csvserver_lbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of csvserver_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/csvserver_lbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the csvserver_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "csvserver_lbvserver_binding": [ {

"targetvserver":<String_value>,

"lbvserver":<String_value>,

"name":<String_value>,

"cookieipport":<String_value>,

"vserverid":<String_value>,

"hits":<Integer_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/csvserver_lbvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/csvserver_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "csvserver_lbvserver_binding": [ {

"targetvserver":<String_value>,

"lbvserver":<String_value>,

"name":<String_value>,

"cookieipport":<String_value>,

"vserverid":<String_value>,
```

```
"hits":<Integer_value>

}]}
```

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"csvserver_lbvserver_binding": [ { "__count": "#no"} ] }
```

csvserver_responderpolicy_binding

Binding object showing the responderpolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the content switching virtual server to which the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			content switching policy applies. Minimum length = 1
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver, resvserver, policylabel
priority	<Integer>	Read-write	Priority for the policy.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST, MQTT_JUMBO_REQ
labelname	<String>	Read-write	Name of the label invoked.
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1 -policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this parameter only in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			case of Content Switching policy bind operations to a CS vserver. Minimum length = 1
policyname	<String>	Read-write	Policies bound to this vserver.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag.
__count	<Double>	Read-write	count parameter

Operations

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

csvserver_tmtrafficpolicy_binding

Binding object showing the tmtrafficpolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
bindpoint	<String>	Read-write	Bind point at which policy needs to be bound. Note: Content switching policies are evaluated only at request time. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST, MQTT_JUMBO_REQ
labeltype	<String>	Read-write	Type of label to be invoked. Possible values = reqvserver,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resvserver, policylabel
priority	<Integer>	Read-write	Priority for the policy.
labelname	<String>	Read-write	Name of the label to be invoked.
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1 -policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this parameter only in case of Content Switching policy bind operations to a CS vserver. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke a policy label if this policy's rule evaluates to TRUE.
policyname	<String>	Read-write	Policies bound to this vserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-write	count parameter

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/csvserver_tmtrafficpolicy_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"csvserver_tmtrafficpolicy_binding":{

<b>"name":<String_value>,

</b>"policyname":<String_value>,

"targetlbvserver":<String_value>,

"priority":<Integer_value>,

"gotopriorityexpression":<String_value>,

"bindpoint":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/csvserver_tmtrafficpolicy_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ csvserver_tmtrafficpolicy_binding/ name_value<String> ? **args=policyname: <String_value> ,bindpoint: <String_value> ,priority: <Integer_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/csvserver_tmtrafficpolicy_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ csvserver_tmtrafficpolicy_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of csvserver_tmtrafficpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/csvserver_tmtrafficpolicy_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the csvserver_tmtrafficpolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "csvserver_tmtrafficpolicy_binding": [ {

"name":<String_value>,

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"csvserver_tmtrafficpolicy_binding": [ { "__count": "#no"} ] }
```

csvserver_transformpolicy_binding

Binding object showing the transformpolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the label invoked.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST, MQTT_JUMBO_REQ
labeltype	<String>	Read-write	The invocation type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = reqvserver, resvserver, policylabel
priority	<Integer>	Read-write	Priority for the policy.
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag.
policyname	<String>	Read-write	Policies bound to this vserver.
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1 -policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this parameter only in case of Content

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Switching policy bind operations to a CS vserver. Minimum length = 1
__count	<Double>	Read-write	count parameter

db

Db

All the commands associated with database user

NAME	DESCRIPTION
dbdbprofile	Configuration for DB profile

NAME	DESCRIPTION
dbuser	Configuration for DB user

dbdbprofile

Configuration for DB profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the database profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after the profile is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my profile" or 'my profile'). .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
interpretquery	<String>	Read-write	If ENABLED, inspect the query and update the connection information, if required. If DISABLED, forward the query to the server. Default value: YES Possible values = YES, NO
stickiness	<String>	Read-write	If the queries are related to each other, forward to the same backend server. Default value: NO Possible values = YES, NO
kcdaccount	<String>	Read-write	Name of the KCD account that is used for Windows authentication. Minimum length = 1 Maximum length = 127
conmultiplex	<String>	Read-write	Use the same server-side connection for multiple client-side

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requests. Default is enabled. Default value: ENABLED Possible values = ENABLED, DISABLED
enablecachingconmuxoff	<String>	Read-write	Enable caching when connection multiplexing is OFF. Default value: DISABLED Possible values = ENABLED, DISABLED
refcnt	<Integer>	Read-only	Profile Reference Count.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Response Payload:

```
{ "dbdbprofile": [ { "__count": "#no"} ] }
```

dbuser

Configuration for DB user resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name of the database user. Must be the same as the user name specified in the database. Minimum length = 1
password	<String>	Read-write	Password for logging on to the database. Must be the same as the password specified in the database. Minimum length = 1
loggedin	<Boolean>	Read-write	Display the names of all database users

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			currently logged on to the Citrix ADC.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/dbuser **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dbuser":{

<b>"username":<String_value>,

</b>"password":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/dbuser/ username_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/dbuser **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dbuser":{

<b>"username":<String_value>,

</b><b>"password":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dbuser **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/dbuser? **args=username: <String_value> ,loggedin: <Boolean_value>**

Use this query-parameter to get dbuser resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/dbuser? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/dbuser? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dbuser resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/dbuser? **view=summary**

Use this query-parameter to get the summary output of dbuser resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/dbuser? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dbuser resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dbuser": [ {

username:<String_value>,loggedin:<Boolean_value>"_nextgenapiresource":<Str
ing_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dbuser/ username_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/dbuser/ username_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/dbuser/ username_value<String> ? **view=summary**

Use this query-parameter to get the summary output of dbuser resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dbuser": [ {

username:<String_value>,loggedin:<Boolean_value>"_nextgenapiresource":<Str
ing_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/dbuser? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dbuser": [ { "__count": "#no"} ] }
```

dns

Domain Name Service

Domain Name Service(DNS) configuration.

NAME	DESCRIPTION
dnsaaaarec	Configuration for IPv6 address type record
dnsaction	Configuration for DNS action
dnsaction64	Configuration for dns64 action
dnsaddrec	Configuration for address type record
dnscaarec	Configuration for CAA record
dnscnamerec	Configuration for CNAME record
dnsdsfile	Configuration for dnskey dsfile
dnsglobal_binding	Binding object showing the resources that can be bound to dnsglobal
dnsglobal_dnspolicy_binding	Binding object showing the dnspolicy that can be bound to dnsglobal
dnskey	Configuration for dns key

NAME	DESCRIPTION
dnsmxrec	Configuration for MX record
dnsnameserver	Configuration for name server
dnsnaptrrec	Configuration for NAPTR record
dnsnegativecacherecords	Configuration for Negative Cache Records
dnsnsecrec	
dnsnsrec	Configuration for name server record
dnsparameter	Configuration for DNS parameter
dnspolicy	Configuration for DNS policy
dnspolicy64	Configuration for dns64 policy
dnspolicy64_binding	Binding object showing the resources that can be bound to dnspolicy64
dnspolicy64_lbvserver_binding	Binding object showing the lbvserver that can be bound to dnspolicy64
dnspolicy_binding	Binding object showing the resources that can be bound to dnspolicy
dnspolicy_dnsglobal_binding	Binding object showing the dnsglobal that can be bound to dnspolicy
dnspolicy_dnspolicylabel_binding	Binding object showing the dnspolicylabel that can be bound to dnspolicy
dnspolicylabel	Configuration for dns policy label
dnspolicylabel_binding	Binding object showing the resources that can be bound to dnspolicylabel

NAME	DESCRIPTION
dnspolicylabel_dnspolicy_binding	Binding object showing the dnspolicy that can be bound to dnspolicylabel
dnspolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to dnspolicylabel
dnsprofile	Configuration for DNS profile
dnsproxyrecords	Configuration for proxy record
dnsptrrec	Configuration for PTR record
dnsresolverentry	Configuration for Active DNS resolution entries
dnssoarec	Configuration for SOA record
dnssrvrec	Configuration for server record
dnssubnetcache	Configuration for subnet cache
dnssuffix	Configuration for DNS suffix
dnssvcbrec	Configuration for SVCB/HTTPS service binding record
dnstxtrec	Configuration for TXT record
dnsview	Configuration for DNS view
dnsview_binding	Binding object showing the resources that can be bound to dnsview
dnsview_dnspolicy_binding	Binding object showing the dnspolicy that can be bound to dnsview
dnsview_gslbservice_binding	Binding object showing the gslbservice that can be bound to dnsview

NAME	DESCRIPTION
dnszone	Configuration for DNS zone
dnszone_binding	Binding object showing the resources that can be bound to dnszone
dnszone_dnskey_binding	Binding object showing the dnskey that can be bound to dnszone
dnszone_domain_binding	Binding object showing the domain that can be bound to dnszone

dnsaaaarec

Configuration for IPv6 address type record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hostname	<String>	Read-write	Domain name. Minimum length = 1
ipv6address	<String>	Read-write	One or more IPv6 addresses to assign to the domain name. Minimum length = 1
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached records need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
vservername	<String>	Read-only	Vitual server name.
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

dnsaction

Configuration for DNS action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
actionname	<String>	Read-write	Name of the dns action.
actiontype	<String>	Read-write	The type of DNS action that is being configured. Possible values = ViewName, GslbPrefLoc, noop, Drop, Cache_Bypass, Rewrite_Response
ipaddress	<String[]>	Read-write	List of IP address to be returned in case of rewrite_response actiontype. They can be of IPV4 or IPV6 type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			In case of set command We will remove all the IP address previously present in the action and will add new once given in set dns action command.
ttl	<Integer>	Read-write	Time to live, in seconds. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
viewname	<String>	Read-write	The view name that must be used for the given action.
preferredloclist	<String[]>	Read-write	The location list in priority order used for the given action. Minimum length = 1
dnsprofilename	<String>	Read-write	Name of the DNS profile to be associated with the transaction for which the action is chosen. Minimum length = 1 Maximum length = 127
drop	<String>	Read-only	The dns packet must be dropped.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
cachebypass	<String>	Read-only	By pass dns cache for this. Possible values = YES, NO
builtin	<String[]>	Read-only	Flag to determine whether DNS action is default or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

dnsaddrec

Configuration for address type record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hostname	<String>	Read-write	Domain name. Minimum length = 1
ipaddress	<String>	Read-write	One or more IPv4 addresses to assign to the domain name. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ecssubnet	<String>	Read-write	Subnet for which the cached address records need to be removed.
type	<String>	Read-write	The address record type. The type can take 3 values: ADNS - If this is specified, all of the authoritative address records will be displayed. PROXY - If this is specified, all of the proxy address records will be displayed. ALL - If this is specified, all of the address records will be displayed. Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
vservername	<String>	Read-only	Vitual server name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsaddrec **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dnsaddrec":{

<b>"hostname":<String_value>,

</b><b>"ipaddress":<String_value>,

</b>"ttl":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsaddrec/ hostname_value<String> **Query-parameters: args=ecssubnet: <String_value> ,ipaddress: <String_value>**
get (all)
URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsaddrec **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/dnsaddrec? **args=hostname: <String_value> ,type: <String_value> ,nodeid: <Integer_value>**

Use this query-parameter to get dnsaddrec resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/dnsaddrec? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/dnsaddrec? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dnsaddrec resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/dnsaddrec? **view=summary**

Use this query-parameter to get the summary output of dnsaddrec resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnsaddrec? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnsaddrec resources in chunks.

