Before you Begin

This topic covers the prerequisites and limitations related to using the NITRO APIs.

Prerequisites

To use NITRO, you must have a basic understanding of the Citrix ADC appliance and you must make sure that the client application has one of the following:

- Access to a Citrix ADC appliance.
- To use REST APIs through HTTP, you must have a system to generate HTTP or HTTPS requests (payload in JSON format) to the Citrix ADC appliance. You can use any programming language or tool.
- For Java clients, you must have a system where Java Development Kit (JDK) 1.5 or later is available. The JDK can be downloaded from http://www.oracle.com/technetwork/java/javase/downloads/index.html.

  The NITRO library (available in <NITRO_SDK_HOME>/lib) must be installed on the client path. For installation instructions, read the <NITRO_SDK_HOME>/README.txt file.
- For .NET clients, you must have a system with .NET framework 3.5 or later installed. The .NET framework can be downloaded from http://www.microsoft.com/downloads/en/default.aspx.

  The NITRO library (available in <NITRO_SDK_HOME>/lib) must be installed on the client path. For installation instructions, read the <NITRO_SDK_HOME>/README.txt file.
- For Python clients, you must have a system with Python 2.7 or above version.

  The NITRO library (available in <NITRO_SDK_HOME>/lib) must be installed on the client path. For installation instructions, read the <NITRO_SDK_HOME>/README.txt file.

Obtaining the NITRO SDK Package

The NITRO package is available as a tar file on the Downloads page of the configuration utility of the Citrix ADC appliance. You must download and untar the file to a folder on your local system. This folder is referred to as \<NITRO_SDK_HOME\> in this documentation.

The folder contains the NITRO libraries in the lib subfolder. The libraries must be added to the client application classpath to access NITRO functionality. The \<NITRO_SDK_HOME\> folder also provides samples and documentation that can help you understand the NITRO SDK.

Limitations

The section lists the Citrix ADC operations that cannot be performed by using NITRO API.

`Note:` These operations can be performed on the Citrix ADC CLI or the GUI.

- install API and diff API on nsconfig resource
- UI-internal APIs (update, unset, and get)
- show ns info
- shutdown
- Application firewall API
- importwsdl
- importcustom
- importxmlschema
- importxmlerrorpage
- importhtmlerrorpage
- rmcustom
- rmxmlschema
- rmxmlerrorpage
- rmhtmlerrorpage
- CLI-specific API
- start nstrace/stop nstrace/show nstrace
- scp
- configaudit
- show defaults
- show permission
- batch
- source

NITRO Changes Across Releases

Some NITRO API have changed across releases. This topic details information which can help you avoid compatibility issues in your application. The changes are categorized as:

- Changes made from 12.0-57.24 -> 12.1-48.13
- Changes made from 11.1-53.3 -> 12.0-48.x
- Changes Made from 10.5 57.x -> 11.0
- Changes made from 9.3 -> 10.1 or 10.5

Changes made from 12.0-57.24 -> 12.1-4813

- `Changes across NITRO flavors`

  The NITRO changes that were made in release 12.1-48.13 when compared with release 12.0-57.24.

TYPE OF CHANGE	RESOURCE	METHOD/ ATTRIBUTE	REMARKS
Attribute removed	nsicapprofile	insertxserverip, insertxclientip, sendreqinresmod, insertxauthuseruri, onservererrorresponse	-
Attribute removed	lsnclient	td	“td” is applicable to lsnclientonly in conjunction with network/network6. This attribute is now a part of lsnclient_network_binding and lsclient_netwrok6_binding resources.

TYPE OF CHANGE	RESOURCE	METHOD/ ATTRIBUTE	REMARKS
Attribute removed	nspartition_stats	minbandwidth	minbandwidth setting on the partition is deprecated.
Attribute removed	cloudparameter	verifyurl	This attribute is renamed to activationcode.
Attribute removed	appfwprofile_safeobject_binding	expression	This attribute is renamed to as_expression.

- `Changes specific to NITRO SDKs`

  The SDK-specific changes that were made in release 12.1-48.13 when compared with release 12.0-57.24.

TYPE OF CHANGE	CLASS	METHOD/ ATTRIBUTE	REMARKS
Method removed	nsacls	(base_response) renumber(nitro_service session)	Alternate method - (base_response)renumber(nitro_service client, nsacls resource)
Method removed	nsacls	(base_response) clear(nitro_service session)	Alternate method - (base_response)clear(nitro_service client, nsacls resource)
Method removed	nsacls	(base_response) apply(nitro_service session)	Alternate method - (base_response)apply(nitro_service client, nsacls resource)
Method removed	nsacls6	(base_response) renumber(nitro_service session)	Alternate method - (base_response)renumber(nitro_service

TYPE OF CHANGE	CLASS	METHOD/ ATTRIBUTE	REMARKS
			client, nsacls6 resource)
Method removed	nsacls6	(base_response) clear(nitro_service session)	Alternate method - (base_response)clear(nitro_service client, nsacls6 resource)
Method removed	nsacls6	(base_response) apply(nitro_service session)	Alternate method - (base_response)apply(nitro_service client, nsacls6 resource)

Changes made from 11.1-53.3 -> 12.0-48x

- `Changes across NITRO flavors`

  The NITRO changes that were made in release 12.0-48.x when compared with release 11.1-53.3.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Resource removed	vpath, vpathparam	ALL	All resources and parameters related to vpath feature.
Attribute removed	l3param	-	Icmperrgenerate This attribute is related to vpath for which the support is removed in 12.0.
Attribute removed	qos_stats	-	ipcpe2qosfailedrate **Note**: Some of the counters under this resource are removed. For new

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
			definitions, see http://docs.citrix.com/en-us/netscaler/12/nitro-api/nitro-rest/api-reference/statistics/qos/qos.html
Attribute removed	vrid_interface_binding	-	trackifnum New resources (vrid_trackifnum_binding and vrid6_trackifnum_binding) are introduced to deal with track interfaces.
Attribute removed	vrid_interface_binding	-	ifaces is replaced with ifnum. Previously, ifaces parameter was used in the response and ifnum was used in the input. Now both POST and GET are consistent and use the same attribute name.
Attribute removed	sslprofile_sslciphersuite_binding	-	cipheraliasname

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
			cipheraliasname is a redundant parameter. The required information is provided by ciphername parameter.
Attribute removed	nslicense	-	Ispooledlicensing Ispooledlicensing Is replaced with a new parameter licensingmode which returns if the license of "Local".html"Pooled ".html"CICO" type.
Attribute removed	lbmonitor_sslcertkey_binding	DELETE	crlcheck

- `Changes specific to NITRO SDKs`

  The SDK-specific changes that were made in release 12.0-48.x when compared with release 11.1-53.3.

TYPE OF CHANGE	CLASS	METHOD/ ATTRIBUTE	REMARKS
Attribute type changed	pcpmap	pcpprotocol	Datatype changed from double to string.
Class removed	mediaclassification_stats	-	-

TYPE OF CHANGE	CLASS	METHOD/ ATTRIBUTE	REMARKS
Method removed	vxlan_iptunnel_binding	add(vxlan_iptunnel_binding obj, nitro_service session) delete(vxlan_iptunnel_binding obj, nitro_service session)	Feature is deprecated, use bridgetable with broadcast mac option.
Method removed	inatsession_stats	get(inatsession obj, nitro_service session)	-

Changes Made from 10.5 57.x -> 110

`All NITRO Flavors - Changes from 10.5 57.x to 11.0`

The NITRO changes that were made in release 11.0 when compared with release 10.5 Build 57.x.

TYPE OF CHANGE	RESOURCE	ATTRIBUTE
Attribute removed	nstrace	doruntimemerge
Attribute removed	nstrace	tcpdump
Attribute removed	cacheobject	force

`NITRO SDKs - Changes from 10.5-57.x to 11.0`

The SDK-specific changes that were made in release 11.0 when compared with release 10.5 Build 57.x.

TYPE OF CHANGE	CLASS	METHOD	REPLACE WITH
Attribute missing in method	cacheobject	(base_response) flush(cacheobject obj, nitro_service session) 'force' attribute missing in this method.	-
Method missing	clustersync	(base_response) Force(clustersync obj, nitro_service session)	(base_response) Force(nitro_service session)
Method missing	shutdown	(base_response) Shutdown(shutdown obj, nitro_service session)	(base_response) Shutdown(nitro_service session)
Method missing	systemfile	(systemfile) get(systemfile obj, nitro_service session)	-
Method missing	sslfips	(base_response) reset(sslfips obj, nitro_service session)	(base_response) reset(nitro_service session)

Changes made from 9.3 -> 10.1 or 105

`Note.` No changes are introduced from release 10.1 to release 10.5. Therefore, you should not face any compatibility issues when migrating from release 10.1 to 10.5.

`All NITRO Flavors - Changes from 9.3 to 10.1/10.5`

The NITRO changes that were made in release 10.1/10.5 when compared with release 9.3.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Resource removed	lbmonitor_lbmetrictable_binding Replaced with the resource 'lbmonitor_metric_binding'.	-	-
Method removed	vserver	GET Perform the GET operation on specific virtual server types such as lb/cr/cs.	-
Method removed	filterpolicy	POST with 'action=unset' This method is removed as unsetting the attributes('action') of a policy makes it invalid.	-
Method removed	auditsyslogpolicy	POST with 'action=unset' This method is removed as unsetting the attributes('action') of a policy makes it invalid.	-

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Method removed	auditnslogpolicy	POST with 'action=unset' This method is removed as unsetting the attributes('action') of a policy makes it invalid.	-
Method removed	authorizationpolicy	POST with 'action=unset' This method is removed as unsetting the attributes('action') of a policy makes it invalid.	-
Return-type changed	snmpengineid	GET Return type changed to an array.	-
Return-type changed	nshostname	GET Return type changed to an array.	-
Attribute-type changed	appfwpolicy_lbvserver_binding	-	activepolicy Data type changed from Boolean to Integer.

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
Attribute-type changed	appfwpolicy_appfwglobal_binding	-	activepolicy Data type changed from Boolean to Integer.
Attribute-type changed	vlan	-	portbitmap Data type changed from uint to ulong.
Attribute-type changed	vlan	-	tagbitmap Data type changed from uint to ulong.
Attribute removed	policypatset_pattern_binding	-	indextype This attribute is moved to 'policypatset' resource as this attribute is applicable at patset level.
Attribute removed	system_stats	-	powersupply1failure Replaced with 'powersupply1status'. Note: Change is applicable from release 9.3 Build 65.8.
Attribute removed	system_stats	-	powersupply2failure

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
			Replaced with 'powersupply2status'. Note: Change is applicable from release 9.3 Build 65.8.
Attribute removed	server_servicegroup_binding	-	servicetype Replaced with 'svctype'.
Attribute removed	server_service_binding	-	servicetype Replaced with 'svctype'.
Attribute removed	crvserver	-	hits Hits are calculated per policy binding hence moved this parameter to binding resources.
Attribute removed	crvserver	-	dstvsvr Replaced with 'destinationvserver'.
Attribute removed	crvserver	-	destvserver Replaced with 'domain'.
Attribute removed	crvserver	-	dnsvserver

TYPE OF CHANGE	RESOURCE	METHOD	ATTRIBUTE
			Replaced with 'dnsvservername'.
Attribute removed	appflowpolicylabel	-	type Replaced with 'policylabeltype'.
Attribute removed	sslcipher	-	ciphgrpals Replaced with 'ciphergroupname'.
Attribute removed	csvserver_cspolicy_binding	-	targetvserver Replaced with 'targetlbvserver'. Note: This change is applicable for the 'sslcipher_*_binding' resources also.
Attribute removed	csvserver_cspolicy_binding	-	targetvserver Replaced with 'targetlbvserver'.
Attribute removed	rewriteaction	-	allow_unsafe_pi1, allow_unsafe_pi Replaced with 'bypassSafetyCheck'.
Attribute removed	nsconfig	-	nwfwmode Marked as a hidden attribute.

`NITRO SDKs - Changes from 9.3 to 10.1/10.5`

The SDK-specific changes that were made in release 10.1/10.5 when compared with release 9.3.

TYPE OF CHANGE	CLASS	METHOD	REPLACE WITH
Class removed	Routerbgp	-	This class is removed as all router configurations are deprecated in 9.2.
Method signature changed	dnsptrrec	get(dnsptrrec obj, nitro_service session)	get(nitro_service session, String reversedomain)
Method signature changed	dnsaddrec	get(dnsaddrec obj, nitro_service session)	get(nitro_service session, String hostname)
Method signature changed	dnsnsrec	get(dnsnsrec obj, nitro_service session)	get(nitro_service session, String domain)
Method signature changed	snmpengineid	unset(nitro_service session, String[] args)	unset(nitro_service session, snmpengineid resource, String[] args)
Method signature changed	arp	arp.get(nitro_service session, String ipaddress)	arp.get(nitro_service session, arp resource)
Method signature changed	nsip	get(nitro_service session, String ipaddress)	get(nitro_service client, nsip resource)

TYPE OF CHANGE	CLASS	METHOD	REPLACE WITH
Method signature changed	nsip6	get(nitro_service session, String ipv6address)	get(nitro_service session, nsip6 resource)
Method signature changed	dnsmxrec	dnsmxrec.get(dnsmxrec obj, nitro_service session)	dnsmxrec[] get(nitro_service service, dnsmxrec_args args)
Method Missing	authenticationnegotiatepolicy	(base_response) unset(nitro_service session, String[] args, String name)' is missing in	-
Method missing	authenticationnegotiatepolicy	(base_response) unset(authenticationnegotiatepolicy obj, nitro_service session, String[] args)	-
Attribute missing in method	nsconfig	(base_response) update(nsconfig obj, nitro_service session) 'nwfwmode' attribute is missing in this method.	-

Performing Basic Citrix ADC Operations

This section covers procedures for performing the following basic Citrix ADC operations using NITRO APIs.

- Connecting to the Citrix ADC Appliance
- Enabling Citrix ADC Features and Modes
- Saving Citrix ADC Configurations
- Killing a System Session
- Disconnecting from the Citrix ADC Appliance

Connecting to the Citrix ADC Appliance

The first step towards using NITRO is to establish a session with the Citrix ADC appliance and then authenticate the session by using the Citrix ADC administrator's credentials.

Some points to note with regards to session timeout:

- When restricted timeout param is enabled, NITRO, by default, uses the timeout value that is configured for the logged in user. You can customize this value but it must be limited to the value specified for the user. If no value is specified for the user, the default timeout value of 15 minutes is used.
- When restricted timeout param is not enabled, NITRO uses the default value of 30 minutes as session timeout.
- `Using REST APIs through HTTP`

  You must specify the username and password in the login object. The session ID that is created must be specified in the request header of all further operations in the session.
- `Note.`
  - You must have a user account on the appliance to log on to it. The configuration operations that you can perform are limited by the administrative roles assigned to your account.
- To ensure secure communication, use the HTTPS protocol in NITRO requests.

- Instead of creating a NITRO session, you can log on to the Citrix ADC appliance while performing individual operations. To do this, you must specify the username and password in the request header of the NITRO request as follows:
  - X-NITRO-USER:<username\>
  - X-NITRO-PASS:<password\>
  - Content-Type:application/json

For example, to connect and create a session with a Citrix ADC appliance with NSIP address 10.102.29.60 by using the HTTP protocol:

- `Request`

  `HTTP Method:` POST

`URL:` http://10.102.29.60/nitro/v1/config/login

`Request Headers:` Content-Type:application/json

`Request Payload:`

```
{

    "login":

    {

    "username":"admin",

    "password":"verysecret"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

```
Set-Cookie:NITRO_AUTH_TOKEN=<tokenvalue>;

path=/nitro/v1
```

- `Using REST APIs through SDKs`

  You must create an object of the com.citrix.netscaler.nitro.service.nitro_service class by specifying the Citrix ADC IP (NSIP) address and the protocol to connect to the appliance (HTTP or HTTPS). You then use this object and log on to the appliance by specifying the user name and the password of the Citrix ADC administrator.

`Note:`

- For the python SDK, the package path is of the form nssrc.com.citrix.netscaler...
- You must have a user account on that appliance. The configuration operations that you perform are limited by the administrative roles assigned to your account.

The following sample code establishes a session with a Citrix ADC appliance with IP address 10.102.29.60 by using the HTTPS protocol and also sets a session timeout period (in seconds) of 60 minutes.

`Java - Sample code to establish session`

```
//Specify the Citrix ADC appliance IP address and protocol

nitro_service ns_session = new nitro_service("10.102.29.60","https");

//Specify the login credentials

ns_session.login("admin","verysecret",3600);
```

`.NET - Sample code to establish session`

```
//Specify the Citrix ADC appliance IP address and protocol

nitro_service ns_session = new nitro_service("10.102.29.60","https");
```

```
//Specify the login credentials

ns_session.login("admin","verysecret",3600);
```

`Python - Sample code to establish session`

```
# Specify the Citrix ADC appliance IP address and protocol

ns_session = nitro_service("10.102.29.60","https")

# Specify the login credentials

ns_session.login("admin","verysecret",3600)
```

Disable SSL Checks

When using HTTPS, you must make sure that the root CA is added to the truststore. By default, NITRO validates the SSL certificate and verifies the hostname.

- `Using REST APIs through SDKs`

  Disable these validations as shown in the following sample codes.

`Java - Sample code for disabling SSL checks`

```
ns_session.set_certvalidation(false);

ns_session.set_hostnameverification(false);
```

`.NET - Sample code for disabling SSL checks`

```
ns_session.certvalidation = false;

ns_session.hostnameverification = false;
```

`Python - Sample code for disabling SSL checks`

```
ns_session.certvalidation = false
```

Enabling Citrix ADC Features and Modes

Some Citrix ADC features and modes are disabled by default and therefore must be enabled before they can be configured. To enable a Citrix ADC feature or mode, specify the action as "enable" in the URL query string, and in the request payload, specify the feature or mode to be enabled.

- `Using REST APIs through HTTP`

  To disable a feature or mode, in the URL query string, specify the action as "disable".

For example, to enable the load balancing and content switching features:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsfeature?action=enable

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "nsfeature":

    {

        "feature":
```

```
        [
            "LB",
            "CS"
        ]
    }
}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

To enable the L2 and fast ramp modes:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsmode?action=enable

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{
    "nsmode":
    {
        "mode":
```

```
        [
            "L2",
            "FR"
        ]
    }
}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Saving Citrix ADC Configurations

To make sure that the configurations persist on rebooting the appliance, you must save the Citrix ADC configurations. To save the configurations, specify the action as "save" in the URL query string.

- `Using REST APIs through HTTP`

  To save the configurations:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconfig?action=save

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "nsconfig":

    {}

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Killing a System Session

A Citrix ADC administrator can kill any system session by specifying the action as "kill" in the URL query string and by specifying the required system session ID in the request payload.

- `Using REST APIs through HTTP`

  For example, to kill a system session that has ID as 311:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemsession?action=kill

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "systemsession":

    {
```

```
    "sid":"311"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Disconnecting from the Citrix ADC Appliance

Before disconnecting (logging out) from the Citrix ADC appliance, make sure that you have saved the Citrix ADC configurations.

- `Using REST APIs through HTTP`

  To logout of the Citrix ADC appliance:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/logout

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "logout":{}

}
```

- `Response`

`HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Performing Citrix ADC Resource Operations

Citrix ADC resources are organized into a set of packages or namespaces. Each package or namespace corresponds to a Citrix ADC feature. For example, all load-balancing related resources, such as load balancing virtual server, load balancing group, and load balancing monitor are available in com.citrix.netscaler.nitro.resource.config.lb.

Similarly, all application firewall related resources, such as application firewall policy and application firewall archive are available in com.citrix.netscaler.nitro.resource.config.appfw.

Each Citrix ADC resource is represented by a class. For example, the class that represents a load balancing virtual server is called lbvserver (in com.citrix.netscaler.nitro.resource.config.lb). The state of a resource is represented by properties of a class. You can get and set the properties of the class.

The setter and getter properties are always executed locally on the client. They do not involve any network interaction with the NITRO web service. All properties have basic simple types: integer, long, boolean, and string.

Adding a Citrix ADC Resource

This topic covers adding a Citrix ADC resource by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To create a new resource (for example, an lbvserver) on the appliance, specify the resource name and other related arguments in the specific resource object.

For example, to create an load balancing virtual server named MyFirstLbVServer:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "lbvserver":

    {

    "name":"MyFirstLbVServer",

    "servicetype":"http"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To create a new resource, instantiate the resource class, configure the resource by setting its properties locally, and then upload the new resource instance to the Citrix ADC appliance.

The following sample code creates a load balancing virtual server.

`Java - Sample code to add a Citrix ADC resource`

```
//Create an instance of the lbvserver class

lbvserver new_lbvserver_obj = new lbvserver();

//Set the properties of the resource locally
```

```
new_lbvserver_obj.set_name("MyFirstLbVServer");
new_lbvserver_obj.set_ipv46("10.102.29.88");
new_lbvserver_obj.set_port(88);
new_lbvserver_obj.set_servicetype("HTTP");
new_lbvserver_obj.set_lbmethod("ROUNDROBIN");

//Upload the resource to Citrix ADC

lbvserver.add(ns_session,new_lbvserver_obj);
```

`.NET - Sample code to add a Citrix ADC resource`

```
//Create an instance of the lbvserver class

lbvserver new_lbvserver_obj = new lbvserver();

//Set the properties of the resource locally

new_lbvserver_obj.name = "MyFirstLbVServer";
new_lbvserver_obj.ipv46 = "10.102.29.88";
new_lbvserver_obj.port = 88;
new_lbvserver_obj.servicetype = "HTTP";
```

```
new_lbvserver_obj.lbmethod = "ROUNDROBIN";

//Upload the resource to Citrix ADC

lbvserver.add(ns_session,new_lbvserver_obj);
```

`Python - Sample code to add a Citrix ADC resource`

```

# Create an instance of the lbvserver class

new_lbvserver_obj = lbvserver()

# Set the properties of the resource locally

new_lbvserver_obj.name = "MyFirstLbVServer"

new_lbvserver_obj.ipv46 = "10.102.29.88"

new_lbvserver_obj.port = 88

new_lbvserver_obj.servicetype = "HTTP"

new_lbvserver_obj.lbmethod = "ROUNDROBIN"

# Upload the resource to CItrix ADC

```

```
lbvserver.add(ns_session, new_lbvserver_obj)
```

Enabling a Citrix ADC Resource

This topic covers enabling a Citrix ADC resource by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To enable a resource on the Citrix ADC appliance, specify the action as "enable" in the URL query string, and in the request payload, specify the resource to be enabled. To disable a resource, in the URL query string, specify the action as "disable".

For example, to enable a load balancing virtual server named MyFirstLbVServer.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?action=enable

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "lbvserver":

    {

    "name":"MyFirstLbVServer"

    }

}
```

- `Response`

`HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To enable a resource, invoke the enable() method and to disable, invoke the disable() method.

The following sample code enables a load balancing virtual server named lb_vip.

`Java - Sample code to enable a Citrix ADC resource`

```
lbvserver obj = new lbvserver();

obj.set_name("lb_vip");

lbvserver.enable(ns_session, obj);
```

`.NET - Sample code to enable a Citrix ADC resource`

```
lbvserver obj = new lbvserver();

obj.name = "lb_vip";

lbvserver.enable(ns_session, obj);
```

`Python - Sample code to enable a Citrix ADC resource`

```
obj = lbvserver()
```

```
obj.name = "lb_vip"

lbvserver.enable(ns_session, obj)
```

Retrieving Properties of Citrix ADC Resources

This topic covers retrieving properties of a Citrix ADC resource by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  NITRO provides multiple approaches using which you can retrieve resources and their relevant details. The following table explains each of these approaches with the required URL.

Retrieving all details of all resources of a specific type	In the URL, specify the type of resource for which you want to retrieve the details. For example, to retrieve all details of load balancing virtual servers available on a Citrix ADC appliance. http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver
Retrieving all details of a specific resource	In the URL, specify the name of resource for which you want to retrieve the details. For example, to retrieve all details of a load balancing virtual server named MyFirstLbVServer: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver/MyFirstLbVServer
Retrieving summary or detailed view of resources	In the URL, use the "view" query parameter to specify whether you want to view the

	summary (mandatory parameters) or detail (all parameters). For example, to view the mandatory parameters for all load balancing virtual servers: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?view=summary Note: By default, the retrieved results are displayed in detail view (?view=detail).
Retrieving all details of resources that have multiple unique identifiers	In the URL, specify the type of resource and use the "args" query parameter to specify the unique attributes and the values for those attributes. For example, to get the application firewall profiles that have unique identifiers "name" and "starturl" as appfw1 and aa respectively. http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile?args=name:appfw1,starturl:aa
Retrieving specific details of all resources of a specific type	In the URL, specify the type of the resource and use the "attrs" query parameter to specify the resource details that you want to retrieve. For example, to retrieve the "name" and "lbmethod" of all load balancing virtual servers: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?attrs=name,lbmethod
Retrieving specific details of a specific resource	In the URL, specify the type and name of the resource and use the "attrs" query parameter

	to specify the resource details that you want to retrieve. For example, to retrieve the "name" and "lbmethod" of a load balancing virtual server named "MyFirstLbVServer": http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver/MyFirstLbVServer?attrs=name,lbmethod
Filtering the retrieved resources	In the URL, specify the type of resource and use the "filter" query parameter to specify the attribute(s) and the value(s) of the attributes. The resources fetched will be filtered based on the filter criteria. Note: The filter query parameter supports the use of PCRE regular expressions. For example, to filter the load balancing virtual servers where the "lbmethod" is ROUNDROBIN. http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?filter=lbmethod:ROUNDROBIN
Retrieving resources in paginated manner	If the request is likely to result in a large number of resources, you can divide the results into pages and retrieve them page by page (paginated). For example, if you are retrieving all the 53 load balancing virtual servers of a Citrix ADC appliance, instead of retrieving all 53 in one response, you can configure the results to be divided into 6 pages each having 10 results. In the URL, specify the name of the resource and use the following query parameters:

	• "pageno" - The page number to be displayed. • "pagesize" - The number of resources to be displayed in each page. For example, to retrieve the load balancing virtual servers in a paginated form, first get a count (using the "count" query parameter shown in below row) of the load balancing virtual servers. Then, accordingly specify the number of results for each page and then specify the page number to be displayed. http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?pagesize=10&pageno=3

For example, to retrieve only the name and load balancing method of all load balancing virtual servers on a Citrix ADC.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?attrs=name,lbmethod

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{
    lbvserver:
    {
        name: "test",
        lbmethod: "LEASTCONNECTION"
    }
    {
        name: "test1",
        lbmethod: "LEASTCONNECTION"
    }
}
```

- `Using REST APIs through SDKs`

  To retrieve the properties of a resource, you retrieve the resource object from the Citrix ADC appliance. Once the object is retrieved, you can extract the required properties of the resource locally, without further network traffic.

The following sample code retrieves the details of a load balancing virtual server.

`Java - Sample code to get details of resource`

```
//Retrieve the resource object from the Citrix ADC

new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer");

//Extract the properties of the resource from the object locally
```

```
System.out.println(new_lbvserver_obj.get_name());

System.out.println(new_lbvserver_obj.get_servicetype());
```

`.NET - Sample code to get details of resource`

```
//Retrieve the resource object from the Citrix ADC

new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer");

//Extract the properties of the resource from the object locally

Console.WriteLine(new_lbvserver_obj.name);

Console.WriteLine(new_lbvserver_obj.servicetype);
```

`Python - Sample code to get details of resource`

```

# Retrieve the resource object from the CItrix ADC

new_lbvserver_obj = lbvserver.get(ns_session,"MyFirstLbVServer")

# Extract the properties of the resource from the object locally

print(new_lbvserver_obj.name)
```

```
print(new_lbvserver_obj.servicetype)
```

Filtering Results

This topic covers retrieving filtered information of a resource by using REST APIs through SDKs.

- `Using REST APIs through SDKs`

  You can also retrieve resources by specifying a filter on the value of their properties by using the com.citrix.netscaler.nitro.util.filtervalue class.

For example, you can retrieve all the load balancing virtual servers that have their port set to 80 and servicetype to HTTP.

`Java - Sample code to get filtered results`

```
filtervalue[] filter = new filtervalue[2];

filter[0] = new filtervalue("port","80");

filter[1] = new filtervalue("servicetype","HTTP");

lbvserver[] result = lbvserver.get_filtered(ns_session,filter);
```

`.NET - Sample code to get filtered results`

```
filtervalue[] filter = new filtervalue[2];

filter[0] = new filtervalue("port","80");

filter[1] = new filtervalue("servicetype","HTTP");

lbvserver[] result = lbvserver.get_filtered(ns_session,filter);
```

`Python - Sample code to get filtered results`

```
filter_params = []

      filter_params = [ filtervalue() for _ in range(2)]
```

```
filter_params[0] = filtervalue("servicetype","HTTP")

filter_params[1] = filtervalue("port","80")

result = lbvserver.get_filtered(ns_session1, filter_params)
```

Retrieving Statistics of Citrix ADC Resources

The Citrix ADC appliance collects statistics about the usage of its features and the corresponding resources. NITRO can retrieve these statistics. Not all Citrix ADC features and resources have statistic objects associated with them.

- `Using REST APIs through HTTP`

  To get statistics of a feature, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/\<feature_name\>.

To get statistics of a resource, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/\<resource_type\>/\<resource_name\>.

To get statistics of the services and service groups that are bound to a load balancing virtual server, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/\<name\>?statbindings=yes*.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/MyFirstLbVServer

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Payload:`

```
{

    "lbvserver":

    [

        {

            "name":"MyFirstLbVServer",

            "establishedconn":0,

            "vslbhealth":0,

            "primaryipaddress":"0.0.0.0",

            ...
```

```
        }

    ]

}
```

To get statistics of the bound entities, use statbindings=yes. For example, to get the statistics of the services that are bound to a load balancing virtual server named MyFirstLbVServer.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/MyFirstLbVServer?statbindings=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status code on success:` 200 OK

`HTTP Status code on failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{

"lbvserver": [{

    "name": "MyFirstLbVServer",

    "sortorder": "descending",

    "vsvrsurgecount": "0",

    "establishedconn": "0",

    ...

    "service": [{

        "name": "s1",

        "throughput": "0",

        "throughputrate": 0,
```

```
        "avgsvrttfb": "0",

        "primaryipaddress": "1.2.3.5",

        "primaryport": 80,

        "servicetype": "HTTP",

        "state": "DOWN",

            "totalrequests": "0",

            "requestsrate": 0,

            ...

            }]
    }]

}
```

- `Using REST APIs through SDKs`

The Citrix ADC appliance collects statistics about the usage of its features and the corresponding resources. You can retrieve these statistics by using NITRO API. The statistics APIs are available in different packages from the configuration APIs.

For example, the API to retrieve statistics of the load balancing virtual server are available in com.citrix.netscaler.nitro.resource.stat.lb.

`Note.`

- For the python SDK, the package path is of the form nssrc.com.citrix.netscaler.....
- Not all Citrix ADC features and resources have statistic objects associated with them.

The following sample code retrieves the statistics of a load balancing virtual server and displays some of the statistics returned.

`Java - Sample code to get feature statistics`

```
lbvserver_stats stats =
lbvserver_stats.get(ns_session,"MyFirstLbVServer");

System.out.println(stats.get_curclntconnections());

System.out.println(stats.get_deferredreqrate());
```

`.NET - Sample code to get feature statistics`

```
lbvserver_stats stats =
lbvserver_stats.get(ns_session,"MyFirstLbVServer");

Console.WriteLine(stats.curclntconnections);

Console.WriteLine(stats.deferredreqrate);
```

`Python - Sample code to get feature statistics`

```
stats = lbvserver_stats.get(ns_session,"MyFirstLbVServer")

print(stats.curclntconnections)

print(stats.deferredreqrate)
```

Retrieving Statistics of Citrix ADC Resources

The Citrix ADC appliance collects statistics about the usage of its features and the corresponding resources. NITRO can retrieve these statistics. Not all Citrix ADC features and resources have statistic objects associated with them.

- `Using REST APIs through HTTP`

  To get statistics of a feature, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/\<feature_name\>.

To get statistics of a resource, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/\<resource_type\>/\<resource_name\>.

To get statistics of the services and service groups that are bound to a load balancing virtual server, the URL format must be: http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/\<name\>?statbindings=yes*.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/MyFirstLbVServer

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Payload:`

```
{

    "lbvserver":

    [

        {

            "name":"MyFirstLbVServer",

            "establishedconn":0,

            "vslbhealth":0,

            "primaryipaddress":"0.0.0.0",

            ...
```

```
        }

    ]

}
```

To get statistics of the bound entities, use statbindings=yes. For example, to get the statistics of the services that are bound to a load balancing virtual server named MyFirstLbVServer.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/stat/lbvserver/MyFirstLbVServer?statbindings=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status code on success:` 200 OK

`HTTP Status code on failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{

"lbvserver": [{

    "name": "MyFirstLbVServer",

    "sortorder": "descending",

    "vsvrsurgecount": "0",

    "establishedconn": "0",

    ...

    "service": [{

        "name": "s1",

        "throughput": "0",

        "throughputrate": 0,
```

```
        "avgsvrttfb": "0",

        "primaryipaddress": "1.2.3.5",

        "primaryport": 80,

        "servicetype": "HTTP",

        "state": "DOWN",

            "totalrequests": "0",

            "requestsrate": 0,

            ...

            }]
    }]

}
```

- `Using REST APIs through SDKs`

The Citrix ADC appliance collects statistics about the usage of its features and the corresponding resources. You can retrieve these statistics by using NITRO API. The statistics APIs are available in different packages from the configuration APIs.

For example, the API to retrieve statistics of the load balancing virtual server are available in com.citrix.netscaler.nitro.resource.stat.lb.

`Note:`

- For the python SDK, the package path is of the form nssrc.com.citrix.netscaler.....
- Not all Citrix ADC features and resources have statistic objects associated with them.

The following sample code retrieves the statistics of a load balancing virtual server and displays some of the statistics returned.

`Java - Sample code to get feature statistics`

```
lbvserver_stats stats =
lbvserver_stats.get(ns_session,"MyFirstLbVServer");

System.out.println(stats.get_curclntconnections());

System.out.println(stats.get_deferredreqrate());
```

`.NET - Sample code to get feature statistics`

```
lbvserver_stats stats =
lbvserver_stats.get(ns_session,"MyFirstLbVServer");

Console.WriteLine(stats.curclntconnections);

Console.WriteLine(stats.deferredreqrate);
```

`Python - Sample code to get feature statistics`

```
stats = lbvserver_stats.get(ns_session,"MyFirstLbVServer")

print(stats.curclntconnections)

print(stats.deferredreqrate)
```

Updating a Citrix ADC Resource

You can modify the properties of a resource after creating it.

Some properties in some Citrix ADC resources are not allowed to be modified after creation. The port number or the service type (protocol) of a load balancing virtual server or a service, are examples of such properties. Even though the update method appears to succeed, these properties retain their original values on the appliance.

- `Using REST APIs through HTTP`

  To update the details of an existing resource on the Citrix ADC appliance, specify the name of the resource in the URL, and in the request payload,within the specific resource object, specify the name and the updated details of the resource.

For example, to change the load balancing method to ROUNDROBIN and update the comment property for a load balancing virtual server named MyFirstLbVServer:

- `Request`

  `HTTP Method:` PUT

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver/MyFirstLbVServer

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "lbvserver":

    {

        "name":"MyFirstLbVServer",

        "lbmethod":"ROUNDROBIN",

        "comment":"Updated comments"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To update the properties of a resource, instantiate the resource class, specify the name of the resource to be updated, configure the resource by updating its properties locally, and then upload the updated resource instance to the Citrix ADC appliance.

The following sample code updates the service type and load balancing method of a load balancing virtual server.

`Java - Sample code to update a Citrix ADC resource`

```
//Create an instance of the lbvserver class

lbvserver update_lb = new lbvserver();
```

```
//Specify the name of the lbvserver to be updated

update_lb.set_name("MyFirstLbVServer");

//Specify the updated service type and lb method

update_lb.set_servicetype("https");
update_lb.set_lbmethod("LEASTRESPONSETIME");

//Upload the resource to Citrix ADC

lbvserver.update(ns_session,update_lb);
```

`.NET - Sample code to update a Citrix ADC resource`

```
//Create an instance of the lbvserver class

lbvserver update_lb = new lbvserver();

//Specify the name of the lbvserver to be updated

update_lb.name = "MyFirstLbVServer";
```

```
//Specify the updated service type and lb method

update_lb.servicetype = "https";

update_lb.lbmethod = "LEASTRESPONSETIME";

//Upload the resource to Citrix ADC

lbvserver.update(ns_session, update_lb);
```

`Python - Sample code to update a Citrix ADC resource`

```
# Create an instance of the lbvserver class

update_lb = lbvserver()

# Specify the name of the lbvserver to be updated

update_lb.name = "MyFirstLbVServer"

# Specify the updated service type and lb method

update_lb.servicetype = "https"
```

```
update_lb.lbmethod = "LEASTRESPONSETIME"

# Upload the resource to the CItrix ADC

lbvserver.update(ns_session, update_lb)
```

Binding Citrix ADC Resources

Citrix ADC resources form relationships with each other through the process of binding. This is how services are associated with a load balancing virtual server, or how policies are bound to a load balancing virtual server. Each binding relationship is represented by its own object.

A binding resource has properties representing the name of each Citrix ADC resource in the binding relationship. It can also have other properties related to that relationship (for example, the weight of the binding between an lbvserver resource and a service resource).

