { "__count": "#no"} ] }
```

authenticationradiuspolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationradiuspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the RADIUS authentication policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationradiuspolicy_authenticationvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationradiuspolicy_authenticationvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationradiuspolicy_authenticationvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationradiuspolicy_authenticationvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationradiuspolicy_authenticationvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationradiuspolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationradiuspolicy_authenticationvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationradiuspolicy_authenticationvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationradiuspolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy_vpnglobal_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationradiuspolicy_vpnglobal_binding": [ { "__count": "#no"} ] }
```

authenticationradiuspolicy_vpnvserver_binding

Binding object showing the vpnvserver that can be bound to authenticationradiuspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the RADIUS authentication policy. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy_vpnvserver_binding/name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy_vpnvserver_binding/name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationradiuspolicy_vpnvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy_vpnvserver_binding/name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationradiuspolicy_vpnvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationradiuspolicy_vpnvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy_vpnvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy_vpnvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationradiuspolicy_vpnvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationradiuspolicy_vpnvserver_binding/name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationradiuspolicy_vpnvserver_binding": [ { "__count":
"#no"} ] }
```

authenticationsamlaction

Configuration for AAA Saml action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SAML server profile (action). Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after SAML profile is created. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1
metadataurl	<String>	Read-write	This URL is used for obtaining saml metadata. Note that it fills samlIdPCertName and samlredirectUrl fields so those fields should not be updated when metadataUrl present.
samlidpcertname	<String>	Read-write	Name of the SSL certificate used to verify responses from SAML Identity Provider (IdP). Note that if metadateURL is present then this filed should be empty. Minimum length = 1
samlsigningcertname	<String>	Read-write	Name of the SSL certificate to sign

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requests from ServiceProvider (SP) to Identity Provider (IdP). Minimum length = 1
samlredirecturl	<String>	Read-write	URL to which users are redirected for authentication. Note that if metadateURL is present then this filed should be empty. Minimum length = 1
samlacsindex	<Double>	Read-write	Index/ID of the metadata entry corresponding to this configuration. Default value: 255 Minimum value = 0 Maximum value = 255
samluserfield	<String>	Read-write	SAML user ID, as given in the SAML assertion. Minimum length = 1
samlrejectunsignedassertion	<String>	Read-write	Reject unsigned SAML assertions. ON option results in rejection of Assertion that is received without signature. STRICT option ensures that both Response and Assertion are signed.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OFF allows unsigned Assertions. Default value: ON Possible values = ON, OFF, STRICT
samlissuername	<String>	Read-write	The name to be used in requests sent from Citrix ADC to IdP to uniquely identify Citrix ADC. Minimum length = 1
samltwofactor	<String>	Read-write	Option to enable second factor after SAML. Default value: OFF Possible values = ON, OFF
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
attribute1	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute1. Maximum length of the extracted attribute is 239 bytes.
attribute2	<String>	Read-write	Name of the attribute in SAML Assertion

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			whose value needs to be extracted and stored as attribute2. Maximum length of the extracted attribute is 239 bytes.
attribute3	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute3. Maximum length of the extracted attribute is 239 bytes.
attribute4	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute4. Maximum length of the extracted attribute is 239 bytes.
attribute5	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute5. Maximum length of the extracted attribute is 239 bytes.
attribute6	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to be extracted and stored as attribute6. Maximum length of the extracted attribute is 239 bytes.
attribute7	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute7. Maximum length of the extracted attribute is 239 bytes.
attribute8	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute8. Maximum length of the extracted attribute is 239 bytes.
attribute9	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute9. Maximum length of the extracted attribute is 239 bytes.
attribute10	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			stored as attribute10. Maximum length of the extracted attribute is 239 bytes.
attribute11	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute11. Maximum length of the extracted attribute is 239 bytes.
attribute12	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute12. Maximum length of the extracted attribute is 239 bytes.
attribute13	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute13. Maximum length of the extracted attribute is 239 bytes.
attribute14	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute14.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length of the extracted attribute is 239 bytes.
attribute15	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute15. Maximum length of the extracted attribute is 239 bytes.
attribute16	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute16. Maximum length of the extracted attribute is 239 bytes.
attributes	<String>	Read-write	List of attribute names separated by ',' which needs to be extracted. Note that preceeding and trailing spaces will be removed. Attribute name can be 127 bytes and total length of this string should not cross 2047 bytes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			These attributes have multi-value support separated by ',' and stored as key-value pair in AAA session.
signaturealg	<String>	Read-write	Algorithm to be used to sign/verify SAML transactions. Default value: RSA-SHA256 Possible values = RSA-SHA1, RSA-SHA256
digestmethod	<String>	Read-write	Algorithm to be used to compute/verify digest for SAML transactions. Default value: SHA256 Possible values = SHA1, SHA256
requestedauthncontext	<String>	Read-write	This element specifies the authentication context requirements of authentication statements returned in the response. Default value: exact Possible values = exact, minimum, maximum, better