HTTP Method: GET

Request Headers:

dnscaarec

Configuration for CAA record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name of the CAA record. Minimum length = 1
valuestring	<String>	Read-write	Value associated with the chosen property tag in the CAA resource record. Enclose the string in single or double quotation marks. Minimum length = 1
tag	<String>	Read-write	String that represents the identifier of the property represented by the CAA record. The RFC currently defines three available tags - issue, issuwild and iodef. Default value: "issue"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 255
flag	<String>	Read-write	Flag associated with the CAA record. Default value: 5 Possible values = NONE, CRITICAL
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
recordid	<Integer>	Read-write	Unique, internally generated record ID. View the details of the CAA record to obtain its record ID. Records can be removedby either specifying the domain name and record id OR by specifying domain name and all other CAA record attributes as was supplied during the add command. Minimum value = 1 Maximum value = 65535
ecssubnet	<String>	Read-write	Subnet for which the cached CAA record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Default value: ADNS Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Use this query-parameter to get the summary output of dnscnamerec resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnscnamerec": [ {

aliasname:<String_value>,type:<String_value>,nodeid:<Integer_value>"canoni
calname":<String_value>,

"ttl":<Integer_value>,

"vservername":<String_value>,

"authtype":<String_value>,

"ecssubnet":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

count

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnscnamerec? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnscnamerec": [ { "__count": "#no"} ] }
```

dnsdsfile

Configuration for dnskey dsfile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyname	<String>	Read-write	Name of the DNS key. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsdsfile **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/dnsdsfile? **args=keyname: <String_value>**

Use this query-parameter to get dnsdsfile resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnsdsfile": [ {

keyname:<String_value>"_nextgenapiresource":<String_value>

}]}
```

dnsglobal_binding

Binding object which returns the resources bound to dnsglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dnsglobal_dnspolicy_binding	<dnsglobal_dnspolicy_binding[]>	Read-write	dnspolicy that can be bound to dnsglobal.

Operations

(click to see Properties)

- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnsglobal_binding": [ {

"dnsglobal_dnspolicy_binding":<dnsglobal_dnspolicy_binding[]_value>

}]}
```

dnsglobal_dnspolicy_binding

Binding object showing the dnspolicy that can be bound to dnsglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of global bind point for which to show bound policies. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label. Minimum length = 1
invoke	<Boolean>	Read-write	Invoke flag.
policyname	<String>	Read-write	Name of the dns policy.
globalbindtype	<String>	Read-write	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL, APPFW_GLOBAL, TM_GLOBAL
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = policylabel
priority	<Integer>	Read-write	Specifies the priority of the policy with which it is bound. Maximum allowed priority should be less than 65535.
labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE.
flowtype	<Integer>	Read-only	flowtype of the bound rewrite policy.
numpol	<Integer>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

```

dnskey

Configuration for dns key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyname	<String>	Read-write	Name of the public-private key pair to publish in the zone. Minimum length = 1
publickey	<String>	Read-write	File name of the public key.
privatekey	<String>	Read-write	File name of the private key.
expires	<Integer>	Read-write	Time period for which to consider the key valid, after the key is used to sign a zone. Default value: 120 Minimum value = 1 Maximum value = 32767
units1	<String>	Read-write	Units for the expiry period. Default value: DAYS Possible values = MINUTES, HOURS, DAYS
notificationperiod	<Integer>	Read-write	Time at which to generate notification

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of key expiration, specified as number of days, hours, or minutes before expiry. Must be less than the expiry period. The notification is an SNMP trap sent to an SNMP manager. To enable the appliance to send the trap, enable the DNSKEY-EXPIRY SNMP alarm. In case autorollover option is enabled, rollover for successor key will be intiated at this time. No notification trap will be sent. Default value: 7 Minimum value = 1 Maximum value = 32767
units2	<String>	Read-write	Units for the notification period. Default value: DAYS Possible values = MINUTES, HOURS, DAYS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the DNSKEY resource record created in the zone. TTL is the time for which the record must be cached by the DNS proxies. If the TTL is not specified, either the DNS zone's minimum TTL or the default value of 3600 is used. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
password	<String>	Read-write	Passphrase for reading the encrypted public/ private DNS keys. Minimum length = 1
autorollover	<String>	Read-write	Flag to enable/ disable key rollover automatically. Note: * Key name will be appended with _AR1 for successor key. For e.g. current key=k1, successor key=k1_AR1.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Key name can be truncated if current name length is more than 58 bytes to accomodate the suffix. Default value: DISABLED Possible values = ENABLED, DISABLED
rollovermethod	<String>	Read-write	Method used for automatic rollover. * Key type: ZSK, Method: PrePublication or DoubleSignature. * Key type: KSK, Method: DoubleRRSet. Possible values = PrePublication, DoubleSignature, DoubleRRSet
revoke	<Boolean>	Read-write	Revoke the key. Note: This operation is non-reversible.
zonename	<String>	Read-write	Name of the zone for which to create a key. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keytype	<String>	Read-write	Type of key to create. Default value: ZSK Possible values = KSK, KeySigningKey, ZSK, ZoneSigningKey
algorithm	<String>	Read-write	Algorithm to generate the key. Default value: NS_DNSKEYALGO_RSASHA1 Possible values = RSASHA1, RSASHA256, RSASHA512
keysize	<Integer>	Read-write	Size of the key, in bits. Default value: 512 Minimum value = 1 Maximum value = 4096
filenameprefix	<String>	Read-write	Common prefix for the names of the generated public and private key files and the Delegation Signer (DS) resource record. During key generation, the .key, .private, and .ds suffixes are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			appended automatically to the file name prefix to produce the names of the public key, the private key, and the DS record, respectively. Minimum length = 1 Maximum length = 55
src	<String>	Read-write	URL (protocol, host, path, and file name) from where the DNS key file will be imported. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. This is a mandatory argument. Minimum length = 1 Maximum length = 2047
state	<String>	Read-only	Current key state. Default value: Created Possible values = Created, Activated, Deactivated, Revoked