- `Using REST APIs through HTTP`

  To bind one Citrix ADC resource to another, you must instantiate the appropriate binding class (for example, to bind a service to a load balancing virtual server, you must instantiate the lbvserver_service_binding class) and add it to the Citrix ADC configuration (by using the static add() method on this class).

To unbind a resource, use the DELETE method and specify an "args" query string parameter in the URL that contains the attribute name and value in the relationship resource that designates the secondary resource.

The following example binds a service named svc_prod to a load balancing virtual server named MyFirstLbVServer and specify a weight for the binding.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/lbvserver_service_binding

`Request Headers:` Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

`Request Payload:`

```
{

"lbvserver_service_binding":

    {

    "servicename":"svc_prod",

    "weight":"20",

    "name":"MyFirstLbVServer"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx \<string \> (for general HTTP errors) or 5xx \<string \> (for Citrix-ADC-specific errors). The response payload provides details of the error.

The following example binds a policy to a policy label.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/authenticationpolicylabel_authenticationpolicy_binding

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"authenticationpolicylabel_authenticationpolicy_binding":

    {

    "policyname":"p1",

    "priority":"100",

    "gotopriorityexpression":"END",

    "labelname":"pl1"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

The following example unbinds the service svc_prod from the load balancing virtual server MyFirstLbVServer.

- `Request`

  `HTTP Method:` DELETE

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_service_binding/MyFirstLbVServer?args=servicename:svc_prod

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To bind one Citrix ADC resource to another, you must instantiate the appropriate binding class (for example, to bind a service to a load balancing virtual server, you must instantiate the lbvserver_service_binding class) and add it to the Citrix ADC configuration (by using the static add() method on this class).

To unbind a resource from another, invoke the delete() method from the resource binding class, by passing the name of the two resources.

The following sample code binds a service to a load balancing virtual server, by specifying a certain weight for the binding.

`Java - Sample code for binding`

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();

bindObj.set_name("MyFirstLbVServer");

bindObj.set_servicename("svc_prod");

bindObj.set_weight(20);

lbvserver_service_binding.add(ns_session,bindObj);
```

`.NET - Sample code for binding`

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();

bindObj.name = "MyFirstLbVServer";

bindObj.servicename = "svc_prod";

bindObj.weight = 20;

lbvserver_service_binding.add(ns_session,bindObj);
```

`Python - Sample code for binding`

```
bindObj = lbvserver_service_binding()

bindObj.name = "MyFirstLbVServer"

bindObj.servicename = "svc_prod"

bindObj.weight = 20

lbvserver_service_binding.add(ns_session, bindObj)
```

The following code sample unbinds a service from a server.

`Java - Sample Code for unbinding`

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();

bindObj.set_name("MyFirstLbVServer");

bindObj.set_servicename("svc_prod");

lbvserver_service_binding.delete(ns_session,bindObj);
```

`.NET - Sample code for unbinding`

```
lbvserver_service_binding bindObj = new lbvserver_service_binding();

bindObj.name("MyFirstLbVServer");

bindObj.servicename("svc_prod");

lbvserver_service_binding.delete(ns_session,bindObj);
```

`Python - Sample code for unbinding`

```
bindObj = lbvserver_service_binding()

bindObj.name = "MyFirstLbVServer"

bindObj.servicename = "svc_prod"
```

```
lbvserver_service_binding.delete(ns_session, bindObj)
```

Globally Binding Citrix ADC Resources

Some Citrix ADC resources can be bound globally to affect the whole system. For example, a compression policy can be bound to an load balancing virtual server, in which case the policy affects only the traffic on that load balancing virtual server. However, if bound globally, it can affect any traffic on the appliance, regardless of which virtual servers handle the traffic.

The names of NITRO resources that can be used to bind resources globally have the pattern *\<featurename \>global_\<resourcetype \>_binding*. For example, the object *aaaglobal_aaapreauthenticationpolicy_binding* is used to bind preauthentication policies globally.

- `Using REST APIs through HTTP`

  The following example binds the policy named preautpol1 globally at priority 200.

- `Request`

  `HTTP Method:` POST

`URL:`

http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding/preautpol1

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"aaaglobal_aaapreauthenticationpolicy_binding":

    {

    "policy":"preautpol1",
```

```
    "priority":"200"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

The following example unbinds the policy named preautpol1.

- `Request`

  `HTTP Method:` DELETE

`URL:`

http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/aaaglobal_aaapreauthenticationpolicy_binding?args=policy:preautpol1

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code creates a preauthentication action and a preauthentication policy that uses that action, and then binds the policy globally at priority 200.

Java - Sample code

```
aaapreauthenticationaction preauth_act1;

aaapreauthenticationpolicy preauth_pol1;

aaaglobal_aaapreauthenticationpolicy_binding glob_binding;

preauth_act1 = new aaapreauthenticationaction();

preauth_act1.set_name("preauth_act1");

preauth_act1.set_preauthenticationaction("ALLOW");

aaapreauthenticationaction.add(ns_session,preauth_act1);

preauth_pol1 = new aaapreauthenticationpolicy();

preauth_pol1.set_name("preauth_pol1");

preauth_pol1.set_rule("CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS");

preauth_pol1.set_reqaction("preauth_act1");
```

```
aaapreauthenticationpolicy.add(ns_session,preauth_pol1);

 glob_binding = new aaaglobal_aaapreauthenticationpolicy_binding();

glob_binding.set_policy("preauth_pol1");

glob_binding.set_priority(200);

aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session,glob_binding);
```

`.NET - Sample code`

```
aaapreauthenticationaction preauth_act1;

aaapreauthenticationpolicy preauth_pol1;

aaaglobal_aaapreauthenticationpolicy_binding glob_binding;

preauth_act1 = new aaapreauthenticationaction();

preauth_act1.name = "preauth_act1";
```

```
preauth_act1.preauthenticationaction = "ALLOW";

aaapreauthenticationaction.add(ns_session, preauth_act1);

preauth_pol1 = new aaapreauthenticationpolicy();

preauth_pol1.name = "preauth_pol1";

preauth_pol1.rule = "CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS";

preauth_pol1.reqaction = "preauth_act1";

aaapreauthenticationpolicy.add(ns_session, preauth_pol1);

glob_binding = new aaaglobal_aaapreauthenticationpolicy_binding();

glob_binding.policy = "preauth_pol1";

glob_binding.priority = 200;

aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session,glob_binding);
```

Python - Sample code

```
preauth_act1 = aaapreauthenticationaction()

preauth_act1.name = "preauth_act1"

preauth_act1.preauthenticationaction = "ALLOW"

aaapreauthenticationaction.add(ns_session, preauth_act1)

preauth_pol1 = aaapreauthenticationpolicy()

preauth_pol1.name = "preauth_pol1"

preauth_pol1.rule = "CLIENT.APPLICATION.PROCESS(antivirus.exe) EXISTS"

preauth_pol1.reqaction = "preauth_act1"

aaapreauthenticationpolicy.add(ns_session, preauth_pol1)

glob_binding = aaaglobal_aaapreauthenticationpolicy_binding()

glob_binding.policy = "preauth_pol1"
```

```
glob_binding.priority = 200

aaaglobal_aaapreauthenticationpolicy_binding.add(ns_session, glob_binding)
```

Deleting a Citrix ADC Resource

The usage of the delete operation depends on the unique identifiers (UIDs) of the resource being deleted.

Deleting Resource with Single UID. To delete a Citrix ADC resource that can be identified by a single identifier, specify the resource name. Deleting Resource with Multiple UIDs. To delete a Citrix ADC resource that is identified using multiple identifiers, use the "args" query parameter to specify the unique attributes along with their values.

- `Using REST APIs through HTTP`

  The following example deletes a load balancing virtual server named MyFirstLbVServer.

- `Request`

  `HTTP Method:` DELETE

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver/MyFirstLbVServer

`Request Header:` Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

The following example deletes a resource with multiple UIDs. Consider a SNIP (10.102.29.71) that belongs to two traffic domains (TDs) 123 and 110. To delete the SNIP from one of the traffic domains, specify the IP address and the relevant TD in the URL as follows:

- `Request`

  `HTTP Method:` DELETE

`URL:`

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip?args=ipaddress:10.102.29.71,td:123

`Request Header:` Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To delete an existing resource, invoke the static method delete() on the resource class, by passing the name of the resource.

The following sample code deletes a load balancing virtual server with name MyFirstLbVServer.

`Java - Sample code to delete a Citrix ADC resource`

```
lbvserver remove_lb = new lbvserver();

remove_lb.set_name("MyFirstLbVServer");

lbvserver.delete(ns_session, remove_lb);
```

`.NET - Sample code to delete a Citrix ADC resource`

```
lbvserver remove_lb = new lbvserver();

remove_lb.name("MyFirstLbVServer");

lbvserver.delete(ns_session, remove_lb);
```

`Python - Sample code to delete a Citrix ADC resource`

```
remove_lb = lbvserver()

remove_lb.name = "MyFirstLbVServer"

lbvserver.delete(ns_session, remove_lb)
```

Performing Bulk Operations

You can create, retrieve, update, and delete multiple resources simultaneously and thus minimize network traffic. For example, you can add multiple load balancing virtual servers in the same operation.

To account for the failure of some operations within the bulk operation, NITRO allows you to configure one of the following behaviors while establishing a connection with the appliance.

- `Exit`. When the first error is encountered, the execution stops. The commands that were executed before the error are committed.
- `Rollback`. When the first error is encountered, the execution stops. The commands that were executed before the error are rolled back. Rollback is only supported for add and bind commands.
- `Continue`. All the commands in the list are executed even if some commands fail.
- `Using REST APIs through HTTP`

  To perform a bulk operation, specify the required parameters in the same request payload. You must specify the behavior of the bulk operation in the request header using the X-NITRO-ONERROR parameter.

The following example adds two load balancing virtual servers in one operation. The operation continues even if one of the add operation fails.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "lbvserver":

    [

        {

        "name":"new_lbvserver1",

        "servicetype":"http"

        },

        {

        "name":"new_lbvserver2",

        "servicetype":"http"

        }

    ]

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created for the add operation and 200 OK for the update operation.

`HTTP Status Code on Failure:` 207 Multi Status with error details in the response payload.

The following example enables multiple load balancing virtual servers in the same operation.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?action=enable

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Content-Type:application/json

`Request Payload:`

```
{
            "lbvserver":
    [
        {
            "name":"v1",
        },

        {
            "name":"v2",
        }
    ]
}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created for the add operation and 200 OK for the update operation.

`HTTP Status Code on Failure:` 207 Multi Status with error details in the response payload.

- `Using REST APIs through SDKs`

To perform a bulk operation, you instantiate an array of the resource class, configure the properties of all the instances locally, and then upload all the instances to the Citrix ADC with one command.

The following sample code specifies bulk operation behavior.

`Java - Sample code to specify bulk operation behavior`

```
nitro_service ns_session = new nitro_service("10.102.29.60","http");

ns_session.set_onerror(OnerrorEnum.CONTINUE);

ns_session.login("admin","verysecret");
```

`.NET - Sample code to specify bulk operation behavior`

```
nitro_service ns_session = new nitro_service("10.102.29.60","http");

ns_session.onerror = OnerrorEnum.CONTINUE;

ns_session.login("admin","verysecret");
```

`Python - Sample code to specify bulk operation behavior`

```
ns_session = nitro_service("10.102.29.60","http")

ns_session.onerror = OnerrorEnum.CONTINUE

ns_session.login("admin","verysecret")
```

The following sample code creates two load balancing virtual servers.

`Java - Sample code for bulk creation`

```
//Create an array of lbvserver instances

lbvserver[] lbs = new lbvserver[2];
```

```
//Specify properties of the first lbvserver

lbs[0] = new lbvserver();

lbs[0].set_name("lbvserv1");

lbs[0].set_servicetype("http");

lbs[0].set_ipv46("10.70.136.5");

lbs[0].set_port(80);

//Specify properties of the second lbvserver

lbs[1] = new lbvserver();

lbs[1].set_name("lbvserv2");

lbs[1].set_servicetype("https");

lbs[1].set_ipv46("10.70.136.5");

lbs[1].set_port(443);

//Upload the properties of the two lbvservers to the Citrix ADC

lbvserver.add(ns_session,lbs);
```

`.NET - Sample code for bulk creation`

```
//Create an array of lbvserver instances

lbvserver[] lbs = new lbvserver[2];

//Specify details of first lbvserver

lbs[0] = new lbvserver();

lbs[0].name = "lbvserv1";

lbs[0].servicetype = "http";

lbs[0].ipv46 = "10.70.136.5";

lbs[0].port = 80;

//Specify details of second lbvserver

lbs[1] = new lbvserver();

lbs[1].name = "lbvserv2";

lbs[1].servicetype = "https";

lbs[1].ipv46 = "10.70.136.5";

lbs[1].port = 443;

//upload the details of the lbvservers to the NITRO server
```

```
lbvserver.add(ns_session,lbs);
```

`Python - Sample code for bulk creation`

```
# Create an array of lbvserver instances

lbs = lbvserver[2]

# Specify properties of the first lbvserver

lbs[0] = lbvserver()
lbs[0].name = "lbvserv1"
lbs[0].servicetype = "http"
lbs[0].ipv46 = "10.70.136.5"
lbs[0].port = 80

# Specify properties of the second lbvserver

lbs[1] = lbvserver()
lbs[1].name = "lbvserv2"
lbs[1].servicetype = "https"
lbs[1].ipv46 = "10.70.136.5"
```

```
lbs[1].port = 443

# Upload the properties of the two lbvservers to the CItrix ADC

lbvserver.add(ns_session, lbs)
```

Getting the Count of Citrix ADC Resources

This topic covers getting the count of a type of Citrix ADC resource present in a Citrix ADC appliance by using REST APIs through HTTP.

- `Using REST APIs through HTTP`

  To get a count of a specific resource type, in the URL specify the count query parameter as "yes".

For example, to get a count of all the load balancing virtual servers.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver?count=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{

    "lbvserver":

    [

        {

            "__count": 4

        }

    ]

}
```

Renaming a Citrix ADC Resource

This topic covers renaming a Citrix ADC resource by using REST APIs through HTTP.

- `Using REST APIs through HTTP`

  To change the name of an existing resource, specify the action as "rename" in the URL query string, and in the request payload, specify the existing name and the new name.

For example, to change the name of a load balancing virtual server from MyFirstLbVServer to MyServer:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/lbvserver?action=rename

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{
    "lbvserver":
    {
        "name":"MyFirstLbVServer",
        "newname":"MyServer"
    }
}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Performing File Operations

Citrix ADC operations such as configuring SSL certificates requires the input files to be available locally on the Citrix ADC appliance. NITRO allows you to perform file operations such as uploading files, retrieving files, retrieving file content, and deleting files of types: txt, cert, req, xml, lic, and key.

- `Notes`
  - File size must be less than or equal to 2 MB.
- Use the "BASE64" value for the fileencoding attribute in the request payload. This is the only valid encoding currently supported.
- The filelocation path must be URL encoded. For example, if the path is /nsconfig/ssl, encode the / and use the file location as %2Fnsconfig%2Fssl.

- When uploading a file, make sure that each directory of the file path has the 755 (read, write, execute) permission. For example, to upload a file to the "/nsconfig/ssl.html" directory, the following directories must have the 755 permission: flash (because the "/nsconfig" folder is actually a link to "/flash/nsconfig.html" directory)
    - nsconfig
    - ssl

Uploading a File

To upload a file to the Citrix ADC, specify a name for the file, the location where the file must be created on the Citrix ADC, and the content of the file.

- `Using REST APIs through HTTP`

  For example, to upload a file named cert1.crt in the /nsconfig/ssl/ directory:

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemfile

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

        "systemfile":

        {

            "filename": "cert1.crt",

            "filelocation": "/nsconfig/ssl.html",

            "filecontent":"VGhpcyBpcyBteSBmaWxl",

            "fileencoding": "BASE64"
```

```
        }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Retrieving the Files

To retrieve the files from a specific Citrix ADC directory, specify the directory path in the URL.

- `Using REST APIs through HTTP`

  For example, to retrieve the files from the /nsconfig/ssl directory.

- `Request`

  `HTTP Method:` GET

`URL:`

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemfile?args=filelocation:%2Fnsconfig%2Fssl

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{

    "systemfile":

    [

            "filename": "ns-root.key",

            "filelocation": "/nsconfig/ssl",

            "fileaccesstime": "Tue Jan 14 19:27:01 2014",

            "filemodifiedtime": "Tue Nov  5 17:16:00 2013"

        },

        {

        {

            "filename": "ns-root.req",

            "filelocation": "/nsconfig/ssl",

            "fileaccesstime": "Tue Jan 14 19:27:01 2014",

            "filemodifiedtime": "Tue Nov  5 17:16:00 2013"

        }

    ]

}
```

Retrieving Contents of a Specific File

To retrieve the contents of a file, specify the filename and its directory path in the URL.

- `Using REST APIs through HTTP`

  For example, to retrieve the contents of the ns-root.key file from the /nsconfig/ssl directory.

- `Request`

  `HTTP Method:` GET

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemfile/ns-root.key?args=filelocation:%2Fnsconfig%2Fssl

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

Accept:application/json

- `Response`

  `HTTP Status Code on Success:`

200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error.

`Response Header:`

Content-Type:application/json

`Response Payload:`

```
{

    "systemfile":

    [

        {

            "filename": "ns-root.key",

            "filelocation": "/nsconfig/ssl",
```

```
            "filecontent": "LS0tLS1CRUdJTiBSU0EgUFJJVkFU0tLQo=",

            "fileencoding": "BASE64",

            "fileaccesstime": "Tue Jan 14 19:27:01 2014",

            "filemodifiedtime": "Tue Nov  5 17:16:00 2013"

        }

    ]

}
```

Deleting a File

To delete a file from the Citrix ADC appliance, specify the filename and the directory path in the URL.

- `Using REST APIs through HTTP`

  For example, to delete the ns-root.key file from the /nsconfig/ssl directory.

`Request:`

`HTTP Method:` DELETE

`URL:` https://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemfile/ns-root.key?args=filelocation:%2Fnsconfig%2Fssl

`Request Header:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue\>

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:`

4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Use Cases and Samples

This section covers some use case scenarios to certain resources and scenarios. More scenarios will be added in future updates to this section.

Managing a Citrix ADC Cluster

For managing clusters, you can add or remove a cluster instance or an individual node and perform a few other instance or node operations such as viewing instance or node properties. You can also configure the cluster IP address. Other cluster-management tasks include joining a Citrix ADC appliance to the cluster and configuring a linkset. For detailed information and best practices, see Clustering.

Cluster Instance Operations

This topic covers cluster instance operations by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  All operations on a cluster instance must be performed on the clusterinstance object.

For example, to create a cluster instance with ID 1, connect to the Citrix ADC appliance that you are first adding to the cluster.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "clusterinstance":

    {

    "clid":1,

    "preemption":"ENABLED"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.cluster.clusterinstance class provides APIs to manage a cluster instance.

The following sample code creates a cluster instance with ID 1.

`Java - Sample code to create a cluster instance`

```
clusterinstance new_cl_inst_obj = new clusterinstance();

//Set the properties of the cluster instance locally

new_cl_inst_obj.set_clid(1);

new_cl_inst_obj.set_preemption("ENABLED");
```

```
//Upload the cluster instance

clusterinstance.add(ns_session,new_cl_inst_obj);
```

`.NET - Sample code to create a cluster instance`

```
clusterinstance new_cl_inst_obj = new clusterinstance();

//Set the properties of the cluster instance locally

new_cl_inst_obj.clid = 1;

new_cl_inst_obj.preemption = "ENABLED";

//Upload the cluster instance

clusterinstance.add(ns_session,new_cl_inst_obj);
```

`Python - Sample code to create a cluster instance`

```
new_cl_inst_obj = clusterinstance()

# Set the properties of the cluster instance locally
```

```
new_cl_inst_obj.clid = 1

# Upload the cluster instance

clusterinstance.add(ns_session, new_cl_inst_obj)
```

Cluster Node Operations

This topic covers cluster node operations by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  All operations on a cluster node must be performed on the clusternode object. For example, to add a Citrix ADC appliance with NSIP address 10.102.29.60 to the cluster.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternode

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"clusternode":

    {

    "nodeid":1,

    "ipaddress":"10.102.29.60",
```

```
    "state":"ACTIVE",

    "backplane":"1/1/2"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

The com.citrix.netscaler.nitro.resource.config.cluster.clusternode class provides APIs to manage cluster nodes.

The following sample code adds a cluster node with NSIP address 10.102.29.60.

`Java - Sample code to add a cluster node`

```
clusternode new_cl_node_obj = new clusternode();

//Set the properties of the cluster node locally

new_cl_node_obj.set_nodeid(0);

new_cl_node_obj.set_ipaddress("10.102.29.60");

new_cl_node_obj.set_state("ACTIVE");
```

```
new_cl_node_obj.set_backplane("0/1/1");

//Upload the cluster node

clusternode.add(ns_session,new_cl_node_obj);
```

`.NET - Sample code to add a cluster node`

```
clusternode new_cl_node_obj = new clusternode();

//Set the properties of the cluster node locally

new_cl_node_obj.nodeid = 0;

new_cl_node_obj.ipaddress = "10.102.29.60";

new_cl_node_obj.state = "ACTIVE";

new_cl_node_obj.backplane = "0/1/1";

//Upload the cluster node

clusternode.add(ns_session,new_cl_node_obj);
```

`Python - Sample code to add a cluster node`

```
new_cl_node_obj = clusternode()

# Set the properties of the cluster node locally

new_cl_node_obj.nodeid = 0

new_cl_node_obj.ipaddress = "10.102.29.60"

new_cl_node_obj.state = "ACTIVE"

new_cl_node_obj.backplane = "0/1/1"

# Upload the cluster node

clusternode.add(ns_session, new_cl_node_obj)
```

Add a Cluster IP Address

This topic covers adding a cluster IP address by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To define a cluster IP address, specify the required parameters in the nsip object. For example, to configure a cluster IP address.

- `Request`

`HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"nsip":

    {

    "ipaddress":"10.102.29.61",

    "netmask":"255.255.255.255",

    "type":"CLIP"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.ns.nsip class provides the add() API to configure an IP address. To configure the IP address as a cluster IP address, you must specify the type as CLIP.

The following sample code configures a cluster IP address on Citrix ADC appliance with IP address 10.102.29.60.

`Java - Sample code to add a cluster IP address`

```
nsip new_nsip_obj = new nsip();

//Set the properties locally

new_nsip_obj.set_ipaddress("10.102.29.61");

new_nsip_obj.set_netmask("255.255.255.255");

new_nsip_obj.set_type("CLIP");

//Upload the cluster node

nsip.add(ns_session,new_nsip_obj);
```

`.NET - Sample code to add a cluster IP address`

```
nsip new_nsip_obj = new nsip();

//Set the properties locally

new_nsip_obj.ipaddress = "10.102.29.61";
```

```
new_nsip_obj.netmask = "255.255.255.255";

new_nsip_obj.type = "CLIP";

//Upload the cluster node

nsip.add(ns_session,new_nsip_obj);
```

`Python - Sample code to add a cluster IP address`

```
new_nsip_obj = nsip()

# Set the properties locally

new_nsip_obj.ipaddress = "10.102.29.61"

new_nsip_obj.netmask = "255.255.255.255"

new_nsip_obj.type = "CLIP"

# Upload the cluster node

nsip.add(ns_session, new_nsip_obj)
```

Add a Spotted IP Address

This topic covers adding a spotted IP address by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To configure an IP address as spotted, specify the required parameters in the nsip object. This configuration must be done on the cluster IP address.

For example, to configure a spotted SNIP address on a node with ID 1.

- `Request`

  `HTTP Method:` POST

`URL:` http://<cluster-ip-address\>/nitro/v1/config/nsip

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"nsip":

    {

    "ipaddress":"10.102.29.77",

    "netmask":"255.255.255.0",

    "type":"SNIP",

    "ownernode":1

    }

}
```

- `Response`

`HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.ns.nsip class provides the add() API to configure an IP address. To configure the IP address as spotted, you must specify the ID of the node that must own the IP address. This configuration must be done on the cluster IP address.

The following sample code configures a spotted SNIP address on a node with ID 1.

`Java - Sample code to configure a spotted IP address`

```
nsip new_nsip_obj = new nsip();

//Set the properties locally

new_nsip_obj.set_ipaddress("10.102.29.77");

new_nsip_obj.set_netmask("255.255.255.0");

new_nsip_obj.set_type("SNIP");

new_nsip_obj.set_ownernode(1);

//Upload the cluster node
```

```
nsip.add(ns_session,new_nsip_obj);
```

`.NET - Sample code to configure a spotted IP address`

```
nsip new_nsip_obj = new nsip();

//Set the properties locally

new_nsip_obj.ipaddress = "10.102.29.77";

new_nsip_obj.netmask = "255.255.255.0";

new_nsip_obj.type = "SNIP";

new_nsip_obj.ownernode = 1;

//Upload the cluster node

nsip.add(ns_session,new_nsip_obj);
```

`Python - Sample code to configure a spotted IP address`

```

# Add a spotted IP address

```

```
new_nsip_obj = nsip()

# Set the properties locally

new_nsip_obj.ipaddress = "10.102.29.77"

new_nsip_obj.netmask = "255.255.255.0"

new_nsip_obj.type = "SNIP"

new_nsip_obj.ownernode = 1

# Upload the cluster node

nsip.add(ns_session, new_nsip_obj)
```

Join Citrix ADC Appliance to Cluster

This topic covers adding a Citrix ADC appliance to a cluster by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To join an appliance to a cluster, specify the required parameters in the cluster object. For example, to join a Citrix ADC appliance to a cluster.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cluster

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"cluster":

    {

    "clip":"10.102.29.61",

    "password":"verysecret"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.cluster.cluster class provides the join() API to join a Citrix ADC appliance to the cluster. You must specify the cluster IP address and the nsroot password of the configuration coordinator.

The following sample code joins a Citrix ADC appliance to a cluster.

`Java - Sample code to join an appliance to a cluster`

```
cluster new_cl_obj = new cluster();

//Set the properties of the cluster  locally

new_cl_obj.set_clip("10.102.29.61");

new_cl_obj.set_password("verysecret");

//Upload the cluster

cluster.add(ns_session,new_cl_obj);
```

`.NET - Sample code to join an appliance to a cluster`

```
cluster new_cl_obj = new cluster();

//Set the properties of the cluster locally

new_cl_obj.clip = "10.102.29.61";

new_cl_obj.password = "verysecret";

//Upload the cluster node
```

```
cluster.add(ns_session,new_cl_node_obj);
```

`Python - Sample code to join an appliance to a cluster`

```
new_cl_obj = cluster()

# Set the properties of the cluster locally

new_cl_obj.clip = "10.102.29.61"

new_cl_obj.password = "verysecret"

# Upload the cluster

cluster.add(ns_session, new_cl_obj)
```

Linkset Operations

This topic covers some linkset operations by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To configure a linkset, do the following:

Create a linkset by specifying the required parameters in the linkset object. For example, to add a linkset LS/1:

`Request:`

`HTTP Method:` POST

`URL:` http://<cluster-ip-address\>/nitro/v1/config/linkset

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

- `Request Payload`

```
{ "linkset": { "id":"LS/1" } }
```

```
-   `Response`

    `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx &lt;string&gt; (for general HTTP
errors) or 5xx &lt;string&gt; (for Citrix-ADC-specific errors). The
response payload provides details of the error.

Bind the required interfaces to the linkset by specifying the interfaces
in the linkset_interface_binding object.For example, to bind interfaces
1/1/2 and 2/1/2 to linkset LS/1.

-   `Request`

    `HTTP Method:` PUT
```

```
`URL:` http://\&lt;cluster-ip-address\>/nitro/v1/config/
linkset_interface_binding/LS%2F1?action=bind

`Note.` The linkset name (LS/1), must be URL encoded as LS%2F1.

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\&lt;tokenvalue>

Content-Type:application/json

`Request Payload:`

```json

{

"linkset_interface_binding":

    {

    "id":"LS/1",

    "ifnum":"1/1/2 2/1/2"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 Ok
```

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The com.citrix.netscaler.nitro.resource.config.network.linkset class provides the APIs to manage linksets.

To configure a linkset, do the following:

1. Add a linkset by invoking the add() method of the linkset class.
2. Bind the interfaces to the linkset using the add() method of the linkset_interface_binding class.

The following sample code creates a linkset LS/1 and bind interfaces 1/1/2 and 2/1/2 to it.

`Java - Sample code to configure linksets`

```
linkset new_linkset_obj = new linkset();

new_linkset_obj.set_id("LS/1");

linkset.add(ns_session,new_linkset_obj);

//Bind the interfaces to the linkset

linkset_interface_binding new_linkif_obj = new
linkset_interface_binding();

new_linkif_obj.set_id("LS/1");

new_linkif_obj.set_ifnum("1/1/2 2/1/2");
```

```
linkset_interface_binding.add(ns_session,new_linkif_obj);
```

`.NET - Sample code to configure linksets`

```
linkset new_linkset_obj = new linkset();

new_linkset_obj.id = "LS/1";

linkset.add(ns_session,new_linkset_obj);

//Bind the interfaces to the linkset

linkset_interface_binding new_linkif_obj = new
linkset_interface_binding();

new_linkif_obj.id = "LS/1";

new_linkif_obj.ifnum = "1/1/2 2/1/2";

linkset_interface_binding.add(ns_session,new_linkif_obj);
```

`Python - Sample code to configure linksets`

```
# Create a new linkset

new_linkset_obj = linkset()

new_linkset_obj.id = "LS/1"

linkset.add(ns_session, new_linkset_obj)

# Bind the interfaces to the linkset

new_linkif_obj = linkset_interface_binding()

new_linkif_obj.id = "LS/1"

new_linkif_obj.ifnum = "1/1/2 2/1/2"

linkset_interface_binding.add(ns_session, new_linkif_obj)
```

Configuring Admin Partitions

To create an admin partition, you must perform a set of operations on the default partition. To understand this procedure, let us consider a company that has two departments each of which has an application that requires the Citrix ADC functionality. The Citrix ADC admin wants to have a

different partition for each department so that there is isolation of users and configurations. For detailed information and best practices, see Admin Partitions.

Creating an Admin Partition

While creating an admin partition, you must also specify the system resources that must be allocated to that partition.

- `Using REST APIs through HTTP`

  The following example creates an admin partition named partition-dept1.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartition

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"nspartition":

{

    "partitionname":"partition-dept1",

    "maxbandwidth":"10240",

    "minbandwidth":"10240",

    "maxconn":"1024",

    "maxmemlimit":"10"

}
```

```
}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code creates an admin partition named partition-dept1.

`Java - Sample code to create an admin partition`

```
nspartition nspartitionObject = new nspartition();

nspartitionObject.set_partitionname("partition-dept1");

nspartitionObject.set_maxbandwidth(10240);

nspartitionObject.set_maxconn(1024);

nspartitionObject.set_maxmemlimit(10);

nspartitionObject.set_minbandwidth(1240);

base_response result = nspartition.add(nitroService, nspartitionObject);
```

`.NET - Sample code to create an admin partition`

```
nspartition nspartitionObject = new nspartition();

nspartitionObject.partitionname = "partition-dept1";

nspartitionObject.maxbandwidth = 10240;

nspartitionObject.maxconn = 1024;

nspartitionObject.maxmemlimit = 10;

nspartitionObject.minbandwidth = 1240;

base_response result = nspartition.add(nitroService, nspartitionObject);
```

`Python - Sample code to create an admin partition`

```
nspartitionObject = nspartition()

nspartitionObject.partitionname = "partition-dept1"

nspartitionObject.maxbandwidth = 10240

nspartitionObject.maxconn = 1024
```

```
nspartitionObject.maxmemlimit = 10

nspartitionObject.minbandwidth = 1240

result = nspartition.add(nitroService, nspartitionObject)
```

Associating Users with Partitions

Associate the appropriate users with the partition.

- `Using REST APIs through HTTP`

  The following example associates user1 to a partition named partition-dept1.

- `Request`

  `HTTP Method:` PUT

`URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/systemuser_nspartition_binding/user1

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "systemuser_nspartition_binding":

    {

    "username":"user1",

    "partitionname":"partition-dept1"
```

```
    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code associates "user1" to a partition named "partition-dept1".

`Java - Sample code for associating user with partition`

```
systemuser_nspartition_binding systemuser_nspartition_binding_object = new
systemuser_nspartition_binding();

systemuser_nspartition_binding_object.set_partitionname("partition-
dept1");

systemuser_nspartition_binding_object.set_username("user1");

base_response result = systemuser_nspartition_binding.add(nitroService,
systemuser_nspartition_binding_object);
```

`.NET - Sample code for associating user with partition`

```
systemuser_nspartition_binding systemuser_nspartition_binding_object = new
systemuser_nspartition_binding();

systemuser_nspartition_binding_object.partitionname = "partition-dept1";
```

```
systemuser_nspartition_binding_object.username = "user1";

base_response result = systemuser_nspartition_binding.add(nitroService,
systemuser_nspartition_binding_object);
```

`Python - Sample code for associating user with partition`

```
systemuser_nspartition_binding_object =  systemuser_nspartition_binding()

systemuser_nspartition_binding_object.partitionname = "partition-dept1"

systemuser_nspartition_binding_object.username = "user1"

result = systemuser_nspartition_binding.add(nitroService,
systemuser_nspartition_binding_object)
```

Specifying Command Policy for Partition Users

Associate an appropriate command policy to the admin partition user.

- `Using REST APIs through HTTP`

  The following example associates the command policy partition-admin to user1.

- `Request`

  `HTTP Method:` PUT

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/systemuser_systemcmdpolicy_binding/user1

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "systemuser_systemcmdpolicy_binding":

    {

    "username":"user1",

    "policyname":"partition-admin",

    "priority":"1"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code associates the command policy "partition-admin" to "user1".

`Java - Sample code to specify command policy for partition user`

```
systemuser_systemcmdpolicy_binding binding_object = new
systemuser_systemcmdpolicy_binding();

binding_object.set_username("user1");
```

```
binding_object.set_policyname("partition-admin");

binding_object.set_priority(1);

base_response result =
systemuser_systemcmdpolicy_binding.add(nitroService,binding_object);
```

`.NET - Sample code to specify command policy for partition user`

```
systemuser_systemcmdpolicy_binding binding_object = new
systemuser_systemcmdpolicy_binding();

binding_object.username = "user1";

binding_object.policyname = "partition-admin";

binding_object.priority = 1;

base_response result =
systemuser_systemcmdpolicy_binding.add(nitroService,binding_object);
```

`Python - Sample code to specify command policy for partition user`

```
binding_object = systemuser_systemcmdpolicy_binding()

binding_object.username = "user1"
```

```
binding_object.policyname = "partition-admin"

binding_object.priority = 1

result =
systemuser_systemcmdpolicy_binding.add(nitroService,binding_object)
```

Specifying the Admin Partition VLAN or Bridgegroup

Specify the VLANs or bridgegroups to be associated with the partition. This step ensures network isolation of the traffic. Traffic received on the interfaces of the VLAN or bridgegroup is isolated from the traffic of other partitions.

- `Using REST APIs through HTTP`

  The following example specifies a VLAN for an admin partition.

- `Request`

  `HTTP Method:` PUT

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartition_vlan_binding/partition-dept1

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "nspartition_vlan_binding":

    {
```

```
    "partitionname":"partition-dept1",

    "vlan":"2"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code specifies a VLAN for an admin partition.

`Java - Sample Code to specify the VLAN`

```
nspartition_vlan_binding nspartition_vlan_binding_object = new
nspartition_vlan_binding();

nspartition_vlan_binding_object.set_vlan(2);

nspartition_vlan_binding_object.set_partitionname("partition-dept1");

base_response result = nspartition_vlan_binding.add(nitroService,
nspartition_vlan_binding_object);
```

`.NET - Sample code to specify the VLAN`

```
nspartition_vlan_binding nspartition_vlan_binding_object = new
nspartition_vlan_binding();

nspartition_vlan_binding_object.vlan = 2;

nspartition_vlan_binding_object.partitionname = "partition-dept1";

base_response result = nspartition_vlan_binding.add(nitroService,
nspartition_vlan_binding_object);
```

`Python - Sample code to specify the VLAN`

```
nspartition_vlan_binding_object = nspartition_vlan_binding()

nspartition_vlan_binding_object.vlan = 2

nspartition_vlan_binding_object.partitionname = "partition-dept1"

result = nspartition_vlan_binding.add(nitroService,
nspartition_vlan_binding_object)
```

Switching Partitions

If you are associated with multiple admin partitions, you can switch to the required partition.

- `Using REST APIs through HTTP`

  The following example shows how to switch from current partition to a partition named partition-dept2.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartition?action=Switch

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "nspartition":

    {

    "partitionname":"partition-dept2"

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 201 Created

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  The following sample code switches from current partition to a partition named "partition-dept2".

`Java - Sample code to switch partitions`

```
nspartition nspartitionObject = new nspartition();
```

```
vnspartitionObject.set_partitionname("partition-dept2");

base_response result = nspartition.Switch(nitroService,
nspartitionObject);
```

`.NET - Sample code to switch partitions`

```
nspartition nspartitionObject = new nspartition();

nspartitionObject.partitionname = "partition-dept2";

base_response result = nspartition.Switch(nitroService,
nspartitionObject);
```

`Python - Sample code to switch partitions`