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authnctxclassref	<String[]>	Read-write	This element specifies the authentication class types that are requested from IdP (IdentityProvider). InternetProtocol: This is applicable when a principal is authenticated through the use of a provided IP address. InternetProtocolPassword: This is applicable when a principal is authenticated through the use of a provided IP address, in addition to a username/ password. Kerberos: This is applicable when the principal has authenticated using a password to a local authentication authority, in order to acquire a Kerberos ticket.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			MobileOneFactorUnregistered: This indicates authentication of the mobile device without requiring explicit end-user interaction. MobileTwoFactorUnregistered: This indicates two-factor based authentication during mobile customer registration process, such as secure device and user PIN. MobileOneFactorContract: Reflects mobile contract customer registration procedures and a single factor authentication. MobileTwoFactorContract: Reflects mobile contract customer registration procedures and a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			two-factor based authentication. Password: This class is applicable when a principal authenticates using password over unprotected http session. PasswordProtected Transport: This class is applicable when a principal authenticates to an authentication authority through the presentation of a password over a protected session. PreviousSession: This class is applicable when a principal had authenticated to an authentication authority at some point in the past using any authentication context. X509: This indicates that the principal authenticated by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			means of a digital signature where the key was validated as part of an X.509 Public Key Infrastructure. PGP: This indicates that the principal authenticated by means of a digital signature where the key was validated as part of a PGP Public Key Infrastructure. SPKI: This indicates that the principal authenticated by means of a digital signature where the key was validated via an SPKI Infrastructure. XMLDSig: This indicates that the principal authenticated by means of a digital signature according to the processing rules specified in the XML Digital

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Signature specification. Smartcard: This indicates that the principal has authenticated using smartcard. SmartcardPKI: This class is applicable when a principal authenticates to an authentication authority through a two-factor authentication mechanism using a smartcard with enclosed private key and a PIN. SoftwarePKI: This class is applicable when a principal uses an X.509 certificate stored in software to authenticate to the authentication authority. Telephony: This class is used to indicate that the principal authenticated via

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the provision of a fixed-line telephone number, transported via a telephony protocol such as ADSL. NomadTelephony: Indicates that the principal is "roaming" and authenticates via the means of the line number, a user suffix, and a password element. PersonalTelephony: This class is used to indicate that the principal authenticated via the provision of a fixed-line telephone. AuthenticatedTelephony: Indicates that the principal authenticated via the means of the line number, a user suffix, and a password element. SecureRemotePassword: This class is applicable when the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication was performed by means of Secure Remote Password. TLSClient: This class indicates that the principal authenticated by means of a client certificate, secured with the SSL/TLS transport. TimeSyncToken: This is applicable when a principal authenticates through a time synchronization token. Unspecified: This indicates that the authentication was performed by unspecified means. Windows: This indicates that Windows integrated authentication is utilized for authentication. Possible values = InternetProtocol, InternetProtocolPas

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			sword, Kerberos, MobileOneFactorUnregistered, MobileTwoFactorUnregistered, MobileOneFactorContract, MobileTwoFactorContract, Password, PasswordProtectedTransport, PreviousSession, X509, PGP, SPKI, XMLDSig, Smartcard, SmartcardPKI, SoftwarePKI, Telephony, NomadTelephony, PersonalTelephony, AuthenticatedTelephony, SecureRemotePassword, TLSClient, TimeSyncToken, Unspecified, Windows
customauthnctxclassref	<String>	Read-write	This element specifies the custom authentication class reference to be sent as a part of the Authentication Request that is sent by the SP to SAML IDP. The input string

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must be the body of the authentication class being requested. Input format: Alphanumeric string or URL specifying the body of the Request.If more than one string has to be provided, then the same can be done by specifying the classes as a string of comma separated values. Example input: set authentication samlaction samlact1 -customAuthnCtxClassRef http://www.class1.com/LoA1,http://www.class2.com/LoA2 . Maximum length = 512
samlbinding	<String>	Read-write	This element specifies the transport mechanism of saml messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: POST Possible values = REDIRECT, POST, ARTIFACT
attributeconsumingserviceindex	<Double>	Read-write	Index/ID of the attribute specification at Identity Provider (IdP). IdP will locate attributes requested by SP using this index and send those attributes in Assertion. Default value: 255 Minimum value = 0 Maximum value = 255
sendthumbprint	<String>	Read-write	Option to send thumbprint instead of x509 certificate in SAML request. Default value: OFF Possible values = ON, OFF
enforceusername	<String>	Read-write	Option to choose whether the username that is extracted from SAML assertion can be edited in login page while doing second factor.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ON Possible values = ON, OFF
logouturl	<String>	Read-write	SingleLogout URL on IdP to which logoutRequest will be sent on Citrix ADC session cleanup.
artifactresolutionserviceurl	<String>	Read-write	URL of the Artifact Resolution Service on IdP to which Citrix ADC will post artifact to get actual SAML token.
skewtime	<Double>	Read-write	This option specifies the allowed clock skew in number of minutes that Citrix ADC ServiceProvider allows on an incoming assertion. For example, if skewTime is 10, then assertion would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
logoutbinding	<String>	Read-write	This element specifies the transport mechanism of saml logout messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: POST Possible values = REDIRECT, POST
forceauthn	<String>	Read-write	Option that forces authentication at the Identity Provider (IdP) that receives Citrix ADC's request. Default value: OFF Possible values = ON, OFF
groupnamefield	<String>	Read-write	Name of the tag in assertion that contains user groups.
audience	<String>	Read-write	Audience for which assertion sent by IdP is applicable. This is typically entity name or url that represents ServiceProvider.
metadatarefreshinterval	<Double>	Read-write	Interval in minutes for fetching metadata from specified metadata URL. Default value: 36000
storesamlresponse	<String>	Read-write	Option to store entire SAML Response through the life of user session. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
metadataimportstatus	<String>	Read-only	Describes metadata import status. Default value: SUCCESS Possible values = INIT, SUCCESS, FAIL
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationsamlaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlaction? **view=summary**

Use this query-parameter to get the summary output of authenticationsamlaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationsamlaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Payload:

```
{ "authenticationsamlaction": [ { "__count": "#no"} ] }
```

authenticationsamlidppolicy

Configuration for AAA Saml IdentityProvider (IdP) policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SAML Identity Provider (IdP) authentication policy. This is used for configuring Citrix ADC as SAML Identity Provider. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression which is evaluated to choose a profile for authentication. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks. Minimum length = 1
action	<String>	Read-write	Name of the profile to apply to requests or connections that match this policy. Minimum length = 1
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the SAML IdentityProvider policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my samlidppolicy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy" or 'my samlidppolicy policy'). Minimum length = 1
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
hits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationsamlidppolicy":{

<b>      "name":<String_value>,

</b><b>      "rule":<String_value>,

</b><b>      "action":<String_value>,
```

```
</b>      "undefaction":<String_value>,

      "comment":<String_value>,

      "logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy/name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationsamlidppolicy":{

<b>      "name":<String_value>,

</b>      "rule":<String_value>,

      "action":<String_value>,

      "undefaction":<String_value>,

      "comment":<String_value>,

      "logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationsamlidppolicy":{

<b>      "name":<String_value>,

</b>      "undefaction":true,

      "comment":true,

      "logaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy? **action=rename**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationsamlidppolicy":{

<b>      "name":<String_value>,

</b><b>      "newname":<String_value>
```

```
</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationsamlidppolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy? **view=summary**

Use this query-parameter to get the summary output of authenticationsamlidppolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationsamlidppolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationsamlidppolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "action":<String_value>,

      "undefaction":<String_value>,

      "comment":<String_value>,

      "logaction":<String_value>,

      "gotopriorityexpression":<String_value>,

      "hits":<Double_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of authenticationsamlidppolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationsamlidppolicy": [ { "__count": "#no"} ] }
```

authenticationsamlidppolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationsamlidppolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the SAML IdentityProvider (IdP) policy for which to display detailed information. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlidppolicy_authenticationvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlidppolicy_authenticationvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationsamlidppolicy_authenticationvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlidppolicy_authenticationvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationsamlidppolicy_authenticationvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationsamlidppolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlidppolicy_authenticationvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlidppolicy_authenticationvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationsamlidppolicy_binding": [ {

      "name":<String_value>,

      "authenticationsamlidppolicy_authenticationvserver_binding":<authent
icationsamlidppolicy_authenticationvserver_binding[]_value>,

      "authenticationsamlidppolicy_vpnvserver_binding":<authenticationsaml
idppolicy_vpnvserver_binding[]_value>

}]}
```

authenticationsamlidppolicy_vpnvserver_binding

Binding object showing the vpnvserver that can be bound to authenticationsamlidppolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the SAML IdentityProvider (IdP) policy for which to display detailed information. Minimum length = 1
priority	<Double>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlidppolicy_vpnvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy_vpnvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationsamlidppolicy_vpnvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy_vpnvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationsamlidppolicy_vpnvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationsamlidppolicy_vpnvserver_binding": [ {
      "boundto":<String_value>,
      "name":<String_value>,
      "priority":<Double_value>,
      "activepolicy":<Double_value>
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlidppolicy_vpnvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidppolicy_vpnvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationsamlidppolicy_vpnvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlidppolicy_vpnvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"authenticationsamlidppolicy_vpnvserver_binding": [ { "__count":
"#no"} ] }
```

authenticationsamlidpprofile

Configuration for AAA Saml IdentityProvider (IdP) profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new saml single sign-on profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
samlspcertname	<String>	Read-write	Name of the SSL certificate of SAML Relying Party. This certificate is used to verify signature of the incoming AuthnRequest from a Relying Party or Service Provider. Minimum length = 1
samlidpcertname	<String>	Read-write	Name of the certificate used to sign the SAMLResposne that is sent to Relying Party or Service Provider after successful authentication. Minimum length = 1
assertionconsumerserviceurl	<String>	Read-write	URL to which the assertion is to be sent. Minimum length = 1
sendpassword	<String>	Read-write	Option to send password in assertion. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
samlissuername	<String>	Read-write	The name to be used in requests sent from Citrix ADC to IdP to uniquely identify Citrix ADC. Minimum length = 1
rejectunsignedrequests	<String>	Read-write	Option to Reject unsigned SAML Requests. ON option denies any authentication requests that arrive without signature. Default value: ON Possible values = ON, OFF
signaturealg	<String>	Read-write	Algorithm to be used to sign/verify SAML transactions. Default value: RSA-SHA256 Possible values = RSA-SHA1, RSA-SHA256
digestmethod	<String>	Read-write	Algorithm to be used to compute/verify digest for SAML transactions. Default value: SHA256

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = SHA1, SHA256
audience	<String>	Read-write	Audience for which assertion sent by IdP is applicable. This is typically entity name or url that represents ServiceProvider.
nameidformat	<String>	Read-write	Format of Name Identifier sent in Assertion. Default value: transient Possible values = Unspecified, emailAddress, X509SubjectName, WindowsDomainQualifiedName, kerberos, entity, persistent, transient
nameidexpr	<String>	Read-write	Expression that will be evaluated to obtain NameIdentifier to be sent in assertion. Maximum length = 128
attribute1	<String>	Read-write	Name of attribute1 that needs to be sent in SAML Assertion.
attribute1expr	<String>	Read-write	Expression that will be evaluated to obtain attribute1's