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-only	Key type. Default value: ZSK Possible values = KSK, KeySigningKey, ZSK, ZoneSigningKey
tag	<Integer>	Read-only	Key tag/ID. Default value: 0
createtimestr	<String>	Read-only	Key creation time. Default value: 0
activationtimestr	<String>	Read-only	Key activation time. Default value: 0
expirytimestr	<String>	Read-only	Key expiry time. Default value: 0
deletiontimestr	<String>	Read-only	Key deletion time if autorollover option is enabled. Default value: 0
rolloverfailrc	<Integer>	Read-only	Reason code in case rollover event failed. Default value: 0
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnskey **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

```

dnsmxrec

Configuration for MX record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name for which to add the MX record. Minimum length = 1
mx	<String>	Read-write	Host name of the mail exchange server. Minimum length = 1
pref	<Integer>	Read-write	Priority number to assign to the mail exchange server. A domain name can have multiple mail servers, with a priority number assigned to each server. The lower the priority number, the higher the mail server's priority. When other mail servers have to deliver mail to the specified domain, they begin with the mail server with the lowest priority number, and use other configured mail servers, in priority order, as backups. Minimum value = 0 Maximum value = 65535
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached MX record need to be removed.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Default value: ADNS Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Record type. Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dnsmxrec":{

<b>"domain":<String_value>,

</b><b>"mx":<String_value>,

</b><b>"pref":<Integer_value>,

</b>"ttl":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec/ domain_value<String> **Query-parameters: args= mx:<String_value>, ecssubnet: <String_value>**
update
URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dnsmxrec":{

<b>"domain":<String_value>,
```

```
</b><b>"mx":<String_value>,

</b>"pref":<Integer_value>,

"ttl":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

unset

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dnsmxrec":{

<b>"domain":<String_value>,

</b><b>"mx":<String_value>,

</b>"ttl":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

get (all)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec? **args=domain: <String_value> ,type: <String_value> ,nodeid: <Integer_value>**

Use this query-parameter to get dnsmxrec resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dnsmxrec resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec? **view=summary**

Use this query-parameter to get the summary output of dnsmxrec resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnsmxrec? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnsmxrec resources in chunks.

HTTP Method: GET

Request Headers:

dnsnameserver

Configuration for name server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ip	<String>	Read-write	IP address of an external name server or, if the Local parameter is set, IP address of a local DNS server (LDNS). Minimum length = 1
dnsvservername	<String>	Read-write	Name of a DNS virtual server. Overrides any IP address-based name servers configured on the Citrix ADC. Minimum length = 1
local	<Boolean>	Read-write	Mark the IP address as one that belongs to a local recursive DNS server on the Citrix ADC. The appliance recursively resolves queries received on an IP address that is marked as being

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			local. For recursive resolution to work, the global DNS parameter, Recursion, must also be set. From 14.1 47.x build , it is recommended to use ADNS and ADNS_TCP service and associating a DNS profile with recursiveResolution parameter enabled to achieve the same functionality.
state	<String>	Read-write	Administrative state of the name server. Default value: ENABLED Possible values = ENABLED, DISABLED
type	<String>	Read-write	Protocol used by the name server. UDP_TCP is not valid if the name server is a DNS virtual server configured on the appliance. Default value: UDP Possible values = UDP, TCP, UDP_TCP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dnsprofilename	<String>	Read-write	Name of the DNS profile to be associated with the name server. Minimum length = 1
servicename	<String>	Read-only	The name of the dns vserver.
port	<Integer>	Read-only	Port of the service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
nameserverstate	<String>	Read-only	State of the server. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
clmonowner	<Integer>	Read-only	Tells the mon owner of the service.
clmonview	<Integer>	Read-only	Tells the view id by which state of the service is updated.
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

dnsnaptrrec

Configuration for NAPTR record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Name of the domain for the NAPTR record. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
order	<Integer>	Read-write	An integer specifying the order in which the NAPTR records MUST be processed in order to accurately represent the ordered list of Rules. The ordering is from lowest to highest. Minimum value = 0 Maximum value = 65535
preference	<Integer>	Read-write	An integer specifying the preference of this NAPTR among NAPTR records having same order. lower the number, higher the preference. Minimum value = 0 Maximum value = 65535
flags	<String>	Read-write	flags for this NAPTR. Maximum length = 255
services	<String>	Read-write	Service Parameters applicable to this delegation path. Maximum length = 255
regexp	<String>	Read-write	The regular expression, that specifies the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			substitution expression for this NAPTR. Maximum length = 255
replacement	<String>	Read-write	The replacement domain name for this NAPTR. Maximum length = 255
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
recordid	<Integer>	Read-write	Unique, internally generated record ID. View the details of the naptr record to obtain its record ID. Records can be removed by either specifying the domain name and record id OR by specifying domain name and all other naptr record attributes as was supplied during the add command. Minimum value = 1 Maximum value = 65535
ecssubnet	<String>	Read-write	Subnet for which the cached NAPTR record need to be removed.
type	<String>	Read-write	Type of records to display. Available

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Default value: ADNS Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
vservername	<String>	Read-only	Virtual server name.
_nextgenapiresource	<String>	Read-only	.

dnsnegativecacherecords

Configuration for Negative Cache Records resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 31
hostname	<String>	Read-only	Domain name. Minimum length = 1
negcachetype	<String>	Read-only	negative cache record type. Possible values = NODATA, NXDOMAIN, CNAME-REFERRAL
rdclient	<String>	Read-only	cname referral type. Possible values = YES, NO, NA
querytype	<String>	Read-only	DNS query type. Possible values = A, NS, CNAME, SOA, MX, AAAA, SRV, RRSIG, NSEC, DNSKEY, PTR, TXT, NAPTR, CAA, SVCB, HTTPS
ttl	<Integer>	Read-only	Time to Live (TTL), in seconds, for the record. Default value: 3600 Minimum value = 0 Maximum value = 2147483647

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ecssubnet	<String>	Read-only	Subnet for which this particular record is cached. Subnet caching will occur for responses with EDNS Client Subnet (ECS) option. Applies to resource records obtained through proxy configurations only.
peid	<Integer>	Read-only	PE where the cache is stored. Minimum value = 0 Maximum value = 32
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsnegativecacherecords **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/dnsnegativecacherecords? **args=nodeid: <Integer_value>**

Use this query-parameter to get dnsnegativecacherecords resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/dnsnegativecacherecords? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/dnsnegativecacherecords? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dnsnegativecacherecords resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/dnsnegativecacherecords? **view=summary**

Use this query-parameter to get the summary output of dnsnegativecacherecords resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnsnegativecacherecords? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnsnegativecacherecords resources in chunks.

dnsnsrec

Configuration for name server record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name. Minimum length = 1
nameserver	<String>	Read-write	Host name of the name server to add to the domain. Minimum length = 1
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached name server record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Record type. Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

dnsparameter

Configuration for DNS parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
retries	<Integer>	Read-write	Maximum number of retry attempts when no response is received for a query sent to a name server. Applies to end resolver and forwarder configurations. Default value: 5 Minimum value = 1 Maximum value = 5
minttl	<Integer>	Read-write	Minimum permissible time to live (TTL) for all records cached in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the DNS cache by DNS proxy, end resolver, and forwarder configurations. If the TTL of a record that is to be cached is lower than the value configured for minTTL, the TTL of the record is set to the value of minTTL before caching. When you modify this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed. Minimum value = 0 Maximum value = 604800
maxttl	<Integer>	Read-write	Maximum time to live (TTL) for all records cached in the DNS cache by DNS proxy, end resolver, and forwarder configurations. If the TTL of a record that is to be cached is higher than the value configured for maxTTL, the TTL of the record is set to the value of maxTTL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			before caching. When you modify this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed. Default value: 604800 Minimum value = 1 Maximum value = 604800
cacherecords	<String>	Read-write	Cache resource records in the DNS cache. Applies to resource records obtained through proxy configurations only. End resolver and forwarder configurations always cache records in the DNS cache, and you cannot disable this behavior. When you disable record caching, the appliance stops caching server responses. However, cached records are not flushed. The appliance does not serve requests from

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the cache until record caching is enabled again. Default value: YES Possible values = YES, NO
namelookuppriority	<String>	Read-write	Type of lookup (DNS or WINS) to attempt first. If the first-priority lookup fails, the second-priority lookup is attempted. Used only by the SSL VPN feature. Default value: WINS Possible values = WINS, DNS
recursion	<String>	Read-write	Function as an end resolver and recursively resolve queries for domains that are not hosted on the Citrix ADC. Also resolve queries recursively when the external name servers configured on the appliance (for a forwarder configuration) are unavailable. When external name servers are unavailable, the appliance queries a root server and resolves the request

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			recursively, as it does for an end resolver configuration. This parameter will be effective only for queries recieved on nameserver with local flag. To enable recursion for queries recieved through ADNS service , CS vserver and LB vserver it is recommended to use recursiveResolution parameter on DNS profile. Default value: DISABLED Possible values = ENABLED, DISABLED
resolutionorder	<String>	Read-write	Type of DNS queries (A, AAAA, or both) to generate during the routine functioning of certain Citrix ADC features, such as SSL VPN, cache redirection, and the integrated cache. The queries are sent to the external name servers that are configured for the forwarder function. If you specify both query types, you can

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			also specify the order. Available settings function as follows: * OnlyAQuery. Send queries for IPv4 address records (A records) only. * OnlyAAAAQuery. Send queries for IPv6 address records (AAAA records) instead of queries for IPv4 address records (A records). * AThenAAAAQuery. Send a query for an A record, and then send a query for an AAAA record if the query for the A record results in a NODATA response from the name server. * AAAAThenAQuery. Send a query for an AAAA record, and then send a query for an A record if the query for the AAAA record results in a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NODATA response from the name server. Default value: OnlyAQuery Possible values = OnlyAQuery, OnlyAAAAQuery, AThenAAAAQuery, AAAAThenAQuery
dnssec	<String>	Read-write	Enable or disable the Domain Name System Security Extensions (DNSSEC) feature on the appliance. Note: Even when the DNSSEC feature is enabled, forwarder configurations (used by internal Citrix ADC features such as SSL VPN and Cache Redirection for name resolution) do not support the DNSSEC OK (DO) bit in the EDNS0 OPT header. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxpipeline	<Integer>	Read-write	Maximum number of concurrent DNS requests to allow on a single client connection, which is identified by the <clientip:port>-<vserver ip:port> tuple. A value of 0 (zero) applies no limit to the number of concurrent DNS requests allowed on a single client connection.
dnsrootreferral	<String>	Read-write	Send a root referral if a client queries a domain name that is unrelated to the domains configured/cached on the Citrix ADC. If the setting is disabled, the appliance sends a blank response instead of a root referral. Applicable to domains for which the appliance is authoritative. Disable the parameter when the appliance is under attack from a client that is sending a flood of queries for unrelated domains. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dns64timeout	<Integer>	Read-write	While doing DNS64 resolution, this parameter specifies the time to wait before sending an A query if no response is received from backend DNS server for AAAA query. Minimum value = 0 Maximum value = 10000
ecsmaxsubnets	<Integer>	Read-write	Maximum number of subnets that can be cached corresponding to a single domain. Subnet caching will occur for responses with EDNS Client Subnet (ECS) option. Caching of such responses can be disabled using DNS profile settings. A value of zero indicates that the number of subnets cached is limited only by existing memory constraints. The default value is zero.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 1280
maxnegcachettl	<Integer>	Read-write	Maximum time to live (TTL) for all negative records (NXDONAIN and NODATA) cached in the DNS cache by DNS proxy, end resolver, and forwarder configurations. If the TTL of a record that is to be cached is higher than the value configured for maxnegcacheTTL, the TTL of the record is set to the value of maxnegcacheTTL before caching. When you modify this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed. Default value: 604800 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 604800
cachehitbypass	<String>	Read-write	This parameter is applicable only in proxy mode and if this parameter is enabled we will forward all the client requests to the backend DNS server and the response served will be cached on Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
maxcachesize	<Integer>	Read-write	Maximum memory, in megabytes, that can be used for dns caching per Packet Engine.
resolvermaxactiveresolutions	<Integer>	Read-write	Maximum number of active concurrent DNS resolutions per Packet Engine. Default value: 0
resolvermaxtcpconnections	<Integer>	Read-write	Maximum DNS-TCP connections opened for recursive resolution per Packet Engine.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 1000 Minimum value = 1
resolvermaxtcptimeout	<Integer>	Read-write	Maximum wait time in seconds for the response on DNS-TCP connection for recursive resolution per Packet Engine. Default value: 5 Minimum value = 1 Maximum value = 120
maxnegativecachesize	<Integer>	Read-write	Maximum memory, in megabytes, that can be used for caching of negative DNS responses per packet engine.
cachenoexpire	<String>	Read-write	If this flag is set to YES, the existing entries in cache do not age out. On reaching the max limit the cache records are frozen. Default value: DISABLED Possible values = ENABLED, DISABLED
splitpktqueryprocessing	<String>	Read-write	Processing requests split across multiple packets.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ALLOW Possible values = ALLOW, DROP
cacheecszeroprefix	<String>	Read-write	Cache ECS responses with a Scope Prefix length of zero. Such a cached response will be used for all queries with this domain name and any subnet. When disabled, ECS responses with Scope Prefix length of zero will be cached, but not tied to any subnet. This option has no effect if caching of ECS responses is disabled in the corresponding DNS profile. Default value: ENABLED Possible values = ENABLED, DISABLED
maxudppacketsize	<Integer>	Read-write	Maximum UDP packet size that can be handled by Citrix ADC. This is the value advertised by Citrix ADC when responding as an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authoritative server and it is also used when Citrix ADC queries other name servers as a forwarder. When acting as a proxy, requests from clients are limited by this parameter - if a request contains a size greater than this value in the OPT record, it will be replaced. Default value: 1280 Minimum value = 512 Maximum value = 16384
zonetransfer	<String>	Read-write	Flag to enable/ disable DNS zones configuration transfer to remote GSLB site nodes. Default value: DISABLED Possible values = ENABLED, DISABLED
autosavekeyops	<String>	Read-write	Flag to enable/ disable saving of rollover operations executed

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			automatically to avoid config loss. Applicable only when autorollover option is enabled on a key. Note: when you enable this, full configuration will be saved. Default value: DISABLED Possible values = ENABLED, DISABLED
nxdomainratelimitthreshold	<Integer>	Read-write	Rate limit threshold for Non-Existant domain (NXDOMAIN) responses generated from Citrix ADC. Once the threshold is breached , DNS queries leading to NXDOMAIN response will be dropped. This threshold will not be applied for NXDOMAIN responses got from the backend. The threshold will be applied per packet engine and per second.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
builtin	<String[]>	Read-only	Flag to determine if dns param is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
nxdomainthresholdcrossed	<Integer>	Read-only	Number of times requests has been dropped as number of DNS queries leading to NXDOMAIN response has crossed the threshold.
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsparameter **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dnsparameter":{

dnspolicy

Configuration for DNS policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DNS policy.
rule	<String>	Read-write	Expression against which DNS traffic is evaluated. Note: * On the command line interface, if the expression includes blank spaces, the entire expression must be enclosed in double quotation marks. * If the expression itself includes double quotation marks, you must escape the quotations by using the character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks. Example: CLIENT.UDP.DNS.DOMAIN.EQ("domainname").

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viewname	<String>	Read-write	The view name that must be used for the given policy.
preferredlocation	<String>	Read-write	The location used for the given policy. This is deprecated attribute. Please use -prefLocList.
preferredloclist	<String[]>	Read-write	The location list in priority order used for the given policy. Minimum length = 1
drop	<String>	Read-write	The dns packet must be dropped. Possible values = YES, NO
cachebypass	<String>	Read-write	By pass dns cache for this. Possible values = YES, NO
actionname	<String>	Read-write	Name of the DNS action to perform when the rule evaluates to TRUE. The built in actions function as follows: * dns_default_act_Drop. Drop the DNS request. * dns_default_act_Cachebypass. Bypass the DNS cache and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			forward the request to the name server. You can create custom actions by using the add dns action command in the CLI or the DNS > Actions > Create DNS Action dialog box in the Citrix ADC configuration utility.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
hits	<Integer>	Read-only	The number of times the policy has been hit.
undefhits	<Integer>	Read-only	Number of Undef hits.
description	<String>	Read-only	Description of the policy.
builtin	<String[]>	Read-only	Flag to determine whether DNS policy is default or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

dnspolicy64_binding

Binding object which returns the resources bound to dnspolicy64.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the DNS64 policy.
dnspolicy64_lbvserver_binding	<dnspolicy64_lbvserver_binding[]>	Read-only	lbvserver that can be bound to dnspolicy64.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy64_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnspolicy64_binding": [ {

"name":<String_value>,

"dnspolicy64_lbvserver_binding":<dnspolicy64_lbvserver_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy64_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy64_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnspolicy64_binding": [ {

"name":<String_value>,

"dnspolicy64_lbvserver_binding":<dnspolicy64_lbvserver_binding[]_value>

}]}
```

dnspolicy64_lbvserver_binding

Binding object showing the lbvserver that can be bound to dnspolicy64.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the DNS64 policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
priority	<Integer>	Read-only	Specifies the priority of the policy.
__count	<Double>	Read-only	count parameter