```
nspartitionObject = nspartition()

nspartitionObject.partitionname = "partition-dept2"

result = nspartition.Switch(nitroService, nspartitionObject)
```

Managing AppExpert Applications

The following sections talks about exporting and importing an AppExpert application using NITRO APIs.

Exporting an AppExpert Application

This topic covers exporting an AppExpert application by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To export an AppExpert application, specify the parameters needed for the export operation in the apptemplateinfo object. Optionally, you can specify basic information about the AppExpert application template, such as the author of the configuration, a summary of the template functionality, and the template version number, in the template_info object. This information is stored as part of the template file that is created.

For example, to export an AppExpert application named MyApp1.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/apptemplateinfo?action=export

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "apptemplateinfo":

    {

        "appname":"MyApp1",

        "apptemplatefilename":"BizAp.xml",

        "template_info":

        {

            "templateversion_major":"2",

            "templateversion_minor":"1",

            "author":"XYZ",
```

```
            "introduction":"Intro",

            "summary":"Summary"

        }

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To export an AppExpert application, you must do the following:

1. Instantiate the com.citrix.netscaler.nitro.resource.config.app.application class.

   `Note.` For the python SDK, the package path is of the form nssrc.com.citrix.netscaler.....

2. Configure the properties of the AppExpert locally.
3. Export the AppExpert application.

The following samples export an AppExpert application named MyApp1.

`JAVA - sample code to export an AppExpert application`

```
application myapp = new application();

myapp.set_appname("MyApp1");

myapp.set_apptemplatefilename("myapp_template");

application.export(ns_session,myapp);
```

`.NET - sample code to export an AppExpert application`

```
application myapp = new application();

myapp.appname = "MyApp1";

myapp.apptemplatefilename = "myapp_template";

application.export(ns_session,myapp);
```

`Python - sample code to export an AppExpert application`

```
myapp = application()

myapp.appname = "MyApp1"

myapp.apptemplatefilename = "myapp_template"

application.export(ns_session, myapp)
```

Importing an AppExpert Application

This topic covers importing an AppExpert application by using REST APIs through HTTP or SDKs.

- `Using REST APIs through HTTP`

  To import an AppExpert application, specify the parameters needed for the import operation in the apptemplateinfo object.

For example, to import an AppExpert application named MyApp1.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/apptemplateinfo?action=import

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

"apptemplateinfo":

{

    "apptemplatefilename":"BizAp.xml",

    "deploymentfilename":"BizAp_deployment.xml",

    "appname":"MyApp1"

}

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

To import an AppExpert application by specifying different deployment settings.

- `Request`

  `HTTP Method:` POST

`URL:` http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/apptemplateinfo?action=import

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "apptemplateinfo":

    {
```

```
    "apptemplatefilename":"BizAp.xml",

    "appname":"Myapp2",

    "deploymentinfo":

    {

        "appendpoint":

        [

            {

                "ipv46":"11.2.3.8",

                "port":80,

                "servicetype":"HTTP"

            }

        ],

        "service":

        [

            {

                "ip":"12.3.3.15",

                "port":80,

                "servicetype":"SSL"

            },

            {

                "ip":"14.5.5.16",

                "port":443,
```

```
                "servicetype":"SSL"

            }

        ]

    }

    }

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

- `Using REST APIs through SDKs`

  To import an AppExpert application, you must do the following:

1. Instantiate the com.citrix.netscaler.nitro.resource.config.app.application class.

   `Note`. For the python SDK, the package path is of the form nssrc.com.citrix.netscaler.....
2. Configure the properties of the AppExpert locally.
3. Import the AppExpert application.

The following samples import an AppExpert application named MyApp1.

`Java - sample code to import an AppExpert application`

```
application myapp = new application();

myapp.set_appname("MyApp1");

myapp.set_apptemplatefilename("myapp_template");

application.Import(ns_session,myapp);
```

`.NET - sample code to import an AppExpert application`

```
application myapp = new application();

myapp.appname = "MyApp1";

myapp.apptemplatefilename = "myapp_template";

application.Import(ns_session,myapp);
```

`Python - sample code to import an AppExpert application`

```
myapp = application()

myapp.appname = "MyApp1"

myapp.apptemplatefilename = "myapp_template"

application.Import(ns_session, myapp)
```

Automate Citrix ADC Upgrade and Downgrade with a Single API

You can use the "install" API to automate not just installation, but also an upgrade or a downgrade of the build on a Citrix ADC appliance. You can specify a local or remote location for the build file.

- `Using REST APIs through HTTP`

  For example, the following information describes a downgrade to Citrix ADC release 10.5 build 46, using a local build file:

- `Request`

  `HTTP Method:` POST

`URL:` http://<NSIP\>/nitro/v1/config/install

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=\<tokenvalue \>

Content-Type: application/json

`Request Payload:`

```
{

“install”:

{

        “url”: “file:///var/tagma/build_tagma_46_nc.tgz”

    }

}
```

- `Response`

  `HTTP status Code on Success:`

201 Created

209 Citrix ADC specific warning

`Note.` when “y” option is not specified and warning is enabled, API returns “1120 - The configuration must be saved and the system rebooted for these settings to take effect” message in X-NITRO-WARNING.

`HTTP Status Code on Failure:` 599 Citrix ADC specific error

- `Additional parameters available in the install API request payload`
  - “y”:“true” - This option enables reboot on successful loading of kernel.
- “L”:“true” - This option enables the callhome feature.

`Supported formats for the "url" parameter (specifies the location of the tar.gz file for the build)`

- http://:@host/path/to/file
- https://:@host/path/to/file
- sftp://:@host/path/to/file
- scp://:@host/path/to/file
- ftp://:@host/path/to/file
- file://path/to/file
- `Possible errors`
  - Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.
- Installation failed.

Handle Multiple NITRO Calls in a Single Request

You can use the "macroapi" API to create, update, and delete multiple resources simultaneously, and thereby minimize network traffic. For example, multiple load-balancing virtual servers can be added in a single API.

To account for the failure of some operations within the bulk operation, NITRO allows configuring one of the following behaviors.

- `EXIT`. When the first error is encountered, execution stops. The commands that were executed before the error are committed.
- `ROLLBACK`. When the first error is encountered, execution stops. The commands that were executed before the error are rolled back. Rollback is supported for add and bind commands only.
- `CONTINUE`. All the commands in the request are executed even if some commands fail.

You must specify the behavior of the bulk operation in the request header, by using the X-NITRO-ONERROR parameter.

- `Advantages`

  Heterogeneous resources can be configured with a single API. For example, multiple load balancing virtual servers and multiple services can be created, and services can be bound to load balancing virtual servers in a single API.

- `Limitations`

  Only homogenous operation is supported in this API. For example, multiple load balancing virtual servers can be created but cannot be updated or deleted in the same API. “rollback” is supported only on “add” and “bind” operations.

- `Using REST APIs through HTTP`

  To add multiple load balancing resources in a single request:

- `Request`

  `HTTP Method:` POST

`URL:` http://<NSIP\>/nitro/v1/config/macroapi

`Request Headers:`

Content-Type: application/json

Cookie: NITRO_AUTH_TOKEN=<tokenvalue>

X-NITRO-ONERROR: exit

`Request Payload:`

```
{

"lbvserver":[

{"name":"lbv1","servicetype":"http"},

{"name":"lbv2","servicetype":"http"}
```

```
],

"serviceGroup": [

{ "servicegroupname": "sg1", "servicetype": "HTTP" },

{ "servicegroupname": "sg2", "servicetype": "HTTP" }

],

"lbvserver_servicegroup_binding":[

{ "name":"lbv1", "servicegroupname":"sg1" },

{ "name":"lbv2", "servicegroupname":"sg2" }

]

}
```

- `Response`

`HTTP Status Code on Success:` 201 Created for the add operation and 200 OK for the update operation.

`HTTP Status Code on Failure:` 207 Multi Status with error details in the response payload. For more information, see Error Handling.

For deleting multiple resources using macroapi, use POST HTTP method with query parameter “action=remove” in the URI.

Simplify Management Operations with an Idempotent API

You can add or update Citrix ADC resources seamlessly, with a single API. Previously, an attempt to add a resource that was already configured, or to update a resource that was not yet configured, caused an error.

If you enable the “idempotent” query parameter (“idempotent=yes”) in any POST request, NITRO executes the request in an idempotent manner. An idempotent HTTP method is an HTTP method that can be called many times without different results, and POST is desinged as a non-idempotent method.

`Note.` Use POST request with “idempotent” option if you are unsure whether the resource in the request exists on Citrix ADC or not.

This API hides the inconsistencies between parameter lists of POST and PUT operations. For some NITRO resources, certain parameters are accepted only on PUT not in POST, or vice versa. By using this idempotent API, you can overcome such challenges.

- `Limitations`

  If a resource is already configured and you try to add the same resource again, the resource is "updated," but the arguments already present are not unset. For example, if a load balancing virtual server named "V1" is configured to use the round robin load balancing method, and you try to ADD an lbvserver named "V1" without specifying a value for "lbmethod" in the request, the Citrix ADC appliance does not unset "lbmethod" to its default value of "leastconnection."

- `Using REST APIs through HTTP`

  In the following example, “preferredntpserver” is allowed only in PUT, but when given in POST request with idempotent=yes, NITRO internally adds the ntpserver and updates it with given properties.

- `Request`

`HTTP Method:` POST

`URL:` http://<NSIP\>/nitro/v1/config/ntpserver?idempotent=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type: application/json

`Request Payload:`

```
{

“ntpserver”:{“servername”:“ntp1”,“minpoll”:“4,  “preferredntpserver”:
“yes”}

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

Retrieve Bindings in Bulk

This topic covers retrieving bindings information in bulk by using REST APIs through HTTP.

- `Using REST APIs through HTTP`

  You can use a bulk GET API to fetch bindings of all the entities of a given entity type.

For example, you can fetch bindings of all the load balancing virtual servers in one call instead of by using multiple GET by "name" calls. In the examples below, the Citrix ADC appliance has the following configuration.

- add lb vserver lbv1 http

- add lb vserver lbv2 http
- add service svc1 10.20.30.40 http 80
- add servicegroup sg1 http
- bind lb vserver lbv1 svc1
- bind lb vserver lbv1 sg1
- bind lb vserver lbv2 svc1
- bind lb vserver lbv2 sg1

`Example - To fetch bindings of all lbvservers, in a single NITRO API`

- `Request`

  `HTTP Method:` GET

`URL:` http://<NSIP\>/nitro/v1/config/lbvserver_binding?bulkbindings=yes

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Accept: application/json

- `Response`

  `HTTP Status Code on Success:` 200 OK

`HTTP Status Code on Failure:` 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix-ADC-specific errors). The response payload provides details of the error.

`Response Header:` Content-Type:application/json

`Response Payload:`

```
{

"errorcode":0,

"message":"Done",
```

```
"severity":"NONE",

"lbvserver_binding":[

{

    "name":"lbv1",

    "lbvserver_service_binding":[

    {

        "name":"lbv1",

        "servicename":"svc1",

        "stateflag":"536936451",

        "ipv46":"10.20.30.40",

        "port":80,
```

```
        "servicetype":"HTTP",

        "curstate":"DOWN",

        "weight":"1",

        "dynamicweight":"0",

        "cookieipport":"",

        "vserverid":"mcw1",

        "vsvrbindsvcip":"10.20.30.40",

        "vsvrbindsvcport":80,

        "preferredlocation":""

    }

    ],
```

```
    "lbvserver_servicegroup_binding":[

    {

        "name":"lbv1",

        "servicegroupname":"sg1",

        "stateflag":"536936464",

        "servicename":"sg1"

    }

    ]

},

{

    "name":"lbv2",
```

```
"lbvserver_service_binding":[

{

    "name":"lbv2",

    "servicename":"svc1",

    "stateflag":"536936451",

    "ipv46":"10.20.30.40",

    "port":80,

    "servicetype":"HTTP",

    "curstate":"DOWN",

    "weight":"1",

    "dynamicweight":"0",
```

```
        "cookieipport":"",

        "vserverid":"mcw2",

        "vsvrbindsvcip":"10.20.30.40",

        "vsvrbindsvcport":80,

        "preferredlocation":""

    }

    ],

    "lbvserver_servicegroup_binding":[

    {

        "name":"lbv2",

        "servicegroupname":"sg1",
```

```
        "stateflag":"536936464",

        "servicename":"sg1"

    }

    ]

}

]

}
```

`Example - To fetch only “service” bindings of all lbvservers`

- `Request`

  `HTTP Method:` GET

`URL:` http://<NSIP\>/nitro/v1/config/lbvserver_service_binding?bulkbindings=yes

`Request Header:` Content-Type:application/json

- `Response`

  `Response Payload:`

```
{

"errorcode":0,

"message":"Done",

"severity":"NONE",

"lbvserver_service_binding":[

    {

        "name":"lbv1",

        "servicename":"svc1",

        "stateflag":"536936451",

        "ipv46":"10.20.30.40",

        "port":80,
```

```
        "servicetype":"HTTP",

        "curstate":"DOWN",

        "weight":"1",

        "dynamicweight":"0",

        "cookieipport":"",

        "vserverid":"mcw1",

        "vsvrbindsvcip":"10.20.30.40",

        "vsvrbindsvcport":80,

        "preferredlocation":""

    },

    {
```

```
        "name":"lbv2",

        "servicename":"svc1",

        "stateflag":"536936451",

        "ipv46":"10.20.30.40",

        "port":80,

        "servicetype":"HTTP",

        "curstate":"DOWN",

        "weight":"1",

        "dynamicweight":"0",

        "cookieipport":"",

        "vserverid":"mcw2",
```

```
        "vsvrbindsvcip":"10.20.30.40",

        "vsvrbindsvcport":80,

        "preferredlocation":""

    }

    ]

}
```

View Individual Counter Information

This topic viewing individual counter information by using REST APIs through HTTP.

- `Using REST APIs through HTTP`

  To view global counters that are not otherwise shown by the Citrix ADC CLI or the GUI, you can now use the following URL format.

`URL`: http://<NSIP\>/nitro/v1/stat/nsglobalcntr?args=counters:\<counter1\>;\<counter2\>

Previously, these counter values could be viewed only through the “nsconmsg” Shell command.

`Note.` You can view only global counters of type ULONG and only up to 12 counters in a single request.

- `Example`

This example shows how to view the individual counters http_tot_Requests and http_tot_Responses. Enter the details in the system or tool that you are using to generate HTTP or HTTPS requests.

- `Request`

  `HTTP Method:` GET

`URL:` http://<NSIP\>/nitro/v1/stat/nsglobalcntr?args=counters:http_tot_Requests;http_tot_Responses

- `Response`

```
{

"errorcode": 0,

"message": "Done",

"severity": "NONE",

"nsglobalcntr":

    {

    "http_tot_Requests": "5783",

    "http_tot_Responses": "5783"

    }

}
```

Prevent XSS and CSRF Attacks by Disabling Basic Authentication

As an administrator or a root user, you can now prevent users from making API calls after using basic authentication (such as one-time credentials) to log on. You can use this feature to prevent Cross-Site Scripting (XSS), Cross-Site Request Forgery (CSRF), and other types of attacks.

- `Procedure for Disabling Basic Authentication`

  Use the following formats to enter the details in the system or tool that you are using to generate HTTP or HTTPS requests.

- `Using REST APIs through HTTP`

  - `Request`

  `URL:` http://<Citrix-ADC-ip-address(NSIP)\>/nitro/v1/config/systemparameter

`HTTP Method:` PUT

`Request Headers:`

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Content-Type:application/json

`Request Payload:`

```
{

    "systemparameter":{ "basicauth":"disabled",}

}
```

- `Response`

  `HTTP Status Code on Success:` 200 OK

After you disable the basic authentication, access to Citrix ADC through the one-time password is denied and an error message is displayed.

- `Example`

This example shows what happens if you make any API call after basic authentication has been disabled.

- `Request`

  `URL:` http://10.102.201.159/nitro/v1/config/lbvserver

`HTTP Method:` GET

After you make a GET call, the a logon screen appears. If you click `Log In` after entering the logon credentials, then you get the following response, which shows an error message.

- `Response`

```
{"errorcode": 1244,"message": "Authentication Failed: Use of Basic
Authentication is Disabled.","severity": "ERROR"

}
```

Error and Exception Handling

This section covers error handling support for NITRO APIs and exception handling support for SDKs.

Error Handling for NITRO APIs

In case of a failed request, NITRO provides the required information through the HTTP status code and in the response header and response payload.

- Error in a Single Resource Operation
- Error in a Bulk Operations
- Warnings
- `Error in a Single Resource Operation`

  The response of a single erroneous operation is as follows:
- `Response`

  `HTTP Status Code:` 4xx \<string\> (for general HTTP errors) or 5xx \<string\> (for Citrix-ADC-specific errors)

`Response Header:` Content-Type:application/json

`Response Payload:`

```
{

    errorcode: <Error code>,

    message: "<Error message>",

    severity: "ERROR"

}
```

- `Error in a Bulk Operation`

When there is a failure in one of the bulk operations, the response payload gives a combination of success and failure (depends on the value set for X-NITRO-ONERROR in the request header).

- `Response`

  `HTTP Status Code:` 207 Multi Status

`Response Header:` Content-Type:application/json

`Response Payload when X-NITRO-ONERROR is set to continue:`

When the first operation fails, the request is not terminated. The response payload shows the error details of the failed operation and the success status of the other operations.

```
{

    "errorcode": 1243,

    "message": "Bulk operation failed",

    "severity": "ERROR",

    "response":

    [

        {

            "errorcode": 273,

            "message": "Resource already exists",

            "severity": "ERROR"

        },

        {

            "errorcode": 0,

            "message": "Done",

            "severity": "NONE"
```

```
        }
    ]
}
```

`Response Payload when X-NITRO-ONERROR is set to exit:`

When the first operation fails, the request is terminated. The response payload only shows the error details of the failed operation.

```
{
    "errorcode": 1243,
    "message": "Bulk operation failed",
    "severity": "ERROR",
    "response":
    [
        {
            "errorcode": 273,
            "message": "Resource already exists",
            "severity": "ERROR"
        }
    ]
}
```

- `Warnings in NITRO Operations`

Warnings can be captured by specifying the "warning" query parameter as "yes" when performing any NITRO operation. For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/llbvserver?warning=yes

If there are any warnings, the response is as follows:

- `Response`

  `HTTP Status Code:` 209 X-NITRO-WARNING

`Response Header:` X-NITRO-WARNING →1067 - Feature(s) not enabled

Exception Handling Support for SDKs

The status of a NITRO request is captured in the com.citrix.netscaler.nitro.exception.nitro_exception class. This class provides the following details of the exception:

- `Session ID`. The session in which the exception occurred.
- `Severity`. The severity of the exception: error or warning. By default, only errors are captured. To capture warnings, you must set the warning flag to true, while connecting to the appliance.
- `Error code`. The status of the NITRO request. An error code of 0 indicates that the NITRO request is successful. A non-zero error code indicates an error in processing the NITRO request.
- `Error message`. Provides a brief description of the exception.

For a list of error codes, see the errorlisting.html file available in the \<NITRO_SDK_HOME\>/doc/api_reference folder.

API Reference

This documentation provides details of all operations that can be performed on the Citrix ADC appliance by using the REST API.

- Configuration
- Statistics
- Error Messages

Configuration

The configuration API is arranged in a logical groups of objects. Choose an appropriate group to find more details.

NAME	DESCRIPTION
AAA	Authentication, authorization, and accounting service configuration.
Analytics	Analytics configuration.
App	Application
Appflow	AppFlow configuration.
Application Firewall	Application Firewall configuration.
Appqoe	Application Level Quality of Experience configuration
Audit	Audit configuration.
Authentication	Authentication configuration.
Authorization	Authorization configuration. Authorization services check which resources users are authorized to access, and grant permissions accordingly.
Autoscale	AutoScale configuration.
Azure	Azure configuration
Basic	Basic system configuration.
Bfd	Bidirectional Forwarding Detection

NAME	DESCRIPTION
Ca	Content Accelerator Configuration. The Content Accelerator feature is used to cache static and dynamic web application data.
Integrated Caching	Integrated Caching Configuration. The Integrated Caching feature is used to cache static and dynamic web application data.
Cloud	Citrix ADC as SD proxy Configuration and cloud discovery commands.
Cluster	Cluster commands.
Compression	Compression configuration. The systems feature for compressing HTTP responses to compression-aware browsers.
CI	Content Inspection
Cache Redirection	Cache redirection configuration. The cache redirection feature can transparently redirect cacheable HTTP requests to a cache and send non-cacheable or dynamic HTTP requests to the origin server. A cache stores or caches frequently requested web content and serves such web content to a client on behalf of the origin servers, alleviating the load on the origin server farm.
Content Switching	Content Switching configuration. Content Switching feature that enables you to direct traffic to servers on the basis of content.
Db	All the commands associated with database user
Domain Name Service	Domain Name Service(DNS) configuration.
HTTP DoS Protection	HTTP DOS protection configuration.

NAME	DESCRIPTION
Front-end-optimization	Front end optimization configuration. The systems feature to optimize Web content for performance.
Filter	Filter configuration. Protection from malicious attacks can be achieved for web sites at the content level with the systems content filtering feature. When this feature is enabled, the system inspects every incoming request with the user-configured rules based on any HTTP URL or headers.
Global Server Load Balancing	Global Server Load Balancing (GSLB) configuration. GSLB feature ensures that client requests are directed to a best performing site available in a global enterprise and distributed Internet environment.
High Availability	High-availability commands.
Ica	ICA configuration.
Ipsec	IPSEC configuration.
Ipsecalg	IPSECALG configuration.
Load Balancing	Load Balancing configuration. The load balancing methods manage the selection of an appropriate physical server in a server farm.
LLDP	Link Layer Discovery Protocol.
Lsn	Large Scale NAT commands
Network	Networking commands.
NS	System/Global level configuration.
NTP	NTP configuration.
Pcp	Port Control Protocol Configuration.

NAME	DESCRIPTION
Policy	Policy configuration.
Priority Queuing	Priority Queuing configuration. Priority Queuing ensures that key customer web sites get the timely responses they need. System provides priority-based queuing, which provides different levels of service to customers.
Protocol	Protocol Configuration.
Rdp	RDP configuration.
Reputation	Reputation services configuration.
Responder	Responder configuration.
Rewrite	Rewrite configuration.
Rise	RISE feature related configuration.
Router	Router configuration.
Sure Connect	SureConnect configuration. SureConnect allows the system to deliver alternate content to clients when the system is under heavy load for the original URL. The original content will be served to the client, automatically, after an estimated delay period.
Smpp	All the commands associated with SMPP.
SNMP	SNMP(Simple Network Management Protocol) configuration.
Spillover	Spillover policies and actions.
SSL	SSL Configuration
Stream	Stream configuration.
Subscriber	Subscriber configuration

NAME	DESCRIPTION
System	System configuration.
Traffic Management	TM session/policy configuration.
Transform	URL Transformation configuration.
Tunnel	SSL VPN Tunnel Configuration.
Ulfd	ULFD server configuration.
Urlfiltering	URL Filtering feature is used control access to webpages based on category.
User	User protocol configuration.
Utility	Utilities.
VideoOptimization	Video optimization feature is used to show (i) the stats of different media types that are being served by the Citrix ADC and (ii) the details of optimization applied on ABR videos
SSL VPN	Virtual Private Network configuration.
Wf	Web Front configuration.
WebInterface	Web Interface configuration.
Xm	XenMobile deployment configuration.

AAA

AAA

Authentication, authorization, and accounting service configuration.

NAME	DESCRIPTION
aaacertparams	Configuration for certificate parameter

NAME	DESCRIPTION
aaaglobal_aaapreauthenticationpolicy_binding	Binding object showing the aaapreauthenticationpolicy that can be bound to aaaglobal
aaaglobal_authenticationnegotiateaction_binding	Binding object showing the authenticationnegotiateaction that can be bound to aaaglobal
aaaglobal_binding	Binding object showing the resources that can be bound to aaaglobal
aaagroup	Configuration for AAA group
aaagroup_aaauser_binding	Binding object showing the aaauser that can be bound to aaagroup

aaauser_aaagroup_binding	Binding object showing the aaagroup that can be bound to aaauser
aaauser_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to aaauser
aaauser_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to aaauser
aaauser_authorizationpolicy_binding	Binding object showing the authorizationpolicy that can be bound to aaauser
aaauser_binding	Binding object showing the resources that can be bound to aaauser
aaauser_intranetip6_binding	Binding object showing the intranetip6 that can be bound to aaauser
aaauser_intranetip_binding	Binding object showing the intranetip that can be bound to aaauser
aaauser_tmsessionpolicy_binding	Binding object showing the tmsessionpolicy that can be bound to aaauser
aaauser_vpnintranetapplication_binding	Binding object showing the vpnintranetapplication that can be bound to aaauser
aaauser_vpnsessionpolicy_binding	Binding object showing the vpnsessionpolicy that can be bound to aaauser
aaauser_vpntrafficpolicy_binding	Binding object showing the vpntrafficpolicy that can be bound to aaauser
aaauser_vpnurl_binding	Binding object showing the vpnurl that can be bound to aaauser

NAME	DESCRIPTION
aaauser_vpnurlpolicy_binding	Binding object showing the vpnurlpolicy that can be bound to aaauser

aaacertparams

Configuration for certificate parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
usernamefield	<String>	Read-write	Client certificate field that contains the username, in the format <field>:<subfield>. .
groupnamefield	<String>	Read-write	Client certificate field that specifies the group, in the format <field>:<subfield>.
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Maximum length = 64
twofactor	<String>	Read-only	The state of the two-factor authentication. Possible values = ON, OFF

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaacertparams

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"aaacertparams":{

"usernamefield":<String_value>,

"groupnamefield":<String_value>,

"defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaacertparams?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"aaacertparams":{

"usernamefield":true,

"groupnamefield":true,

"defaultauthenticationgroup":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaacertparams

```

aaagroup

Configuration for AAA group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupname	<String>	Read-write	Name for the group. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the group is added. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my aaa group" or 'my aaa group'). Minimum length = 1
weight	<Double>	Read-write	Weight of this group with respect to other configured aaa groups (lower the number higher the weight). Default value: 0 Minimum value = 0 Maximum value = 65535
loggedin	<Boolean>	Read-write	Display only the group members who are currently logged in.
__count	<Double>	Read-only	count parameter

aaagroup_aaauser_binding

Binding object showing the aaauser that can be bound to aaagroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			every successive policy, and therefore a priority number of 85 does not exist in the policy label.
username	<String>	Read-write	The user name.
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
__count	<Double>	Read-write	count parameter

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"aaagroup_aaauser_binding": [ { "__count": "#no"} ] }
```

aaagroup_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to aaagroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the priority of the policy. A lower number indicates a higher priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
policy	<String>	Read-write	The policy name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Bindpoint to which the policy is bound. Default value: REQUEST Possible values = REQUEST, UDP_REQUEST, DNS_REQUEST, ICMP_REQUEST
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaagroup_binding/groupname_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

}]}
```

aaagroup_intranetip6_binding

Binding object showing the intranetip6 that can be bound to aaagroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
intranetip6	<String>	Read-write	The Intranet IP6(s) bound to the group.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
numaddr	<Double>	Read-write	Numbers of ipv6 address bound starting with intranetip6.
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
__count	<Double>	Read-write	count parameter

aaagroup_tmsessionpolicy_binding

Binding object showing the tmsessionpolicy that can be bound to aaagroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the priority of the policy. A lower number indicates a higher priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 2147483647
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
policy	<String>	Read-write	The policy name.
type	<String>	Read-write	Bindpoint to which the policy is bound. Default value: REQUEST Possible values = REQUEST, UDP_REQUEST, DNS_REQUEST, ICMP_REQUEST
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
groupname	<String>	Read-write	Name of the group that you are binding. Minimum length = 1
intranetapplication	<String>	Read-write	Bind the group to the specified intranet VPN application.
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

aaakcdaccount

Configuration for Kerberos constrained delegation account resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
kcdaccount	<String>	Read-write	The name of the KCD account. Minimum length = 1
keytab	<String>	Read-write	The path to the keytab file. If specified other parameters in this command need not be given.
realmstr	<String>	Read-write	Kerberos Realm.
delegateduser	<String>	Read-write	Username that can perform kerberos constrained delegation.
kcdpassword	<String>	Read-write	Password for Delegated User.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
usercert	<String>	Read-write	SSL Cert (including private key) for Delegated User.
cacert	<String>	Read-write	CA Cert for UserCert or when doing PKINIT backchannel.
userrealm	<String>	Read-write	Realm of the user.
enterpriserealm	<String>	Read-write	Enterprise Realm of the user. This should be given only in certain KDC deployments where KDC expects Enterprise username instead of Principal Name.
servicespn	<String>	Read-write	Service SPN. When specified, this will be used to fetch kerberos tickets. If not specified, Citrix ADC will construct SPN using service fqdn.
principle	<String>	Read-only	SPN extracted from keytab file.
kcdspn	<String>	Read-only	Host SPN extracted from keytab file.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaakcdaccount

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"aaakcdaccount":{

<b>"kcdaccount":<String_value>,

</b>"keytab":<String_value>,

"realmstr":<String_value>,

aaaldapparams

Configuration for LDAP parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of your LDAP server.
serverport	<Integer>	Read-write	Port number on which the LDAP server listens for connections. Default value: 389 Minimum value = 1
authtimeout	<Double>	Read-write	Maximum number of seconds that the Citrix ADC waits for a response from the LDAP server. Default value: 3 Minimum value = 1
ldapbase	<String>	Read-write	Base (the server and location) from which LDAP search commands should start. If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ldapbinddn	<String>	Read-write	Complete distinguished name (DN) string used for binding to the LDAP server.
ldapbinddnpassword	<String>	Read-write	Password for binding to the LDAP server. Minimum length = 1
ldaploginname	<String>	Read-write	Name attribute that the Citrix ADC uses to query the external LDAP server or an Active Directory.
searchfilter	<String>	Read-write	String to be combined with the default LDAP user search string to form the value to use when executing an LDAP search. For example, the following values: vpnallowed=true, ldaploginame=""sa maccount"" when combined with the user-supplied username ""bob"", yield the following LDAP search string:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			""(; (vpnallowed=true) (samaccount=bob)"" . Minimum length = 1
groupattrname	<String>	Read-write	Attribute name used for group extraction from the LDAP server.
subattributename	<String>	Read-write	Subattribute name used for group extraction from the LDAP server.
sectype	<String>	Read-write	Type of security used for communications between the Citrix ADC and the LDAP server. For the PLAINTEXT setting, no encryption is required. Default value: PLAINTEXT Possible values = PLAINTEXT, TLS, SSL
svrtype	<String>	Read-write	The type of LDAP server. Default value: AAA_LDAP_SERVER_TYPE_DEFAULT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = AD, NDS
ssonameattribute	<String>	Read-write	Attribute used by the Citrix ADC to query an external LDAP server or Active Directory for an alternative username. This alternative username is then used for single sign-on (SSO).
passwdchange	<String>	Read-write	Accept password change requests. Default value: DISABLED Possible values = ENABLED, DISABLED
nestedgroupextraction	<String>	Read-write	Queries the external LDAP server to determine whether the specified group belongs to another group. Default value: OFF Possible values = ON, OFF
maxnestinglevel	<Double>	Read-write	Number of levels up to which the system can query nested LDAP groups.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 2 Minimum value = 2
groupnameidentifier	<String>	Read-write	LDAP-group attribute that uniquely identifies the group. No two groups on one LDAP server can have the same group name identifier.
groupsearchattribute	<String>	Read-write	LDAP-group attribute that designates the parent group of the specified group. Use this attribute to search for a group's parent group.
groupsearchsubattribute	<String>	Read-write	LDAP-group subattribute that designates the parent group of the specified group. Use this attribute to search for a group's parent group.
groupsearchfilter	<String>	Read-write	Search-expression that can be specified for sending group-search requests to the LDAP server.
defaultauthenticationgroup	<String>	Read-write	This is the default group that is chosen when the authentication

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			succeeds in addition to extracted groups. Maximum length = 64
groupauthname	<String>	Read-only	To associate AAA users with an AAA group, use the command "bind AAA group ... -username ...". You can bind different policies to each AAA group. Use the command "bind AAA group ... -policy ...".

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

```

aaaparameter

Configuration for AAA parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
enablestaticpagecaching	<String>	Read-write	The default state of VPN Static Page caching. If nothing is specified, the default value is set to YES. Default value: YES Possible values = YES, NO
enableenhancedauthfeedback	<String>	Read-write	Enhanced auth feedback provides more information to the end user about the reason for an authentication failure. The default value is set to NO. Default value: NO Possible values = YES, NO
defaultauthtype	<String>	Read-write	The default authentication server type. Default value: LOCAL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = LOCAL, LDAP, RADIUS, TACACS, CERT
maxaaausers	<Double>	Read-write	Maximum number of concurrent users allowed to log on to VPN simultaneously. Minimum value = 1
maxloginattempts	<Double>	Read-write	Maximum Number of login Attempts. Minimum value = 1
failedlogintimeout	<Double>	Read-write	Number of minutes an account will be locked if user exceeds maximum permissible attempts. Minimum value = 1
aaadnatip	<String>	Read-write	Source IP address to use for traffic that is sent to the authentication server.
enablesessionstickiness	<String>	Read-write	Enables/Disables stickiness to authentication servers. Default value: NO Possible values = YES, NO
aaasessionloglevel	<String>	Read-write	Audit log level, which specifies the types of events to log for cli

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			executed commands. Available values function as follows: * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DEBUG - All events, in extreme detail. Default value: DEFAULT_LOGLEVEL_AAA Possible values = EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG
aaadloglevel	<String>	Read-write	AAAD log level, which specifies the types of AAAD events to log in nsvpn.log. Available values function as follows: * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. Default value: INFORMATIONAL Possible values = EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG
dynaddr	<String>	Read-write	Set by the DHCP client when the IP address was fetched dynamically.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: OFF Possible values = ON, OFF
ftmode	<String>	Read-write	First time user mode determines which configuration options are shown by default when logging in to the GUI. This setting is controlled by the GUI. Default value: ON Possible values = ON, HA, OFF
maxsamldeflatesize	<Double>	Read-write	This will set the maximum deflate size in case of SAML Redirect binding.
persistentloginattempts	<String>	Read-write	Persistent storage of unsuccessful user login attempts. Default value: DISABLED Possible values = ENABLED, DISABLED
pwdexpirynotificationdays	<Double>	Read-write	This will set the threshold time in days for password expiry notification. Default value is 0, which means no notification is sent.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxkbquestions	<Double>	Read-write	This will set maximum number of Questions to be asked for KB Validation. Default value is 2, Max Value is 6. Minimum value = 2 Maximum value = 6

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

aaapreauthenticationaction

Configuration for pre authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the preauthentication action. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after preauthentication action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my aaa action" or 'my aaa action'). Minimum length = 1
preauthenticationaction	<String>	Read-write	Allow or deny logon after endpoint analysis (EPA) results. Possible values = ALLOW, DENY
killprocess	<String>	Read-write	String specifying the name of a process to be terminated by the endpoint analysis (EPA) tool.
deletefiles	<String>	Read-write	String specifying the path(s) and name(s) of the files to be deleted by the endpoint analysis (EPA) tool.
defaultepagroup	<String>	Read-write	This is the default group that is chosen when the EPA check succeeds. Maximum length = 64
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"aaapreauthenticationaction":{
```

```
<b>"name":<String_value>,

</b>"preauthenticationaction":<String_value>,

"killprocess":<String_value>,

"deletefiles":<String_value>,

"defaultepagroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"aaapreauthenticationaction":{

<b>"name":<String_value>,

</b>"preauthenticationaction":<String_value>,

"killprocess":<String_value>,

"deletefiles":<String_value>,

"defaultepagroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"aaapreauthenticationaction":{
```

```
<b>"name":<String_value>,

</b>"killprocess":true,

"deletefiles":true,

"defaultepagroup":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of aaapreauthenticationaction resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction?**pagesize=#no;pageno=#no**

Use this query-parameter to get the aaapreauthenticationaction resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaapreauthenticationaction": [ {

"name":<String_value>,

"preauthenticationaction":<String_value>,

"killprocess":<String_value>,

"deletefiles":<String_value>,

"defaultepagroup":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaapreauthenticationaction": [ {

"name":<String_value>,

"defaultepagroup":<String_value>
```

```
}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationaction?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaapreauthenticationaction": [ { "__count": "#no"} ] }
```

aaapreauthenticationparameter

Configuration for pre authentication parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
preauthenticationaction	<String>	Read-write	Deny or allow login on the basis of end point analysis results.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ALLOW, DENY
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, to be evaluated by the EPA tool.
killprocess	<String>	Read-write	String specifying the name of a process to be terminated by the EPA tool.
deletefiles	<String>	Read-write	String specifying the path(s) to and name(s) of the files to be deleted by the EPA tool, as a string of between 1 and 1023 characters.

Operations

```

aaapreauthenticationpolicy

Configuration for pre authentication policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the preauthentication policy. Must begin with a letter, number, or the underscore

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the preauthentication policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, defining connections that match the policy.
reqaction	<String>	Read-write	Name of the action that the policy is to invoke when a connection matches the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
hits	<Double>	Read-only	No of hits.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationpolicy_vpnvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationpolicy_vpnvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaapreauthenticationpolicy_vpnvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationpolicy_vpnvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the aaapreauthenticationpolicy_vpnvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaapreauthenticationpolicy_vpnvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationpolicy_vpnvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationpolicy_vpnvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaapreauthenticationpolicy_vpnvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaapreauthenticationpolicy_vpnvserver_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"aaapreauthenticationpolicy_vpnvserver_binding": [ { "__count":
"#no"} ] }
```

aaaradiusparams

Configuration for RADIUS parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of your RADIUS server. Minimum length = 1
serverport	<Integer>	Read-write	Port number on which the RADIUS server listens for connections. Default value: 1812 Minimum value = 1
authtimeout	<Double>	Read-write	Maximum number of seconds that the Citrix ADC waits for a response from the RADIUS server. Default value: 3 Minimum value = 1
radkey	<String>	Read-write	The key shared between the RADIUS server and clients. Required for allowing the Citrix ADC to communicate with the RADIUS server. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
radnasip	<String>	Read-write	Send the Citrix ADC IP (NSIP) address to the RADIUS server as the Network Access Server IP (NASIP) part of the Radius protocol. Possible values = ENABLED, DISABLED
radnasid	<String>	Read-write	Send the Network Access Server ID (NASID) for your Citrix ADC to the RADIUS server as the nasid part of the Radius protocol.
radvendorid	<Double>	Read-write	Vendor ID for RADIUS group extraction. Minimum value = 1
radattributetype	<Double>	Read-write	Attribute type for RADIUS group extraction. Minimum value = 1
radgroupsprefix	<String>	Read-write	Prefix string that precedes group names within a RADIUS attribute for RADIUS group extraction.
radgroupseparator	<String>	Read-write	Group separator string that delimits group names within a RADIUS attribute

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for RADIUS group extraction.
passencoding	<String>	Read-write	Enable password encoding in RADIUS packets that the Citrix ADC sends to the RADIUS server. Default value: pap Possible values = pap, chap, mschapv1, mschapv2
ipvendorid	<Double>	Read-write	Vendor ID attribute in the RADIUS response. If the attribute is not vendor-encoded, it is set to 0.
ipattributetype	<Double>	Read-write	IP attribute type in the RADIUS response. Minimum value = 1
accounting	<String>	Read-write	Configure the RADIUS server state to accept or refuse accounting messages. Possible values = ON, OFF
pwdvendorid	<Double>	Read-write	Vendor ID of the password in the RADIUS response. Used to extract the user password.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1
pwdattributetype	<Double>	Read-write	Attribute type of the Vendor ID in the RADIUS response. Minimum value = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Maximum length = 64
callingstationid	<String>	Read-write	Send Calling-Station-ID of the client to the RADIUS server. IP Address of the client is sent as its Calling-Station-ID. Default value: DISABLED Possible values = ENABLED, DISABLED
authservretry	<Double>	Read-write	Number of retry by the Citrix ADC before getting response from the RADIUS server. Default value: 3 Minimum value = 1 Maximum value = 10

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authentication	<String>	Read-write	Configure the RADIUS server state to accept or refuse authentication messages. Default value: ON Possible values = ON, OFF
tunnelendpointclientip	<String>	Read-write	Send Tunnel Endpoint Client IP address to the RADIUS server. Default value: DISABLED Possible values = ENABLED, DISABLED
groupauthname	<String>	Read-only	To associate AAA users with an AAA group, use the command "bind AAA group ... -username ...". You can bind different policies to each AAA group. Use the command "bind AAA group ... -policy ...".
ipaddress	<String>	Read-only	IP Address.