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value to be sent in Assertion. Maximum length = 128
attribute1friendlyname	<String>	Read-write	User-Friendly Name of attribute1 that needs to be sent in SAML Assertion.
attribute1format	<String>	Read-write	Format of Attribute1 to be sent in Assertion. Possible values = URI, Basic
attribute2	<String>	Read-write	Name of attribute2 that needs to be sent in SAML Assertion.
attribute2expr	<String>	Read-write	Expression that will be evaluated to obtain attribute2's value to be sent in Assertion. Maximum length = 128
attribute2friendlyname	<String>	Read-write	User-Friendly Name of attribute2 that needs to be sent in SAML Assertion.
attribute2format	<String>	Read-write	Format of Attribute2 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute3	<String>	Read-write	Name of attribute3 that needs to be sent in SAML Assertion.
attribute3expr	<String>	Read-write	Expression that will be evaluated to obtain attribute3's value to be sent in Assertion. Maximum length = 128
attribute3friendlyname	<String>	Read-write	User-Friendly Name of attribute3 that needs to be sent in SAML Assertion.
attribute3format	<String>	Read-write	Format of Attribute3 to be sent in Assertion. Possible values = URI, Basic
attribute4	<String>	Read-write	Name of attribute4 that needs to be sent in SAML Assertion.
attribute4expr	<String>	Read-write	Expression that will be evaluated to obtain attribute4's value to be sent in Assertion. Maximum length = 128
attribute4friendlyname	<String>	Read-write	User-Friendly Name of attribute4 that needs to be sent in SAML Assertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute4format	<String>	Read-write	Format of Attribute4 to be sent in Assertion. Possible values = URI, Basic
attribute5	<String>	Read-write	Name of attribute5 that needs to be sent in SAML Assertion.
attribute5expr	<String>	Read-write	Expression that will be evaluated to obtain attribute5's value to be sent in Assertion. Maximum length = 128
attribute5friendlyname	<String>	Read-write	User-Friendly Name of attribute5 that needs to be sent in SAML Assertion.
attribute5format	<String>	Read-write	Format of Attribute5 to be sent in Assertion. Possible values = URI, Basic
attribute6	<String>	Read-write	Name of attribute6 that needs to be sent in SAML Assertion.
attribute6expr	<String>	Read-write	Expression that will be evaluated to obtain attribute6's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute6friendlyname	<String>	Read-write	User-Friendly Name of attribute6 that needs to be sent in SAML Assertion.
attribute6format	<String>	Read-write	Format of Attribute6 to be sent in Assertion. Possible values = URI, Basic
attribute7	<String>	Read-write	Name of attribute7 that needs to be sent in SAML Assertion.
attribute7expr	<String>	Read-write	Expression that will be evaluated to obtain attribute7's value to be sent in Assertion. Maximum length = 128
attribute7friendlyname	<String>	Read-write	User-Friendly Name of attribute7 that needs to be sent in SAML Assertion.
attribute7format	<String>	Read-write	Format of Attribute7 to be sent in Assertion. Possible values = URI, Basic
attribute8	<String>	Read-write	Name of attribute8 that needs to be sent in SAML Assertion.
attribute8expr	<String>	Read-write	Expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain attribute8's value to be sent in Assertion. Maximum length = 128
attribute8friendlyname	<String>	Read-write	User-Friendly Name of attribute8 that needs to be sent in SAML Assertion.
attribute8format	<String>	Read-write	Format of Attribute8 to be sent in Assertion. Possible values = URI, Basic
attribute9	<String>	Read-write	Name of attribute9 that needs to be sent in SAML Assertion.
attribute9expr	<String>	Read-write	Expression that will be evaluated to obtain attribute9's value to be sent in Assertion. Maximum length = 128
attribute9friendlyname	<String>	Read-write	User-Friendly Name of attribute9 that needs to be sent in SAML Assertion.
attribute9format	<String>	Read-write	Format of Attribute9 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute10	<String>	Read-write	Name of attribute10 that needs to be sent in SAML Assertion.
attribute10expr	<String>	Read-write	Expression that will be evaluated to obtain attribute10's value to be sent in Assertion. Maximum length = 128
attribute10friendlyname	<String>	Read-write	User-Friendly Name of attribute10 that needs to be sent in SAML Assertion.
attribute10format	<String>	Read-write	Format of Attribute10 to be sent in Assertion. Possible values = URI, Basic
attribute11	<String>	Read-write	Name of attribute11 that needs to be sent in SAML Assertion.
attribute11expr	<String>	Read-write	Expression that will be evaluated to obtain attribute11's value to be sent in Assertion. Maximum length = 128