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy64_lbvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ dnspolicy64_lbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of dnspolicy64_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy64_lbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnspolicy64_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnspolicy64_lbvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"gotopriorityexpression":<String_value>,

"priority":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy64_lbvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy64_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnspolicy64_lbvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"gotopriorityexpression":<String_value>,

"priority":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy64_lbvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"dnspolicy64_lbvserver_binding": [ { "__count": "#no"} ] }
```

dnspolicy_binding

Binding object which returns the resources bound to dnspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the DNS policy.
dnspolicy_dnspolicylabel_binding	<dnspolicy_dnspolicylabel_binding[]>	Read-only	dnspolicylabel that can be bound to dnspolicy.
dnspolicy_dnsglobal_binding	<dnspolicy_dnsglobal_binding[]>	Read-only	dnsglobal that can be bound to dnspolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnspolicy_binding": [ {

"name":<String_value>,
```

```
"dnspolicy_dnspolicylabel_binding":<dnspolicy_dnspolicylabel_binding[]_val
ue>,

"dnspolicy_dnsglobal_binding":<dnspolicy_dnsglobal_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/dnspolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnspolicy_binding": [ {

"name":<String_value>,

"dnspolicy_dnspolicylabel_binding":<dnspolicy_dnspolicylabel_binding[]_value>,

"dnspolicy_dnsglobal_binding":<dnspolicy_dnsglobal_binding[]_value>

}]}
```

dnspolicy_dnsglobal_binding

Binding object showing the dnsglobal that can be bound to dnspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the DNS policy.
priority	<Integer>	Read-only	Specifies the priority of the policy.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

Operations

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/dnspolicylabel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnspolicylabel_binding": [ {

"labelname":<String_value>,

"dnspolicylabel_policybinding_binding":<dnspolicylabel_policybinding_binding[]_value>,

"dnspolicylabel_dnspolicy_binding":<dnspolicylabel_dnspolicy_binding[]_value>

}]}
```

dnspolicylabel_dnspolicy_binding

Binding object showing the dnspolicy that can be bound to dnspolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the dns policy label.
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = policylabel
priority	<Integer>	Read-write	Specifies the priority of the policy.
policyname	<String>	Read-write	The dns policy name.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag.
invoke_labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-write	count parameter

Operations

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/dnspolicylabel_dnspolicy_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"dnspolicylabel_dnspolicy_binding":{
```

```
<b>"labelname":<String_value>,

</b><b>"policyname":<String_value>,

</b><b>"priority":<Integer_value>,

</b>"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"invoke_labelname":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnspolicylabel_dnspolicy_binding/ labelname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ dnspolicylabel_dnspolicy_binding/ labelname_value<String> ? **args= policyname:<String_value>, priority: <Integer_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnspolicylabel_dnspolicy_binding/ labelname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/

dnspolicylabel_dnspolicy_binding/ labelname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of dnspolicylabel_dnspolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnspolicylabel_dnspolicy_binding/ labelname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnspolicylabel_dnspolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnspolicylabel_dnspolicy_binding": [ {

"labelname":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>,

```
{"dnspolicylabel_policybinding_binding": [ { "__count": "#no"} ] }
```

dnsprofile

Configuration for DNS profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dnsprofilename	<String>	Read-write	Name of the DNS profile. Minimum length = 1 Maximum length = 127
recursiveresolution	<String>	Read-write	DNS recursive resolution; if enabled, will do recursive resolution for DNS query when the profile is associated with ADNS service, CS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Vserver and DNS action. Default value: DISABLED Possible values = ENABLED, DISABLED
dnsquerylogging	<String>	Read-write	DNS query logging; if enabled, DNS query information such as DNS query id, DNS query flags , DNS domain name and DNS query type will be logged. Default value: DISABLED Possible values = ENABLED, DISABLED
dnsanswersecloggin g	<String>	Read-write	DNS answer section; if enabled, answer section in the response will be logged. Default value: DISABLED Possible values = ENABLED, DISABLED
dnsextendedlogging	<String>	Read-write	DNS extended logging; if enabled, authority and additional section in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the response will be logged. Default value: DISABLED Possible values = ENABLED, DISABLED
dnserrorlogging	<String>	Read-write	DNS error logging; if enabled, whenever error is encountered in DNS module reason for the error will be logged. Default value: DISABLED Possible values = ENABLED, DISABLED
cacherecords	<String>	Read-write	Cache resource records in the DNS cache. Applies to resource records obtained through proxy configurations only. End resolver and forwarder configurations always cache records in the DNS cache, and you cannot disable this behavior. When you disable record caching, the appliance stops caching server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			responses. However, cached records are not flushed. The appliance does not serve requests from the cache until record caching is enabled again. Default value: ENABLED Possible values = ENABLED, DISABLED
cachenegativerespo nses	<String>	Read-write	Cache negative responses in the DNS cache. When disabled, the appliance stops caching negative responses except referral records. This applies to all configurations - proxy, end resolver, and forwarder. However, cached responses are not flushed. The appliance does not serve negative responses from the cache until this parameter is enabled again. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dropmultiqueryrequest	<String>	Read-write	Drop the DNS requests containing multiple queries. When enabled, DNS requests containing multiple queries will be dropped. In case of proxy configuration by default the DNS request containing multiple queries is forwarded to the backend and in case of ADNS and Resolver configuration NOCODE error response will be sent to the client. Default value: DISABLED Possible values = ENABLED, DISABLED
cacheecsresponses	<String>	Read-write	Cache DNS responses with EDNS Client Subnet(ECS) option in the DNS cache. When disabled, the appliance stops caching responses with ECS option.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This is relevant to proxy configuration. Enabling/disabling support of ECS option when Citrix ADC is authoritative for a GSLB domain is supported using a knob in GSLB vserver. In all other modes, ECS option is ignored. Default value: DISABLED Possible values = ENABLED, DISABLED
insertecs	<String>	Read-write	Insert ECS Option on DNS query. Default value: DISABLED Possible values = ENABLED, DISABLED
replaceecs	<String>	Read-write	Replace ECS Option on DNS query. Default value: DISABLED Possible values = ENABLED, DISABLED
maxcacheableecsprefixlength	<Integer>	Read-write	The maximum ecs prefix length that will be cached.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 32 Minimum value = 0 Maximum value = 32
maxcacheableecsprefixlength6	<Integer>	Read-write	The maximum ecs prefix length that will be cached for IPv6 subnets. Default value: 128 Minimum value = 0 Maximum value = 128
referencecount	<Integer>	Read-only	Number of entities using this profile.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

dnsproxyrecords

Configuration for proxy record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Filter the DNS records to be flushed.e.g flush dns proxyRecords -type A will flush only the A records from the cache. . Possible values = A, NS, CNAME, SOA, MX, AAAA, SRV, RRSIG, NSEC, DNSKEY, PTR, TXT, NAPTR, CAA, SVCB, HTTPS
negrectype	<String>	Read-write	Filter the Negative DNS records i.e NXDOMAIN and NODATA entries to be flushed. e.g flush dns proxyRecords

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NXDOMAIN will flush only the NXDOMAIN entries from the cache. Possible values = NXDOMAIN, NODATA

Operations

(click to see Properties)

- FLUSH

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsproxyrecords? **action=flush HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dnsproxyrecords":{

"type":<String_value>,

"negrectype":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

dnsptrrec

Configuration for PTR record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reversedomain	<String>	Read-write	Reversed domain name representation of the IPv4 or IPv6 address for which to create the PTR record. Use the "in-addr.arpa." suffix for IPv4 addresses and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the "ip6.arpa." suffix for IPv6 addresses. Minimum length = 1
domain	<String>	Read-write	Domain name for which to configure reverse mapping. Minimum length = 1
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached PTR record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsptrrec **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dnsptrrec":{

<b>"reversedomain":<String_value>,

</b><b>"domain":<String_value>,

</b>"ttl":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsptrrec/ reversedomain_value<String>

dnssoarec

Configuration for SOA record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name for which to add the SOA record. Minimum length = 1
originserver	<String>	Read-write	Domain name of the name server that responds authoritatively for the domain. Minimum length = 1
contact	<String>	Read-write	Email address of the contact to whom domain issues can be addressed. In the email address, replace the @ sign with a period (.). For example, enter domainadmin.example.com instead of domainadmin@example.com. Minimum length = 1
serial	<Integer>	Read-write	The secondary server uses this parameter to determine whether it

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requires a zone transfer from the primary server. Default value: 100 Minimum value = 0 Maximum value = 4294967294
refresh	<Integer>	Read-write	Time, in seconds, for which a secondary server must wait between successive checks on the value of the serial number. Default value: 3600 Minimum value = 0 Maximum value = 4294967294
retry	<Integer>	Read-write	Time, in seconds, between retries if a secondary server's attempt to contact the primary server for a zone refresh fails. Default value: 3 Minimum value = 0 Maximum value = 4294967294
expire	<Integer>	Read-write	Time, in seconds, after which the zone data on a secondary name server can no longer be considered

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authoritative because all refresh and retry attempts made during the period have failed. After the expiry period, the secondary server stops serving the zone. Typically one week. Not used by the primary server. Default value: 3600 Minimum value = 0 Maximum value = 4294967294
minimum	<Integer>	Read-write	Default time to live (TTL) for all records in the zone. Can be overridden for individual records. Default value: 5 Minimum value = 0 Maximum value = 2147483647
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached SOA record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Record type. Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

dnssrvrec

Configuration for server record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name, which, by convention, is prefixed by the symbolic name of the desired service and the symbolic name of the desired protocol, each with an underscore (_) prepended. For example, if an SRV-aware client wants to discover a SIP service that is provided over UDP, in the domain example.com, the client performs a lookup for _sip._udp.example.com. Minimum length = 1
target	<String>	Read-write	Target host for the specified service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-write	Integer specifying the priority of the target host. The lower the number, the higher the priority. If multiple target hosts have the same priority, selection is based on the Weight parameter. Minimum value = 0 Maximum value = 65535
weight	<Integer>	Read-write	Weight for the target host. Aids host selection when two or more hosts have the same priority. A larger number indicates greater weight. Minimum value = 0 Maximum value = 65535
port	<Integer>	Read-write	Port on which the target host listens for client requests. Minimum value = 0 Maximum value = 65535
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached SRV record need to be removed.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Record type. Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache? **action=flush HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dnssubnetcache":{

"ecssubnet":<String_value>,

"all":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache? **args=ecssubnet: <String_value> ,nodeid: <Integer_value>**

Use this query-parameter to get dnssubnetcache resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dnssubnetcache resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache? **view=summary**

Use this query-parameter to get the summary output of dnssubnetcache resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnssubnetcache resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnssubnetcache": [ {

ecssubnet:<String_value>,nodeid:<Integer_value>"hostname":<String_value>,

"nextrecs":<String[]_value>,

"_nextgenapiresource":<String_value>
```

```
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache/ ecssubnet_value<String>
Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache/ ecssubnet_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache/ ecssubnet_value<String> ? **view=summary**

Use this query-parameter to get the summary output of dnssubnetcache resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnssubnetcache": [ {

ecssubnet:<String_value>,nodeid:<Integer_value>"hostname":<String_value>,

"nextrecs":<String[]_value>,
```

```
"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnssubnetcache? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnssubnetcache": [ { "__count": "#no"} ] }
```

dnssuffix

Configuration for DNS suffix resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
Dnssuffix	<String>	Read-write	Suffix to be appended when resolving domain