```

aaasession

Configuration for active connection resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name of the AAA user. Minimum length = 1
groupname	<String>	Read-write	Name of the AAA group. Minimum length = 1
iip	<String>	Read-write	IP address or the first address in the intranet IP range.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
netmask	<String>	Read-write	Subnet mask for the intranet IP range. Minimum length = 1
sessionkey	<String>	Read-write	Show aaa session associated with given session key. Minimum length = 1 Maximum length = 127
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
all	<Boolean>	Read-write	Terminate all active AAA-TM/VPN sessions.
publicip	<String>	Read-only	Client's public IP address.
publicport	<Integer>	Read-only	Client's public port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
ipaddress	<String>	Read-only	Citrix ADC's IP address.
port	<Integer>	Read-only	Citrix ADC's port.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
privateip	<String>	Read-only	Client's private/ mapped IP address.
privateport	<Integer>	Read-only	Client's private/ mapped port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
destip	<String>	Read-only	Destination IP address.
destport	<Integer>	Read-only	Destination port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
intranetip	<String>	Read-only	Specifies the Intranet IP.
intranetip6	<String>	Read-only	Specifies the Intranet IP6.
peid	<Double>	Read-only	Core id of the session owner.
__count	<Double>	Read-only	count parameter

Operations

aaauser

Configuration for AAA user resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name for the user. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the user is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my aaa user" or "my aaa user"). Minimum length = 1
password	<String>	Read-write	Password with which the user logs on. Required for any user account that does not exist on an external

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication server. If you are not using an external authentication server, all user accounts must have a password. If you are using an external authentication server, you must provide a password for local user accounts that do not exist on the authentication server. Minimum length = 1
loggedin	<Boolean>	Read-write	Show whether the user is logged in or not.
__count	<Double>	Read-only	count parameter

Operations

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"aaauser":{

<b>"username":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser?**args=username:<String_value>,loggedin:<Boolean_value>**

Use this query-parameter to get aaauser resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of aaauser resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser?**pagesize=#no;pageno=#no**

Use this query-parameter to get the aaauser resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaauser": [ {

username:<String_value>,loggedin:<Boolean_value>"password":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser/username_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser/username_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser/username_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaauser": [ {

username:<String_value>,loggedin:<Boolean_value>"password":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser?**count=yes**

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaauser": [ { "__count": "#no"} ] }
```

aaauser_aaagroup_binding

Binding object showing the aaagroup that can be bound to aaauser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User account to which to bind the policy. Minimum length = 1
groupname	<String>	Read-write	The group name.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_aaagroup_binding/username_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_aaagroup_binding/username_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaauser_aaagroup_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_aaagroup_binding/username_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the aaauser_aaagroup_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

aaauser_vpnintranet application_binding	<aaauser_vpnintrane tapplication_binding[] >	Read-only	vpnintranetapplicatio n that can be bound to aaauser.
aaauser_tmsessionp olicy_binding	<aaauser_tmsession policy_binding[]>	Read-only	tmsessionpolicy that can be bound to aaauser.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

}]}
```

aaauser_intranetip6_binding

Binding object showing the intranetip6 that can be bound to aaauser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
intranetip6	<String>	Read-write	The Intranet IP6 bound to the user.
username	<String>	Read-write	User account to which to bind the policy. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
numaddr	<Double>	Read-write	Numbers of ipv6 address bound starting with intranetip6.
__count	<Double>	Read-write	count parameter

aaauser_tmsessionpolicy_binding

Binding object showing the tmsessionpolicy that can be bound to aaauser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the priority of the policy. A lower number indicates a higher priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies max priority is 64000. . Minimum value = 0 Maximum value = 2147483647
username	<String>	Read-write	User account to which to bind the policy. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
policy	<String>	Read-write	The policy Name.
type	<String>	Read-write	Bindpoint to which the policy is bound. Default value: REQUEST Possible values = REQUEST, UDP_REQUEST, DNS_REQUEST, ICMP_REQUEST
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

aaauser_vpnintranetapplication_binding

Binding object showing the vpnintranetapplication that can be bound to aaauser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User account to which to bind the policy. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
intranetapplication	<String>	Read-write	Name of the intranet VPN application to which the policy applies.
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/aaauser_vpnurl_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"aaauser_vpnurl_binding":{

<b>"username":<String_value>,

</b>"urlname":<String_value>,

"gotopriorityexpression":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_vpnurl_binding/username_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_vpnurl_binding/username_value<String>?**args=urlname:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_vpnurl_binding/username_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_vpnurl_binding/username_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of aaauser_vpnurl_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_vpnurl_binding/username_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the aaauser_vpnurl_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaauser_vpnurl_binding": [ {

"urlname":<String_value>,

"username":<String_value>,

"gotopriorityexpression":<String_value>,

"acttype":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_vpnurl_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_vpnurl_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "aaauser_vpnurl_binding": [ {

"urlname":<String_value>,

"username":<String_value>,

"gotopriorityexpression":<String_value>,

"acttype":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/aaauser_vpnurl_binding/username_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"aaauser_vpnurl_binding": [ { "__count": "#no"} ] }
```

Analytics

Analytics

Analytics configuration.

NAME	DESCRIPTION
analyticsprofile	Configuration for Analytics profile

analyticsprofile

Configuration for Analytics profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the analytics profile. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow profile" or 'my appflow profile'). Minimum length = 1 Maximum length = 127
collectors	<String>	Read-write	The collector can be an IP, an appflow collector name, a service or a vserver. If IP is specified, the transport is considered as logstream and default port of 5557 is taken. If collector name is specified, the collector properties are taken from the configured

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			collector. If service is specified, the configured service is assumed as the collector. If vserver is specified, the services bound to it are considered as collectors and the records are load balanced. Minimum length = 1
type	<String>	Read-write	This option indicates what information needs to be collected and exported. Possible values = global, webinsight, tcpinsight, securityinsight, videoinsight, hdxinsight, gatewayinsight, httpstream, lsninsight
httpclientsidemeasurements	<String>	Read-write	On enabling this option, the Citrix ADC will insert a javascript into the HTTP response to collect the client side page-timings and will send the same to the configured collectors. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
httppagetracking	<String>	Read-write	On enabling this option, the Citrix ADC will link the embedded objects of a page together. Default value: DISABLED Possible values = ENABLED, DISABLED
httpurl	<String>	Read-write	On enabling this option, the Citrix ADC will log the URL in appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
httphost	<String>	Read-write	On enabling this option, the Citrix ADC will log the Host header in appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpmethod	<String>	Read-write	On enabling this option, the Citrix ADC will log the method header in appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
httpreferer	<String>	Read-write	On enabling this option, the Citrix ADC will log the referer header in appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
httpuseragent	<String>	Read-write	On enabling this option, the Citrix ADC will log User-Agent header. Default value: DISABLED Possible values = ENABLED, DISABLED
httpcookie	<String>	Read-write	On enabling this option, the Citrix ADC will log cookie header.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
httplocation	<String>	Read-write	On enabling this option, the Citrix ADC will log location header. Default value: DISABLED Possible values = ENABLED, DISABLED
urlcategory	<String>	Read-write	On enabling this option, the Citrix ADC will send the URL category record. Default value: DISABLED Possible values = ENABLED, DISABLED
httpcontenttype	<String>	Read-write	On enabling this option, the Citrix ADC will log content-length header. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
httpauthentication	<String>	Read-write	On enabling this option, the Citrix ADC will log Authentication header. Default value: DISABLED Possible values = ENABLED, DISABLED
httpvia	<String>	Read-write	On enabling this option, the Citrix ADC will Via header. Default value: DISABLED Possible values = ENABLED, DISABLED
httpxforwardedforheader	<String>	Read-write	On enabling this option, the Citrix ADC will log X-Forwarded-For header. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpsetcookie	<String>	Read-write	On enabling this option, the Citrix ADC will log set-cookie header. Default value: DISABLED Possible values = ENABLED, DISABLED
httpsetcookie2	<String>	Read-write	On enabling this option, the Citrix ADC will log set-cookie2 header. Default value: DISABLED Possible values = ENABLED, DISABLED
httpdomainname	<String>	Read-write	On enabling this option, the Citrix ADC will log domain name. Default value: DISABLED Possible values = ENABLED, DISABLED
httpurlquery	<String>	Read-write	On enabling this option, the Citrix ADC will log URL Query.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
tcpburstreporting	<String>	Read-write	On enabling this option, the Citrix ADC will log TCP burst parameters. Default value: ENABLED Possible values = ENABLED, DISABLED
cqareporting	<String>	Read-write	On enabling this option, the Citrix ADC will log TCP CQA parameters. Default value: DISABLED Possible values = ENABLED, DISABLED
integratedcache	<String>	Read-write	On enabling this option, the Citrix ADC will log the Integrated Caching appflow records. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
refcnt	<Double>	Read-only	The number of references to the profile.
__count	<Double>	Read-only	count parameter

Operations

appflowpolicylabel_appflowpolicy_binding	Binding object showing the appflowpolicy that can be bound to appflowpolicylabel

NAME	DESCRIPTION
appflowpolicylabel_binding	Binding object showing the resources that can be bound to appflowpolicylabel

appflowaction

Configuration for AppFlow action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow action"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or 'my appflow action').
collectors	<String[]>	Read-write	Name(s) of collector(s) to be associated with the AppFlow action. Minimum length = 1
clientsidemeasurements	<String>	Read-write	On enabling this option, the Citrix ADC will collect the time required to load and render the mainpage on the client. Default value: DISABLED Possible values = ENABLED, DISABLED
pagetracking	<String>	Read-write	On enabling this option, the Citrix ADC will start tracking the page for waterfall chart by inserting a NS_ESNS cookie in the response. Default value: DISABLED Possible values = ENABLED, DISABLED
webinsight	<String>	Read-write	On enabling this option, the Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADC will send the webinsight records to the configured collectors. Default value: ENABLED Possible values = ENABLED, DISABLED
securityinsight	<String>	Read-write	On enabling this option, the Citrix ADC will send the security insight records to the configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
videoanalytics	<String>	Read-write	On enabling this option, the Citrix ADC will send the videoinsight records to the configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
distributionalgorithm	<String>	Read-write	On enabling this option, the Citrix ADC will distribute

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			records among the collectors. Else, all records will be sent to all the collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
metricslog	<Boolean>	Read-write	If only the stats records are to be exported, turn on this option.
transactionlog	<String>	Read-write	Log ANOMALOUS or ALL transactions. Default value: ALL Possible values = ALL, ANOMALOUS
comment	<String>	Read-write	Any comments about this action. In the CLI, if including spaces between words, enclose the comment in quotation marks. (The quotation marks are not required in the configuration utility.). Maximum length = 256
newname	<String>	Read-write	New name for the AppFlow action. Must begin with an ASCII alphabetic or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow action" or 'my appflow action'). Minimum length = 1
hits	<Double>	Read-only	The number of times the action has been taken.
referencecount	<Double>	Read-only	The number of references to the action.
description	<String>	Read-only	Description of the action.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowaction

HTTP Method:POST

appflowcollector

Configuration for AppFlow collector resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the collector. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Only four collectors can be configured. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow collector" or 'my appflow collector'). Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IPv4 address of the collector.
port	<Integer>	Read-write	Port on which the collector listens.
netprofile	<String>	Read-write	Netprofile to associate with the collector. The IP address defined in the profile is used as the source IP address for AppFlow traffic for this collector. If you do not set this parameter, the Citrix ADC IP (NSIP) address is used as the source IP address. Maximum length = 128
transport	<String>	Read-write	Type of collector: either logstream or ipfix or rest. Default value: ipfix, Possible values = ipfix, logstream, rest
newname	<String>	Read-write	New name for the collector. Must begin with an ASCII alphabetic or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at(@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow coll" or 'my appflow coll'). Minimum length = 1
state	<String>	Read-only	Appflow collector state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Unknown, DISABLED
__count	<Double>	Read-only	count parameter

appflowglobal_appflowpolicy_binding

Binding object showing the appflowpolicy that can be bound to appflowglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
globalbindtype	<String>	Read-write	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the AppFlow policy.
labelname	<String>	Read-write	Name of the label to invoke if the current policy evaluates to TRUE.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority.
type	<String>	Read-write	Global bind point for which to show detailed information about the policies bound to the bind point.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = REQ_OVERRIDE, REQ_DEFAULT, OVERRIDE, DEFAULT, OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, MSSQL_REQ_OVERRIDE, MSSQL_REQ_DEFAULT, MYSQL_REQ_OVERRIDE, MYSQL_REQ_DEFAULT, ICA_REQ_OVERRIDE, ICA_REQ_DEFAULT, ORACLE_REQ_OVERRIDE, ORACLE_REQ_DEFAULT
labeltype	<String>	Read-write	Type of policy label to invoke. Specify vserver for a policy label associated with a virtual server, or policylabel for a user-defined policy label. Possible values = vserver, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flowtype	<Double>	Read-only	Flow type of the bound AppFlow policy.
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

{ "appflowglobal_binding": [ {

"appflowglobal_appflowpolicy_binding":<appflowglobal_appflowpolicy_binding
[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appflowglobal_binding": [ {

"appflowglobal_appflowpolicy_binding":<appflowglobal_appflowpolicy_binding
[]_value>

}]}
```

appflowparam

Configuration for AppFlow parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
templaterefresh	<Double>	Read-write	Refresh interval, in seconds, at which to export the template data. Because data transmission is in UDP, the templates must be resent at regular intervals. Default value: 600

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 60 Maximum value = 3600
appnamerefresh	<Double>	Read-write	Interval, in seconds, at which to send Appnames to the configured collectors. Appname refers to the name of an entity (virtual server, service, or service group) in the Citrix ADC. Default value: 600 Minimum value = 60 Maximum value = 3600
flowrecordinterval	<Double>	Read-write	Interval, in seconds, at which to send flow records to the configured collectors. Default value: 60 Minimum value = 60 Maximum value = 3600
securityinsightrecordinterval	<Double>	Read-write	Interval, in seconds, at which to send security insight flow records to the configured collectors. Default value: 600

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 60 Maximum value = 3600
udppmtu	<Double>	Read-write	MTU, in bytes, for IPFIX UDP packets. Default value: 1472 Minimum value = 128 Maximum value = 1472
httpurl	<String>	Read-write	Include the http URL that the Citrix ADC received from the client. Default value: DISABLED Possible values = ENABLED, DISABLED
aaausername	<String>	Read-write	Enable AppFlow AAA Username logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpcookie	<String>	Read-write	Include the cookie that was in the HTTP request the appliance received from the client.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
httpreferer	<String>	Read-write	Include the web page that was last visited by the client. Default value: DISABLED Possible values = ENABLED, DISABLED
httpmethod	<String>	Read-write	Include the method that was specified in the HTTP request that the appliance received from the client. Default value: DISABLED Possible values = ENABLED, DISABLED
httphost	<String>	Read-write	Include the host identified in the HTTP request that the appliance received from the client. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
httpuseragent	<String>	Read-write	Include the client application through which the HTTP request was received by the Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
clienttrafficonly	<String>	Read-write	Generate AppFlow records for only the traffic from the client. Default value: NO Possible values = YES, NO
httpcontenttype	<String>	Read-write	Include the HTTP Content-Type header sent from the server to the client to determine the type of the content sent. Default value: DISABLED Possible values = ENABLED, DISABLED
httpauthorization	<String>	Read-write	Include the HTTP Authorization header information.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
httpvia	<String>	Read-write	Include the httpVia header which contains the IP address of proxy server through which the client accessed the server. Default value: DISABLED Possible values = ENABLED, DISABLED
httpxforwardedfor	<String>	Read-write	Include the httpXForwardedFor header, which contains the original IP Address of the client using a proxy server to access the server. Default value: DISABLED Possible values = ENABLED, DISABLED
httplocation	<String>	Read-write	Include the HTTP location headers returned from the HTTP responses.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
httpsetcookie	<String>	Read-write	Include the Set-cookie header sent from the server to the client in response to a HTTP request. Default value: DISABLED Possible values = ENABLED, DISABLED
httpsetcookie2	<String>	Read-write	Include the Set-cookie header sent from the server to the client in response to a HTTP request. Default value: DISABLED Possible values = ENABLED, DISABLED
connectionchaining	<String>	Read-write	Enable connection chaining so that the client server flows of a connection are linked. Also the connection chain ID is propagated across Citrix ADCs, so that in a multi-hop

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			environment the flows belonging to the same logical connection are linked. This id is also logged as part of appflow record. Default value: DISABLED Possible values = ENABLED, DISABLED
httpdomain	<String>	Read-write	Include the http domain request to be exported. Default value: DISABLED Possible values = ENABLED, DISABLED
skipcacheredirection httptransaction	<String>	Read-write	Skip Cache http transaction. This HTTP transaction is specific to Cache Redirection module. In Case of Cache Miss there will be another HTTP transaction initiated by the cache server. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
identifiername	<String>	Read-write	Include the stream identifier name to be exported. Default value: DISABLED Possible values = ENABLED, DISABLED
identifiersessionname	<String>	Read-write	Include the stream identifier session name to be exported. Default value: DISABLED Possible values = ENABLED, DISABLED
observationdomainid	<Double>	Read-write	An observation domain groups a set of Citrix ADCs based on deployment: cluster, HA etc. A unique Observation Domain ID is required to be assigned to each such group. Default value: 0 Minimum value = 1000
observationdomainname	<String>	Read-write	Name of the Observation Domain defined by the observation domain ID.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
subscriberawareness	<String>	Read-write	Enable this option for logging end user MSISDN in L4/L7 appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
subscriberidobfuscation	<String>	Read-write	Enable this option for obfuscating MSISDN in L4/L7 appflow records. Default value: DISABLED Possible values = ENABLED, DISABLED
subscriberidobfuscationalgo	<String>	Read-write	Algorithm(MD5 or SHA256) to be used for obfuscating MSISDN. Default value: MD5 Possible values = MD5, SHA256
gxsessionreporting	<String>	Read-write	Enable this option for Gx session reporting. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
securityinsighttraffic	<String>	Read-write	Enable/disable the feature individually on appflow action. Default value: DISABLED Possible values = ENABLED, DISABLED
cacheinsight	<String>	Read-write	Flag to determine whether cache records need to be exported or not. If this flag is true and IC is enabled, cache records are exported instead of L7 HTTP records. Default value: DISABLED Possible values = ENABLED, DISABLED
videoinsight	<String>	Read-write	Enable/disable the feature individually on appflow action. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpquerywithurl	<String>	Read-write	Include the HTTP query segment along with the URL that the Citrix ADC received from the client. Default value: DISABLED Possible values = ENABLED, DISABLED
urlcategory	<String>	Read-write	Include the URL category record. Default value: DISABLED Possible values = ENABLED, DISABLED
lsnlogging	<String>	Read-write	On enabling this option, the Citrix ADC will send the Large Scale Nat(LSN) records to the configured collectors. Default value: DISABLED Possible values = ENABLED, DISABLED
cqareporting	<String>	Read-write	TCP CQA reporting enable/disable knob.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
emailaddress	<String>	Read-write	Enable AppFlow user email-id logging. Default value: DISABLED Possible values = ENABLED, DISABLED
usagerecordinterval	<Double>	Read-write	On enabling this option, the NGS will send bandwidth usage record to configured collectors. Default value: 0 Minimum value = 0 Maximum value = 7200
metrics	<String>	Read-write	Enable Citrix ADC Stats to be sent to the Telemetry Agent. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
events	<String>	Read-write	Enable Events to be sent to the Telemetry Agent. Default value: DISABLED Possible values = ENABLED, DISABLED
auditlogs	<String>	Read-write	Enable Auditlogs to be sent to the Telemetry Agent. Default value: DISABLED Possible values = ENABLED, DISABLED
observationpointid	<Double>	Read-write	An observation point ID is identifier for the Citrix ADC from which appflow records are being exported. By default, the Citrix ADC IP is the observation point ID. Minimum value = 1
distributedtracing	<String>	Read-write	Enable generation of the distributed tracing templates in the Appflow records. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
disttracingsamplingrate	<Double>	Read-write	Sampling rate for Distributed Tracing. Default value: 0 Minimum value = 0 Maximum value = 100
tcpattackcounterinterval	<Double>	Read-write	Interval, in seconds, at which to send tcp attack counters to the configured collectors. If 0 is configured, the record is not sent. Default value: 0 Minimum value = 0 Maximum value = 3600
tcpburstreporting	<String>	Read-only	TCP burst reporting enable/disable knob. Default value: ENABLED Possible values = ENABLED, DISABLED
tcpburstreportingthreshold	<Double>	Read-only	TCP burst reporting threshold. Default value: 1500

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 10 Maximum value = 5000

Operations

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

appflowpolicy

Configuration for AppFlow policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policy" or 'my appflow policy').
rule	<String>	Read-write	Expression or other value against which the traffic is evaluated. Must be a Boolean expression. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Name of the action to be associated with this policy.
undefaction	<String>	Read-write	Name of the appflow action to be associated with this policy when an undef event occurs.
comment	<String>	Read-write	Any comments about this policy.
newname	<String>	Read-write	New name for the policy. Must begin with an ASCII alphabetic or underscore (_)character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my appflow policy" or 'my appflow policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of policy UNDEF hits.
description	<String>	Read-only	Description of the policy.
__count	<Double>	Read-only	count parameter

Operations

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appflowpolicy": [ { "__count": "#no"} ] }
```

appflowpolicylabel

Configuration for AppFlow policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the AppFlow policy label. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my appflow policylabel" or 'my appflow policylabel'). Minimum length = 1
policylabeltype	<String>	Read-write	Type of traffic evaluated by the policies bound to the policy label. Default value: HTTP Possible values = HTTP, OTHERTCP
newname	<String>	Read-write	New name for the policy label. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks (for example, "my appflow policylabel" or 'my appflow policylabel'). Minimum length = 1
numpol	<Double>	Read-only	Number of polices bound to the policy label.
hits	<Double>	Read-only	Number of times the policy label was invoked.
policyname	<String>	Read-only	Name of the AppFlow policy.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label to be invoked. Possible values = vserver, policylabel
invoke_labelname	<String>	Read-only	Name of the label to invoke if the current policy evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flowtype	<Double>	Read-only	Flowtype of the bound AppFlow policy.
description	<String>	Read-only	Description of the policylabel.
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicylabel

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appflowpolicylabel":{

<b>"labelname":<String_value>,

</b>"policylabeltype":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicylabel/labelname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicylabel?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appflowpolicylabel":{

<b>"labelname":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicylabel

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicylabel?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicylabel?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appflowpolicylabel resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicylabel?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicylabel?**pagesize=#no;pageno=#no**

Use this query-parameter to get the appflowpolicylabel resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

appflowpolicylabel_appflowpolicy_binding

Binding object showing the appflowpolicy that can be bound to appflowpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
policyname	<String>	Read-write	Name of the AppFlow policy.
labelname	<String>	Read-write	Name of the policy label to which to bind the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
invoke_labelname	<String>	Read-write	Name of the label to invoke if the current policy evaluates to TRUE.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority.
labeltype	<String>	Read-write	Type of policy label to be invoked. Possible values = vserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicy_appflowpolicylabel_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appflowpolicy_appflowpolicylabel_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"labeltype":<String_value>,

"activepolicy":<Integer_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicy_appflowpolicylabel_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"appflowpolicy_appflowpolicylabel_binding": [ { "__count": "#no"} ] }
```

appflowpolicy_binding

Binding object which returns the resources bound to appflowpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the policy about which to display detailed information.
appflowpolicy_vpnvserver_binding	<appflowpolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to appflowpolicy.
appflowpolicy_csvserver_binding	<appflowpolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to appflowpolicy.
appflowpolicy_lbvserver_binding	<appflowpolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to appflowpolicy.
appflowpolicy_appflowpolicylabel_binding	<appflowpolicy_appflowpolicylabel_binding[]>	Read-only	appflowpolicylabel that can be bound to appflowpolicy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appflowpolicy_appflowglobal_binding	<appflowpolicy_appflowglobal_binding[]>	Read-only	appflowglobal that can be bound to appflowpolicy.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicy_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appflowpolicy_binding": [ {

"name":<String_value>,

"appflowpolicy_appflowglobal_binding":<appflowpolicy_appflowglobal_binding
[]_value>,

"appflowpolicy_appflowpolicylabel_binding":<appflowpolicy_appflowpolicylab
el_binding[]_value>,

"appflowpolicy_csvserver_binding":<appflowpolicy_csvserver_binding[]_value
>,

"appflowpolicy_lbvserver_binding":<appflowpolicy_lbvserver_binding[]_value
>,

"appflowpolicy_vpnvserver_binding":<appflowpolicy_vpnvserver_binding[]_val
ue>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowaction_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appflowaction_binding": [ {

"name":<String_value>,

"appflowaction_analyticsprofile_binding":<appflowaction_analyticsprofile_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowaction_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appflowaction_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appflowaction_binding": [ {

"name":<String_value>,

"appflowaction_analyticsprofile_binding":<appflowaction_analyticsprofile_b
inding[]_value>

}]}
```

Application Firewall

Application Firewall

Application Firewall configuration.

NAME	DESCRIPTION
appfwarchive	Configuration for archive
appfwconfidfield	Configuration for configured confidential form fields
appfwcustomsettings	Configuration for application firewall custom settings XML configuration
appfwfieldtype	Configuration for application firewall form field type
appfwglobal_appfwpolicy_binding	Binding object showing the appfwpolicy that can be bound to appfwglobal
appfwglobal_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to appfwglobal
appfwglobal_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to appfwglobal
appfwglobal_binding	Binding object showing the resources that can be bound to appfwglobal
appfwhtmlerrorpage	Configuration for HTML error page
appfwjsoncontenttype	Configuration for JSON content type
appfwlearningdata	Configuration for learning data
appfwlearningsettings	Configuration for learning settings
appfwpolicy	Configuration for application firewall policy
appfwpolicy_appfwglobal_binding	Binding object showing the appfwglobal that can be bound to appfwpolicy

NAME	DESCRIPTION
appfwpolicy_appfwpolicylabel_binding	Binding object showing the appfwpolicylabel that can be bound to appfwpolicy
appfwpolicy_binding	Binding object showing the resources that can be bound to appfwpolicy
appfwpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to appfwpolicy
appfwpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to appfwpolicy
appfwpolicylabel	Configuration for application firewall policy label
appfwpolicylabel_appfwpolicy_binding	Binding object showing the appfwpolicy that can be bound to appfwpolicylabel
appfwpolicylabel_binding	Binding object showing the resources that can be bound to appfwpolicylabel
appfwpolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to appfwpolicylabel
appfwprofile	Configuration for application firewall profile
appfwprofile_binding	Binding object showing the resources that can be bound to appfwprofile
appfwprofile_contenttype_binding	Binding object showing the contenttype that can be bound to appfwprofile
appfwprofile_cookieconsistency_binding	Binding object showing the cookieconsistency that can be bound to appfwprofile
appfwprofile_creditcardnumber_binding	Binding object showing the creditcardnumber that can be bound to appfwprofile
appfwprofile_crosssitescripting_binding	Binding object showing the crosssitescripting that can be bound to appfwprofile

NAME	DESCRIPTION
appfwprofile_csrftag_binding	Binding object showing the csrftag that can be bound to appfwprofile
appfwprofile_denyurl_binding	Binding object showing the denyurl that can be bound to appfwprofile
appfwprofile_excluderescontenttype_binding	Binding object showing the excluderescontenttype that can be bound to appfwprofile
appfwprofile_fieldconsistency_binding	Binding object showing the fieldconsistency that can be bound to appfwprofile
appfwprofile_fieldformat_binding	Binding object showing the fieldformat that can be bound to appfwprofile
appfwprofile_logexpression_binding	Binding object showing the logexpression that can be bound to appfwprofile
appfwprofile_safeobject_binding	Binding object showing the safeobject that can be bound to appfwprofile
appfwprofile_sqlinjection_binding	Binding object showing the sqlinjection that can be bound to appfwprofile
appfwprofile_starturl_binding	Binding object showing the starturl that can be bound to appfwprofile
appfwprofile_trustedlearningclients_binding	Binding object showing the trustedlearningclients that can be bound to appfwprofile
appfwprofile_xmlattachmenturl_binding	Binding object showing the xmlattachmenturl that can be bound to appfwprofile
appfwprofile_xmldosurl_binding	Binding object showing the xmldosurl that can be bound to appfwprofile
appfwprofile_xmlsqlinjection_binding	Binding object showing the xmlsqlinjection that can be bound to appfwprofile

NAME	DESCRIPTION
appfwprofile_xmlvalidationurl_binding	Binding object showing the xmlvalidationurl that can be bound to appfwprofile
appfwprofile_xmlwsiurl_binding	Binding object showing the xmlwsiurl that can be bound to appfwprofile
appfwprofile_xmlxss_binding	Binding object showing the xmlxss that can be bound to appfwprofile
appfwsettings	Configuration for AS settings
appfwsignatures	Configuration for application firewall signatures XML configuration
appfwtransactionrecords	Configuration for Application firewall transaction record
appfwwsdl	Configuration for WSDL file
appfwxmlcontenttype	Configuration for XML Content type
appfwxmlerrorpage	Configuration for xml error page
appfwxmlschema	Configuration for XML schema

appfwarchive

Configuration for archive resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of tar archive. Minimum length = 1 Maximum length = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
target	<String>	Read-write	Path to the file to be exported. Minimum length = 1 Maximum length = 2047
src	<String>	Read-write	Indicates the source of the tar archive file as a URL of the form <protocol>://<host>[:<port>][/<path>] <protocol> is http or https. <host> is the DNS name or IP address of the http or https server. <port> is the port number of the server. If omitted, the default port for http or https will be used. <path> is the path of the file on the server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Import will fail if an https server requires client certificate authentication. . Minimum length = 1 Maximum length = 2047
comment	<String>	Read-write	Comments associated with this archive. Maximum length = 128
response	<String>	Read-only	.

EXPORT| IMPORT| DELETE| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

export

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwarchive?**action=export**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appfwarchive":{

<b>"name":<String_value>,

</b><b>"target":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

Import

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwarchive?**action=Import**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appfwarchive":{

<b>"src":<String_value>,

</b><b>"name":<String_value>,

</b>"comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwarchive/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwarchive

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwarchive": [ {

"response":<String_value>

}]}
```

appfwconfidfield

Configuration for configured confidential form fields resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fieldname	<String>	Read-write	Name of the form field to designate as confidential. Minimum length = 1
url	<String>	Read-write	URL of the web page that contains the web form. Minimum length = 1
isregex	<String>	Read-write	Method of specifying the form field name. Available settings function as follows: * REGEX. Form field is a regular expression. * NOTREGEX. Form field is a literal string. Default value: NOTREGEX Possible values = REGEX, NOTREGEX
comment	<String>	Read-write	Any comments to preserve information about the form field designation.
state	<String>	Read-write	Enable or disable the confidential field designation. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

appfwfieldtype

Configuration for application firewall form field type resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the field type. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the field type is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my field type" or 'my field type'). Minimum length = 1
regex	<String>	Read-write	PCRE - format regular expression defining the characters and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			length allowed for this field type. Minimum length = 1
priority	<Double>	Read-write	Positive integer specifying the priority of the field type. A lower number specifies a higher priority. Field types are checked in the order of their priority numbers. Minimum value = 0 Maximum value = 64000
comment	<String>	Read-write	Comment describing the type of field that this field type is intended to match.
nocharmaps	<Boolean>	Read-write	will not show internal field types added as part of FieldFormat learn rules deployment.
__count	<Double>	Read-only	count parameter

appfwglobal_appfwpolicy_binding

Binding object showing the appfwpolicy that can be bound to appfwglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the policy.
labelname	<String>	Read-write	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
state	<String>	Read-write	Enable or disable the binding to activate or deactivate the policy. This is applicable to classic policies only. Possible values = ENABLED, DISABLED
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
type	<String>	Read-write	Bind point to which to policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, NONE
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = reqvserver, policylabel
flowtype	<Double>	Read-only	flowtype of the bound application firewall policy.
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
policytype	<String>	Read-only	. Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/appfwglobal_appfwpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
```

```
"appfwglobal_appfwpolicy_binding":{

<b>"policyname":<String_value>,

```

appfwglobal_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to appfwglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policy.
policyname	<String>	Read-write	Name of the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
state	<String>	Read-write	Enable or disable the binding to activate or deactivate the policy. This is applicable to classic policies only. Possible values = ENABLED, DISABLED
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is smaller than the current policy's

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			priority number. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
type	<String>	Read-write	Bind point to which to policy is bound.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = REQ_OVERRIDE, REQ_DEFAULT, NONE
labeltype	<String>	Read-write	Type of policy label to invoke if the current policy evaluates to TRUE and the invoke parameter is set. Available settings function as follows: * reqvserver. Invoke the unnamed policy label associated with the specified request virtual server. * policylabel. Invoke the specified user-defined policy label. Possible values = reqvserver, policylabel
policytype	<String>	Read-only	. Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

appfwhtmlerrorpage

Configuration for HTML error page resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the XML error object to remove. Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL (protocol, host, path, and name) for the location at which to store the imported HTML error object. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 2047
comment	<String>	Read-write	Any comments to preserve information about the HTML error object. Maximum length = 128
overwrite	<Boolean>	Read-write	Overwrite any existing HTML error object of the same name.
response	<String>	Read-only	.

Operations

(click to see Properties)

DELETE| IMPORT| CHANGE| GET (ALL)| GET

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwhtmlerrorpage/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

Import

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwhtmlerrorpage?**action=Import**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appfwhtmlerrorpage":{

<b>"src":<String_value>,
```

```
</b><b>"name":<String_value>,

</b>"comment":<String_value>,

"overwrite":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

change

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwhtmlerrorpage?**action=update**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appfwhtmlerrorpage":{

<b>"name":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwhtmlerrorpage

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwhtmlerrorpage": [ {

"name":<String_value>,

"response":<String_value>,

"src":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwhtmlerrorpage/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwhtmlerrorpage/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwhtmlerrorpage/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwhtmlerrorpage": [ {

"name":<String_value>,

"response":<String_value>,

"src":<String_value>

}]}
```

appfwjsoncontenttype

Configuration for JSON content type resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jsoncontenttypevalue	<String>	Read-write	Content type to be classified as JSON. Minimum length = 1
isregex	<String>	Read-write	Is json content type a regular expression?. Default value: NOTREGEX Possible values = REGEX, NOTREGEX
__count	<Double>	Read-only	count parameter

Operations

appfwpolicylabel_binding

Binding object which returns the resources bound to appfwpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the application firewall policy label.
appfwpolicylabel_policybinding_binding	<appfwpolicylabel_policybinding_binding[]>	Read-only	policybinding that can be bound to appfwpolicylabel.
appfwpolicylabel_appfwpolicy_binding	<appfwpolicylabel_appfwpolicy_binding[]>	Read-only	appfwpolicy that can be bound to appfwpolicylabel.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwpolicylabel_binding/labelname_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwpolicylabel_binding": [ {

"labelname":<String_value>,

"appfwpolicylabel_appfwpolicy_binding":<appfwpolicylabel_appfwpolicy_binding[]_value>,

"appfwpolicylabel_policybinding_binding":<appfwpolicylabel_policybinding_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwpolicylabel_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwpolicylabel_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwpolicylabel_binding": [ {

"labelname":<String_value>,

"appfwpolicylabel_appfwpolicy_binding":<appfwpolicylabel_appfwpolicy_binding[]_value>,

"appfwpolicylabel_policybinding_binding":<appfwpolicylabel_policybinding_binding[]_value>

}]}
```

appfwpolicylabel_policybinding_binding

Binding object showing the policybinding that can be bound to appfwpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Positive integer specifying the priority of the policy. A lower number specifies a higher priority. Must be unique within a group of policies that are bound to the same bind point or label. Policies are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluated in the order of their priority numbers.
policyname	<String>	Read-write	Name of the application firewall policy to bind to the policy label.
labelname	<String>	Read-write	Name of the application firewall policy label.
invoke_labelname	<String>	Read-write	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labeltype	<String>	Read-write	Type of policy label to invoke if the current policy evaluates to TRUE and the invoke parameter is set. Available settings function as follows: * reqvserver. Invoke the unnamed policy label associated with the specified request virtual server. * policylabel. Invoke the specified user-defined policy label. Possible values = reqvserver, policylabel
__count	<Double>	Read-write	count parameter

appfwpolicy_csvserver_binding

Binding object showing the csvserver that can be bound to appfwpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the policy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwpolicy_csvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwpolicy_csvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwpolicy_csvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwpolicy_csvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwpolicy_csvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwpolicy_csvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"labeltype":<String_value>,

"activepolicy":<Integer_value>,
```

```
"labelname":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwpolicy_csvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwpolicy_csvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwpolicy_csvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

```

appfwprofile

Configuration for application firewall profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the profile. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.), pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) characters. Cannot be changed after the profile is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my profile" or 'my profile'). Minimum length = 1
defaults	<String>	Read-write	Default configuration to apply to the profile. Basic defaults are intended for standard content

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that requires little further configuration, such as static web site content. Advanced defaults are intended for specialized content that requires significant specialized configuration, such as heavily scripted or dynamic content. CLI users: When adding an application firewall profile, you can set either the defaults or the type, but not both. To set both options, create the profile by using the add appfw profile command, and then use the set appfw profile command to configure the other option. Possible values = basic, advanced
starturlaction	<String[]>	Read-write	One or more Start URL actions. Available settings function as follows: * Block - Block connections that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -startURLaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -startURLaction none". Possible values = none, block, learn, log, stats

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
contenttypeaction	<String[]>	Read-write	One or more Content-type actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -contentTypeaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-contentTypeaction none". Possible values = none, block, learn, log, stats
inspectcontenttypes	<String[]>	Read-write	One or more InspectContentType lists. * application/x-www-form-urlencoded * multipart/form-data * text/x-gwt-rpc CLI users: To enable, type "set appfw profile -InspectContentTypes" followed by the content types to be inspected. Possible values = none, application/x-www-form-urlencoded, multipart/form-data, text/x-gwt-rpc
starturlclosure	<String>	Read-write	Toggle the state of Start URL Closure. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
denyurlaction	<String[]>	Read-write	One or more Deny URL actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. NOTE: The Deny URL check takes precedence over the Start URL check. If you enable blocking for the Deny URL check, the application firewall blocks any URL that is explicitly blocked by a Deny URL, even if the same URL would otherwise be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			allowed by the Start URL check. CLI users: To enable one or more actions, type "set appfw profile -denyURLaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -denyURLaction none". Possible values = none, block, log, stats
refererheadercheck	<String>	Read-write	Enable validation of Referer headers. Referer validation ensures that a web form that a user sends to your web site originally came from your web site, not an outside attacker. Although this parameter is part of the Start URL check, referer validation protects against cross-site

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			request forgery (CSRF) attacks, not Start URL attacks. Default value: OFF Possible values = OFF, if_present, AlwaysExceptStart URLs, AlwaysExceptFirstRequest

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cookieconsistencyaction	<String[]>	Read-write	One or more Cookie Consistency actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -cookieConsistency Action" followed by the actions to be enabled. To turn off all actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-cookieConsistency Action none". Default value: none Possible values = none, block, learn, log, stats
cookietransforms	<String>	Read-write	Perform the specified type of cookie transformation. Available settings function as follows: * Encryption - Encrypt cookies. * Proxying - Mask contents of server cookies by sending proxy cookie to users. * Cookie flags - Flag cookies as HTTP only to prevent scripts on user's browser from accessing and possibly modifying them. CAUTION: Make sure that this parameter is set to ON if you are configuring any cookie

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			transformations. If it is set to OFF, no cookie transformations are performed regardless of any other settings. Default value: OFF Possible values = ON, OFF
cookieencryption	<String>	Read-write	Type of cookie encryption. Available settings function as follows: * None - Do not encrypt cookies. * Decrypt Only - Decrypt encrypted cookies, but do not encrypt cookies. * Encrypt Session Only - Encrypt session cookies, but not permanent cookies. * Encrypt All - Encrypt all cookies. Default value: none Possible values = none, decryptOnly,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			encryptSessionOnly , encryptAll
cookieproxying	<String>	Read-write	Cookie proxy setting. Available settings function as follows: * None - Do not proxy cookies. * Session Only - Proxy session cookies by using the Citrix ADC session ID, but do not proxy permanent cookies. Default value: none Possible values = none, sessionOnly
addcookieflags	<String>	Read-write	Add the specified flags to cookies. Available settings function as follows: * None - Do not add flags to cookies. * HTTP Only - Add the HTTP Only flag to cookies, which prevents scripts from accessing cookies.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Secure - Add Secure flag to cookies. * All - Add both HTTPOnly and Secure flags to cookies. Default value: none Possible values = none, httpOnly, secure, all
fieldconsistencyaction	<String[]>	Read-write	One or more Form Field Consistency actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -fieldConsistencyaction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -fieldConsistencyAction none". Default value: none Possible values = none, block, learn, log, stats
csrftagaction	<String[]>	Read-write	One or more Cross-Site Request Forgery (CSRF) Tagging actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -CSRFTagAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -CSRFTagAction none". Default value: none Possible values = none, block, learn, log, stats

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crosssitescriptingaction	<String[]>	Read-write	One or more Cross-Site Scripting (XSS) actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -crossSiteScriptingAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-crossSiteScriptingAction none". Possible values = none, block, learn, log, stats
crosssitescriptingtransformunsafehtml	<String>	Read-write	Transform cross-site scripts. This setting configures the application firewall to disable dangerous HTML instead of blocking the request. CAUTION: Make sure that this parameter is set to ON if you are configuring any cross-site scripting transformations. If it is set to OFF, no cross-site scripting transformations are performed regardless of any other settings. Default value: OFF Possible values = ON, OFF
crosssitescriptingcheckcompleteurls	<String>	Read-write	Check complete URLs for cross-site scripts, instead of just the query portions of URLs.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: OFF Possible values = ON, OFF
sqlinjectionaction	<String[]>	Read-write	One or more HTML SQL Injection actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -SQLInjectionAction " followed by the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			actions to be enabled. To turn off all actions, type "set appfw profile -SQLInjectionAction none". Possible values = none, block, learn, log, stats
sqlinjectiontransformspecialchars	<String>	Read-write	Transform injected SQL code. This setting configures the application firewall to disable SQL special strings instead of blocking the request. Since most SQL servers require a special string to activate an SQL keyword, in most cases a request that contains injected SQL code is safe if special strings are disabled. CAUTION: Make sure that this parameter is set to ON if you are configuring any SQL injection transformations. If it is set to OFF, no SQL injection transformations are performed

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			regardless of any other settings. Default value: OFF Possible values = ON, OFF
sqlinjectiononlycheck fieldswithsqlchars	<String>	Read-write	Check only form fields that contain SQL special strings (characters) for injected SQL code. Most SQL servers require a special string to activate an SQL request, so SQL code without a special string is harmless to most SQL servers. Default value: ON Possible values = ON, OFF
sqlinjectiontype	<String>	Read-write	Available SQL injection types. -SQLSplChar : Checks for SQL Special Chars -SQLKeyword : Checks for SQL Keywords -SQLSplCharANDKeyword : Checks for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			both and blocks if both are found -SQLSplCharORKeyword : Checks for both and blocks if anyone is found. Default value: SQLSplCharANDKeyword Possible values = SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword
sqlinjectionchecksqlwildchars	<String>	Read-write	Check for form fields that contain SQL wild chars . Default value: OFF Possible values = ON, OFF
fieldformataction	<String[]>	Read-write	One or more Field Format actions. Available settings function as follows: * Block - Block connections that violate this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Learn - Use the learning engine to generate a list of suggested web form fields and field format assignments. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -fieldFormatAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -fieldFormatAction none". Possible values = none, block, learn, log, stats
defaultfieldformattype	<String>	Read-write	Designate a default field type to be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			applied to web form fields that do not have a field type explicitly assigned to them. Minimum length = 1
defaultfieldformatminlength	<Double>	Read-write	Minimum length, in characters, for data entered into a field that is assigned the default field type. To disable the minimum and maximum length settings and allow data of any length to be entered into the field, set this parameter to zero (0). Default value: 0 Minimum value = 0 Maximum value = 2147483647
defaultfieldformatmaxlength	<Double>	Read-write	Maximum length, in characters, for data entered into a field that is assigned the default field type. Default value: 65535 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 2147483647
bufferoverflowaction	<String[]>	Read-write	One or more Buffer Overflow actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -bufferOverflowAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -bufferOverflowAction none".

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = none, block, log, stats
bufferoverflowmaxurllength	<Double>	Read-write	Maximum length, in characters, for URLs on your protected web sites. Requests with longer URLs are blocked. Default value: 1024 Minimum value = 0 Maximum value = 65535
bufferoverflowmaxheaderlength	<Double>	Read-write	Maximum length, in characters, for HTTP headers in requests sent to your protected web sites. Requests with longer headers are blocked. Default value: 4096 Minimum value = 0 Maximum value = 65535
bufferoverflowmaxcookielength	<Double>	Read-write	Maximum length, in characters, for cookies sent to your protected web sites. Requests with longer cookies are blocked. Default value: 4096 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65535
creditcardaction	<String[]>	Read-write	One or more Credit Card actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -creditCardAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -creditCardAction none". Default value: none

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = none, block, learn, log, stats
creditcard	<String[]>	Read-write	Credit card types that the application firewall should protect. Default value: none Possible values = none, visa, mastercard, discover, amex, jcb, dinersclub
creditcardmaxallowed	<Double>	Read-write	This parameter value is used by the block action. It represents the maximum number of credit card numbers that can appear on a web page served by your protected web sites. Pages that contain more credit card numbers are blocked. Minimum value = 0 Maximum value = 255
creditcardxout	<String>	Read-write	Mask any credit card number detected in a response by replacing each digit, except the digits in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the final group, with the letter "X.". Default value: OFF Possible values = ON, OFF
dosecurecreditcardlogging	<String>	Read-write	Setting this option logs credit card numbers in the response when the match is found. Default value: ON Possible values = ON, OFF
streaming	<String>	Read-write	Setting this option converts content-length form submission requests (requests with content-type "application/x-www-form-urlencoded" or "multipart/form-data") to chunked requests when atleast one of the following protections : SQL injection protection, XSS protection, form field consistency protection, starturl closure, CSRF tagging is enabled. Please make sure that the backend server accepts chunked requests

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			before enabling this option. Default value: OFF Possible values = ON, OFF
trace	<String>	Read-write	Toggle the state of trace. Default value: OFF Possible values = ON, OFF
requestcontenttype	<String>	Read-write	Default Content-Type header for requests. A Content-Type header can contain 0-255 letters, numbers, and the hyphen (-) and underscore (_) characters. Minimum length = 1 Maximum length = 255
responsecontenttype	<String>	Read-write	Default Content-Type header for responses. A Content-Type header can contain 0-255 letters, numbers, and the hyphen (-) and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore (_) characters. Minimum length = 1 Maximum length = 255
xmldosaction	<String[]>	Read-write	One or more XML Denial-of-Service (XDoS) actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-XMLDoSAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLDoSAction none". Possible values = none, block, learn, log, stats
xmlformataction	<String[]>	Read-write	One or more XML Format actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLFormatAction"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLFormatAction none". Possible values = none, block, log, stats
xmlsqlinjectionaction	<String[]>	Read-write	One or more XML SQL Injection actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLSQLInjectionA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLSQLInjectionAction none". Possible values = none, block, log, stats
xmlsqlinjectiononlycheckfieldswithsqlchars	<String>	Read-write	Check only form fields that contain SQL special characters, which most SQL servers require before accepting an SQL command, for injected SQL. Default value: ON Possible values = ON, OFF
xmlsqlinjectiontype	<String>	Read-write	Available SQL injection types. -SQLSplChar : Checks for SQL Special Chars -SQLKeyword : Checks for SQL Keywords -SQLSplCharANDKeyword : Checks for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			both and blocks if both are found -SQLSplCharORKeyword : Checks for both and blocks if anyone is found. Default value: SQLSplCharANDKeyword Possible values = SQLSplChar, SQLKeyword, SQLSplCharORKeyword, SQLSplCharANDKeyword
xmlsqlinjectioncheck sqlwildchars	<String>	Read-write	Check for form fields that contain SQL wild chars . Default value: OFF Possible values = ON, OFF
xmlsqlinjectionparse comments	<String>	Read-write	Parse comments in XML Data and exempt those sections of the request that are from the XML SQL Injection check. You must configure the type of comments that the application firewall is to detect and exempt from this

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			security check. Available settings function as follows: * Check all - Check all content. * ANSI - Exempt content that is part of an ANSI (Mozilla-style) comment. * Nested - Exempt content that is part of a nested (Microsoft-style) comment. * ANSI Nested - Exempt content that is part of any type of comment. Default value: checkall Possible values = checkall, ansi, nested, ansinested
xmlxssaction	<String[]>	Read-write	One or more XML Cross-Site Scripting actions. Available settings function as follows: * Block - Block connections that violate this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLXSSAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLXSSAction none". Possible values = none, block, learn, log, stats
xmlwsiaction	<String[]>	Read-write	One or more Web Services Interoperability (WSI) actions. Available settings function as follows: * Block - Block connections that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLWSIAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLWSIAction none". Possible values = none, block, learn, log, stats

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlattachmentaction	<String[]>	Read-write	One or more XML Attachment actions. Available settings function as follows: * Block - Block connections that violate this security check. * Learn - Use the learning engine to generate a list of exceptions to this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLAttachmentAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-XMLAttachmentAction none". Possible values = none, block, learn, log, stats
xmlvalidationaction	<String[]>	Read-write	One or more XML Validation actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check. * Stats - Generate statistics for this security check. * None - Disable all actions for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLValidationAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-XMLValidationAction none". Possible values = none, block, log, stats
xmlerrorobject	<String>	Read-write	Name to assign to the XML Error Object, which the application firewall displays when a user request is blocked. Must begin with a letter, number, or the underscore character \(_\), and must contain only letters, numbers, and the hyphen \(-\), period \(.\) pound \(#\), space \(\), at (@), equals \(=\), colon \(:\), and underscore characters. Cannot be changed after the XML error object is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks \(for example, "my XML error object" or 'my XML error object'\). Minimum length = 1
customsettings	<String>	Read-write	Object name for custom settings. This check is applicable to Profile Type: HTML, XML. . Minimum length = 1
signatures	<String>	Read-write	Object name for signatures. This check is applicable to Profile Type: HTML, XML. . Minimum length = 1
xmlsoapfaultaction	<String[]>	Read-write	One or more XML SOAP Fault Filtering actions. Available settings function as follows: * Block - Block connections that violate this security check. * Log - Log violations of this security check.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Stats - Generate statistics for this security check. * None - Disable all actions for this security check. * Remove - Remove all violations for this security check. CLI users: To enable one or more actions, type "set appfw profile -XMLSOAPFaultAction" followed by the actions to be enabled. To turn off all actions, type "set appfw profile -XMLSOAPFaultAction none". Possible values = none, block, log, remove, stats
usehtmlerrorobject	<String>	Read-write	Send an imported HTML Error object to a user when a request is blocked, instead of redirecting the user to the designated Error URL. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
errorurl	<String>	Read-write	URL that application firewall uses as the Error URL. Minimum length = 1
htmlerrorobject	<String>	Read-write	Name to assign to the HTML Error Object. Must begin with a letter, number, or the underscore character \(_\), and must contain only letters, numbers, and the hyphen \(-\), period \(.\) pound \(#\), space \(\), at (@), equals \(=\), colon \(:\), and underscore characters. Cannot be changed after the HTML error object is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks \(for example, "my HTML error object" or 'my HTML error object'\). Minimum length = 1
logeverypolicyhit	<String>	Read-write	Log every profile match, regardless of security checks results. Default value: OFF Possible values = ON, OFF
stripcomments	<String>	Read-write	Strip HTML comments. This check is applicable to Profile Type: HTML. . Default value: OFF Possible values = ON, OFF
striphtmlcomments	<String>	Read-write	Strip HTML comments before forwarding a web page sent by a protected web site in response to a user request. Default value: none Possible values = none, all, exclude_script_tag

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
stripxmlcomments	<String>	Read-write	Strip XML comments before forwarding a web page sent by a protected web site in response to a user request. Default value: none Possible values = none, all
exemptclosureurlsfromsecuritychecks	<String>	Read-write	Exempt URLs that pass the Start URL closure check from SQL injection, cross-site script, field format and field consistency security checks at locations other than headers. Default value: ON Possible values = ON, OFF
defaultcharset	<String>	Read-write	Default character set for protected web pages. Web pages sent by your protected web sites in response to user requests are assigned this character set if the page does not already specify a character set. The character sets supported by the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			application firewall are: * iso-8859-1 (English US) * big5 (Chinese Traditional) * gb2312 (Chinese Simplified) * sjis (Japanese Shift-JIS) * euc-jp (Japanese EUC-JP) * iso-8859-9 (Turkish) * utf-8 (Unicode) * euc-kr (Korean). Minimum length = 1 Maximum length = 31
postbodylimit	<Double>	Read-write	Maximum allowed HTTP post body size, in bytes. Default value: 20000000
postbodylimitsignature	<Double>	Read-write	Maximum allowed HTTP post body size for signature inspection for location HTTP_POST_BODY

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			in the signatures, in bytes. Default value: 8096
fileuploadmaxnum	<Double>	Read-write	Maximum allowed number of file uploads per form-submission request. The maximum setting (65535) allows an unlimited number of uploads. Default value: 65535 Minimum value = 0 Maximum value = 65535
canonicalizehtmlresponse	<String>	Read-write	Perform HTML entity encoding for any special characters in responses sent by your protected web sites. Default value: ON Possible values = ON, OFF
enableformtagging	<String>	Read-write	Enable tagging of web form fields for use by the Form Field Consistency and CSRF Form Tagging checks. Default value: ON

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
sessionlessfieldconsistency	<String>	Read-write	Perform sessionless Field Consistency Checks. Default value: OFF Possible values = OFF, ON, postOnly
sessionlessurlclosure	<String>	Read-write	Enable session less URL Closure Checks. This check is applicable to Profile Type: HTML. . Default value: OFF Possible values = ON, OFF
semicolonfieldseparator	<String>	Read-write	Allow ';' as a form field separator in URL queries and POST form bodies. . Default value: OFF Possible values = ON, OFF
excludefileuploadfromchecks	<String>	Read-write	Exclude uploaded files from Form checks. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sqlinjectionparsecomments	<String>	Read-write	Parse HTML comments and exempt them from the HTML SQL Injection check. You must specify the type of comments that the application firewall is to detect and exempt from this security check. Available settings function as follows: * Check all - Check all content. * ANSI - Exempt content that is part of an ANSI (Mozilla-style) comment. * Nested - Exempt content that is part of a nested (Microsoft-style) comment. * ANSI Nested - Exempt content that is part of any type of comment. Possible values = checkall, ansi, nested, ansinested
invalidpercenthandling	<String>	Read-write	Configure the method that the application firewall

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			uses to handle percent-encoded names and values. Available settings function as follows: * apache_mode - Apache format. * asp_mode - Microsoft ASP format. * secure_mode - Secure format. Default value: secure_mode Possible values = apache_mode, asp_mode, secure_mode
type	<String[]>	Read-write	Application firewall profile type, which controls which security checks and settings are applied to content that is filtered with the profile. Available settings function as follows: * HTML - HTML-based web sites. * XML - XML-based web sites and services.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* HTML XML (Web 2.0) - Sites that contain both HTML and XML content, such as ATOM feeds, blogs, and RSS feeds. Default value: HTML Possible values = HTML, XML
checkrequestheaders	<String>	Read-write	Check request headers as well as web forms for injected SQL and cross-site scripts. Default value: OFF Possible values = ON, OFF
optimizepartialreqs	<String>	Read-write	Optimize handle of HTTP partial requests i.e. those with range headers. Available settings are as follows: * ON - Partial requests by the client result in partial requests to the backend server in most cases.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* OFF - Partial requests by the client are changed to full requests to the backend server. Default value: ON Possible values = ON, OFF
urldecoderequestcookies	<String>	Read-write	URL Decode request cookies before subjecting them to SQL and cross-site scripting checks. Default value: OFF Possible values = ON, OFF
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
percentdecoderecursively	<String>	Read-write	Configure whether the application firewall should use percentage recursive decoding. Default value: ON Possible values = ON, OFF
multipleheaderaction	<String[]>	Read-write	One or more multiple header actions.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Available settings function as follows: * Block - Block connections that have multiple headers. * Log - Log connections that have multiple headers. * KeepLast - Keep only last header when multiple headers are present. CLI users: To enable one or more actions, type "set appfw profile -multipleHeaderAction" followed by the actions to be enabled. Possible values = block, keepLast, log, none
rfcprofile	<String>	Read-write	Object name of the rfc profile. Minimum length = 1
archivename	<String>	Read-write	Source for tar archive. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 31
state	<String>	Read-only	Enabled. Possible values = ENABLED, DISABLED
csrftag	<String>	Read-only	The web form originating URL.
builtin_depr	<Boolean>	Read-only	Indicates that a profile is a built-in entity.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| RESTORE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

appfwprofile_binding

Binding object which returns the resources bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the application firewall profile. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appfwprofile_xmlattachmenturl_binding	<appfwprofile_xmlattachmenturl_binding[]>	Read-only	xmlattachmenturl that can be bound to appfwprofile.
appfwprofile_excluderescontenttype_binding	<appfwprofile_excluderescontenttype_binding[]>	Read-only	excluderescontenttype that can be bound to appfwprofile.
appfwprofile_crosssitescripting_binding	<appfwprofile_crosssitescripting_binding[]>	Read-only	crosssitescripting that can be bound to appfwprofile.
appfwprofile_xmlwsiurl_binding	<appfwprofile_xmlwsiurl_binding[]>	Read-only	xmlwsiurl that can be bound to appfwprofile.
appfwprofile_xmldosurl_binding	<appfwprofile_xmldosurl_binding[]>	Read-only	xmldosurl that can be bound to appfwprofile.
appfwprofile_fieldconsistency_binding	<appfwprofile_fieldconsistency_binding[]>	Read-only	fieldconsistency that can be bound to appfwprofile.
appfwprofile_sqlinjection_binding	<appfwprofile_sqlinjection_binding[]>	Read-only	sqlinjection that can be bound to appfwprofile.
appfwprofile_safeobject_binding	<appfwprofile_safeobject_binding[]>	Read-only	safeobject that can be bound to appfwprofile.
appfwprofile_logexpression_binding	<appfwprofile_logexpression_binding[]>	Read-only	logexpression that can be bound to appfwprofile.
appfwprofile_denyurl_binding	<appfwprofile_denyurl_binding[]>	Read-only	denyurl that can be bound to appfwprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appfwprofile_trustedlearningclients_binding	<appfwprofile_trustedlearningclients_binding[]>	Read-only	trustedlearningclients that can be bound to appfwprofile.
appfwprofile_csrftag_binding	<appfwprofile_csrftag_binding[]>	Read-only	csrftag that can be bound to appfwprofile.
appfwprofile_starturl_binding	<appfwprofile_starturl_binding[]>	Read-only	starturl that can be bound to appfwprofile.
appfwprofile_cookieconsistency_binding	<appfwprofile_cookieconsistency_binding[]>	Read-only	cookieconsistency that can be bound to appfwprofile.
appfwprofile_xmlsqlinjection_binding	<appfwprofile_xmlsqlinjection_binding[]>	Read-only	xmlsqlinjection that can be bound to appfwprofile.
appfwprofile_creditcardnumber_binding	<appfwprofile_creditcardnumber_binding[]>	Read-only	creditcardnumber that can be bound to appfwprofile.
appfwprofile_xmlxss_binding	<appfwprofile_xmlxss_binding[]>	Read-only	xmlxss that can be bound to appfwprofile.
appfwprofile_fieldformat_binding	<appfwprofile_fieldformat_binding[]>	Read-only	fieldformat that can be bound to appfwprofile.
appfwprofile_contenttype_binding	<appfwprofile_contenttype_binding[]>	Read-only	contenttype that can be bound to appfwprofile.
appfwprofile_xmlvalidationurl_binding	<appfwprofile_xmlvalidationurl_binding[]>	Read-only	xmlvalidationurl that can be bound to appfwprofile.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_cookieconsistency_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwprofile_cookieconsistency_binding": [ {

"state":<String_value>,

"name":<String_value>,

"isregex":<String_value>,

"cookieconsistency":<String_value>,

"comment":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_cookieconsistency_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"appfwprofile_cookieconsistency_binding": [ { "__count": "#no"} ] }
```

appfwprofile_creditcardnumber_binding

Binding object showing the creditcardnumber that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
creditcardnumberurl	<String>	Read-write	The url for which the list of credit card numbers are needed to be bypassed from inspection.
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
creditcardnumber	<String>	Read-write	The object expression that is to be excluded from safe commerce check.
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/appfwprofile_creditcardnumber_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"appfwprofile_creditcardnumber_binding":{

<b>"name":<String_value>,

</b>"comment":<String_value>,

"state":<String_value>,

"creditcardnumber":<String_value>,

"creditcardnumberurl":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_creditcardnumber_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_creditcardnumber_binding/name_value<String>?**args=creditcardnumber:<String_value>,creditcardnumberurl:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_creditcardnumber_binding/name_value<String>

Query-parameters:

```

appfwprofile_crosssitescripting_binding

Binding object showing the crosssitescripting that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crosssitescripting	<String>	Read-write	The web form field name.
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
isregex_xss	<String>	Read-write	Is the web form field name a regular expression?. Possible values = REGEX, NOTREGEX
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
formactionurl_xss	<String>	Read-write	The web form action URL.
as_value_expr_xss	<String>	Read-write	The web form value expression.
as_scan_location_xss	<String>	Read-write	Location of cross-site scripting exception - form field, header or cookie. Possible values = FORMFIELD, HEADER, COOKIE
as_value_type_xss	<String>	Read-write	The web form value type. Possible values = Tag, Attribute, Pattern

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
isvalueregex_xss	<String>	Read-write	Is the web form field value a regular expression?. Possible values = REGEX, NOTREGEX
__count	<Double>	Read-write	count parameter

```

appfwprofile_excluderescontenttype_binding

Binding object showing the excluderescontenttype that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
excluderescontenttype	<String>	Read-write	A regular expression that represents the content type of the response that are to be excluded from inspection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/appfwprofile_excluderescontenttype_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"appfwprofile_excluderescontenttype_binding":{

<b>"name":<String_value>,

</b>"comment":<String_value>,

"state":<String_value>,

"excluderescontenttype":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_excluderescontenttype_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_excluderescontenttype_binding/name_value<String>?**args=excluderescontenttype:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_excluderescontenttype_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_excluderescontenttype_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of appfwprofile_excluderescontenttype_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_excluderescontenttype_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the appfwprofile_excluderescontenttype_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwprofile_excluderescontenttype_binding": [ {

"excluderescontenttype":<String_value>,

"name":<String_value>,

"state":<String_value>,

"comment":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_excluderescontenttype_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_excluderescontenttype_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwprofile_excluderescontenttype_binding": [ {

"excluderescontenttype":<String_value>,

"name":<String_value>,

"state":<String_value>,

"comment":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwprofile_excluderescontenttype_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"appfwprofile_excluderescontenttype_binding": [ { "__count": "#no"} ] }
```

appfwprofile_fieldconsistency_binding

Binding object showing the fieldconsistency that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fieldconsistency	<String>	Read-write	The web form field name.
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
isregex_ffc	<String>	Read-write	Is the web form field name a regular expression?. Possible values = REGEX, NOTREGEX
formactionurl_ffc	<String>	Read-write	The web form action URL.
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
__count	<Double>	Read-write	count parameter

Operations

```

appfwprofile_sqlinjection_binding

Binding object showing the sqlinjection that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
as_value_expr_sql	<String>	Read-write	The web form value expression.
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
formactionurl_sql	<String>	Read-write	The web form action URL.
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
isregex_sql	<String>	Read-write	Is the web form field name a regular expression?.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = REGEX, NOTREGEX
isvalueregex_sql	<String>	Read-write	Is the web form field value a regular expression?. Possible values = REGEX, NOTREGEX
as_scan_location_sql	<String>	Read-write	Location of SQL injection exception - form field, header or cookie. Possible values = FORMFIELD, HEADER, COOKIE
sqlinjection	<String>	Read-write	The web form field name.
as_value_type_sql	<String>	Read-write	The web form value type. Possible values = Keyword, SpecialString, Wildchar
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"appfwprofile_xmlattachmenturl_binding": [ { "__count": "#no"} ] }
```

appfwprofile_xmldosurl_binding

Binding object showing the xmldosurl that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlmaxelementdepthcheck	<String>	Read-write	State if XML Max element depth check is ON or OFF. Possible values = ON, OFF
xmlmaxfilesize	<Double>	Read-write	Specify the maximum size of XML messages. Protects against overflow attacks.
xmlmaxnamespaceurilength	<Double>	Read-write	Specify the longest URI of any XML namespace. Protects against overflow attacks.
xmldosurl	<String>	Read-write	XML DoS URL regular expression length.
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlsoaparraycheck	<String>	Read-write	State if XML SOAP Array check is ON or OFF. Possible values = ON, OFF
xmlmaxelementnamelengthcheck	<String>	Read-write	State if XML Max element name length check is ON or OFF. Possible values = ON, OFF
xmlmaxelementscheck	<String>	Read-write	State if XML Max elements check is ON or OFF. Possible values = ON, OFF
xmlmaxentityexpansions	<Double>	Read-write	Specify maximum allowed number of entity expansions. Protects aganist Entity Expansion Attack.
xmlmaxattributes	<Double>	Read-write	Specify maximum number of attributes per XML element. Protects against overflow attacks.
xmlmaxfilesizecheck	<String>	Read-write	State if XML Max file size check is ON or OFF. Possible values = ON, OFF
xmlmaxchardatalength	<Double>	Read-write	Specify the maximum size of CDATA. Protects

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			against overflow attacks and large quantities of unparsed data within XML messages.
xmlmaxnamespaces check	<String>	Read-write	State if XML Max namespaces check is ON or OFF. Possible values = ON, OFF
xmlmaxnamespaces	<Double>	Read-write	Specify maximum number of active namespaces. Protects against overflow attacks.
xmlmaxattributenam elengthcheck	<String>	Read-write	State if XML Max attribute name length check is ON or OFF. Possible values = ON, OFF
xmlblockdtd	<String>	Read-write	State if XML DTD is ON or OFF. Protects against recursive Document Type Declaration (DTD) entity expansion attacks. Also, SOAP messages cannot have DTDs in messages. . Possible values = ON, OFF
xmlmaxattributevalue length	<Double>	Read-write	Specify the longest value of any XML attribute. Protects

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			against overflow attacks.
xmlmaxelementdepth	<Double>	Read-write	Maximum nesting (depth) of XML elements. This check protects against documents that have excessive hierarchy depths.
xmlmaxelementnamelength	<Double>	Read-write	Specify the longest name of any element (including the expanded namespace) to protect against overflow attacks.
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
xmlblockpi	<String>	Read-write	State if XML Block PI is ON or OFF. Protects resources from denial of service attacks as SOAP messages cannot have processing instructions (PI) in messages. Possible values = ON, OFF
xmlmaxelementchildrencheck	<String>	Read-write	State if XML Max element children check is ON or OFF.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
xmlmaxelements	<Double>	Read-write	Specify the maximum number of XML elements allowed. Protects against overflow attacks.
xmlmaxentityexpansionscheck	<String>	Read-write	State if XML Max Entity Expansions Check is ON or OFF. Possible values = ON, OFF
xmlmaxnamespaceurilengthcheck	<String>	Read-write	State if XML Max namespace URI length check is ON or OFF. Possible values = ON, OFF
xmlmaxentityexpansiondepthcheck	<String>	Read-write	State if XML Max Entity Expansions Depth Check is ON or OFF. Possible values = ON, OFF
xmlmaxattributevaluelengthcheck	<String>	Read-write	State if XML Max atribute value length is ON or OFF. Possible values = ON, OFF
xmlmaxsoaparraysize	<Double>	Read-write	XML Max Total SOAP Array Size. Protects against

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SOAP Array Abuse attack.
xmlmaxentityexpansiondepth	<Double>	Read-write	Specify maximum entity expansion depth. Protects aganist Entity Expansion Attack.
xmlmaxnodescheck	<String>	Read-write	State if XML Max nodes check is ON or OFF. Possible values = ON, OFF
xmlmaxattributenamelength	<Double>	Read-write	Specify the longest name of any XML attribute. Protects against overflow attacks.
xmlmaxchardatalengthcheck	<String>	Read-write	State if XML Max CDATA length check is ON or OFF. Possible values = ON, OFF
xmlminfilesizecheck	<String>	Read-write	State if XML Min file size check is ON or OFF. Possible values = ON, OFF
xmlmaxelementchildren	<Double>	Read-write	Specify the maximum number of children allowed per XML element. Protects against overflow attacks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlminfilesize	<Double>	Read-write	Enforces minimum message size.
xmlmaxnodes	<Double>	Read-write	Specify the maximum number of XML nodes. Protects against overflow attacks.
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
xmlmaxattributescheck	<String>	Read-write	State if XML Max attributes check is ON or OFF. Possible values = ON, OFF
xmlmaxsoaparrayrank	<Double>	Read-write	XML Max Individual SOAP Array Rank. This is the dimension of the SOAP array.
xmlblockexternalentities	<String>	Read-write	State if XML Block External Entities Check is ON or OFF. Protects against XML External Entity (XXE) attacks that force applications to parse untrusted external entities (sources) in XML documents. Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

appfwprofile_xmlsqlinjection_binding

Binding object showing the xmlsqlinjection that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
as_scan_location_xmlsql	<String>	Read-write	Location of SQL injection exception - XML Element or Attribute. Possible values = ELEMENT, ATTRIBUTE
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
xmlsqlinjection	<String>	Read-write	Exempt the specified URL from the XML SQL injection check. An XML SQL injection exemption (relaxation) consists of the following items: * Name. Name to exempt, as a string or a PCRE-format regular expression. * ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string. * Location. ELEMENT if the injection is located in an XML element, ATTRIBUTE if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			located in an XML attribute.
isregex_xmlsql	<String>	Read-write	Is the XML SQL Injection exempted field name a regular expression?. Possible values = REGEX, NOTREGEX
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

appfwprofile_xmlvalidationurl_binding

Binding object showing the xmlvalidationurl that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
xmlwsdl	<String>	Read-write	WSDL object for soap request validation.
xmlendpointcheck	<String>	Read-write	Modifies the behaviour of the Request URL validation w.r.t. the Service URL. If set to ABSOLUTE, the entire request URL is validated with the entire URL mentioned in Service of the associated WSDL. eg: Service URL: http://example.org/ExampleService, Request URL: http//example.com/ExampleService would FAIL the validation. If set to RELAIVE, only the non-hostname part of the request URL is validated against the non-hostname part of the Service URL. eg: Service URL: http://example.org/ExampleService, Request URL: http//example.com/

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ExampleService would PASS the validation. Possible values = ABSOLUTE, RELATIVE
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
xmlvalidateresponse	<String>	Read-write	Validate response message. Possible values = ON, OFF
xmlvalidationurl	<String>	Read-write	XML Validation URL regular expression.
xmlresponseschema	<String>	Read-write	XML Schema object for response validation.
xmlvalidatesoapenvelope	<String>	Read-write	Validate SOAP Evelope only. Possible values = ON, OFF

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

appfwprofile_xmlxss_binding

Binding object showing the xmlxss that can be bound to appfwprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Enabled. Possible values = ENABLED, DISABLED
name	<String>	Read-write	Name of the profile to which to bind an exemption or rule. Minimum length = 1
as_scan_location_xmlxss	<String>	Read-write	Location of XSS injection exception - XML Element or Attribute. Possible values = ELEMENT, ATTRIBUTE
isregex_xmlxss	<String>	Read-write	Is the XML XSS exempted field name a regular expression?. Possible values = REGEX, NOTREGEX
comment	<String>	Read-write	Any comments about the purpose of profile, or other useful information about the profile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
xmlxss	<String>	Read-write	Exempt the specified URL from the XML cross-site scripting (XSS) check. An XML cross-site scripting exemption (relaxation) consists of the following items: * URL. URL to exempt, as a string or a PCRE-format regular expression. * ISREGEX flag. REGEX if URL is a regular expression, NOTREGEX if URL is a fixed string. * Location. ELEMENT if the attachment is located in an XML element, ATTRIBUTE if located in an XML attribute.

appfwsettings

Configuration for AS settings resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
defaultprofile	<String>	Read-write	Profile to use when a connection does not match any policy. Default setting is APPFW_BYPASS, which sends unmatched connections back to the Citrix ADC without attempting to filter them further. Default value: APPFW_BYPASS Minimum length = 1
undefaction	<String>	Read-write	Profile to use when an application firewall policy evaluates to undefined (UNDEF). An UNDEF event indicates an internal error condition. The APPFW_BLOCK built-in profile is the default setting. You can specify a different built-in or user-created profile

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			as the UNDEF profile. Default value: APPFW_BLOCK Minimum length = 1
sessiontimeout	<Double>	Read-write	Timeout, in seconds, after which a user session is terminated. Before continuing to use the protected web site, the user must establish a new session by opening a designated start URL. Default value: 900 Minimum value = 1 Maximum value = 65535
learnratelimit	<Double>	Read-write	Maximum number of connections per second that the application firewall learning engine examines to generate new relaxations for learning-enabled security checks. The application firewall drops any connections above this limit from the list of connections used

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by the learning engine. Default value: 400 Minimum value = 1 Maximum value = 1000
sessionlifetime	<Double>	Read-write	Maximum amount of time (in seconds) that the application firewall allows a user session to remain active, regardless of user activity. After this time, the user session is terminated. Before continuing to use the protected web site, the user must establish a new session by opening a designated start URL. Default value: 0 Minimum value = 0 Maximum value = 2147483647
sessioncookiename	<String>	Read-write	Name of the session cookie that the application firewall uses to track user sessions. Must begin with a letter or number, and can consist of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from 1 to 31 letters, numbers, and the hyphen (-) and underscore (_) symbols. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cookie name" or 'my cookie name'). Minimum length = 1
clientiploggingheader	<String>	Read-write	Name of an HTTP header that contains the IP address that the client used to connect to the protected web site or service.
importsizelimit	<Double>	Read-write	Cumulative total maximum number of bytes in web forms imported to a protected web site. If a user attempts to upload files with a total byte count higher than the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified limit, the application firewall blocks the request. Default value: 134217728 Minimum value = 1 Maximum value = 268435456
signatureautoupdate	<String>	Read-write	Flag used to enable/disable auto update signatures. Default value: OFF Possible values = ON, OFF
signatureurl	<String>	Read-write	URL to download the mapping file from server. Default value: https://s3.amazonaws.com/NSAppFwSignatures/SignaturesMapping.xml
cookiepostencryptprefix	<String>	Read-write	String that is prepended to all encrypted cookie values. Minimum length = 1
logmalformedreq	<String>	Read-write	Log requests that are so malformed that application firewall

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parsing doesn't occur. Default value: ON Possible values = ON, OFF
geolocationlogging	<String>	Read-write	Enable Geo-Location Logging in CEF format logs. Default value: OFF Possible values = ON, OFF
ceflogging	<String>	Read-write	Enable CEF format logs. Default value: OFF Possible values = ON, OFF
entitydecoding	<String>	Read-write	Transform multibyte (double- or half-width) characters to single width characters. Default value: OFF Possible values = ON, OFF
useconfigurablesecretkey	<String>	Read-write	Use configurable secret key in AppFw operations. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessionlimit	<Double>	Read-write	Maximum number of sessions that the application firewall allows to be active, regardless of user activity. After the max_limit reaches, No more user session will be created . Default value: 100000 Minimum value = 0 Maximum value = 500000
malformedreqaction	<String[]>	Read-write	flag to define action on malformed requests that application firewall cannot parse. Possible values = none, block, log, stats

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwsettings

```

appfwsignatures

Configuration for application firewall signatures XML configuration resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the signature object. Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL (protocol, host, path, and file name) for the location at which to store the imported signatures object. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
xslt	<String>	Read-write	XSLT file source. Maximum length = 2047
comment	<String>	Read-write	Any comments to preserve information about the signatures object. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
overwrite	<Boolean>	Read-write	Overwrite any existing signatures object of the same name.
merge	<Boolean>	Read-write	Merges the existing Signature with new signature rules.
preservedefactions	<Boolean>	Read-write	preserves def actions of signature rules.
sha1	<String>	Read-write	File path for sha1 file to validate signature file. Minimum length = 1 Maximum length = 2047
mergedefault	<Boolean>	Read-write	Merges signature file with default signature file.
response	<String>	Read-only	.

DELETE| IMPORT| CHANGE| GET (ALL)| GET

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwsignatures/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

Import

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwsignatures?**action=Import**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appfwsignatures":{

<b>"src":<String_value>,

</b><b>"name":<String_value>,

</b>"xslt":<String_value>,

"comment":<String_value>,

"overwrite":<Boolean_value>,

"merge":<Boolean_value>,

"preservedefactions":<Boolean_value>,

"sha1":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

change

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwsignatures?**action=update**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwxmlerrorpage": [ {

"name":<String_value>,

"response":<String_value>,

"src":<String_value>

}]}
```

appfwxmlschema

Configuration for XML schema resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the XML Schema object to remove.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL (protocol, host, path, and file name) for the location at which to store the imported XML Schema. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
comment	<String>	Read-write	Any comments to preserve information about the XML Schema object. Maximum length = 128
overwrite	<Boolean>	Read-write	Overwrite any existing XML Schema object of the same name.
response	<String>	Read-only	.

Operations

(click to see Properties)

DELETE| IMPORT| GET (ALL)| GET

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwxmlschema/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

Import

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwxmlschema?**action=Import**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appfwxmlschema":{

<b>"src":<String_value>,

</b><b>"name":<String_value>,

</b>"comment":<String_value>,

"overwrite":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwxmlschema

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appfwxmlschema": [ {

"name":<String_value>,

"response":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwxmlschema/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appfwxmlschema/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

Appqoe

Appqoe

Application Level Quality of Experience configuration

NAME	DESCRIPTION
appqoeaction	Configuration for AppQoS action
appqoecustomresp	Configuration for AppQoE custom response page
appqoeparameter	Configuration for QOS parameter

NAME	DESCRIPTION
appqoepolicy	Configuration for AppQoS policy
appqoepolicy_binding	Binding object showing the resources that can be bound to appqoepolicy
appqoepolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to appqoepolicy

appqoeaction

Configuration for AppQoS action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the AppQoE action. Must begin with a letter, number, or the underscore symbol (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), and colon (:) characters. This is a mandatory argument.
priority	<String>	Read-write	Priority for queuing the request. If server resources are not available for a request that matches the configured rule, this option specifies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a priority for queuing the request until the server resources are available again. If priority is not configured then Lowest priority will be used to queue the request. Possible values = HIGH, MEDIUM, LOW, LOWEST
respondwith	<String>	Read-write	Responder action to be taken when the threshold is reached. Available settings function as follows: ACS - Serve content from an alternative content service Threshold : maxConn or delay NS - Serve from the Citrix ADC (built-in response) Threshold : maxConn or delay. Possible values = ACS, NS
customfile	<String>	Read-write	name of the HTML page object to use as the response. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
altcontentsvcname	<String>	Read-write	Name of the alternative content service to be used in the ACS. Minimum length = 1 Maximum length = 127
altcontentpath	<String>	Read-write	Path to the alternative content service to be used in the ACS. Minimum length = 4 Maximum length = 127
polqdepth	<Double>	Read-write	Policy queue depth threshold value. When the policy queue size (number of requests queued for the policy binding this action is attached to) increases to the specified polqDepth value, subsequent requests are dropped to the lowest priority level. Minimum value = 0 Maximum value = 4294967294
priqdepth	<Double>	Read-write	Queue depth threshold value per priorirty level. If the queue size (number

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of requests in the queue of that particular priorirty) on the virtual server to which this policy is bound, increases to the specified qDepth value, subsequent requests are dropped to the lowest priority level. Minimum value = 0 Maximum value = 4294967294
maxconn	<Double>	Read-write	Maximum number of concurrent connections that can be open for requests that matches with rule. Minimum value = 1 Maximum value = 4294967294
delay	<Double>	Read-write	Delay threshold, in microseconds, for requests that match the policy's rule. If the delay statistics gathered for the matching request exceed the specified delay, configured action triggered for that request, if there is no action then requests are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			dropped to the lowest priority level. Minimum value = 1 Maximum value = 599999999
dostrigexpression	<String>	Read-write	Optional expression to add second level check to trigger DoS actions. Specifically used for Analytics based DoS response generation.
dosaction	<String>	Read-write	DoS Action to take when vserver will be considered under DoS attack and corresponding rule matches. Mandatory if AppQoE actions are to be used for DoS attack prevention. Possible values = SimpleResponse, HICResponse
tcpprofile	<String>	Read-write	Bind TCP Profile based on L2/L3/L7 parameters. Minimum length = 1 Maximum length = 127
hits	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appqoepolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"appqoepolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of appqoepolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the appqoepolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appqoepolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"hits":<Double_value>
```

```
}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appqoepolicy": [ {

"name":<String_value>,
```

```
"rule":<String_value>,

"action":<String_value>,

"hits":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appqoepolicy": [ { "__count": "#no"} ] }
```

appqoepolicy_binding

Binding object which returns the resources bound to appqoepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	. Minimum length = 1
appqoepolicy_lbvserver_binding	<appqoepolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to appqoepolicy.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appqoepolicy_binding": [ {

"name":<String_value>,

"appqoepolicy_lbvserver_binding":<appqoepolicy_lbvserver_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/appqoepolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "appqoepolicy_binding": [ {

"name":<String_value>,

"appqoepolicy_lbvserver_binding":<appqoepolicy_lbvserver_binding[]_value>

}]}
```

appqoepolicy_lbvserver_binding

Binding object showing the lbvserver that can be bound to appqoepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	. Minimum length = 1
boundto	<String>	Read-write	The name of the entity to which the policy is bound.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bindpriority	<Double>	Read-only	Specifies the binding of the policy. use only in display.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

Audit

Audit

Audit configuration.

NAME	DESCRIPTION
auditmessageaction	Configuration for message action
auditmessages	Configuration for audit message
auditnslogaction	Configuration for ns log action
auditnslogglobal_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to auditnslogglobal
auditnslogglobal_binding	Binding object showing the resources that can be bound to auditnslogglobal
auditnslogparams	Configuration for ns log parameters
auditnslogpolicy	Configuration for ns log policy
auditnslogpolicy_aaagroup_binding	Binding object showing the aaagroup that can be bound to auditnslogpolicy
auditnslogpolicy_aaauser_binding	Binding object showing the aaauser that can be bound to auditnslogpolicy
auditnslogpolicy_appfwglobal_binding	Binding object showing the appfwglobal that can be bound to auditnslogpolicy
auditnslogpolicy_auditnslogglobal_binding	Binding object showing the auditnslogglobal that can be bound to auditnslogpolicy

NAME	DESCRIPTION
auditnslogpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to auditnslogpolicy
auditnslogpolicy_binding	Binding object showing the resources that can be bound to auditnslogpolicy
auditnslogpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to auditnslogpolicy
auditnslogpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to auditnslogpolicy
auditnslogpolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to auditnslogpolicy
auditnslogpolicy_tmglobal_binding	Binding object showing the tmglobal that can be bound to auditnslogpolicy
auditnslogpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to auditnslogpolicy
auditnslogpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to auditnslogpolicy
auditsyslogaction	Configuration for system log action
auditsyslogglobal_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to auditsyslogglobal
auditsyslogglobal_binding	Binding object showing the resources that can be bound to auditsyslogglobal
auditsyslogparams	Configuration for system log parameters
auditsyslogpolicy	Configuration for system log policy
auditsyslogpolicy_aaagroup_binding	Binding object showing the aaagroup that can be bound to auditsyslogpolicy
auditsyslogpolicy_aaauser_binding	Binding object showing the aaauser that can be bound to auditsyslogpolicy

NAME	DESCRIPTION
auditsyslogpolicy_auditsysloglobal_binding	Binding object showing the auditsysloglobal that can be bound to auditsyslogpolicy
auditsyslogpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to auditsyslogpolicy
auditsyslogpolicy_binding	Binding object showing the resources that can be bound to auditsyslogpolicy
auditsyslogpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to auditsyslogpolicy
auditsyslogpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to auditsyslogpolicy
auditsyslogpolicy_rnatglobal_binding	Binding object showing the rnatglobal that can be bound to auditsyslogpolicy
auditsyslogpolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to auditsyslogpolicy
auditsyslogpolicy_tmglobal_binding	Binding object showing the tmglobal that can be bound to auditsyslogpolicy
auditsyslogpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to auditsyslogpolicy
auditsyslogpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to auditsyslogpolicy

auditmessageaction

Configuration for message action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the audit message action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the message action is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my message action" or 'my message action'). Minimum length = 1
loglevel	<String>	Read-write	Audit log level, which specifies the severity level of the log message being generated..

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following loglevels are valid: * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG
stringbuilderexpr	<String>	Read-write	Default-syntax expression that defines the format and content of the log message.
logtonewnslog	<String>	Read-write	Send the message to the new nslog. Possible values = YES, NO
bypasssafetycheck	<String>	Read-write	Bypass the safety check and allow unsafe expressions. Default value: NO Possible values = YES, NO
loglevel1	<String>	Read-only	. Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG, NONE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hits	<Double>	Read-only	The number of times the action has been taken.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Double>	Read-only	The number of references to the action.
__count	<Double>	Read-only	count parameter

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditmessages

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditmessages?**args=loglevel:<String_value>,numofmesgs:<Double_value>**

Use this query-parameter to get auditmessages resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditmessages?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditmessages?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of auditmessages resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditmessages?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditmessages?**pagesize=#no;pageno=#no**

Use this query-parameter to get the auditmessages resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "auditmessages": [ {

loglevel:<String[]_value>,numofmesgs:<Double_value>"value":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditmessages?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "auditmessages": [ { "__count": "#no"} ] }
```

auditnslogaction

Configuration for ns log action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the nslog action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the nslog action is added. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my nslog action" or 'my nslog action'). Minimum length = 1
serverip	<String>	Read-write	IP address of the nslog server. Minimum length = 1
serverdomainname	<String>	Read-write	Auditserver name as a FQDN. Mutually exclusive with serverIP. Minimum length = 1 Maximum length = 255
domainresolveretry	<Integer>	Read-write	Time, in seconds, for which the Citrix ADC waits before sending another DNS query to resolve the host name of the audit server if the last query failed. Default value: 5 Minimum value = 5

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 20939
serverport	<Integer>	Read-write	Port on which the nslog server accepts connections. Minimum value = 1
loglevel	<String[]>	Read-write	Audit log level, which specifies the types of events to log. Available settings function as follows: * ALL - All events. * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. * NONE - No events. Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG, NONE
dateformat	<String>	Read-write	Format of dates in the logs. Supported formats are: * MMDDYYYY - U.S. style month/date/year format. * DDMMYYYY - European style date/month/year format.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* YYYYMMDD - ISO style year/ month/date format. Possible values = MMDDYYYY, DDMMYYYY, YYYYMMDD
logfacility	<String>	Read-write	Facility value, as defined in RFC 3164, assigned to the log message. Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the Citrix ADC itself, the VPN, or external. Possible values = LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7
tcp	<String>	Read-write	Log TCP messages. Possible values = NONE, ALL
acl	<String>	Read-write	Log access control list (ACL) messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
timezone	<String>	Read-write	Time zone used for date and timestamps in the logs. Available settings function as follows: * GMT_TIME. Coordinated Universal Time. * LOCAL_TIME. The server's timezone setting. Possible values = GMT_TIME, LOCAL_TIME
userdefinedauditlog	<String>	Read-write	Log user-configurable log messages to nslog. Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
appflowexport	<String>	Read-write	Export log messages to AppFlow collectors. Appflow collectors are entities to which log messages can be sent so that some action can be performed on them. Possible values = ENABLED, DISABLED
lsn	<String>	Read-write	Log the LSN messages. Possible values = ENABLED, DISABLED
alg	<String>	Read-write	Log the ALG messages. Possible values = ENABLED, DISABLED
subscriberlog	<String>	Read-write	Log subscriber session event information. Possible values = ENABLED, DISABLED
sslinterception	<String>	Read-write	Log SSL Interception event information.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
urlfiltering	<String>	Read-write	Log URL filtering event information. Possible values = ENABLED, DISABLED
contentinspectionlog	<String>	Read-write	Log Content Inspection event information. Possible values = ENABLED, DISABLED
domainresolvenow	<Boolean>	Read-write	Immediately send a DNS query to resolve the server's domain name.
ip	<String>	Read-only	The resolved IP address of the auditserver.
__count	<Double>	Read-only	count parameter

Operations

logfacility	<String>	Read-write	Facility value, as defined in RFC 3164, assigned to the log message. Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			where a specific message originated from, such as the Citrix ADC itself, the VPN, or external. Possible values = LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7
tcp	<String>	Read-write	Configure auditing to log TCP messages. Possible values = NONE, ALL
acl	<String>	Read-write	Configure auditing to log access control list (ACL) messages. Possible values = ENABLED, DISABLED
timezone	<String>	Read-write	Time zone used for date and timestamps in the logs. Supported settings are: * GMT_TIME - Coordinated Universal Time. * LOCAL_TIME - Use the server's timezone setting.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = GMT_TIME, LOCAL_TIME
userdefinedauditlog	<String>	Read-write	Log user-configurable log messages to nslog. Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria. Possible values = YES, NO
appflowexport	<String>	Read-write	Export log messages to AppFlow collectors. Appflow collectors are entities to which log messages can be sent so that some action can be performed on them. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lsn	<String>	Read-write	Log the LSN messages. Possible values = ENABLED, DISABLED
alg	<String>	Read-write	Log the ALG messages. Possible values = ENABLED, DISABLED
subscriberlog	<String>	Read-write	Log subscriber session event information. Possible values = ENABLED, DISABLED
sslinterception	<String>	Read-write	Log SSL Interception event information. Possible values = ENABLED, DISABLED
urlfiltering	<String>	Read-write	Log URL filtering event information. Possible values = ENABLED, DISABLED
contentinspectionlog	<String>	Read-write	Log Content Inspection event information. Possible values = ENABLED, DISABLED

Operations

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditnslogparams

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"auditnslogparams":{

auditnslogpolicy

Configuration for ns log policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the nslog policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my nslog policy" or 'my nslog policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that defines the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			messages to be logged to the nslog server. Minimum length = 1
action	<String>	Read-write	Nslog server action that is performed when this policy matches. NOTE: An nslog server action must be associated with an nslog audit policy. Minimum length = 1
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced). Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditnslogpolicy_auditnslogglobal_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditnslogpolicy_auditnslogglobal_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditnslogpolicy_auditnslogglobal_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditnslogpolicy_auditnslogglobal_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the auditnslogpolicy_auditnslogglobal_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "auditnslogpolicy_auditnslogglobal_binding": [ {

"name":<String_value>,
```

```
"boundto":<String_value>,

```

auditnslogpolicy_tmglobal_binding

Binding object showing the tmglobal that can be bound to auditnslogpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the policy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditnslogpolicy_tmglobal_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditnslogpolicy_tmglobal_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditnslogpolicy_tmglobal_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditnslogpolicy_tmglobal_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the auditnslogpolicy_tmglobal_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "auditnslogpolicy_tmglobal_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

auditsyslogaction

Configuration for system log action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the syslog action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the syslog action is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my syslog action" or 'my syslog action'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of the syslog server. Minimum length = 1
serverdomainname	<String>	Read-write	SYSLOG server name as a FQDN. Mutually exclusive with serverIP/ lbVserverName. Minimum length = 1 Maximum length = 255
domainresolveretry	<Integer>	Read-write	Time, in seconds, for which the Citrix ADC waits before sending another DNS query to resolve the host name of the syslog server if the last query failed. Default value: 5 Minimum value = 5 Maximum value = 20939
lbvservername	<String>	Read-write	Name of the LB vserver. Mutually exclusive with syslog serverIP/ serverName. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverport	<Integer>	Read-write	Port on which the syslog server accepts connections. Minimum value = 1
loglevel	<String[]>	Read-write	Audit log level, which specifies the types of events to log. Available values function as follows: * ALL - All events. * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. * NONE - No events. Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG, NONE
dateformat	<String>	Read-write	Format of dates in the logs. Supported formats are: * MMDDYYYY. -U.S. style month/date/year format. * DDMMYYYY - European style date/month/year format.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* YYYYMMDD - ISO style year/ month/date format. Possible values = MMDDYYYY, DDMMYYYY, YYYYMMDD
logfacility	<String>	Read-write	Facility value, as defined in RFC 3164, assigned to the log message. Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the Citrix ADC itself, the VPN, or external. Possible values = LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7
tcp	<String>	Read-write	Log TCP messages. Possible values = NONE, ALL
acl	<String>	Read-write	Log access control list (ACL) messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
timezone	<String>	Read-write	Time zone used for date and timestamps in the logs. Supported settings are: * GMT_TIME. Coordinated Universal time. * LOCAL_TIME. Use the server's timezone setting. Possible values = GMT_TIME, LOCAL_TIME
userdefinedauditlog	<String>	Read-write	Log user-configurable log messages to syslog. Setting this parameter to NO causes auditing to ignore all user-configured message actions. Setting this parameter to YES causes auditing to log user-configured message actions that meet the other logging criteria.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
appflowexport	<String>	Read-write	Export log messages to AppFlow collectors. Appflow collectors are entities to which log messages can be sent so that some action can be performed on them. Possible values = ENABLED, DISABLED
lsn	<String>	Read-write	Log lsn info. Possible values = ENABLED, DISABLED
alg	<String>	Read-write	Log alg info. Possible values = ENABLED, DISABLED
subscriberlog	<String>	Read-write	Log subscriber session event information. Possible values = ENABLED, DISABLED
transport	<String>	Read-write	Transport type used to send auditlogs to syslog server. Default type is UDP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = TCP, UDP
tcpprofilename	<String>	Read-write	Name of the TCP profile whose settings are to be applied to the audit server info to tune the TCP connection parameters. Minimum length = 1 Maximum length = 127
maxlogdatasizetohold	<Double>	Read-write	Max size of log data that can be held in NSB chain of server info. Default value: 500 Minimum value = 50 Maximum value = 25600
dns	<String>	Read-write	Log DNS related syslog messages. Possible values = ENABLED, DISABLED
contentinspectionlog	<String>	Read-write	Log Content Inspection event information. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
netprofile	<String>	Read-write	Name of the network profile. The SNIP configured in the network profile will be used as source IP while sending log messages. Minimum length = 1 Maximum length = 127
sslinterception	<String>	Read-write	Log SSL Interception event information. Possible values = ENABLED, DISABLED
urlfiltering	<String>	Read-write	Log URL filtering event information. Possible values = ENABLED, DISABLED
domainresolvenow	<Boolean>	Read-write	Immediately send a DNS query to resolve the server's domain name.
ip	<String>	Read-only	The resolved IP address of the syslog server.
__count	<Double>	Read-only	count parameter

auditsyslogglobal_auditsyslogpolicy_binding

Binding object showing the auditsyslogpolicy that can be bound to auditsyslogglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy. Minimum value = 1 Maximum value = 2147483647
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the audit syslog policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
numpol	<Double>	Read-only	number of polices bound to label.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/auditsyslogglobal_auditsyslogpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"auditsyslogglobal_auditsyslogpolicy_binding":{

<b>"policyname":<String_value>,

</b><b>"priority":<Double_value>,

</b>"globalbindtype":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogglobal_auditsyslogpolicy_binding

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogglobal_auditsyslogpolicy_binding?**args=policyname:<String_value>,globalbindtype:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogglobal_auditsyslogpolicy_binding

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogglobal_auditsyslogpolicy_binding?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditsyslogglobal_auditsyslogpolicy_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogglobal_auditsyslogpolicy_binding?**pagesize=#no;pageno=#no**

Use this query-parameter to get the auditsyslogglobal_auditsyslogpolicy_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "auditsyslogglobal_auditsyslogpolicy_binding": [ {

"priority":<Double_value>,

"globalbindtype":<String_value>,

"policyname":<String_value>,

"numpol":<Double_value>

}]}
```

auditsyslogparams

Configuration for system log parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of the syslog server. Minimum length = 1
serverport	<Integer>	Read-write	Port on which the syslog server accepts connections. Minimum value = 1
dateformat	<String>	Read-write	Format of dates in the logs. Supported formats are: * MMDDYYYY - U.S. style month/ date/year format. * DDMMYYYY. European style -date/month/year format. * YYYYMMDD - ISO style year/ month/date format. Possible values = MMDDYYYY, DDMMYYYY, YYYYMMDD
loglevel	<String[]>	Read-write	Types of information to be logged. Available settings function as follows: * ALL - All events.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis. * ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. * NONE - No events.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ALL, EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG, NONE
logfacility	<String>	Read-write	Facility value, as defined in RFC 3164, assigned to the log message. Log facility values are numbers 0 to 7 (LOCAL0 through LOCAL7). Each number indicates where a specific message originated from, such as the Citrix ADC itself, the VPN, or external. Possible values = LOCAL0, LOCAL1, LOCAL2, LOCAL3, LOCAL4, LOCAL5, LOCAL6, LOCAL7
tcp	<String>	Read-write	Log TCP messages. Possible values = NONE, ALL
acl	<String>	Read-write	Log access control list (ACL) messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
timezone	<String>	Read-write	Time zone used for date and timestamps in the logs. Available settings function as follows: * GMT_TIME - Coordinated Universal Time. * LOCAL_TIME Use the server's timezone setting. Possible values = GMT_TIME, LOCAL_TIME
userdefinedauditlog	<String>	Read-write	Log user-configurable log messages to syslog. Setting this parameter to NO causes audit to ignore all user-configured message actions. Setting this parameter to YES causes audit to log user-configured message actions that meet the other logging criteria.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
appflowexport	<String>	Read-write	Export log messages to AppFlow collectors. Appflow collectors are entities to which log messages can be sent so that some action can be performed on them. Possible values = ENABLED, DISABLED
lsn	<String>	Read-write	Log the LSN messages. Possible values = ENABLED, DISABLED
alg	<String>	Read-write	Log the ALG messages. Possible values = ENABLED, DISABLED
subscriberlog	<String>	Read-write	Log subscriber session event information. Possible values = ENABLED, DISABLED
dns	<String>	Read-write	Log DNS related syslog messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
sslinterception	<String>	Read-write	Log SSL Interceptionn event information. Possible values = ENABLED, DISABLED
urlfiltering	<String>	Read-write	Log URL filtering event information. Possible values = ENABLED, DISABLED
contentinspectionlog	<String>	Read-write	Log Content Inspection event ifnormation. Possible values = ENABLED, DISABLED

```

auditsyslogpolicy

Configuration for system log policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with a letter, number, or the underscore character (_), and must consist only of letters, numbers, and the hyphen (-),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the syslog policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my syslog policy" or 'my syslog policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that defines the messages to be logged to the syslog server. Minimum length = 1
action	<String>	Read-write	Syslog server action to perform when this

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy matches traffic. NOTE: A syslog server action must be associated with a syslog audit policy. Minimum length = 1
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced). Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

Operations

activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_aaagroup_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_aaagroup_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditsyslogpolicy_aaagroup_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_aaagroup_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the auditsyslogpolicy_aaagroup_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "auditsyslogpolicy_aaagroup_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_aaagroup_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_aaagroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "auditsyslogpolicy_aaagroup_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_aaagroup_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"auditsyslogpolicy_aaagroup_binding": [ { "__count": "#no"} ] }
```

auditsyslogpolicy_aaauser_binding

Binding object showing the aaauser that can be bound to auditsyslogpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_csvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_csvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditsyslogpolicy_csvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_csvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the auditsyslogpolicy_csvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_csvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_csvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "auditsyslogpolicy_csvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_csvserver_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"auditsyslogpolicy_csvserver_binding": [ { "__count": "#no"} ] }
```

auditsyslogpolicy_lbvserver_binding

Binding object showing the lbvserver that can be bound to auditsyslogpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_lbvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_lbvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of auditsyslogpolicy_lbvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_lbvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the auditsyslogpolicy_lbvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_vpnvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "auditsyslogpolicy_vpnvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/auditsyslogpolicy_vpnvserver_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"auditsyslogpolicy_vpnvserver_binding": [ { "__count": "#no"} ] }
```

Authentication

Authentication

Authentication configuration.

NAME	DESCRIPTION
authenticationadfsproxyprofile	Configuration for ADFSProxy Profile
authenticationauthnprofile	Configuration for Authentication profile
authenticationazurekeyvault	Configuration for Azure Key Vault entity
authenticationcaptchaaction	Configuration for Captcha Action
authenticationcertaction	Configuration for CERT action
authenticationcertpolicy	Configuration for CERT policy
authenticationcertpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationcertpolicy
authenticationcertpolicy_binding	Binding object showing the resources that can be bound to authenticationcertpolicy
authenticationcertpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationcertpolicy
authenticationcertpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationcertpolicy
authenticationcitrixauthaction	Configuration for Citrix Authentication action
authenticationdfaaction	Configuration for Dfa authentication action
authenticationdfapolicy	Configuration for Dfa authentication policy
authenticationdfapolicy_binding	Binding object showing the resources that can be bound to authenticationdfapolicy
authenticationdfapolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationdfapolicy

NAME	DESCRIPTION
authenticationemailaction	Configuration for Email entity
authenticationepaaction	Configuration for epa action
authenticationldapaction	Configuration for LDAP action
authenticationldappolicy	Configuration for LDAP policy
authenticationldappolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationldappolicy
authenticationldappolicy_binding	Binding object showing the resources that can be bound to authenticationldappolicy
authenticationldappolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationldappolicy
authenticationldappolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationldappolicy
authenticationldappolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationldappolicy
authenticationlocalpolicy	Configuration for LOCAL policy
authenticationlocalpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationlocalpolicy
authenticationlocalpolicy_binding	Binding object showing the resources that can be bound to authenticationlocalpolicy
authenticationlocalpolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationlocalpolicy
authenticationlocalpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationlocalpolicy
authenticationlocalpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationlocalpolicy

NAME	DESCRIPTION
authenticationloginschema	
authenticationloginschemapolicy	
authenticationloginschemapolicy_authenticationvserver_binding	
authenticationloginschemapolicy_binding	
authenticationloginschemapolicy_vpnvserver_binding	
authenticationnegotiateaction	Configuration for Negotiate action
authenticationnegotiatepolicy	Configuration for Negotiate Policy
authenticationnegotiatepolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationnegotiatepolicy
authenticationnegotiatepolicy_binding	Binding object showing the resources that can be bound to authenticationnegotiatepolicy
authenticationnegotiatepolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationnegotiatepolicy
authenticationnegotiatepolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationnegotiatepolicy
authenticationnoauthaction	Configuration for no authentication action
authenticationoauthaction	Configuration for OAuth authentication action
authenticationoauthidppolicy	Configuration for AAA OAuth IdentityProvider (IdP) policy
authenticationoauthidppolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationoauthidppolicy
authenticationoauthidppolicy_binding	Binding object showing the resources that can be bound to authenticationoauthidppolicy

NAME	DESCRIPTION
authenticationoauthidppolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationoauthidppolicy
authenticationoauthidpprofile	Configuration for OAuth Identity Provider (IdP) profile
authenticationpolicy	Configuration for Authentication Policy
authenticationpolicy_authenticationpolicylabel_binding	Binding object showing the authenticationpolicylabel that can be bound to authenticationpolicy
authenticationpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationpolicy
authenticationpolicy_binding	Binding object showing the resources that can be bound to authenticationpolicy
authenticationpolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationpolicy
authenticationpolicylabel	Configuration for authentication policy label
authenticationpolicylabel_authenticationpolicy_binding	Binding object showing the authenticationpolicy that can be bound to authenticationpolicylabel
authenticationpolicylabel_binding	Binding object showing the resources that can be bound to authenticationpolicylabel
authenticationpushservice	Configuration for Service details for sending push notifications
authenticationradiusaction	Configuration for RADIUS action
authenticationradiuspolicy	Configuration for RADIUS policy
authenticationradiuspolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationradiuspolicy

NAME	DESCRIPTION
authenticationradiuspolicy_binding	Binding object showing the resources that can be bound to authenticationradiuspolicy
authenticationradiuspolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationradiuspolicy
authenticationradiuspolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationradiuspolicy
authenticationradiuspolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationradiuspolicy
authenticationsamlaction	Configuration for AAA Saml action
authenticationsamlidppolicy	Configuration for AAA Saml IdentityProvider (IdP) policy
authenticationsamlidppolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationsamlidppolicy
authenticationsamlidppolicy_binding	Binding object showing the resources that can be bound to authenticationsamlidppolicy
authenticationsamlidppolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationsamlidppolicy
authenticationsamlidpprofile	Configuration for AAA Saml IdentityProvider (IdP) profile
authenticationsamlpolicy	Configuration for AAA Saml policy
authenticationsamlpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationsamlpolicy
authenticationsamlpolicy_binding	Binding object showing the resources that can be bound to authenticationsamlpolicy
authenticationsamlpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationsamlpolicy

NAME	DESCRIPTION
authenticationsamlpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationsamlpolicy
authenticationstorefrontauthaction	Configuration for Storefront authentication action
authenticationtacacsaction	Configuration for TACACS action
authenticationtacacspolicy	Configuration for TACACS policy
authenticationtacacspolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to authenticationtacacspolicy
authenticationtacacspolicy_binding	Binding object showing the resources that can be bound to authenticationtacacspolicy
authenticationtacacspolicy_systemglobal_binding	Binding object showing the systemglobal that can be bound to authenticationtacacspolicy
authenticationtacacspolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationtacacspolicy
authenticationtacacspolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationtacacspolicy
authenticationvserver	Configuration for authentication virtual server
authenticationvserver_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to authenticationvserver
authenticationvserver_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to authenticationvserver

authenticationwebauthpolicy_vpnglobal_binding	Binding object showing the vpnglobal that can be bound to authenticationwebauthpolicy
authenticationwebauthpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to authenticationwebauthpolicy

authenticationauthnprofile

Configuration for Authentication profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the authentication profile. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the RADIUS action is added. Minimum length = 1
authnvsname	<String>	Read-write	Name of the authentication vserver at which authentication should be done. Minimum length = 1 Maximum length = 128
authenticationhost	<String>	Read-write	Hostname of the authentication vserver to which user must be redirected for authentication. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 256
authenticationdomain	<String>	Read-write	Domain for which TM cookie must to be set. If unspecified, cookie will be set for FQDN. Minimum length = 1 Maximum length = 256
authenticationlevel	<Double>	Read-write	Authentication weight or level of the vserver to which this will bound. This is used to order TM vservers based on the protection required. A session that is created by authenticating against TM vserver at given level cannot be used to access TM vserver at a higher level. Minimum value = 0 Maximum value = 255
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationauthnprofile":{

<b>"name":<String_value>,

</b><b>"authnvsname":<String_value>,

</b>"authenticationhost":<String_value>,

"authenticationdomain":<String_value>,

"authenticationlevel":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationauthnprofile":{

<b>"name":<String_value>,

</b>"authnvsname":<String_value>,

"authenticationhost":<String_value>,

"authenticationdomain":<String_value>,

"authenticationlevel":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationauthnprofile":{

<b>"name":<String_value>,

</b>"authenticationdomain":true,

"authenticationlevel":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationauthnprofile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationauthnprofile resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationauthnprofile": [ {

"name":<String_value>,

"authnvsname":<String_value>,

"authenticationhost":<String_value>,

"authenticationdomain":<String_value>,

"authenticationlevel":<Double_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationauthnprofile": [ {

"name":<String_value>,

"authnvsname":<String_value>,
```

```
"authenticationhost":<String_value>,

"authenticationdomain":<String_value>,

"authenticationlevel":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationauthnprofile?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationauthnprofile": [ { "__count": "#no"} ] }
```

authenticationcertaction

Configuration for CERT action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the client cert authentication server profile (action). Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after certifcate action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
twofactor	<String>	Read-write	Enables or disables two-factor authentication. Two factor authentication is client cert authentication followed by password authentication. Default value: OFF Possible values = ON, OFF
usernamefield	<String>	Read-write	Client-cert field from which the username is extracted. Must be set to either ""Subject"" and ""Issuer"" (include both sets of double quotation marks). Format: <field>:<subfield>. Minimum length = 1
groupnamefield	<String>	Read-write	Client-cert field from which the group is extracted. Must be set to either ""Subject"" and ""Issuer"" (include both sets of double quotation marks). Format: <field>:<subfield>.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
__count	<Double>	Read-only	count parameter

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationcertpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b>"reqaction":<String_value>
```

```
}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationcertpolicy":{

<b>"name":<String_value>,
```

```
</b>"rule":<String_value>,

"reqaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationcertpolicy":{

<b>"name":<String_value>,

</b>"rule":true,

"reqaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationcertpolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationcertpolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationcertpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"reqaction":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationcertpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"reqaction":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationcertpolicy": [ { "__count": "#no"} ] }
```

authenticationcertpolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationcertpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the client cert authentication policy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy_authenticationvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy_authenticationvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationcertpolicy_authenticationvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy_authenticationvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationcertpolicy_authenticationvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationcertpolicy_authenticationvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy_authenticationvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationcertpolicy_authenticationvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

authenticationdfaaction

Configuration for Dfa authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DFA action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the DFA action is added. Minimum length = 1
clientid	<String>	Read-write	If configured, this string is sent to the DFA server as the X-Citrix-Exchange header value.
serverurl	<String>	Read-write	DFA Server URL.
passphrase	<String>	Read-write	Key shared between the DFA server and the Citrix ADC. Required to allow the Citrix ADC to communicate with the DFA server. Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
success	<Double>	Read-only	.
failure	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

```

authenticationdfapolicy

Configuration for Dfa authentication policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DFA policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after DFA policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the Web server. Minimum length = 1
action	<String>	Read-write	Name of the DFA action to perform if the policy matches. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationdfapolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationdfapolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationdfapolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationdfapolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationdfapolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationdfapolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationdfapolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationdfapolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationdfapolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationdfapolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationdfapolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationdfapolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new LDAP action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the LDAP action is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1
serverip	<String>	Read-write	IP address assigned to the LDAP server. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servername	<String>	Read-write	LDAP server name as a FQDN. Mutually exclusive with LDAP IP address. Minimum length = 1
serverport	<Integer>	Read-write	Port on which the LDAP server accepts connections. Default value: 389 Minimum value = 1
authtimeout	<Double>	Read-write	Number of seconds the Citrix ADC waits for a response from the RADIUS server. Default value: 3 Minimum value = 1
ldapbase	<String>	Read-write	Base (node) from which to start LDAP searches. If the LDAP server is running locally, the default value of base is dc=netscaler, dc=com.
ldapbinddn	<String>	Read-write	Full distinguished name (DN) that is used to bind to the LDAP server. Default: cn=Manager,dc=netscaler,dc=com.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ldapbinddnpassword	<String>	Read-write	Password used to bind to the LDAP server. Minimum length = 1
ldaploginname	<String>	Read-write	LDAP login name attribute. The Citrix ADC uses the LDAP login name to query external LDAP servers or Active Directories.
searchfilter	<String>	Read-write	String to be combined with the default LDAP user search string to form the search value. For example, if the search filter "vpnallowed=true" is combined with the LDAP login name "samaccount" and the user-supplied username is "bob", the result is the LDAP search string ""(;(vpnallowed=true)(samaccount=bob)"" (Be sure to enclose the search string in two sets of double quotation marks; both sets are needed.). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupattrname	<String>	Read-write	LDAP group attribute name. Used for group extraction on the LDAP server.
subattributename	<String>	Read-write	LDAP group sub-attribute name. Used for group extraction from the LDAP server.
sectype	<String>	Read-write	Type of security used for communications between the Citrix ADC and the LDAP server. For the PLAINTEXT setting, no encryption is required. Default value: PLAINTEXT Possible values = PLAINTEXT, TLS, SSL
svrtype	<String>	Read-write	The type of LDAP server. Default value: AAA_LDAP_SERVER_TYPE_DEFAULT Possible values = AD, NDS
ssonameattribute	<String>	Read-write	LDAP single signon (SSO) attribute.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The Citrix ADC uses the SSO name attribute to query external LDAP servers or Active Directories for an alternate username.
authentication	<String>	Read-write	Perform LDAP authentication. If authentication is disabled, any LDAP authentication attempt returns authentication success if the user is found. CAUTION! Authentication should be disabled only for authorization group extraction or where other (non-LDAP) authentication methods are in use and either bound to a primary list or flagged as secondary. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
requireuser	<String>	Read-write	Require a successful user search for authentication. CAUTION! This field should be set to NO only if usersearch not required [Both username validation as well as password validation skipped] and (non-LDAP) authentication methods are in use and either bound to a primary list or flagged as secondary. Default value: YES Possible values = YES, NO
passwdchange	<String>	Read-write	Allow password change requests. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nestedgroupextraction	<String>	Read-write	Allow nested group extraction, in which the Citrix ADC queries external LDAP servers to determine whether a group is part of another group. Default value: OFF Possible values = ON, OFF
maxnestinglevel	<Double>	Read-write	If nested group extraction is ON, specifies the number of levels up to which group extraction is performed. Default value: 2 Minimum value = 2
followreferrals	<String>	Read-write	Setting this option to ON enables following LDAP referrals received from the LDAP server. Default value: OFF Possible values = ON, OFF
maxldapreferrals	<Double>	Read-write	Specifies the maximum number of nested referrals to follow. Default value: 1 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
referraldnslookup	<String>	Read-write	Specifies the DNS Record lookup Type for the referrals. Default value: A-REC Possible values = A-REC, SRV-REC, MSSRV-REC
mssrvrecordlocation	<String>	Read-write	MSSRV Specific parameter. Used to locate the DNS node to which the SRV record pertains in the domainname. The domainname is appended to it to form the srv record. Example : For "dc._msdcs", the srv record formed is _ldap._tcp.dc._msdcs.<domainname>.
validateservercert	<String>	Read-write	When to validate LDAP server certs. Default value: NO Possible values = YES, NO
ldaphostname	<String>	Read-write	Hostname for the LDAP server. If -validateServerCert is ON then this must be the host name on the certificate from the LDAP server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			A hostname mismatch will cause a connection failure.
groupnameidentifier	<String>	Read-write	Name that uniquely identifies a group in LDAP or Active Directory.
groupsearchattribute	<String>	Read-write	LDAP group search attribute. Used to determine to which groups a group belongs.
groupsearchsubattribute	<String>	Read-write	LDAP group search subattribute. Used to determine to which groups a group belongs.
groupsearchfilter	<String>	Read-write	String to be combined with the default LDAP group search string to form the search value. For example, the group search filter ""vpnallowed=true"" when combined with the group identifier ""samaccount"" and the group name ""g1"" yields the LDAP search string ""(;(vpnallowed=true)(samaccount=g1)"". (Be sure to enclose the search string in two sets of double

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotation marks; both sets are needed.).
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
attribute1	<String>	Read-write	Expression that would be evaluated to extract attribute1 from the ldap response.
attribute2	<String>	Read-write	Expression that would be evaluated to extract attribute2 from the ldap response.
attribute3	<String>	Read-write	Expression that would be evaluated to extract attribute3 from the ldap response.
attribute4	<String>	Read-write	Expression that would be evaluated to extract attribute4 from the ldap response.
attribute5	<String>	Read-write	Expression that would be evaluated to extract attribute5 from the ldap response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute6	<String>	Read-write	Expression that would be evaluated to extract attribute6 from the ldap response.
attribute7	<String>	Read-write	Expression that would be evaluated to extract attribute7 from the ldap response.
attribute8	<String>	Read-write	Expression that would be evaluated to extract attribute8 from the ldap response.
attribute9	<String>	Read-write	Expression that would be evaluated to extract attribute9 from the ldap response.
attribute10	<String>	Read-write	Expression that would be evaluated to extract attribute10 from the ldap response.
attribute11	<String>	Read-write	Expression that would be evaluated to extract attribute11 from the ldap response.
attribute12	<String>	Read-write	Expression that would be evaluated to extract attribute12 from the ldap response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute13	<String>	Read-write	Expression that would be evaluated to extract attribute13 from the ldap response.
attribute14	<String>	Read-write	Expression that would be evaluated to extract attribute14 from the ldap response.
attribute15	<String>	Read-write	Expression that would be evaluated to extract attribute15 from the ldap response.
attribute16	<String>	Read-write	Expression that would be evaluated to extract attribute16 from the ldap response.
attributes	<String>	Read-write	List of attribute names separated by ',' which needs to be fetched from ldap server. Note that preceeding and trailing spaces will be removed. Attribute name can be 127 bytes and total length of this string should not cross 2047 bytes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			These attributes have multi-value support separated by ',' and stored as key-value pair in AAA session.
sshpublickey	<String>	Read-write	SSH PublicKey is attribute on AD. This attribute is used to retrieve ssh PublicKey for RBA authentication. Minimum length = 1
pushservice	<String>	Read-write	Name of the service used to send push notifications. Minimum length = 1
otpsecret	<String>	Read-write	OneTimePassword(OTP) Secret key attribute on AD. This attribute is used to store and retrieve secret key used for OTP check. Minimum length = 1
email	<String>	Read-write	The Citrix ADC uses the email attribute to query the Active Directory for the email id of a user. Default value: mail Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
kbattribute	<String>	Read-write	KnowledgeBasedAuthentication(KBA) attribute on AD. This attribute is used to store and retrieve preconfigured Question and Answer knowledge base used for KBA authentication. Minimum length = 1 Maximum length = 127
alternateemailattr	<String>	Read-write	The Citrix ADC appliance uses the alternateive email attribute to query the Active Directory for the alternative email id of a user. Maximum length = 128
success	<Double>	Read-only	.
failure	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

authenticationldappolicy

Configuration for LDAP policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LDAP policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after LDAP policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the LDAP server. Minimum length = 1
reqaction	<String>	Read-write	Name of the LDAP action to perform if the policy matches. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationldappolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"reqaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationldappolicy":{

<b>"name":<String_value>,

</b>"rule":true,

"reqaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationldappolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationldappolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationldappolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"reqaction":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationldappolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"reqaction":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationldappolicy": [ { "__count": "#no"} ] }
```

authenticationldappolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationldappolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the LDAP policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy_authenticationvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy_authenticationvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationldappolicy_authenticationvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy_authenticationvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationldappolicy_authenticationvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationldappolicy_authenticationvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy_authenticationvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy_authenticationvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationldappolicy_authenticationvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationldappolicy_authenticationvserver_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"authenticationldappolicy_authenticationvserver_binding": [ { "__count":
"#no"} ] }
```

authenticationldappolicy_binding

Binding object which returns the resources bound to authenticationldappolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the LDAP policy. Minimum length = 1
authenticationldappolicy_vpnglobal_binding	<authenticationldappolicy_vpnglobal_binding[]>	Read-only	vpnglobal that can be bound to authenticationldappolicy.
authenticationldappolicy_vpnvserver_binding	<authenticationldappolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to authenticationldappolicy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authenticationldappolicy_systemglobal_binding	<authenticationldappolicy_systemglobal_binding[]>	Read-only	systemglobal that can be bound to authenticationldappolicy.
authenticationldappolicy_authenticationvserver_binding	<authenticationldappolicy_authenticationvserver_binding[]>	Read-only	authenticationvserver that can be bound to authenticationldappolicy.

authenticationlocalpolicy

Configuration for LOCAL policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the local authentication policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after local policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication policy').
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to perform the authentication.
reqaction	<String>	Read-only	The name of the RADIUS action the policy uses.
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| UPDATE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationlocalpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationlocalpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationlocalpolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationlocalpolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationlocalpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"reqaction":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationlocalpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"reqaction":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationlocalpolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationlocalpolicy": [ { "__count": "#no"} ] }
```

authenticationlocalpolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationlocalpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the local authentication policy.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

```

authenticationloginschema

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new login schema. Login schema defines the way login form is rendered. It provides a way to customize

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the fields that are shown to the user. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
authenticationschema	<String>	Read-write	Name of the file for reading authentication schema to be sent for Login Page UI. This file should contain xml definition of elements as per

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix Forms Authentication Protocol to be able to render login form. If administrator does not want to prompt users for additional credentials but continue with previously obtained credentials, then "noschema" can be given as argument. Please note that this applies only to loginSchemas that are used with user-defined factors, and not the vserver factor. Minimum length = 1
userexpression	<String>	Read-write	Expression for username extraction during login. This can be any relevant advanced policy expression. Minimum length = 1
passwdexpression	<String>	Read-write	Expression for password extraction during login. This can be any relevant advanced policy expression. Minimum length = 1
usercredentialindex	<Double>	Read-write	The index at which user entered

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			username should be stored in session. Minimum value = 1 Maximum value = 16
passwordcredentialindex	<Double>	Read-write	The index at which user entered password should be stored in session. Minimum value = 1 Maximum value = 16
authenticationstrength	<Double>	Read-write	Weight of the current authentication. Minimum value = 0 Maximum value = 65535
ssocredentials	<String>	Read-write	This option indicates whether current factor credentials are the default SSO (SingleSignOn) credentials. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationloginschema

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

authenticationloginschemapolicy

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LoginSchema policy. This is used for selecting parameters for user logon. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression which is evaluated to choose a profile for authentication. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks. Minimum length = 1
action	<String>	Read-write	Name of the profile to apply to requests or connections that match this policy. * NOOP - Do not take any specific action when this policy evaluates to true. This is useful to implicitly go to a different policy set. * RESET - Reset the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			may then resend the request if desired. * DROP - Drop the request without sending a response to the user. Minimum length = 1
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the LoginSchema policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my loginschemapolicy policy" or 'my loginschemapolicy policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of Undef hits.
__count	<Double>	Read-only	count parameter

```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationloginschemapolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationloginschemapolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationloginschemapolicy_binding": [ {

"name":<String_value>,
```

```
"authenticationloginschemapolicy_authenticationvserver_binding":<authentic
ationloginschemapolicy_authenticationvserver_binding[]_value>,

"authenticationloginschemapolicy_vpnvserver_binding":<authenticationlogins
chemapolicy_vpnvserver_binding[]_value>

}]}
```

authenticationloginschemapolicy_vpnvserver_binding

Binding object showing the vpnvserver that can be bound to authenticationloginschemapolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the LoginSchema policy for which to display detailed information. Minimum length = 1
priority	<Double>	Read-only	.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = reqvserver, resvserver, policylabel
activepolicy	<Double>	Read-only	.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationloginschemapolicy_vpnvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationloginschemapolicy_vpnvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationloginschemapolicy_vpnvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationloginschemapolicy_vpnvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationloginschemapolicy_vpnvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationloginschemapolicy_vpnvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

authenticationnegotiateaction

Configuration for Negotiate action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the AD KDC server profile (negotiate action). Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			AD KDC server profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1
domain	<String>	Read-write	Domain name of the service principal that represnts Citrix ADC. Minimum length = 1
domainuser	<String>	Read-write	User name of the account that is mapped with Citrix ADC principal. This can be given along with domain and password when keytab file is not available. If username is given along with keytab file, then that keytab file will be searched

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for this user's credentials. Minimum length = 1
domainuserpasswd	<String>	Read-write	Password of the account that is mapped to the Citrix ADC principal. Minimum length = 1
ou	<String>	Read-write	Active Directory organizational units (OU) attribute. Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
keytab	<String>	Read-write	The path to the keytab file that is used to decrypt kerberos tickets presented to Citrix ADC. If keytab is not available, domain/ username/password can be specified in the negotiate action configuration. Minimum length = 1
ntlmpath	<String>	Read-write	The path to the site that is enabled for NTLM authentication, including FQDN of the server. This is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			used when clients fallback to NTLM. Minimum length = 1
kcdspn	<String>	Read-only	Host SPN extracted from keytab file.
__count	<Double>	Read-only	count parameter

{"authenticationnegotiatepolicy_authenticationvserver_binding":
[ { "__count": "#no"} ] }
```

authenticationnegotiatepolicy_binding

Binding object which returns the resources bound to authenticationnegotiatepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the negotiate policy. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authenticationnegotiatepolicy_vpnvserver_binding	<authenticationnegotiatepolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to authenticationnegotiatepolicy.
authenticationnegotiatepolicy_authenticationvserver_binding	<authenticationnegotiatepolicy_authenticationvserver_binding[]>	Read-only	authenticationvserver that can be bound to authenticationnegotiatepolicy.
authenticationnegotiatepolicy_vpnglobal_binding	<authenticationnegotiatepolicy_vpnglobal_binding[]>	Read-only	vpnglobal that can be bound to authenticationnegotiatepolicy.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnegotiatepolicy_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationnegotiatepolicy_binding": [ {

"name":<String_value>,

"authenticationnegotiatepolicy_vpnglobal_binding":<authenticationnegotiate
policy_vpnglobal_binding[]_value>,

"authenticationnegotiatepolicy_authenticationvserver_binding":<authenticat
ionnegotiatepolicy_authenticationvserver_binding[]_value>,

"authenticationnegotiatepolicy_vpnvserver_binding":<authenticationnegotiat
epolicy_vpnvserver_binding[]_value>
```

```
}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnegotiatepolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnegotiatepolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationnegotiatepolicy_binding": [ {

"name":<String_value>,

"authenticationnegotiatepolicy_vpnglobal_binding":<authenticationnegotiate
policy_vpnglobal_binding[]_value>,

authenticationoauthaction

Configuration for OAuth authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the OAuth Authentication action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
oauthtype	<String>	Read-write	Type of the OAuth implementation. Default value is generic implementation that is applicable for most deployments. Default value: GENERIC Possible values = GENERIC, INTUNE, ATHENA
authorizationendpoint	<String>	Read-write	Authorization endpoint/url to which unauthenticated user will be redirected. Citrix ADC redirects user to this endpoint by adding query parameters including clientid. If this parameter not specified then as default value we take Token Endpoint/URL value. Please note that Authorization Endpoint or Token Endpoint is mandatory for oauthAction.
tokenendpoint	<String>	Read-write	URL to which OAuth token will be posted to verify its authenticity. User obtains this token from Authorization

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server upon successful authentication. Citrix ADC will validate presented token by posting it to the URL configured.
idtokendecryptendpoint	<String>	Read-write	URL to which obtained idtoken will be posted to get a decrypted user identity. Encrypted idtoken will be obtained by posting OAuth token to token endpoint. In order to decrypt idtoken, Citrix ADC posts request to the URL configured.
clientid	<String>	Read-write	Unique identity of the client/user who is getting authenticated. Authorization server infers client configuration using this ID. Minimum length = 1
clientsecret	<String>	Read-write	Secret string established by user and authorization server. Minimum length = 1
defaultauthenticationgroup	<String>	Read-write	This is the default group that is chosen when the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication succeeds in addition to extracted groups.
attribute1	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute1.
attribute2	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute2.
attribute3	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute3.
attribute4	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute4.
attribute5	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute5.
attribute6	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute6.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute7	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute7.
attribute8	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute8.
attribute9	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute9.
attribute10	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute10.
attribute11	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute11.
attribute12	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute12.
attribute13	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute13.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute14	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute14.
attribute15	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute15.
attribute16	<String>	Read-write	Name of the attribute to be extracted from OAuth Token and to be stored in the attribute16.
tenantid	<String>	Read-write	TenantID of the application. This is usually specific to providers such as Microsoft and usually refers to the deployment identifier.
graphendpoint	<String>	Read-write	URL of the Graph API service to learn Enterprise Mobility Services (EMS) endpoints.
refreshinterval	<Double>	Read-write	Interval at which services are monitored for necessary configuration. Default value: 1440
certendpoint	<String>	Read-write	URL of the endpoint that contains JWKs

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(Json Web Key) for JWT (Json Web Token) verification.
audience	<String>	Read-write	Audience for which token sent by Authorization server is applicable. This is typically entity name or url that represents the recipient.
usernamefield	<String>	Read-write	Attribute in the token from which username should be extracted. Minimum length = 1
skewtime	<Double>	Read-write	This option specifies the allowed clock skew in number of minutes that Citrix ADC allows on an incoming token. For example, if skewTime is 10, then token would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
issuer	<String>	Read-write	Identity of the server whose tokens are to be accepted.
userinfourl	<String>	Read-write	URL to which OAuth access token will be posted to obtain user information.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certfilepath	<String>	Read-write	Path to the file that contains JWKs (Json Web Key) for JWT (Json Web Token) verification.
granttype	<String>	Read-write	Grant type support. value can be code or password. Default value: CODE Possible values = CODE, PASSWORD
authentication	<String>	Read-write	If authentication is disabled, password is not sent in the request. . Default value: ENABLED Possible values = ENABLED, DISABLED
oauthstatus	<String>	Read-only	Describes status information of oauth server. Default value: INIT Possible values = INIT, CERTFETCH, AADFORGRAPH, GRAPH, AADFORMDM, MDMINFO, COMPLETE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

authenticationoauthidppolicy

Configuration for AAA OAuth IdentityProvider (IdP) policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the OAuth Identity Provider (IdP) authentication policy. This is used for configuring Citrix ADC as OAuth Identity Provider. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rule	<String>	Read-write	Expression that the policy uses to determine whether to respond to the specified request. Minimum length = 1
action	<String>	Read-write	Name of the profile to apply to requests or connections that match this policy. Minimum length = 1
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only DROP/RESET actions can be used.
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the OAuth IdentityProvider policy. Must begin with a letter, number, or the underscore character (_), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my oauthidppolicy policy" or 'my oauthidppolicy policy'). Minimum length = 1
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
hits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationoauthidppolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationoauthidppolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>,

</b>"undefaction":<String_value>,

"comment":<String_value>,

"logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationoauthidppolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationoauthidppolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationoauthidppolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>,

"undefaction":<String_value>,

"comment":<String_value>,

"logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationoauthidppolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationoauthidppolicy":{

<b>"name":<String_value>,

</b>"undefaction":true,

"comment":true,

"logaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationoauthidppolicy?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationoauthidppolicy":{

<b>"name":<String_value>,
```

```
</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationoauthidppolicy

Query-parameters:

authenticationoauthidpprofile

Configuration for OAuth Identity Provider (IdP) profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new OAuth Identity Provider (IdP) single sign-on profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
clientid	<String>	Read-write	Unique identity of the relying party requesting for authentication. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientsecret	<String>	Read-write	Unique secret string to authorize relying party at authorization server. Minimum length = 1
redirecturl	<String>	Read-write	URL endpoint on relying party to which the OAuth token is to be sent. Minimum length = 1
issuer	<String>	Read-write	The name to be used in requests sent from Citrix ADC to IdP to uniquely identify Citrix ADC. Minimum length = 1
configservice	<String>	Read-write	Name of the entity that is used to obtain configuration for the current authentication request. It is used only in Citrix Cloud. Minimum length = 1
audience	<String>	Read-write	Audience for which token is being sent by Citrix ADC IdP. This is typically entity name or url that represents the recipient.
skewtime	<Double>	Read-write	This option specifies the duration for which the token sent by Citrix ADC IdP is valid. For example, if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			skewTime is 10, then token would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
defaultauthentication group	<String>	Read-write	This is the group that is added to user sessions that match current IdP policy. It can be used in policies to identify relying party trust.
relyingpartymetadata url	<String>	Read-write	This is the endpoint at which Citrix ADC IdP can get details about Relying Party (RP) being configured. Metadata response should include endpoints for jwks_uri for RP public key(s).
refreshinterval	<Double>	Read-write	Interval at which Relying Party metadata is refreshed. Default value: 50
encrypttoken	<String>	Read-write	Option to encrypt token when Citrix ADC IDP sends one. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
signatureservice	<String>	Read-write	Name of the service in cloud used to sign the data. This is applicable only if signature if offloaded to cloud. Minimum length = 1
signaturealg	<String>	Read-write	Algorithm to be used to sign OpenID tokens. Default value: RS256 Possible values = RS256, RS512
attributes	<String>	Read-write	Name-Value pairs of attributes to be inserted in idtoken. Configuration format is name=value_expr@@@name2=value2_expr@@@. '@@@' is used as delimiter between Name-Value pairs. name is a literal string whose value is 127 characters and does not contain '=' character. Value is advanced policy expression terminated by @@@ delimiter.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Last value need not contain the delimiter.
sendpassword	<String>	Read-write	Option to send encrypted password in idtoken. Default value: OFF Possible values = ON, OFF
oauthstatus	<String>	Read-only	Describes status information of oauth idp metadata fetch process. Default value: INIT Possible values = INIT, CERTFETCH, AADFORGRAPH, GRAPH, AADFORMDM, MDMINFO, COMPLETE
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationoauthidpprofile

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

```

authenticationvserver_authenticationoauthidppolicy_binding

Binding object showing the authenticationoauthidppolicy that can be bound to authenticationvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority, if any, of the vpn vserver policy.
name	<String>	Read-write	Name of the authentication virtual server to which to bind the policy. Minimum length = 1
nextfactor	<String>	Read-write	Applicable only while binding advance authentication policy as classic authentication policy does not support nFactor.
gotopriorityexpression	<String>	Read-write	Applicable only to advance authentication policy. Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
secondary	<Boolean>	Read-write	Applicable only while bindind classic authentication policy as advance authentication policy use nFactor.
policy	<String>	Read-write	The name of the policy, if any, bound to the authentication vserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupextraction	<Boolean>	Read-write	Applicable only while bindind classic authentication policy as advance authentication policy use nFactor.
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

authenticationpolicy

Configuration for Authentication Policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the advance AUTHENTICATION policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after AUTHENTICATION policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the AUTHENTICATION server.
action	<String>	Read-write	Name of the authentication action to be performed if the policy matches.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the authentication policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
description	<String>	Read-only	Description of the policy.
policysubtype	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = LOCAL, RADIUS, LDAP, TACACS, CERT, NEGOTIATE, SAML, PROFILE, DFA, SAMLIDP, WEBAUTH, OAUTH, NO_AUTHN, EPA, SFAUTH, AZUREVAULT, EMAIL, CAPTCHA
__count	<Double>	Read-only	count parameter

authenticationpolicylabel

Configuration for authentication policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the new authentication policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy label" or 'authentication policy label').
type	<String>	Read-write	Type of feature (aaatm or rba) against which to match the policies bound to this policy label. Default value: AAATM_REQ Possible values = AAATM_REQ, RBA_REQ
comment	<String>	Read-write	Any comments to preserve information about this authentication policy label.
loginschema	<String>	Read-write	Login schema associated with authentication policy label. Login schema

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			defines the UI rendering by providing customization option of the fields. If user intervention is not needed for a given factor such as group extraction, a loginSchema whose authentication schema is "noschema" should be used.
newname	<String>	Read-write	The new name of the auth policy label. Minimum length = 1
numpol	<Double>	Read-only	Number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
policyname	<String>	Read-only	Name of the authentication policy to bind to the policy label.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flowtype	<Double>	Read-only	Flowtype of the bound authentication policy.
description	<String>	Read-only	Description of the policylabel.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationpolicylabel

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationpolicylabel":{

<b>"labelname":<String_value>,

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationpolicy_authenticationpolicylabel_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"nextfactor":<String_value>,

"gotopriorityexpression":<String_value>,

"activepolicy":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationpolicy_authenticationpolicylabel_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"authenticationpolicy_authenticationpolicylabel_binding": [ { "__count":
"#no"} ] }
```

authenticationpolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the advance authentication policy. Minimum length = 1
priority	<Double>	Read-only	.
nextfactor	<String>	Read-only	On success invoke label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationpolicy_authenticationvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationpolicy_authenticationvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationpolicy_authenticationvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationpolicy_authenticationvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationpolicy_authenticationvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationpolicy_authenticationvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"nextfactor":<String_value>,

"gotopriorityexpression":<String_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationpolicy_authenticationvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationpolicy_authenticationvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationpolicy_authenticationvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"nextfactor":<String_value>,

}]}
```

authenticationradiusaction

Configuration for RADIUS action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the RADIUS action. Must begin with a letter, number, or the underscore

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the RADIUS action is added. Minimum length = 1
serverip	<String>	Read-write	IP address assigned to the RADIUS server. Minimum length = 1
servername	<String>	Read-write	RADIUS server name as a FQDN. Mutually exclusive with RADIUS IP address. Minimum length = 1
serverport	<Integer>	Read-write	Port number on which the RADIUS server listens for connections. Minimum value = 1
authtimeout	<Double>	Read-write	Number of seconds the Citrix ADC waits for a response from the RADIUS server. Default value: 3

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1
radkey	<String>	Read-write	Key shared between the RADIUS server and the Citrix ADC. Required to allow the Citrix ADC to communicate with the RADIUS server. Minimum length = 1
radnasip	<String>	Read-write	If enabled, the Citrix ADC IP address (NSIP) is sent to the RADIUS server as the Network Access Server IP (NASIP) address. The RADIUS protocol defines the meaning and use of the NASIP address. Possible values = ENABLED, DISABLED
radnasid	<String>	Read-write	If configured, this string is sent to the RADIUS server as the Network Access Server ID (NASID).
radvendorid	<Double>	Read-write	RADIUS vendor ID attribute, used for RADIUS group extraction. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
radattributetype	<Double>	Read-write	RADIUS attribute type, used for RADIUS group extraction. Minimum value = 1
radgroupsprefix	<String>	Read-write	RADIUS groups prefix string. This groups prefix precedes the group names within a RADIUS attribute for RADIUS group extraction.
radgroupseparator	<String>	Read-write	RADIUS group separator string The group separator delimits group names within a RADIUS attribute for RADIUS group extraction.
passencoding	<String>	Read-write	Encoding type for passwords in RADIUS packets that the Citrix ADC sends to the RADIUS server. Default value: pap Possible values = pap, chap, mschapv1, mschapv2

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipvendorid	<Double>	Read-write	Vendor ID of the intranet IP attribute in the RADIUS response. NOTE: A value of 0 indicates that the attribute is not vendor encoded.
ipattributetype	<Double>	Read-write	Remote IP address attribute type in a RADIUS response. Minimum value = 1
accounting	<String>	Read-write	Whether the RADIUS server is currently accepting accounting messages. Possible values = ON, OFF
pwdvendorid	<Double>	Read-write	Vendor ID of the attribute, in the RADIUS response, used to extract the user password. Minimum value = 1
pwdattributetype	<Double>	Read-write	Vendor-specific password attribute type in a RADIUS response. Minimum value = 1
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			succeeds in addition to extracted groups.
callingstationid	<String>	Read-write	Send Calling-Station-ID of the client to the RADIUS server. IP Address of the client is sent as its Calling-Station-ID. Default value: DISABLED Possible values = ENABLED, DISABLED
authservretry	<Double>	Read-write	Number of retry by the Citrix ADC before getting response from the RADIUS server. Default value: 3 Minimum value = 1 Maximum value = 10
authentication	<String>	Read-write	Configure the RADIUS server state to accept or refuse authentication messages. Default value: ON Possible values = ON, OFF
tunnelendpointclientip	<String>	Read-write	Send Tunnel Endpoint Client IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address to the RADIUS server. Default value: DISABLED Possible values = ENABLED, DISABLED
ipaddress	<String>	Read-only	IP address.
success	<Double>	Read-only	.
failure	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

authenticationradiuspolicy

Configuration for RADIUS policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the RADIUS authentication policy. Must begin with a letter, number, or the underscore character (_), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after RADIUS policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			with the RADIUS server.
reqaction	<String>	Read-write	Name of the RADIUS action to perform if the policy matches. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationradiuspolicy":{

<b>"name":<String_value>,

</b>"rule":true,

"reqaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationradiuspolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationradiuspolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationradiuspolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"reqaction":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationradiuspolicy": [ {

"name":<String_value>,

"rule":<String_value>,
```

```
"reqaction":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationradiuspolicy": [ { "__count": "#no"} ] }
```

authenticationradiuspolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationradiuspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the RADIUS authentication policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy_authenticationvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy_authenticationvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationradiuspolicy_authenticationvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy_authenticationvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationradiuspolicy_authenticationvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationradiuspolicy_authenticationvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy_authenticationvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationradiuspolicy_authenticationvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationradiuspolicy_authenticationvserver_binding": [ {

"boundto":<String_value>,

authenticationsamlaction

Configuration for AAA Saml action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SAML server profile (action).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after SAML profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1
samlidpcertname	<String>	Read-write	Name of the SSL certificate used to verify responses

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from SAML Identity Provider (IdP). Minimum length = 1
samlsigningcertname	<String>	Read-write	Name of the SSL certificate to sign requests from ServiceProvider (SP) to Identity Provider (IdP). Minimum length = 1
samlredirecturl	<String>	Read-write	URL to which users are redirected for authentication. Minimum length = 1
samlacsindex	<Double>	Read-write	Index/ID of the metadata entry corresponding to this configuration. Default value: 255 Minimum value = 0 Maximum value = 255
samluserfield	<String>	Read-write	SAML user ID, as given in the SAML assertion. Minimum length = 1
samlrejectunsignedassertion	<String>	Read-write	Reject unsigned SAML assertions. ON option results in rejection of Assertion that is received without signature. STRICT option ensures that both

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Response and Assertion are signed. OFF allows unsigned Assertions. Default value: ON Possible values = ON, OFF, STRICT
samlissuername	<String>	Read-write	The name to be used in requests sent from Citrix ADC to IdP to uniquely identify Citrix ADC. Minimum length = 1
samltwofactor	<String>	Read-write	Option to enable second factor after SAML. Default value: OFF Possible values = ON, OFF
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
attribute1	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute1. Maximum length of the extracted attribute is 239 bytes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute2	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute2. Maximum length of the extracted attribute is 239 bytes.
attribute3	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute3. Maximum length of the extracted attribute is 239 bytes.
attribute4	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute4. Maximum length of the extracted attribute is 239 bytes.
attribute5	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute5. Maximum length of the extracted attribute is 239 bytes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute6	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute6. Maximum length of the extracted attribute is 239 bytes.
attribute7	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute7. Maximum length of the extracted attribute is 239 bytes.
attribute8	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute8. Maximum length of the extracted attribute is 239 bytes.
attribute9	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute9. Maximum length of the extracted attribute is 239 bytes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute10	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute10. Maximum length of the extracted attribute is 239 bytes.
attribute11	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute11. Maximum length of the extracted attribute is 239 bytes.
attribute12	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute12. Maximum length of the extracted attribute is 239 bytes.
attribute13	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute13. Maximum length of the extracted attribute is 239 bytes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute14	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute14. Maximum length of the extracted attribute is 239 bytes.
attribute15	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute15. Maximum length of the extracted attribute is 239 bytes.
attribute16	<String>	Read-write	Name of the attribute in SAML Assertion whose value needs to be extracted and stored as attribute16. Maximum length of the extracted attribute is 239 bytes.
attributes	<String>	Read-write	List of attribute names separated by ',' which needs to be extracted. Note that preceeding and trailing spaces will be removed.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Attribute name can be 127 bytes and total length of this string should not cross 2047 bytes. These attributes have multi-value support separated by ',' and stored as key-value pair in AAA session.
signaturealg	<String>	Read-write	Algorithm to be used to sign/verify SAML transactions. Default value: RSA-SHA256 Possible values = RSA-SHA1, RSA-SHA256
digestmethod	<String>	Read-write	Algorithm to be used to compute/verify digest for SAML transactions. Default value: SHA256 Possible values = SHA1, SHA256
requestedauthncontext	<String>	Read-write	This element specifies the authentication context requirements of authentication

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			statements returned in the response. Default value: exact Possible values = exact, minimum, maximum, better
authnctxclassref	<String[]>	Read-write	This element specifies the authentication class types that are requested from IdP (IdentityProvider). InternetProtocol: This is applicable when a principal is authenticated through the use of a provided IP address. InternetProtocolPassword: This is applicable when a principal is authenticated through the use of a provided IP address, in addition to a username/ password. Kerberos: This is applicable when the principal has authenticated using a password to a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			local authentication authority, in order to acquire a Kerberos ticket. MobileOneFactorUnregistered: This indicates authentication of the mobile device without requiring explicit end-user interaction. MobileTwoFactorUnregistered: This indicates two-factor based authentication during mobile customer registration process, such as secure device and user PIN. MobileOneFactorContract: Reflects mobile contract customer registration procedures and a single factor authentication.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			MobileTwoFactorContract: Reflects mobile contract customer registration procedures and a two-factor based authentication. Password: This class is applicable when a principal authenticates using password over unprotected http session. PasswordProtectedTransport: This class is applicable when a principal authenticates to an authentication authority through the presentation of a password over a protected session. PreviousSession: This class is applicable when a principal had authenticated to an authentication authority at some point in the past using any

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication context. X509: This indicates that the principal authenticated by means of a digital signature where the key was validated as part of an X.509 Public Key Infrastructure. PGP: This indicates that the principal authenticated by means of a digital signature where the key was validated as part of a PGP Public Key Infrastructure. SPKI: This indicates that the principal authenticated by means of a digital signature where the key was validated via an SPKI Infrastructure. XMLDSig: This indicates that the principal authenticated by means of a digital

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			signature according to the processing rules specified in the XML Digital Signature specification. Smartcard: This indicates that the principal has authenticated using smartcard. SmartcardPKI: This class is applicable when a principal authenticates to an authentication authority through a two-factor authentication mechanism using a smartcard with enclosed private key and a PIN. SoftwarePKI: This class is applicable when a principal uses an X.509 certificate stored in software to authenticate to the authentication authority.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Telephony: This class is used to indicate that the principal authenticated via the provision of a fixed-line telephone number, transported via a telephony protocol such as ADSL. NomadTelephony: Indicates that the principal is "roaming" and authenticates via the means of the line number, a user suffix, and a password element. PersonalTelephony: This class is used to indicate that the principal authenticated via the provision of a fixed-line telephone. AuthenticatedTelephony: Indicates that the principal authenticated via the means of the line number, a user

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			suffix, and a password element. SecureRemotePassword: This class is applicable when the authentication was performed by means of Secure Remote Password. TLSClient: This class indicates that the principal authenticated by means of a client certificate, secured with the SSL/TLS transport. TimeSyncToken: This is applicable when a principal authenticates through a time synchronization token. Unspecified: This indicates that the authentication was performed by unspecified means. Windows: This indicates that Windows integrated authentication is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			utilized for authentication. Possible values = InternetProtocol, InternetProtocolPassword, Kerberos, MobileOneFactorUnregistered, MobileTwoFactorUnregistered, MobileOneFactorContract, MobileTwoFactorContract, Password, PasswordProtectedTransport, PreviousSession, X509, PGP, SPKI, XMLDSig, Smartcard, SmartcardPKI, SoftwarePKI, Telephony, NomadTelephony, PersonalTelephony, AuthenticatedTelephony, SecureRemotePassword, TLSClient, TimeSyncToken, Unspecified, Windows
samlbinding	<String>	Read-write	This element specifies the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			transport mechanism of saml messages. Default value: POST Possible values = REDIRECT, POST, ARTIFACT
attributeconsumingserviceindex	<Double>	Read-write	Index/ID of the attribute specification at Identity Provider (IdP). IdP will locate attributes requested by SP using this index and send those attributes in Assertion. Default value: 255 Minimum value = 0 Maximum value = 255
sendthumbprint	<String>	Read-write	Option to send thumbprint instead of x509 certificate in SAML request. Default value: OFF Possible values = ON, OFF
enforceusername	<String>	Read-write	Option to choose whether the username that is extracted from SAML assertion can be edited in login page

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			while doing second factor. Default value: ON Possible values = ON, OFF
logouturl	<String>	Read-write	SingleLogout URL on IdP to which logoutRequest will be sent on Citrix ADC session cleanup.
artifactresolutionserviceurl	<String>	Read-write	URL of the Artifact Resolution Service on IdP to which Citrix ADC will post artifact to get actual SAML token.
skewtime	<Double>	Read-write	This option specifies the allowed clock skew in number of minutes that Citrix ADC ServiceProvider allows on an incoming assertion. For example, if skewTime is 10, then assertion would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
logoutbinding	<String>	Read-write	This element specifies the transport mechanism

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of saml logout messages. Default value: POST Possible values = REDIRECT, POST
forceauthn	<String>	Read-write	Option that forces authentication at the Identity Provider (IdP) that receives Citrix ADC's request. Default value: OFF Possible values = ON, OFF
groupnamefield	<String>	Read-write	Name of the tag in assertion that contains user groups.
audience	<String>	Read-write	Audience for which assertion sent by IdP is applicable. This is typically entity name or url that represents ServiceProvider.
metadataurl	<String>	Read-write	This URL is used for obtaining saml metadata.
metadatarefreshinterval	<Double>	Read-write	Interval in minutes for fetching metadata from specified metadata URL. Default value: 36000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
storesamlresponse	<String>	Read-write	Option to store entire SAML Response through the life of user session. Default value: OFF Possible values = ON, OFF
metadataimportstatus	<String>	Read-only	Describes metadata import status. Default value: SUCCESS Possible values = INIT, SUCCESS, FAIL
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

authenticationsamlidppolicy

Configuration for AAA Saml IdentityProvider (IdP) policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SAML Identity Provider (IdP) authentication policy. This is used for configuring Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADC as SAML Identity Provider. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression which is evaluated to choose a profile for authentication. The following requirements apply

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks. Minimum length = 1
action	<String>	Read-write	Name of the profile to apply to requests or connections that match this policy. Minimum length = 1
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the SAML IdentityProvider policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my samlidppolicy policy" or 'my samlidppolicy policy'). Minimum length = 1
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
hits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlidppolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

authenticationsamlidppolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationsamlidppolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the SAML IdentityProvider (IdP) policy for which to display detailed information.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlidppolicy_authenticationvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlidppolicy_authenticationvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationsamlidppolicy_authenticationvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlidppolicy_authenticationvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationsamlidppolicy_authenticationvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationsamlidppolicy_authenticationvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlidppolicy_authenticationvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlidppolicy_authenticationvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationsamlidppolicy_authenticationvserver_binding": [ {

authenticationsamlidpprofile

Configuration for AAA Saml IdentityProvider (IdP) profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new saml single sign-on profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
samlspcertname	<String>	Read-write	Name of the SSL certificate of SAML Relying Party. This certificate is used to verify signature of the incoming AuthnRequest from a Relying Party or Service Provider. Minimum length = 1
samlidpcertname	<String>	Read-write	Name of the certificate used to sign the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SAMLResposne that is sent to Relying Party or Service Provider after successful authentication. Minimum length = 1
assertionconsumerserviceurl	<String>	Read-write	URL to which the assertion is to be sent. Minimum length = 1
sendpassword	<String>	Read-write	Option to send password in assertion. Default value: OFF Possible values = ON, OFF
samlissuername	<String>	Read-write	The name to be used in requests sent from Citrix ADC to IdP to uniquely identify Citrix ADC. Minimum length = 1
rejectunsignedrequests	<String>	Read-write	Option to Reject unsigned SAML Requests. ON option denies any authentication requests that arrive without signature. Default value: ON Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
signaturealg	<String>	Read-write	Algorithm to be used to sign/verify SAML transactions. Default value: RSA-SHA256 Possible values = RSA-SHA1, RSA-SHA256
digestmethod	<String>	Read-write	Algorithm to be used to compute/verify digest for SAML transactions. Default value: SHA256 Possible values = SHA1, SHA256
audience	<String>	Read-write	Audience for which assertion sent by IdP is applicable. This is typically entity name or url that represents ServiceProvider.
nameidformat	<String>	Read-write	Format of Name Identifier sent in Assertion. Default value: transient Possible values = Unspecified, emailAddress, X509SubjectName, WindowsDomainQualifiedName,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			kerberos, entity, persistent, transient
nameidexpr	<String>	Read-write	Expression that will be evaluated to obtain NameIdentifier to be sent in assertion. Maximum length = 128
attribute1	<String>	Read-write	Name of attribute1 that needs to be sent in SAML Assertion.
attribute1expr	<String>	Read-write	Expression that will be evaluated to obtain attribute1's value to be sent in Assertion. Maximum length = 128
attribute1friendlyname	<String>	Read-write	User-Friendly Name of attribute1 that needs to be sent in SAML Assertion.
attribute1format	<String>	Read-write	Format of Attribute1 to be sent in Assertion. Possible values = URI, Basic
attribute2	<String>	Read-write	Name of attribute2 that needs to be sent in SAML Assertion.
attribute2expr	<String>	Read-write	Expression that will be evaluated to obtain attribute2's

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value to be sent in Assertion. Maximum length = 128

attribute10format	<String>	Read-write	Format of Attribute10 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute11	<String>	Read-write	Name of attribute11 that needs to be sent in SAML Assertion.
attribute11expr	<String>	Read-write	Expression that will be evaluated to obtain attribute11's value to be sent in Assertion. Maximum length = 128
attribute11friendlyname	<String>	Read-write	User-Friendly Name of attribute11 that needs to be sent in SAML Assertion.
attribute11format	<String>	Read-write	Format of Attribute11 to be sent in Assertion. Possible values = URI, Basic
attribute12	<String>	Read-write	Name of attribute12 that needs to be sent in SAML Assertion.
attribute12expr	<String>	Read-write	Expression that will be evaluated to obtain attribute12's value to be sent in Assertion. Maximum length = 128
attribute12friendlyname	<String>	Read-write	User-Friendly Name of attribute12 that needs to be sent in SAML Assertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute12format	<String>	Read-write	Format of Attribute12 to be sent in Assertion. Possible values = URI, Basic
attribute13	<String>	Read-write	Name of attribute13 that needs to be sent in SAML Assertion.
attribute13expr	<String>	Read-write	Expression that will be evaluated to obtain attribute13's value to be sent in Assertion. Maximum length = 128
attribute13friendlyname	<String>	Read-write	User-Friendly Name of attribute13 that needs to be sent in SAML Assertion.
attribute13format	<String>	Read-write	Format of Attribute13 to be sent in Assertion. Possible values = URI, Basic
attribute14	<String>	Read-write	Name of attribute14 that needs to be sent in SAML Assertion.
attribute14expr	<String>	Read-write	Expression that will be evaluated to obtain attribute14's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute14friendlyname	<String>	Read-write	User-Friendly Name of attribute14 that needs to be sent in SAML Assertion.
attribute14format	<String>	Read-write	Format of Attribute14 to be sent in Assertion. Possible values = URI, Basic
attribute15	<String>	Read-write	Name of attribute15 that needs to be sent in SAML Assertion.
attribute15expr	<String>	Read-write	Expression that will be evaluated to obtain attribute15's value to be sent in Assertion. Maximum length = 128
attribute15friendlyname	<String>	Read-write	User-Friendly Name of attribute15 that needs to be sent in SAML Assertion.
attribute15format	<String>	Read-write	Format of Attribute15 to be sent in Assertion. Possible values = URI, Basic
attribute16	<String>	Read-write	Name of attribute16 that needs to be sent in SAML Assertion.
attribute16expr	<String>	Read-write	Expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain attribute16's value to be sent in Assertion. Maximum length = 128
attribute16friendlyname	<String>	Read-write	User-Friendly Name of attribute16 that needs to be sent in SAML Assertion.
attribute16format	<String>	Read-write	Format of Attribute16 to be sent in Assertion. Possible values = URI, Basic
encryptassertion	<String>	Read-write	Option to encrypt assertion when Citrix ADC IDP sends one. Default value: OFF Possible values = ON, OFF
encryptionalgorithm	<String>	Read-write	Algorithm to be used to encrypt SAML assertion. Default value: AES256 Possible values = DES3, AES128, AES192, AES256
samlbinding	<String>	Read-write	This element specifies the transport mechanism of saml messages.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: POST Possible values = REDIRECT, POST, ARTIFACT
skewtime	<Double>	Read-write	This option specifies the number of minutes on either side of current time that the assertion would be valid. For example, if skewTime is 10, then assertion would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
serviceproviderid	<String>	Read-write	Unique identifier of the Service Provider that sends SAML Request. Citrix ADC will ensure that the Issuer of the SAML Request matches this URI. Minimum length = 1
signassertion	<String>	Read-write	Option to sign portions of assertion when Citrix ADC IDP sends one. Based on the user selection, either Assertion or Response or Both or none can be signed.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ASSERTION Possible values = NONE, ASSERTION, RESPONSE, BOTH
keytransportalg	<String>	Read-write	Key transport algorithm to be used in encryption of SAML assertion. Default value: RSA_OAEP Possible values = RSA-V1_5, RSA_OAEP
splogouturl	<String>	Read-write	Endpoint on the ServiceProvider (SP) to which logout messages are to be sent. Minimum length = 1
logoutbinding	<String>	Read-write	This element specifies the transport mechanism of saml logout messages. Default value: POST Possible values = REDIRECT, POST
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication succeeds in addition to extracted groups. This group can be used in policies to select specific authentication policy during logon.
metadataurl	<String>	Read-write	This URL is used for obtaining samlidp metadata.
metadatarefreshinterval	<Double>	Read-write	Interval in minute for fetching metadata from specified metadata URL. Default value: 3600
signatureservice	<String>	Read-write	Name of the service in cloud used to sign the data. Minimum length = 1
samlsigningcertversion	<String>	Read-write	version of the certificate in signature service used to sign the SAMLResposne that is sent to Relying Party or Service Provider after successful authentication. Minimum length = 1
samlspcertversion	<String>	Read-write	version of the certificate in signature service used to verify the signature of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			incoming AuthnRequest from a Relying Party or Service Provider. Minimum length = 1
metadataimportstatus	<String>	Read-only	Describes metadata import status. Default value: INIT Possible values = INIT, SUCCESS, FAIL
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlidpprofile?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationsamlidpprofile": [ { "__count": "#no"} ] }
```

authenticationsamlpolicy

Configuration for AAA Saml policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SAML policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after SAML policy is created. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the SAML server. Minimum length = 1
reqaction	<String>	Read-write	Name of the SAML authentication action to be performed if the policy matches. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationsamlpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"reqaction":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationsamlpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"reqaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationsamlpolicy":{

<b>"name":<String_value>,

</b>"rule":true,

"reqaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationsamlpolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationsamlpolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationsamlpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"reqaction":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationsamlpolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

authenticationstorefrontauthaction

Configuration for Storefront authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Storefront Authentication action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1
serverurl	<String>	Read-write	URL of the Storefront server. This is the FQDN of the Storefront server. example: https://storefront.com/. Authentication endpoints are learned dynamically by Gateway.
domain	<String>	Read-write	Domain of the server that is used for authentication. If

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			users enter name without domain, this parameter is added to username in the authentication request to server.
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
success	<Double>	Read-only	.
failure	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationstorefrontauthaction

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationstorefrontauthaction":{

<b>"name":<String_value>,

</b><b>"serverurl":<String_value>,

</b>"domain":<String_value>,

"defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationstorefrontauthaction/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationstorefrontauthaction

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationstorefrontauthaction":{

authenticationtacacsaction

Configuration for TACACS action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the TACACS+ profile (action). Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			characters. Cannot be changed after TACACS profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'y authentication action'). Minimum length = 1
serverip	<String>	Read-write	IP address assigned to the TACACS+ server. Minimum length = 1
serverport	<Integer>	Read-write	Port number on which the TACACS+ server listens for connections. Default value: 49 Minimum value = 1
authtimeout	<Double>	Read-write	Number of seconds the Citrix ADC waits for a response from

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the TACACS+ server. Default value: 3 Minimum value = 1
tacacssecret	<String>	Read-write	Key shared between the TACACS+ server and the Citrix ADC. Required for allowing the Citrix ADC to communicate with the TACACS+ server. Minimum length = 1
authorization	<String>	Read-write	Use streaming authorization on the TACACS+ server. Possible values = ON, OFF
accounting	<String>	Read-write	Whether the TACACS+ server is currently accepting accounting messages. Possible values = ON, OFF
auditfailedcmds	<String>	Read-write	The state of the TACACS+ server that will receive accounting messages. Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupattrname	<String>	Read-write	TACACS+ group attribute name. Used for group extraction on the TACACS+ server.
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
attribute1	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '1' (where '1' changes for each attribute).
attribute2	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '2' (where '2' changes for each attribute).
attribute3	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '3' (where '3' changes for each attribute).
attribute4	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			'4' (where '4' changes for each attribute).
attribute5	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '5' (where '5' changes for each attribute).
attribute6	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '6' (where '6' changes for each attribute).
attribute7	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '7' (where '7' changes for each attribute).
attribute8	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '8' (where '8' changes for each attribute).
attribute9	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '9' (where '9'

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			changes for each attribute).
attribute10	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '10' (where '10' changes for each attribute).
attribute11	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '11' (where '11' changes for each attribute).
attribute12	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '12' (where '12' changes for each attribute).
attribute13	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '13' (where '13' changes for each attribute).
attribute14	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '14' (where '14'

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			changes for each attribute).
attribute15	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '15' (where '15' changes for each attribute).
attribute16	<String>	Read-write	Name of the custom attribute to be extracted from server and stored at index '16' (where '16' changes for each attribute).
attributes	<String>	Read-write	List of attribute names separated by ',' which needs to be fetched from tacacs server. Note that preceeding and trailing spaces will be removed. Attribute name can be 127 bytes and total length of this string should not cross 2047 bytes. These attributes have multi-value support separated by ',' and stored as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			key-value pair in AAA session.
success	<Double>	Read-only	.
failure	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Response Payload:

```
{ "authenticationtacacspolicy": [ { "__count": "#no"} ] }
```

authenticationtacacspolicy_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to authenticationtacacspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the TACACS+ policy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationtacacspolicy_authenticationvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationtacacspolicy_authenticationvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationtacacspolicy_authenticationvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationtacacspolicy_authenticationvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationtacacspolicy_authenticationvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationtacacspolicy_authenticationvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationtacacspolicy_authenticationvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationtacacspolicy_authenticationvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationtacacspolicy_authenticationvserver_binding": [ {

authenticationvserver

Configuration for authentication virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new authentication virtual server. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the authentication virtual server is added by using the rename authentication vserver command. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
servicetype	<String>	Read-write	Protocol type of the authentication virtual server. Always SSL. Default value: SSL Possible values = SSL
ipv46	<String>	Read-write	IP address of the authentication virtual server, if a single IP address is assigned to the virtual server. Minimum length = 1
range	<Double>	Read-write	If you are creating a series of virtual servers with a range of IP addresses assigned to them, the length of the range. The new range of authentication virtual servers will have IP addresses consecutively numbered, starting with the primary

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address specified with the IP Address parameter. Default value: 1 Minimum value = 1
port	<Integer>	Read-write	TCP port on which the virtual server accepts connections. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
state	<String>	Read-write	Initial state of the new virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
authentication	<String>	Read-write	Require users to be authenticated before sending traffic through this virtual server. Default value: ON Possible values = ON, OFF
authenticationdomain	<String>	Read-write	The domain of the authentication cookie

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			set by Authentication vserver. Minimum length = 3 Maximum length = 252
comment	<String>	Read-write	Any comments associated with this virtual server.
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
appflowlog	<String>	Read-write	Log AppFlow flow information. Default value: ENABLED Possible values = ENABLED, DISABLED
maxloginattempts	<Double>	Read-write	Maximum Number of login Attempts. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 255
failedlogintimeout	<Double>	Read-write	Number of minutes an account will be locked if user exceeds maximum permissible attempts. Minimum value = 1
certkeynames	<String>	Read-write	Name of the certificate key that was bound to the corresponding SSL virtual server as the Certificate Authority for the device certificate. Minimum length = 1 Maximum length = 127
newname	<String>	Read-write	New name of the authentication virtual server. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, 'my authentication policy' or "my authentication policy"). Minimum length = 1
ip	<String>	Read-only	The Virtual IP address of the authentication vserver.
value	<String>	Read-only	Indicates whether or not the certificate is bound or if SSL offload is disabled. Possible values = Certkey not bound, SSL feature disabled
type	<String>	Read-only	The type of Virtual Server, e.g. CONTENT based or ADDRESS based.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = CONTENT, ADDRESS
curstate	<String>	Read-only	The current state of the Virtual server, e.g. UP, DOWN, BUSY, etc. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
status	<Integer>	Read-only	Whether or not this vserver responds to ARPs and whether or not round-robin selection is temporarily in effect.
cachetype	<String>	Read-only	Virtual server's cache type. The options are: TRANSPARENT, REVERSE and FORWARD. Possible values = TRANSPARENT, REVERSE, FORWARD

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
redirect	<String>	Read-only	The cache redirect policy. The valid redirect policies are: l. CACHE - Directs all requests to the cache. 2. POLICY - Applies cache redirection policy to determine whether the request should be directed to the cache or origin. This is the default setting. 3. ORIGIN - Directs all requests to the origin server. Possible values = CACHE, POLICY, ORIGIN
precedence	<String>	Read-only	This argument is used only when configuring content switching on the specified virtual server. This is applicable only if both the URL and RULE-based policies have been

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configured on the same virtual server. It specifies the type of policy (URL or RULE) that takes precedence on the content switching virtual server. The default setting is RULE. l URL - In this case, the incoming request is matched against the URL-based policies before the rule-based policies. l RULE - In this case, the incoming request is matched against the rule-based policies before the URL-based policies. For all URL-based policies, the precedence hierarchy is: 1. Domain and exact URL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			2. Domain, prefix and suffix 3. Domain and suffix 4. Domain and prefix 5. Domain only 6. Exact URL 7. Prefix and suffix 8. Suffix only 9. Prefix only 10. Default. Possible values = RULE, URL
redirecturl	<String>	Read-only	The URL where traffic is redirected if the virtual server in system becomes unavailable. WARNING! Make sure that the domain you specify in the URL does not match the domain specified in the -d domainName argument of the ###add cs policy### command. If the same domain is specified in both arguments, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			request will be continuously redirected to the same unavailable virtual server in the system. If so, the user may not get the requested content.
curaaausers	<Double>	Read-only	The number of current users logged in to this vserver.
policy	<String>	Read-only	The name of the policy, if any, bound to the authentication vserver.
servicename	<String>	Read-only	The name of the service, if any, to which the vserver policy is bound.
weight	<Double>	Read-only	Weight for this service, if any. This weight is used when the system performs load balancing, giving greater priority to a specific service. It is useful when the services bound to a virtual server are of different capacity.
cachevserver	<String>	Read-only	The name of the default target cache virtual server, if any, to which requests are redirected.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
backupvserver	<String>	Read-only	The name of the backup vpn virtual server for this vpn virtual server.
clttimeout	<Double>	Read-only	The idle time, if any, in seconds after which the client connection is terminated.
somethod	<String>	Read-only	VPN client applications are allocated from a block of Intranet IP addresses. That block may be exhausted after a certain number of connections. This switch specifies the method used to determine whether or not a new connection will spillover, or exhaust, the allocated block of Intranet IP addresses for that application. Possible values are CONNECTION or DYNAMICCONNECTION.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CONNECTION means that a static integer value is the hard limit for the spillover threshold. The spillover threshold is described below. DYNAMICCONNECTION means that the spillover threshold is set according to the maximum number of connections defined for the vpn vserver. Possible values = CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, NONE
sothreshold	<Double>	Read-only	VPN client applications are allocated from a block of Intranet IP addresses. That block may be exhausted after a certain number of connections.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The value of this option is number of client connections after which the Mapped IP address is used as the client source IP address instead of an address from the allocated block of Intranet IP addresses.
sopersistence	<String>	Read-only	Whether or not cookie-based site persistance is enabled for this VPN vserver. Possible values are 'ConnectionProxy', HTTPRedirect, or NONE. Possible values = ENABLED, DISABLED
sopersistencetimeout	<Double>	Read-only	The timeout, if any, for cookie-based site persistance of this VPN vserver.
priority	<Double>	Read-only	The priority, if any, of the vpn vserver policy.
downstateflush	<String>	Read-only	Perform delayed clean up of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connections on this vserver. Possible values = ENABLED, DISABLED
disableprimaryondown	<String>	Read-only	Tells whether traffic will continue reaching backup vservers even after primary comes UP from DOWN state. Possible values = ENABLED, DISABLED
listenpolicy	<String>	Read-only	Listenpolicy configured for authentication vserver.
listenpriority	<Double>	Read-only	Priority of listen policy for authentication vserver.
tcpprofilename	<String>	Read-only	The name of the TCP profile.
httpprofilename	<String>	Read-only	Name of the HTTP profile.
vstype	<Double>	Read-only	Virtual Server Type, e.g. Load Balancing, Content Switch, Cache Redirection.
ngname	<String>	Read-only	Nodegroup devno to which this

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication vsever belongs to.
secondary	<Boolean>	Read-only	Bind the authentication policy to the secondary chain. Provides for multifactor authentication in which a user must authenticate via both a primary authentication method and, afterward, via a secondary authentication method. Because user groups are aggregated across authentication systems, usernames must be the same on all authentication servers. Passwords can be different.
groupextraction	<Boolean>	Read-only	Bind the Authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			against this server, and this will only be called if primary and/or secondary authentication has succeeded.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationvserver

HTTP Method:POST

authenticationvserver_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to authenticationvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority, if any, of the vpn vserver policy.
name	<String>	Read-write	Name of the authentication virtual server to which to bind the policy. Minimum length = 1
nextfactor	<String>	Read-write	Applicable only while binding advance authentication policy as classic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication policy does not support nFactor.
gotopriorityexpression	<String>	Read-write	Applicable only to advance authentication policy. Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
secondary	<Boolean>	Read-write	Applicable only while bindind classic authentication policy as advance authentication policy use nFactor.
policy	<String>	Read-write	The name of the policy, if any, bound to the authentication vserver.
groupextraction	<Boolean>	Read-write	Applicable only while bindind classic authentication policy as advance authentication policy use nFactor.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

```

authenticationvserver_auditsyslogpolicy_binding

Binding object showing the auditsyslogpolicy that can be bound to authenticationvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority, if any, of the vpn vserver policy.
name	<String>	Read-write	Name of the authentication virtual server to which to bind the policy. Minimum length = 1
nextfactor	<String>	Read-write	Applicable only while binding advance authentication policy as classic authentication policy does not support nFactor.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Applicable only to advance authentication policy. Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
secondary	<Boolean>	Read-write	Applicable only while bindind classic authentication policy as advance authentication policy use nFactor.
policy	<String>	Read-write	The name of the policy, if any, bound to the authentication vserver.
groupextraction	<Boolean>	Read-write	Applicable only while bindind classic authentication policy as advance authentication policy use nFactor.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/authenticationvserver_auditsyslogpolicy_binding

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
secondary	<Boolean>	Read-write	Bind the authentication policy to the secondary chain. Provides for multifactor authentication in which a user must authenticate via both a primary authentication method and, afterward, via a secondary authentication method. Because user groups are aggregated across authentication systems, usernames must be the same on all authentication servers. Passwords can be different.
policy	<String>	Read-write	The name of the policy, if any, bound to the authentication vserver.
groupextraction	<Boolean>	Read-write	Applicable only while bindind classic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication policy as advance authentication policy use nFactor.
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/authenticationvserver_authenticationlocalpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"authenticationvserver_authenticationlocalpolicy_binding":{

<b>"name":<String_value>,

</b>"policy":<String_value>,

"priority":<Double_value>,

"secondary":<Boolean_value>,

"groupextraction":<Boolean_value>,

"nextfactor":<String_value>,

"gotopriorityexpression":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationvserver_authenticationlocalpolicy_binding/name_value<String>

Query-parameters:

```

authenticationvserver_authenticationradiuspolicy_binding

Binding object showing the authenticationradiuspolicy that can be bound to authenticationvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority, if any, of the vpn vserver policy.
name	<String>	Read-write	Name of the authentication virtual server to which to bind the policy. Minimum length = 1
nextfactor	<String>	Read-write	Applicable only while binding advance authentication policy as classic authentication policy does not support nFactor.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Applicable only to advance authentication policy. Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
secondary	<Boolean>	Read-write	Bind the authentication policy to the secondary chain. Provides for multifactor authentication in which a user must authenticate via both a primary authentication method and, afterward, via a secondary authentication method. Because user groups are aggregated across authentication systems, usernames must be the same on all authentication servers. Passwords can be different.
policy	<String>	Read-write	The name of the policy, if any, bound to the authentication vserver.
groupextraction	<Boolean>	Read-write	Applicable only while bindind classic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication policy as advance authentication policy use nFactor.
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/authenticationvserver_authenticationradiuspolicy_binding

Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
secondary	<Boolean>	Read-write	Bind the authentication policy to the secondary chain. Provides for multifactor authentication in which a user must authenticate via both a primary authentication method and, afterward, via a secondary authentication method. Because user groups are aggregated across authentication systems, usernames must be the same on all authentication servers. Passwords can be different.
policy	<String>	Read-write	The name of the policy, if any, bound to the authentication vserver.
groupextraction	<Boolean>	Read-write	Applicable only while bindind classic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication policy as advance authentication policy use nFactor.
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/authenticationvserver_authenticationtacacspolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```

```

authenticationvserver_tmsessionpolicy_binding

Binding object showing the tmsessionpolicy that can be bound to authenticationvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority, if any, of the vpn vserver policy.
name	<String>	Read-write	Name of the authentication virtual server to which to bind the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
nextfactor	<String>	Read-write	Applicable only while binding advance authentication policy as classic authentication policy does not support nFactor.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
secondary	<Boolean>	Read-write	Applicable only while bindind classic authentication policy as advance authentication policy use nFactor.
policy	<String>	Read-write	The name of the policy, if any, bound to the authentication vserver.
groupextraction	<Boolean>	Read-write	Applicable only while bindind classic authentication policy as advance authentication policy use nFactor.
__count	<Double>	Read-write	count parameter

Operations

authenticationwebauthaction

Configuration for Web authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Web Authentication action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication action" or 'my authentication action'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of the web server to be used for authentication. Minimum length = 1
serverport	<Integer>	Read-write	Port on which the web server accepts connections. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
fullreqexpr	<String>	Read-write	Exact HTTP request, in the form of an expression, which the Citrix ADC sends to the authentication server. The Citrix ADC does not check the validity of this request. One must manually validate the request.
scheme	<String>	Read-write	Type of scheme for the web server. Possible values = http, https
successrule	<String>	Read-write	Expression, that checks to see if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication is successful.
defaultauthentication group	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups.
attribute1	<String>	Read-write	Expression that would be evaluated to extract attribute1 from the webauth response. Maximum length = 128
attribute2	<String>	Read-write	Expression that would be evaluated to extract attribute2 from the webauth response. Maximum length = 128
attribute3	<String>	Read-write	Expression that would be evaluated to extract attribute3 from the webauth response. Maximum length = 128
attribute4	<String>	Read-write	Expression that would be evaluated to extract attribute4 from the webauth response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 128
attribute5	<String>	Read-write	Expression that would be evaluated to extract attribute5 from the webauth response. Maximum length = 128
attribute6	<String>	Read-write	Expression that would be evaluated to extract attribute6 from the webauth response. Maximum length = 128
attribute7	<String>	Read-write	Expression that would be evaluated to extract attribute7 from the webauth response. Maximum length = 128
attribute8	<String>	Read-write	Expression that would be evaluated to extract attribute8 from the webauth response. Maximum length = 128
attribute9	<String>	Read-write	Expression that would be evaluated to extract attribute9 from the webauth response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 128
attribute10	<String>	Read-write	Expression that would be evaluated to extract attribute10 from the webauth response. Maximum length = 128
attribute11	<String>	Read-write	Expression that would be evaluated to extract attribute11 from the webauth response. Maximum length = 128
attribute12	<String>	Read-write	Expression that would be evaluated to extract attribute12 from the webauth response. Maximum length = 128
attribute13	<String>	Read-write	Expression that would be evaluated to extract attribute13 from the webauth response. Maximum length = 128
attribute14	<String>	Read-write	Expression that would be evaluated to extract attribute14 from the webauth response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 128
attribute15	<String>	Read-write	Expression that would be evaluated to extract attribute15 from the webauth response. Maximum length = 128
attribute16	<String>	Read-write	Expression that would be evaluated to extract attribute16 from the webauth response. Maximum length = 128
__count	<Double>	Read-only	count parameter

authenticationwebauthpolicy

Configuration for Web authentication policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the WebAuth policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), colon (:), and underscore characters. Cannot be changed after LDAP policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authentication policy" or 'my authentication policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to determine whether to attempt to authenticate the user with the Web server. Minimum length = 1
action	<String>	Read-write	Name of the WebAuth action to perform if the policy matches.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationwebauthpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationwebauthpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationwebauthpolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationwebauthpolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

```

authenticationwebauthpolicy_vpnvserver_binding

Binding object showing the vpnvserver that can be bound to authenticationwebauthpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the WebAuth policy. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy_vpnvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy_vpnvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authenticationwebauthpolicy_vpnvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy_vpnvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationwebauthpolicy_vpnvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationwebauthpolicy_vpnvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy_vpnvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy_vpnvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authenticationwebauthpolicy_vpnvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationwebauthpolicy_vpnvserver_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"authenticationwebauthpolicy_vpnvserver_binding": [ { "__count":
"#no"} ] }
```

authenticationazurekeyvault

Configuration for Azure Key Vault entity resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new Azure Key Vault profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
vaultname	<String>	Read-write	Name of the Azure vault account as configured in azure portal. Minimum length = 1 Maximum length = 63
clientid	<String>	Read-write	Unique identity of the relying party requesting for authentication.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
clientsecret	<String>	Read-write	Unique secret string to authorize relying party at authorization server. Minimum length = 1
servicekeyname	<String>	Read-write	Friendly name of the Key to be used to compute signature. Minimum length = 1
signaturealg	<String>	Read-write	Algorithm to be used to sign/verify transactions. Default value: RS256 Possible values = RS256
tokenendpoint	<String>	Read-write	URL endpoint on relying party to which the OAuth token is to be sent. Minimum length = 1
pushservice	<String>	Read-write	Name of the service used to send push notifications. Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the group that is added to user sessions that match current IdP policy. It can be used in policies to identify relying party trust.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
refreshinterval	<Double>	Read-write	Interval at which access token in obtained. Default value: 50
tenantid	<String>	Read-write	TenantID of the application. This is usually specific to providers such as Microsoft and usually refers to the deployment identifier.
authentication	<String>	Read-write	If authentication is disabled, otp checks are not performed after azure vault keys are obtained. This is useful to distinguish whether user has registered devices. . Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

authenticationemailaction

Configuration for Email entity resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new email action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
username	<String>	Read-write	Username/Clientid/ EmailID to be used to authenticate to the server. Minimum length = 1
password	<String>	Read-write	Password/ Clientsecret to use when authenticating to the server. Minimum length = 1
serverurl	<String>	Read-write	Address of the server that delivers the message. It is fully qualified fqdn such as http(s):// or smtp(s):// for http and smtp protocols respectively. For SMTP, the port number is mandatory

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			like smtps://smtp.example.com:25. Minimum length = 1
content	<String>	Read-write	Content to be delivered to the user. "$code" string within the content will be replaced with the actual one-time-code to be sent.
defaultauthenticationgroup	<String>	Read-write	This is the group that is added to user sessions that match current IdP policy. It can be used in policies to identify relying party trust.
timeout	<Double>	Read-write	Time after which the code expires. Default value: 30
type	<String>	Read-write	Type of the email action. Default type is SMTP. Default value: SMTP Possible values = SMTP, ATHENA
emailaddress	<String>	Read-write	An optional expression that yields user's email. When not configured, user's default mail address would be used.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			When configured, result of this expression is used as destination email address.
__count	<Double>	Read-only	count parameter

```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationemailaction?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationemailaction":{

<b>"name":<String_value>,

</b>"content":true,

"defaultauthenticationgroup":true,

"timeout":true,

"type":true,

"emailaddress":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationemailaction

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationemailaction?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationemailaction?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationemailaction resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationemailaction?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationemailaction?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authenticationemailaction resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

authenticationnoauthaction

Configuration for no authentication action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new no-authentication action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
defaultauthentication group	<String>	Read-write	This is the group that is added to user sessions that match current policy.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnoauthaction

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationnoauthaction":{

<b>"name":<String_value>,

</b>"defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnoauthaction/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnoauthaction

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationnoauthaction":{

<b>"name":<String_value>,

</b>"defaultauthenticationgroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnoauthaction?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authenticationnoauthaction":{

<b>"name":<String_value>,

</b>"defaultauthenticationgroup":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnoauthaction

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnoauthaction?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnoauthaction?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authenticationnoauthaction resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authenticationnoauthaction?**view=summary**

authenticationpushservice

Configuration for Service details for sending push notifications resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the push service. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after the profile is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my push service" or 'my push service'). .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
clientid	<String>	Read-write	Unique identity for communicating with Citrix Push server in cloud. Minimum length = 1
clientsecret	<String>	Read-write	Unique secret for communicating with Citrix Push server in cloud. Minimum length = 1
customerid	<String>	Read-write	Customer id/name of the account in cloud that is used to create clientid/secret pair. Minimum length = 1
refreshinterval	<Double>	Read-write	Interval at which certificates or idtoken is refreshed. Default value: 50
Namespace	<String>	Read-only	This is fully qualified domain name of the notification service in the cloud. If omitted, namespace defaults to https://mfa.cloud.com/. Minimum length = 1 Maximum length = 63

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hubname	<String>	Read-only	Name of the hub within a namespace. This is used to classify different identities within a namespace. Minimum length = 1
servicekey	<String>	Read-only	Key to be used to compute signature necessary for registering to notification service. Minimum length = 1
servicekeyname	<String>	Read-only	Friendly name of the Key to be used to compute signature necessary for registering to notification service. Minimum length = 1
certendpoint	<String>	Read-only	URL of the endpoint that contains JWKs (Json Web Key) for JWT (Json Web Token) verification. This is used at cloud instance that offers push service.
pushservicestatus	<String>	Read-only	Describes status of push service. Default value: INIT Possible values = INIT, CERTFETCH, CCTOKEN, COMPLETE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trustservice	<String>	Read-only	URL of the service that generates tokens for cloud access. Minimum length = 1
pushcloudserverstatus	<String>	Read-only	Describes status of the cloud service that does push. Possible values = UP, DOWN
signingkeyname	<String>	Read-only	Friendly name of the Key to be used to compute signature necessary for accessing notification service. Minimum length = 1
signingkey	<String>	Read-only	Key to be used to compute signature necessary for accessing notification service. Minimum length = 1
__count	<Double>	Read-only	count parameter

Authorization

Authorization

Authorization configuration. Authorization services check which resources users are authorized to access, and grant permissions accordingly.

NAME	DESCRIPTION
authorizationaction	Configuration for authorization action
authorizationpolicy	Configuration for authorization policy
authorizationpolicy_aaagroup_binding	Binding object showing the aaagroup that can be bound to authorizationpolicy
authorizationpolicy_aaauser_binding	Binding object showing the aaauser that can be bound to authorizationpolicy
authorizationpolicy_authorizationpolicylabel_binding	Binding object showing the authorizationpolicylabel that can be bound to authorizationpolicy

NAME	DESCRIPTION
authorizationpolicy_binding	Binding object showing the resources that can be bound to authorizationpolicy
authorizationpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to authorizationpolicy
authorizationpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to authorizationpolicy
authorizationpolicylabel	Configuration for authorization policy label
authorizationpolicylabel_authorizationpolicy_binding	Binding object showing the authorizationpolicy that can be bound to authorizationpolicylabel
authorizationpolicylabel_binding	Binding object showing the resources that can be bound to authorizationpolicylabel

authorizationaction

Configuration for authorization action resource.

Properties

name	<String>	Read-write	Name for the new authorization policy. Must begin with a letter, number, or the underscore character (_), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the authorization policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authorization policy" or 'my authorization policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named rule, or an expression, that the policy uses to perform the authentication.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
action	<String>	Read-write	Action to perform if the policy matches: either allow or deny the request. Minimum length = 1
newname	<String>	Read-write	The new name of the author policy. Minimum length = 1
activepolicy	<Double>	Read-only	.
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced) . Possible values = Classic Policy, Advanced Policy
hits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authorizationpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authorizationpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authorizationpolicy":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authorizationpolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authorizationpolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authorizationpolicy": [ {

"name":<String_value>,
```

```
"rule":<String_value>,

"action":<String_value>,

"activepolicy":<Double_value>,

"expressiontype":<String_value>,

"hits":<Double_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy/name_value<String>?**attrs=property-name1,property-name2**