attribute11friendlyname	<String>	Read-write	User-Friendly Name of attribute11 that needs to be sent in SAML Assertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute11format	<String>	Read-write	Format of Attribute11 to be sent in Assertion. Possible values = URI, Basic
attribute12	<String>	Read-write	Name of attribute12 that needs to be sent in SAML Assertion.
attribute12expr	<String>	Read-write	Expression that will be evaluated to obtain attribute12's value to be sent in Assertion. Maximum length = 128
attribute12friendlyname	<String>	Read-write	User-Friendly Name of attribute12 that needs to be sent in SAML Assertion.
attribute12format	<String>	Read-write	Format of Attribute12 to be sent in Assertion. Possible values = URI, Basic
attribute13	<String>	Read-write	Name of attribute13 that needs to be sent in SAML Assertion.
attribute13expr	<String>	Read-write	Expression that will be evaluated to obtain attribute13's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute13friendlyname	<String>	Read-write	User-Friendly Name of attribute13 that needs to be sent in SAML Assertion.
attribute13format	<String>	Read-write	Format of Attribute13 to be sent in Assertion. Possible values = URI, Basic
attribute14	<String>	Read-write	Name of attribute14 that needs to be sent in SAML Assertion.
attribute14expr	<String>	Read-write	Expression that will be evaluated to obtain attribute14's value to be sent in Assertion. Maximum length = 128
attribute14friendlyname	<String>	Read-write	User-Friendly Name of attribute14 that needs to be sent in SAML Assertion.
attribute14format	<String>	Read-write	Format of Attribute14 to be sent in Assertion. Possible values = URI, Basic
attribute15	<String>	Read-write	Name of attribute15 that needs to be sent in SAML Assertion.
attribute15expr	<String>	Read-write	Expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain attribute15's value to be sent in Assertion. Maximum length = 128
attribute15friendlyname	<String>	Read-write	User-Friendly Name of attribute15 that needs to be sent in SAML Assertion.
attribute15format	<String>	Read-write	Format of Attribute15 to be sent in Assertion. Possible values = URI, Basic
attribute16	<String>	Read-write	Name of attribute16 that needs to be sent in SAML Assertion.
attribute16expr	<String>	Read-write	Expression that will be evaluated to obtain attribute16's value to be sent in Assertion. Maximum length = 128
attribute16friendlyname	<String>	Read-write	User-Friendly Name of attribute16 that needs to be sent in SAML Assertion.
attribute16format	<String>	Read-write	Format of Attribute16 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
encryptassertion	<String>	Read-write	Option to encrypt assertion when Citrix ADC IDP sends one. Default value: OFF Possible values = ON, OFF
encryptionalgorithm	<String>	Read-write	Algorithm to be used to encrypt SAML assertion. Default value: AES256 Possible values = DES3, AES128, AES192, AES256
samlbinding	<String>	Read-write	This element specifies the transport mechanism of saml messages. Default value: POST Possible values = REDIRECT, POST, ARTIFACT
skewtime	<Double>	Read-write	This option specifies the number of minutes on either side of current time that the assertion would be valid. For example, if skewTime is 10, then assertion would be valid from (current time - 10) min to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(current time + 10) min, ie 20min in all. Default value: 5
serviceproviderid	<String>	Read-write	Unique identifier of the Service Provider that sends SAML Request. Citrix ADC will ensure that the Issuer of the SAML Request matches this URI. Minimum length = 1
signassertion	<String>	Read-write	Option to sign portions of assertion when Citrix ADC IDP sends one. Based on the user selection, either Assertion or Response or Both or none can be signed. Default value: ASSERTION Possible values = NONE, ASSERTION, RESPONSE, BOTH
keytransportalg	<String>	Read-write	Key transport algorithm to be used in encryption of SAML assertion. Default value: RSA_OAEP Possible values = RSA-V1_5, RSA_OAEP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
splogouturl	<String>	Read-write	Endpoint on the ServiceProvider (SP) to which logout messages are to be sent. Minimum length = 1
logoutbinding	<String>	Read-write	This element specifies the transport mechanism of saml logout messages. Default value: POST Possible values = REDIRECT, POST
defaultauthenticationgroup	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. This group can be used in policies to select specific authentication policy during logon.
metadataurl	<String>	Read-write	This URL is used for obtaining samlidp metadata.
metadatarefreshinterval	<Double>	Read-write	Interval in minute for fetching metadata from specified metadata URL. Default value: 3600

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
signatureservice	<String>	Read-write	Name of the service in cloud used to sign the data. Minimum length = 1
samlsigningcertversion	<String>	Read-write	version of the certificate in signature service used to sign the SAMLResposne that is sent to Relying Party or Service Provider after successful authentication. Minimum length = 1
samlspcertversion	<String>	Read-write	version of the certificate in signature service used to verify the signature of the incoming AuthnRequest from a Relying Party or Service Provider. Minimum length = 1
metadataimportstatus	<String>	Read-only	Describes metadata import status. Default value: INIT Possible values = INIT, SUCCESS, FAIL
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidpprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidpprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidpprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationsamlidpprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidpprofile? **view=summary**

Use this query-parameter to get the summary output of authenticationsamlidpprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlidpprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationsamlidpprofile resources in chunks.

HTTP Method: GET

Response Payload:

```
{ "authenticationsamlidpprofile": [ { "__count": "#no"} ] }
```

authenticationsamlpolicy

Configuration for AAA Saml policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SAML policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), colon (:), and underscore characters. Cannot be changed after SAML policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the SAML server. Minimum length = 1
reqaction	<String>	Read-write	Name of the SAML authentication action

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to be performed if the policy matches. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationsamlpolicy":{

<b>      "name":<String_value>,

</b><b>      "rule":<String_value>,

</b><b>      "reqaction":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationsamlpolicy":{

<b>      "name":<String_value>,

</b>      "rule":<String_value>,

      "reqaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"authenticationsamlpolicy":{

<b>      "name":<String_value>,

</b>      "rule":true,

      "reqaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationsamlpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy? **view=summary**

Use this query-parameter to get the summary output of authenticationsamlpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationsamlpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationsamlpolicy": [ {
      "name":<String_value>,
      "rule":<String_value>,
      "reqaction":<String_value>
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of authenticationsamlpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationsamlpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "reqaction":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/authenticationsamlpolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "authenticationsamlpolicy": [ { "__count": "#no"} ] }
```

authenticationsamlpolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationsamlpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the SAML policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlpolicy_authenticationvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlpolicy_authenticationvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationsamlpolicy_authenticationvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlpolicy_authenticationvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationsamlpolicy_authenticationvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationsamlpolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,
```

```
      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlpolicy_authenticationvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/ authenticationsamlpolicy_authenticationvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "authenticationsamlpolicy_authenticationvserver_binding": [ {

      "boundto":<String_value>,

authenticationstorefrontauthaction

Configuration for Storefront authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Storefront Authentication action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1
serverurl	<String>	Read-write	URL of the Storefront server. This is the FQDN of the Storefront server. example: https://storefront.com/. Authentication endpoints are learned dynamically by Gateway.
domain	<String>	Read-write	Domain of the server that is used for authentication. If users enter name without domain, this parameter is added to username in the authentication request to server.
defaultauthenticationgroup	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
success	<Double>	Read-only	.
failure	<Double>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter