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			names that are not fully qualified. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

dnssvcbrec

Configuration for SVCB/HTTPS service binding record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name for the SVCB/HTTPS record. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-write	Service priority (0 for AliasMode, >0 for ServiceMode). Minimum value = 0 Maximum value = 65535
targetname	<String>	Read-write	Target domain name. Minimum length = 1
svcbtype	<String>	Read-write	Service type: SVCB or HTTPS. Default value: SVCB Possible values = SVCB, HTTPS
alpn	<String>	Read-write	Comma-separated list of ALPN protocol identifiers. Minimum length = 1
port	<Integer>	Read-write	Port number for the service. Minimum value = 1 Maximum value = 65535
ipv4hint	<String>	Read-write	Comma-separated list of IPv4 hint addresses. Minimum length = 1
ipv6hint	<String>	Read-write	Comma-separated list of IPv6 hint addresses. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
encryptedclienthello	<String>	Read-write	Base64-encoded ECH configuration. Minimum length = 1
nodefaultalpn	<Boolean>	Read-write	Indicates no default ALPN protocols. Default value: 0
mandatory	<String>	Read-write	Comma-separated list of mandatory SvcParam keys. Minimum length = 1
ttl	<Integer>	Read-write	Time to Live (TTL) in seconds. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
type	<String>	Read-write	Type of records: ADNS, PROXY, or ALL. Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
ecssubnet	<String>	Read-only	Subnet for which this particular record is cached. Subnet

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			caching will occur for responses with EDNS Client Subnet (ECS) option. Applies to resource records obtained through proxy configurations only.
authtype	<String>	Read-only	Record type (ADNS/PROXY/ALL). Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

dnstxtrec

Configuration for TXT record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Name of the domain for the TXT record. Minimum length = 1
String	<String[]>	Read-write	Information to store in the TXT resource record. Enclose the string in single or double quotation marks. A TXT resource record can contain up to six strings, each of which can contain up to 255 characters. If you want to add a string of more than 255 characters, evaluate whether splitting it into two or more smaller strings, subject to the six-string limit, works for you. Maximum length = 255
ttl	<Integer>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
recordid	<Integer>	Read-write	Unique, internally generated record ID. View the details of the TXT record to obtain its record ID. Mutually exclusive with the string parameter. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65535
ecssubnet	<String>	Read-write	Subnet for which the cached TXT record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Default value: ADNS Possible values = ALL, ADNS, PROXY
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Authentication type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ALL, ADNS, PROXY
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

count

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnstxtrec? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnstxtrec": [ { "__count": "#no"} ] }
```

dnsview

Configuration for DNS view resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viewname	<String>	Read-write	Name for the DNS view. Minimum length = 1
flags	<Integer>	Read-only	Flags controlling display.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"dnsview":{

<b>"viewname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview/ viewname_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/dnsview? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/dnsview? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dnsview resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/dnsview? **view=summary**

Use this query-parameter to get the summary output of dnsview resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnsview? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnsview resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnsview": [ {

"viewname":<String_value>,

"servicename":<String_value>,

"flags":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview/ viewname_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/dnsview/ viewname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/dnsview/ viewname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of dnsview resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnsview": [ {

"viewname":<String_value>,

"servicename":<String_value>,

"flags":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnsview": [ { "__count": "#no"} ] }
```

dnsview_binding

Binding object which returns the resources bound to dnsview.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viewname	<String>	Read-write	Name of the view to display. Minimum length = 1
dnsview_gslbservice_binding	<dnsview_gslbservice_binding[]>	Read-only	gslbservice that can be bound to dnsview.
dnsview_dnspolicy_binding	<dnsview_dnspolicy_binding[]>	Read-only	dnspolicy that can be bound to dnsview.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview_binding/ viewname_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnsview_binding": [ {

"viewname":<String_value>,

"dnsview_dnspolicy_binding":<dnsview_dnspolicy_binding[]_value>,
```

```
"dnsview_gslbservice_binding":<dnsview_gslbservice_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/dnsview_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnsview_binding": [ {

"viewname":<String_value>,

"dnsview_dnspolicy_binding":<dnsview_dnspolicy_binding[]_value>,

"dnsview_gslbservice_binding":<dnsview_gslbservice_binding[]_value>

}]}
```

dnsview_dnspolicy_binding

Binding object showing the dnspolicy that can be bound to dnsview.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viewname	<String>	Read-write	Name of the view to display. Minimum length = 1
dnspolicyname	<String>	Read-write	dnspolicy name of this view.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview_dnspolicy_binding/ viewname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ dnsview_dnspolicy_binding/ viewname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of dnsview_dnspolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnsview_dnspolicy_binding/ viewname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnsview_dnspolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnsview_dnspolicy_binding": [ {

"viewname":<String_value>,

"dnspolicyname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview_dnspolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/dnsview_dnspolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnsview_dnspolicy_binding": [ {

"viewname":<String_value>,

"dnspolicyname":<String_value>
```

```
}]}
```

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview_dnspolicy_binding/viewname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"dnsview_dnspolicy_binding": [ { "__count": "#no"} ] }
```

dnsview_gslbservice_binding

Binding object showing the gslbservice that can be bound to dnsview.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslbservicename	<String>	Read-write	Service name of the service using this view.
viewname	<String>	Read-write	Name of the view to display.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
ipaddress	<String>	Read-only	IP of the service corresponding to the given view.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnsview_gslbservice_binding/ viewname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ dnsview_gslbservice_binding/ viewname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of dnsview_gslbservice_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnsview_gslbservice_binding/ viewname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnsview_gslbservice_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnsview_gslbservice_binding": [ {

"gslbservicename":<String_value>,

"viewname":<String_value>,

Response Payload:

```
{"dnsview_gslbservice_binding": [ { "__count": "#no"} ] }
```

dnszone

Configuration for DNS zone resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
zonename	<String>	Read-write	Name of the zone to create. Minimum length = 1
proxymode	<String>	Read-write	Deploy the zone in proxy mode. Enable in the following scenarios:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* The load balanced DNS servers are authoritative for the zone and all resource records that are part of the zone. * The load balanced DNS servers are authoritative for the zone, but the Citrix ADC owns a subset of the resource records that belong to the zone (partial zone ownership configuration). Typically seen in global server load balancing (GSLB) configurations, in which the appliance responds authoritatively to queries for GSLB domain names but forwards queries for other domain names in the zone to the load balanced servers. In either scenario, do not create the zone's Start of Authority (SOA) and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name server (NS) resource records on the appliance. Disable if the appliance is authoritative for the zone, but make sure that you have created the SOA and NS records on the appliance before you create the zone. Default value: YES Possible values = YES, NO
dnssecoffload	<String>	Read-write	Enable dnssec offload for this zone. Default value: DISABLED Possible values = ENABLED, DISABLED
nsec	<String>	Read-write	Enable nsec generation for dnssec offload. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyname	<String[]>	Read-write	Name of the public/ private DNS key pair with which to sign the zone. You can sign a zone with up to four keys. Minimum length = 1
type	<String>	Read-write	Type of zone to display. Mutually exclusive with the DNS Zone (zoneName) parameter. Available settings function as follows: * ADNS - Display all the zones for which the Citrix ADC is authoritative. * PROXY - Display all the zones for which the Citrix ADC is functioning as a proxy server. * ALL - Display all the zones configured on the appliance. Possible values = ALL, ADNS, PROXY
flags	<Integer>	Read-only	Flags controlling display.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnszone? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnszone": [ { "__count": "#no"} ] }
```

dnszone_binding

Binding object which returns the resources bound to dnszone.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
zonename	<String>	Read-write	Name of the zone. Mutually exclusive with the type parameter. Minimum length = 1
dnszone_domain_binding	<dnszone_domain_binding[]>	Read-only	domain that can be bound to dnszone.
dnszone_dnskey_binding	<dnszone_dnskey_binding[]>	Read-only	dnskey that can be bound to dnszone.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnszone_binding/ zonename_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnszone_binding": [ {

"zonename":<String_value>,

"dnszone_dnskey_binding":<dnszone_dnskey_binding[]_value>,

"dnszone_domain_binding":<dnszone_domain_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnszone_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/dnszone_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "dnszone_binding": [ {

"zonename":<String_value>,

"dnszone_dnskey_binding":<dnszone_dnskey_binding[]_value>,

"dnszone_domain_binding":<dnszone_domain_binding[]_value>

}]}
```

dnszone_dnskey_binding

Binding object showing the dnskey that can be bound to dnszone.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyname	<String[]>	Read-write	Name of the public/ private DNS key pair with which to sign the zone. You can sign a zone with up to four keys. Minimum length = 1
zonename	<String>	Read-write	Name of the zone. Mutually exclusive with the type parameter. Minimum length = 1
expires	<Integer>	Read-only	Time period for which to consider the key valid, after the key is used to sign a zone.
siginceptiontime	<Integer[]>	Read-only	The time when sign was done with this key. Minimum value = 1
signed	<Integer>	Read-only	Integer which denote status of keys.
__count	<Double>	Read-only	count parameter

Operations

```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnszone_dnskey_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/dnszone_dnskey_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnszone_dnskey_binding": [ {

"keyname":<String[]_value>,

"zonename":<String_value>,

"expires":<Integer_value>,

"siginceptiontime":<Integer[]_value>,

"signed":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnszone_dnskey_binding/ zonename_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"dnszone_dnskey_binding": [ { "__count": "#no"} ] }
```

dnszone_domain_binding

Binding object showing the domain that can be bound to dnszone.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
zonename	<String>	Read-write	Name of the zone. Mutually exclusive with the type parameter. Minimum length = 1
domain	<String>	Read-write	Domain name that belongs to the given zone.
nextrecs	<String[]>	Read-only	An array of record types associated with the nsec record. Possible values = A, NS, CNAME, SOA, MX, AAAA, SRV, RRSIG, NSEC, DNSKEY, PTR, TXT, NAPTR, CAA, SVCB, HTTPS
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnszone_domain_binding/ zonename_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ dnszone_domain_binding/ zonename_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of dnszone_domain_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/dnszone_domain_binding/ zonename_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the dnszone_domain_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "dnszone_domain_binding": [ {

"zonename":<String_value>,

"domain":<String_value>,

"nextrecs":<String[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/dnszone_domain_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/dnszone_domain_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"dnszone_domain_binding": [ { "__count": "#no"} ] }
```

dps

Dps

Citrix ADC DPS configuration.

NAME	DESCRIPTION
dpsparameter	Configuration for dps parameter

dpsparameter

Configuration for dps parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
customerid	<String>	Read-write	Customer ID of the Citrix Cloud customer. Default value: "None" Minimum length = 1
deployment	<String>	Read-write	Describes if the customer is connecting to Commerical/ JapanCloud/Gov

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix Cloud customer. Default value: COMMERCIAL Possible values = COMMERCIAL, GOV, JAPANCLOUD
serviceurl	<String>	Read-write	Service URL of the Citrix Cloud customer. Minimum length = 1
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.

endpoint

Endpoint

Lables attached to various endpoints

NAME	DESCRIPTION
endpointinfo	Configuration for Information

endpointinfo

Configuration for Information resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
endpointkind	<String>	Read-write	Endpoint kind. Currently, IP endpoints are supported. Default value: IP Possible values = IP
endpointname	<String>	Read-write	Name of endpoint, depends on kind. For IP Endpoint - IP address. Minimum length = 1
endpointmetadata	<String>	Read-write	String of qualifiers, in dotted notation, structured metadata for an endpoint. Each qualifier is more specific than the one that precedes it, as in cluster.namespace.service. For example: cluster.default.frontend. Note: A qualifier that includes a dot (.) or space ( ) must be enclosed in double quotation marks. Minimum length = 1
endpointlabelsjson	<String>	Read-write	String representing labels in json form.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length 16K. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "endpointinfo": [ { "__count": "#no"} ] }
```

feo

Front-end-optimization

Front end optimization configuration. The system's feature to optimize Web content for performance.

NAME	DESCRIPTION
feoaction	Configuration for Front end optimization action
feoglobal_binding	Binding object showing the resources that can be bound to feoglobal
feoglobal_feopolicy_binding	Binding object showing the feopolicy that can be bound to feoglobal
feoparameter	Configuration for FEO parameter
feopolicy	Configuration for Front end optimization policy
feopolicy_binding	Binding object showing the resources that can be bound to feopolicy
feopolicy_csvserver_binding	Binding object showing the csvserver that can be bound to feopolicy
feopolicy_feoglobal_binding	Binding object showing the feoglobal that can be bound to feopolicy
feopolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to feopolicy

feoaction

Configuration for Front end optimization action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the front end optimization action. Minimum length = 1
pageextendcache	<Boolean>	Read-write	Extend the time period during which the browser can use the cached resource.
cachemaxage	<Integer>	Read-write	Maxage for cache extension. Default value: 30 Minimum value = 0 Maximum value = 360
imgshrinktoattrib	<Boolean>	Read-write	Shrink image dimensions as per the height and width attributes specified in the <img> tag.
imggiftopng	<Boolean>	Read-write	Convert GIF image formats to PNG formats.
imgtowebp	<Boolean>	Read-write	Convert JPEG, GIF, PNG image formats to WEBP format.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
imgtojpegxr	<Boolean>	Read-write	Convert JPEG, GIF, PNG image formats to JXR format.
imginline	<Boolean>	Read-write	Inline images whose size is less than 2KB.
cssimginline	<Boolean>	Read-write	Inline small images (less than 2KB) referred within CSS files as background-URLs.
jpgoptimize	<Boolean>	Read-write	Remove non-image data such as comments from JPEG images.
imglazyload	<Boolean>	Read-write	Download images, only when the user scrolls the page to view them.
cssminify	<Boolean>	Read-write	Remove comments and whitespaces from CSSs.
cssinline	<Boolean>	Read-write	Inline CSS files, whose size is less than 2KB, within the main page.
csscombine	<Boolean>	Read-write	Combine one or more CSS files into one file.
convertimporttolink	<Boolean>	Read-write	Convert CSS import statements to HTML link tags.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jsminify	<Boolean>	Read-write	Remove comments and whitespaces from JavaScript.
jsinline	<Boolean>	Read-write	Convert linked JavaScript files (less than 2KB) to inline JavaScript files.
htmlminify	<Boolean>	Read-write	Remove comments and whitespaces from an HTML page.
cssmovetohead	<Boolean>	Read-write	Move any CSS file present within the body tag of an HTML page to the head tag.
jsmovetoend	<Boolean>	Read-write	Move any JavaScript present in the body tag to the end of the body tag.
domainsharding	<String>	Read-write	Domain name of the server.
dnsshards	<String[]>	Read-write	Set of domain names that replaces the parent domain.
clientsidemeasurements	<Boolean>	Read-write	Send AppFlow records about the web pages optimized by this action. The records provide FEO statistics, such as the number of HTTP requests that have been reduced for this page. You must enable the Appflow

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			feature before enabling this parameter.
imgadddimensions	<Boolean>	Read-only	Add dimension attributes to images, if not specified within the <img> tag.
imgshrinkformobile	<Boolean>	Read-only	Serve smaller images for mobile users.
imgweaken	<Boolean>	Read-only	Reduce the image quality.
jpgprogressive	<Boolean>	Read-only	Convert JPEG image formats to progressive formats.
cssflattenimports	<Boolean>	Read-only	Replace CSS import statements with the file content.
jscombine	<Boolean>	Read-only	Combine one or more JavaScript files into one file.
htmlrmdefaultattribs	<Boolean>	Read-only	Remove default redundant attributes from an HTML file.
htmlrmattribquotes	<Boolean>	Read-only	Remove unnecessary quotes present within the HTML attributes.
htmltrimurls	<Boolean>	Read-only	Trim URLs.
hits	<Integer>	Read-only	The number of times the action has been taken.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefhits	<Integer>	Read-only	Total number of undefined policy hits.
builtin	<String[]>	Read-only	Flag to determine if front end optimization action is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- UPDATE
- UNSET
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/feoaction **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"feoaction":{

<b>"name":<String_value>,

</b>"pageextendcache":<Boolean_value>,

"cachemaxage":<Integer_value>,

"imgshrinktoattrib":<Boolean_value>,

"imggiftopng":<Boolean_value>,
```

```

```

feoglobal_binding

Binding object which returns the resources bound to feoglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feoglobal_feopolicy_binding	<feoglobal_feopolicy_binding[]>	Read-write	feopolicy that can be bound to feoglobal.

Operations

(click to see Properties)

- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/feoglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "feoglobal_binding": [ {

"feoglobal_feopolicy_binding":<feoglobal_feopolicy_binding[]_value>
```

```
}]}
```

feoglobal_feopolicy_binding

Binding object showing the feopolicy that can be bound to feoglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Bindpoint to which the policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT, HTTPQUIC_REQ_OVERRIDE, HTTPQUIC_REQ_DEFAULT
policyname	<String>	Read-write	The name of the globally bound front end optimization policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			APPFW_GLOBAL, TM_GLOBAL
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
priority	<Integer>	Read-write	The priority assigned to the policy binding.
numpol	<Integer>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

feoparameter

Configuration for FEO parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
jpegqualitypercent	<Integer>	Read-write	The percentage value of a JPEG image quality to be reduced. Range: 0 - 100. Default value: 75 Minimum value = 0 Maximum value = 100
cssinlinethressize	<Integer>	Read-write	Threshold value of the file size (in bytes) for converting external CSS files to inline CSS files. Default value: 1024 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 2048
jsinlinethressize	<Integer>	Read-write	Threshold value of the file size (in bytes), for converting external JavaScript files to inline JavaScript files. Default value: 1024 Minimum value = 1 Maximum value = 2048
imginlinethressize	<Integer>	Read-write	Maximum file size of an image (in bytes), for coverting linked images to inline images. Default value: 1024 Minimum value = 1 Maximum value = 2048
builtin	<String[]>	Read-only	Specify the builtin flags for - set feo param. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/feopolicy **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"feopolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/feopolicy? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"feopolicy":{

<b>"name":<String_value>,

</b>"rule":true,

"action":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/feopolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/feopolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/feopolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of feopolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/feopolicy? **view=summary**

Use this query-parameter to get the summary output of feopolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/feopolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the feopolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "feopolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"builtin":<String[]_value>,

"feature":<String_value>,

"hits":<Integer_value>,

"undefhits":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/feopolicy/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/feopolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/feopolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of feopolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "feopolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"builtin":<String[]_value>,
```

```
"feature":<String_value>,

"hits":<Integer_value>,

"undefhits":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/feopolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "feopolicy": [ { "__count": "#no"} ] }
```

feopolicy_binding

Binding object which returns the resources bound to feopolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the front end optimization policy. Minimum length = 1
feopolicy_lbvserver_binding	<feopolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to feopolicy.
feopolicy_csvserver_binding	<feopolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to feopolicy.
feopolicy_feoglobal_binding	<feopolicy_feoglobal_binding[]>	Read-only	feoglobal that can be bound to feopolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/feopolicy_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "feopolicy_binding": [ {

"name":<String_value>,

"feopolicy_lbvserver_binding":<feopolicy_lbvserver_binding[]_value>,

"feopolicy_csvserver_binding":<feopolicy_csvserver_binding[]_value>,

"feopolicy_feoglobal_binding":<feopolicy_feoglobal_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/feopolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/feopolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "feopolicy_binding": [ {

"name":<String_value>,

"feopolicy_lbvserver_binding":<feopolicy_lbvserver_binding[]_value>,

"feopolicy_csvserver_binding":<feopolicy_csvserver_binding[]_value>,

"feopolicy_feoglobal_binding":<feopolicy_feoglobal_binding[]_value>

}]}
```

feopolicy_csvserver_binding

Binding object showing the csvserver that can be bound to feopolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where the policy is bound to.
name	<String>	Read-write	The name of the front end optimization policy. Minimum length = 1
activepolicy	<Integer>	Read-only	Indicates whether a policy is bound or not.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
priority	<Integer>	Read-only	Priority of the policy.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/feopolicy_csvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ feopolicy_csvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of feopolicy_csvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/feopolicy_csvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the feopolicy_csvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "feopolicy_csvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"activepolicy":<Integer_value>,

gslb

Global Server Load Balancing

Global Server Load Balancing (GSLB) configuration. GSLB feature ensures that client requests are directed to a best performing site available in a global enterprise and distributed Internet environment.

NAME	DESCRIPTION
gslbconfig	Configuration for gslb config
gslbdomain	Configuration for GSLB domain

NAME	DESCRIPTION
gslbdomain_binding	Binding object showing the resources that can be bound to gslbdomain
gslbdomain_gslbservice_binding	Binding object showing the gslbservice that can be bound to gslbdomain
gslbdomain_gslbservicegroup_binding	Binding object showing the gslbservicegroup that can be bound to gslbdomain
gslbdomain_gslbservicegroupmember_binding	Binding object showing the gslbservicegroupmember that can be bound to gslbdomain
gslbdomain_gslbvserver_binding	Binding object showing the gslbvserver that can be bound to gslbdomain
gslbdomain_lbmonitor_binding	Binding object showing the lbmonitor that can be bound to gslbdomain
gslbldnsentries	Configuration for LDNS entry
gslbldnsentry	Configuration for LDNS entry
gslbparameter	Configuration for GSLB parameter
gslbrunningconfig	Configuration for running GSLB configuration
gslbservice	Configuration for GSLB service

NAME	DESCRIPTION
gslbservice_binding	Binding object showing the resources that can be bound to gslbservice
gslbservice_dnsview_binding	Binding object showing the dnsview that can be bound to gslbservice
gslbservice_lbmonitor_binding	Binding object showing the lbmonitor that can be bound to gslbservice
gslbservicegroup	Configuration for GSLB service group
gslbservicegroup_binding	Binding object showing the resources that can be bound to gslbservicegroup
gslbservicegroup_gslbservicegroupmember_binding	Binding object showing the gslbservicegroupmember that can be bound to gslbservicegroup
gslbservicegroup_lbmonitor_binding	Binding object showing the lbmonitor that can be bound to gslbservicegroup
gslbservicegroup_servicegroupentitymonbindings_binding	Binding object showing the servicegroupentitymonbindings that can be bound to gslbservicegroup
gslbsite	Configuration for GSLB site
gslbsite_binding	Binding object showing the resources that can be bound to gslbsite

NAME	DESCRIPTION
gslbsite_gslbservice_binding	Binding object showing the gslbservice that can be bound to gslbsite
gslbsite_gslbservicegroup_binding	Binding object showing the gslbservicegroup that can be bound to gslbsite
gslbsite_gslbservicegroupmember_binding	Binding object showing the gslbservicegroupmember that can be bound to gslbsite
gslbsyncstatus	Configuration for sync status
gslbvserver	Configuration for Global Server Load Balancing Virtual Server
gslbvserver_binding	Binding object showing the resources that can be bound to gslbvserver
gslbvserver_domain_binding	Binding object showing the domain that can be bound to gslbvserver
gslbvserver_gslbservice_binding	Binding object showing the gslbservice that can be bound to gslbvserver
gslbvserver_gslbservicegroup_binding	Binding object showing the gslbservicegroup that can be bound to gslbvserver
gslbvserver_gslbservicegroupmember_binding	Binding object showing the gslbservicegroupmember that can be bound to gslbvserver

NAME	DESCRIPTION
gslbvserver_lbpolicy_binding	Binding object showing the lbpolicy that can be bound to gslbvserver
gslbvserver_spilloverpolicy_binding	Binding object showing the spilloverpolicy that can be bound to gslbvserver

gslbconfig

Configuration for gslb config resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
preview	<Boolean>	Read-write	Do not synchronize the GSLB sites, but display the commands that would be applied on the slave node upon synchronization. Mutually exclusive with the Save Configuration option.
debug	<Boolean>	Read-write	Generate verbose output when synchronizing the GSLB sites. The Debug option generates more verbose output than the sync gslb config command in which the option is not used, and is useful for analyzing

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			synchronization issues.
forcesync	<String>	Read-write	Force synchronization of the specified site even if a dependent configuration on the remote site is preventing synchronization or if one or more GSLB entities on the remote site have the same name but are of a different type. You can specify either the name of the remote site that you want to synchronize with the local site, or you can specify All Sites in the configuration utility (the string all-sites in the CLI). If you specify All Sites, all the sites in the GSLB setup are synchronized with the site on the master node. Note: If you select the Force Sync option, the synchronization starts without displaying the commands that are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			going to be executed.
nowarn	<Boolean>	Read-write	Suppress the warning and the confirmation prompt that are displayed before site synchronization begins. This option can be used in automation scripts that must not be interrupted by a prompt.
saveconfig	<Boolean>	Read-write	Save the configuration on all the nodes participating in the synchronization process, automatically. The master saves its configuration immediately before synchronization begins. Slave nodes save their configurations after the process of synchronization is complete. A slave node saves its configuration only if the configuration difference was successfully applied to it. Mutually

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			exclusive with the Preview option.
command	<String>	Read-write	Run the specified command on the master node and then on all the slave nodes. You cannot use this option with the force sync and preview options.

Operations

(click to see Properties)

- SYNC

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

SYNC

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbconfig? **action=sync HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"gslbconfig":{

"preview":<Boolean_value>,

"debug":<Boolean_value>,

"forcesync":<String_value>,

"nowarn":<Boolean_value>,

"saveconfig":<Boolean_value>,

"command":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

gslbdomain

Configuration for GSLB domain resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of gslbdomain resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain? **view=summary**

Use this query-parameter to get the summary output of gslbdomain resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain? **pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbdomain resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbdomain": [ {

"name":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of gslbdomain resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "gslbdomain": [ {

"name":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbdomain": [ { "__count": "#no"} ] }
```

gslbdomain_binding

Binding object which returns the resources bound to gslbdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
gslbdomain_gslbvserver_binding	<gslbdomain_gslbvserver_binding[]>	Read-only	gslbvserver that can be bound to gslbdomain.
gslbdomain_gslbservicegroupmember_binding	<gslbdomain_gslbservicegroupmember_binding[]>	Read-only	gslbservicegroupmember that can be bound to gslbdomain.
gslbdomain_gslbservice_binding	<gslbdomain_gslbservice_binding[]>	Read-only	gslbservice that can be bound to gslbdomain.
gslbdomain_lbmonitor_binding	<gslbdomain_lbmonitor_binding[]>	Read-only	lbmonitor that can be bound to gslbdomain.
gslbdomain_gslbservicegroup_binding	<gslbdomain_gslbservicegroup_binding[]>	Read-only	gslbservicegroup that can be bound to gslbdomain.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

"gslbdomain_gslbservicegroup_binding":<gslbdomain_gslbservicegroup_binding
[]_value>,

"gslbdomain_lbmonitor_binding":<gslbdomain_lbmonitor_binding[]_value>,

"gslbdomain_gslbvserver_binding":<gslbdomain_gslbvserver_binding[]_value>

}]}
```

gslbdomain_gslbservice_binding

Binding object showing the gslbservice that can be bound to gslbdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain. Minimum length = 1
servicename	<String>	Read-write	The service name.
cumulativeweight	<Integer>	Read-only	cumlative weight.
port	<Integer>	Read-only	Port Number. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicetype	<String>	Read-only	The type GSLB service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
ipaddress	<String>	Read-only	The Ip address of the service.
order	<Integer>	Read-only	Order number assigned to the service when it is bound to the gslb vserver.
cnameentry	<String>	Read-only	The cname of the gslb service.
state	<String>	Read-only	The state of the vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
weight	<Integer>	Read-only	weight assigned. Minimum value = 1 Maximum value = 100
dynamicconfwt	<Integer>	Read-only	dynamic weight.
svreffgslbstate	<String>	Read-only	GSLB server state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
vservername	<String>	Read-only	.
gslbthreshold	<Integer>	Read-only	The threshold value of the service.
__count	<Double>	Read-only	count parameter

Operations

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"gslbdomain_gslbservicegroupmember_binding": [ { "__count": "#no"} ] }
```

gslbdomain_gslbvserver_binding

Binding object showing the gslbvserver that can be bound to gslbdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	.
sitename	<String>	Read-only	Name of the site to which the service belongs.
persistmask	<String>	Read-only	The optional IPv4 network mask applied to IPv4 addresses to establish source IP address based persistence. Minimum length = 1
persistenceid	<Integer>	Read-only	Persistence id of the gslb vserver.
dnsrecordtype	<String>	Read-only	The IP type for this GSLB vserver. Possible values = A, AAAA, CNAME, NAPTR
v6netmasklen	<Integer>	Read-only	Number of bits to consider, in an IPv6 source IP address, for creating the hash that is required by the SOURCEIPHASH load balancing method. Default value: 128 Minimum value = 1 Maximum value = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dynamicweight	<String>	Read-only	Dynamic weight method of the vserver. Default value: DISABLED Possible values = SERVICECOUNT, SERVICEWEIGHT, DISABLED
customheaders	<String>	Read-only	The string that is sent to the service. Applicable to HTTP ,HTTP-ECV and RTSP monitor types.
statechangetimesec	<String>	Read-only	Time since last state change.
persistencetype	<String>	Read-only	Indicates if persistence is set on the gslb vserver. Possible values = SOURCEIP, NONE
edr	<String>	Read-only	Send clients an empty DNS response when the GSLB virtual server is DOWN. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lbmethod	<String>	Read-only	The load balancing method set for the virtual server. Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, SOURCEIPHASH, LEASTBANDWIDTH, LEASTPACKETS, STATICPROXIMITY, RTT, CUSTOMLOAD, API
state	<String>	Read-only	The state of the vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
netmask	<String>	Read-only	Netmask. Minimum length = 1
cip	<String>	Read-only	Indicates if Client IP option is enabled.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
siteprefix	<String>	Read-only	The site prefix string.
v6persistmasklen	<Integer>	Read-only	Number of bits to consider in an IPv6 source IP address when creating source IP address based persistence sessions. Default value: 128 Minimum value = 1 Maximum value = 128
sitepersistence	<String>	Read-only	Indicates the type of cookie persistence set. Possible values = ConnectionProxy, HTTPRedirect, NONE
mir	<String>	Read-only	. Default value: DISABLED Possible values = ENABLED, DISABLED
servicetype	<String>	Read-only	The type GSLB service. Possible values = HTTP, FTP, TCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
backuplbmethod	<String>	Read-only	Indicates the backup method in case the primary fails. Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, SOURCEIPHASH, LEASTBANDWIDTH, LEASTPACKETS, STATICPROXIMITY, RTT, CUSTOMLOAD, API
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain_gslbvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ gslbdomain_gslbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of gslbdomain_gslbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/gslbdomain_gslbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbdomain_gslbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "gslbdomain_gslbvserver_binding": [ {

```

gslbdomain_lbmonitor_binding

Binding object showing the lbmonitor that can be bound to gslbdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain. Minimum length = 1
monitorname	<String>	Read-write	Monitor name.
httprequest	<String>	Read-only	HTTP request to the backend server.
monitorcurrentfailedprobes	<Integer>	Read-only	Total number of current failed probes.
vservername	<String>	Read-only	.
responsetime	<Integer>	Read-only	Response time of this monitor.
customheaders	<String>	Read-only	The string that is sent to the service. Applicable to HTTP ,HTTP-ECV and RTSP monitor types.
grpcstatuscode	<Integer>	Read-only	The gRPC status codes.
lastresponse	<String>	Read-only	The string form of monstatcode.
respcode	<String>	Read-only	The response codes.
grpcservicename	<String>	Read-only	The gRPC service name.
iptunnel	<String>	Read-only	The state of the monitor for tunneled devices. Possible values = YES, NO
servicename	<String>	Read-only	The service name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
grpchealthcheck	<String>	Read-only	The gRPC health check service status. Default value: NO Possible values = YES, NO
monitortotalfailedprobes	<Integer>	Read-only	Total probes failed.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monitortotalprobes	<Integer>	Read-only	Total monitor probes.
monstate	<String>	Read-only	Monitor state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
__count	<Double>	Read-only	count parameter

gslbldnsentries

Configuration for LDNS entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
sitename	<String>	Read-only	The GSLB site name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
numsites	<Integer>	Read-only	Specifies the number of gslb sites.
ipaddress	<String>	Read-only	IP address of the LDNS server.
ttl	<Integer>	Read-only	TTL value of the LDNS entry.
name	<String>	Read-only	Monitor that is currently being used to monitor the LDNS ip..
rtt	<Integer[]>	Read-only	RTT value of the LDNS entry for all gslb sites.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbldnsentry **Query-parameters: args= ipaddress:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

gslbparameter

Configuration for GSLB parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ldnsentrytimeout	<Integer>	Read-write	Time, in seconds, after which an inactive LDNS entry is removed. Default value: 180 Minimum value = 30 Maximum value = 65534
rtttolerance	<Integer>	Read-write	Tolerance, in milliseconds, for newly learned round-trip time (RTT) values. If the difference between the old RTT value

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and the newly computed RTT value is less than or equal to the specified tolerance value, the LDNS entry in the network metric table is not updated with the new RTT value. Prevents the exchange of metrics when variations in RTT values are negligible. Default value: 5 Minimum value = 1 Maximum value = 100
ldnsmask	<String>	Read-write	The IPv4 network mask with which to create LDNS entries. Minimum length = 1
v6ldnsmasklen	<Integer>	Read-write	Mask for creating LDNS entries for IPv6 source addresses. The mask is defined as the number of leading bits to consider, in the source IP address, when creating an LDNS entry. Default value: 128 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 128
ldnsprobeorder	<String[]>	Read-write	Order in which monitors should be initiated to calculate RTT. Possible values = PING, DNS, TCP
dropldnsreq	<String>	Read-write	Drop LDNS requests if round-trip time (RTT) information is not available. Default value: DISABLED Possible values = ENABLED, DISABLED
gslbsvcstatedelaytime	<Integer>	Read-write	Amount of delay in updating the state of GSLB service to DOWN when MEP goes down. This parameter is applicable only if monitors are not bound to GSLB services. Default value: 0 Minimum value = 0 Maximum value = 3600

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svcstatelearningtime	<Integer>	Read-write	Time (in seconds) within which local or child site services remain in learning phase. GSLB site will enter the learning phase after reboot, HA failover, Cluster GSLB owner node changes or MEP being enabled on local node. Backup parent (if configured) will selectively move the adopted children's GSLB services to learning phase when primary parent goes down. While a service is in learning period, remote site will not honour the state and stats got through MEP for that service. State can be learnt from health monitor if bound explicitly. Default value: 0 Minimum value = 0 Maximum value = 3600
automaticconfigsync	<String>	Read-write	GSLB configuration will be synced automatically to remote gslb sites if enabled.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
mepkeepalivetimeout	<Integer>	Read-write	Time duartion (in seconds) during which if no new packets received by Local gslb site from Remote gslb site then mark the MEP connection DOWN. Default value: 10 Minimum value = 1
gslbsyncinterval	<Integer>	Read-write	Time duartion (in seconds) for which the gslb sync process will wait before checking for config changes. Default value: 10 Minimum value = 1
gslbsyncmode	<String>	Read-write	Mode in which configuration will be synced from master site to remote sites. Default value: IncrementalSync Possible values = IncrementalSync, FullSync

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslbsynclocfiles	<String>	Read-write	If disabled, Location files will not be synced to the remote sites as part of manual sync and automatic sync. Default value: ENABLED Possible values = ENABLED, DISABLED
gslbconfigsyncmonitor	<String>	Read-write	If enabled, remote gslb site's rsync port will be monitored and site is considered for configuration sync only when the monitor is successful. Default value: DISABLED Possible values = ENABLED, DISABLED
gslbsyncsaveconfigcommand	<String>	Read-write	If enabled, 'save ns config' command will be treated as other GSLB commands and synced to GSLB nodes when auto gslb sync option is enabled. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
undefaction	<String>	Read-write	Action to perform when policy evaluation creates an UNDEF condition. Available settings function as follows: * NOLBACTION - Does not consider LB action in making LB decision. * RESET - Reset the request and notify the user, so that the user can resend the request. * DROP - Drop the request without sending a response to the user. Default value: "NOLBACTION"
usekrpcchannelforsync	<String>	Read-write	This option is to use Krpc channel for GSLB sync. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sourceipwhitelisting	<String>	Read-write	If enabled, local gslb site private IP would be used as the source IP while initiating MEP/GSLB sync connection if srcIP is not configured for GSLB site. Default value: DISABLED Possible values = ENABLED, DISABLED
flags	<Integer>	Read-only	State of the GSLB parameter.
builtin	<String[]>	Read-only	. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
incarnation	<Integer>	Read-only	This is a counter to maintain the gslb sync incarnation number.
overridepersistencyfororder	<String>	Read-only	This option is used to override persistency when order is configured for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			services or servicegroups. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbparameter **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"gslbparameter":{

gslbservice

Configuration for GSLB service resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name for the GSLB service. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			GSLB service is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my gslbsvc" or 'my gslbsvc'). Minimum length = 1
cnameentry	<String>	Read-write	Canonical name of the GSLB service. Used in CNAME-based GSLB. Minimum length = 1
ip	<String>	Read-write	IP address for the GSLB service. Should represent a load balancing, content switching, or VPN virtual server on the Citrix ADC, or the IP address of another load balancing device. Minimum length = 1
servername	<String>	Read-write	Name of the server hosting the GSLB service. Minimum length = 1
servicetype	<String>	Read-write	Type of service to create.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NSSVC_SERVICE_UNKNOWN Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
port	<Integer>	Read-write	Port on which the load balancing entity represented by this GSLB service listens. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
publicip	<String>	Read-write	The public IP address that a NAT device translates to the GSLB service's private IP address. Optional.
publicport	<Integer>	Read-write	The public port associated with the GSLB service's public IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The port is mapped to the service's private port number. Applicable to the local GSLB service. Optional.
maxclient	<Integer>	Read-write	The maximum number of open connections that the service can support at any given time. A GSLB service whose connection count reaches the maximum is not considered when a GSLB decision is made, until the connection count drops below the maximum. Minimum value = 0 Maximum value = 4294967294
healthmonitor	<String>	Read-write	Monitor the health of the GSLB service. Default value: YES Possible values = YES, NO
sitename	<String>	Read-write	Name of the GSLB site to which the service belongs. Minimum length = 1
state	<String>	Read-write	Enable or disable the service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
cip	<String>	Read-write	In the request that is forwarded to the GSLB service, insert a header that stores the client's IP address. Client IP header insertion is used in connection-proxy based site persistence. Default value: DISABLED Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	Name for the HTTP header that stores the client's IP address. Used with the Client IP option. If client IP header insertion is enabled on the service and a name is not specified for the header, the Citrix ADC uses the name specified by the cipHeader parameter in the set ns param command or, in the GUI, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Client IP Header parameter in the Configure HTTP Parameters dialog box. Minimum length = 1
sitepersistence	<String>	Read-write	Use cookie-based site persistence. Applicable only to HTTP and SSL GSLB services. Possible values = ConnectionProxy, HTTPRedirect, NONE
cookietimeout	<Integer>	Read-write	Timeout value, in minutes, for the cookie, when cookie based site persistence is enabled. Minimum value = 0 Maximum value = 1440
siteprefix	<String>	Read-write	The site's prefix string. When the service is bound to a GSLB virtual server, a GSLB site domain is generated internally for each bound service-domain pair by concatenating the site prefix of the service and the name of the domain.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the special string NONE is specified, the site-prefix string is unset. When implementing HTTP redirect site persistence, the Citrix ADC redirects GSLB requests to GSLB services by using their site domains.
clttimeout	<Integer>	Read-write	Idle time, in seconds, after which a client connection is terminated. Applicable if connection proxy based site persistence is used. Minimum value = 0 Maximum value = 31536000
svrtimeout	<Integer>	Read-write	Idle time, in seconds, after which a server connection is terminated. Applicable if connection proxy based site persistence is used. Minimum value = 0 Maximum value = 31536000
maxbandwidth	<Integer>	Read-write	Integer specifying the maximum

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bandwidth allowed for the service. A GSLB service whose bandwidth reaches the maximum is not considered when a GSLB decision is made, until its bandwidth consumption drops below the maximum.
downstateflush	<String>	Read-write	Flush all active transactions associated with the GSLB service when its state transitions from UP to DOWN. Do not enable this option for services that must complete their transactions. Applicable if connection proxy based site persistence is used. Possible values = ENABLED, DISABLED
maxaaausers	<Integer>	Read-write	Maximum number of SSL VPN users that can be logged on concurrently to the VPN virtual server that is represented by this GSLB service. A GSLB service whose user count reaches the maximum is not

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			considered when a GSLB decision is made, until the count drops below the maximum. Minimum value = 0 Maximum value = 65535
monthreshold	<Integer>	Read-write	Monitoring threshold value for the GSLB service. If the sum of the weights of the monitors that are bound to this GSLB service and are in the UP state is not equal to or greater than this threshold value, the service is marked as DOWN. Minimum value = 0 Maximum value = 65535
hashid	<Integer>	Read-write	Unique hash identifier for the GSLB service, used by hash based load balancing methods. Minimum value = 1
comment	<String>	Read-write	Any comments that you might want to associate with the GSLB service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appflowlog	<String>	Read-write	Enable logging appflow flow information. Default value: ENABLED Possible values = ENABLED, DISABLED
naptrreplacement	<String>	Read-write	The replacement domain name for this NAPTR. Maximum length = 255
naptrorder	<Integer>	Read-write	An integer specifying the order in which the NAPTR records MUST be processed in order to accurately represent the ordered list of Rules. The ordering is from lowest to highest. Default value: 1 Minimum value = 1 Maximum value = 65535
naptrservices	<String>	Read-write	Service Parameters applicable to this delegation path. Maximum length = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
naptrdomainttl	<Integer>	Read-write	Modify the TTL of the internally created naptr domain. Default value: 3600 Minimum value = 1
naptrpreference	<Integer>	Read-write	An integer specifying the preference of this NAPTR among NAPTR records having same order. lower the number, higher the preference. Default value: 1 Minimum value = 1 Maximum value = 65535
ipaddress	<String>	Read-write	The new IP address of the service.
viewname	<String>	Read-write	Name of the DNS view of the service. A DNS view is used in global server load balancing (GSLB) to return a predetermined IP address to a specific group of clients, which are identified by using a DNS policy. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viewip	<String>	Read-write	IP address to be used for the given view.
weight	<Integer>	Read-write	Weight to assign to the monitor-service binding. A larger number specifies a greater weight. Contributes to the monitoring threshold, which determines the state of the service. Minimum value = 1 Maximum value = 100
monitor_name_svc	<String>	Read-write	Name of the monitor to bind to the service. Minimum length = 1
newname	<String>	Read-write	New name for the GSLB service. Minimum length = 1
gslb	<String>	Read-only	. Default value: GSLB Possible values = REMOTE, LOCAL
svrstate	<String>	Read-only	Server state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
svreffgslbstate	<String>	Read-only	Effective state of the gslb svc. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
gslbthreshold	<Integer>	Read-only	Indicates if gslb svc has reached threshold.
gslbsvcstats	<Integer>	Read-only	Indicates if gslb svc has stats of the primary or the whole chain.
monstate	<String>	Read-only	State of the monitor bound to gslb service. Possible values = ENABLED, DISABLED
preferredlocation	<String>	Read-only	Prefered location.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitor_state	<String>	Read-only	The running state of the monitor on this service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
tickssincelaststatechange	<Integer>	Read-only	Time in 10 millisecond ticks since the last state change.
threshold	<String>	Read-only	. Possible values = ABOVE, BELOW
clmonowner	<Integer>	Read-only	Tells the mon owner of the gslb service. Minimum value = 0 Maximum value = 32
clmonview	<Integer>	Read-only	Tells the view id of the monitoring owner.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslbsvchealth	<Integer>	Read-only	This parameter displays effective health of a GSLB service.
glsbsvchealthdescr	<String>	Read-only	Displays the warning message related to health a of GSLB service.
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbservice? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbservice": [ { "__count": "#no"} ] }
```

gslbservice_binding

Binding object which returns the resources bound to gslbservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name of the GSLB service. Minimum length = 1
gslbservice_dnsview_binding	<gslbservice_dnsview_binding[]>	Read-only	dnsview that can be bound to gslbservice.
gslbservice_lbmonitor_binding	<gslbservice_lbmonitor_binding[]>	Read-only	lbmonitor that can be bound to gslbservice.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbservice_binding/ servicename_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbservice_binding": [ {

"servicename":<String_value>,

"gslbservice_dnsview_binding":<gslbservice_dnsview_binding[]_value>,

"gslbservice_lbmonitor_binding":<gslbservice_lbmonitor_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbservice_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/gslbservice_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbservice_binding": [ {

"servicename":<String_value>,

"gslbservice_dnsview_binding":<gslbservice_dnsview_binding[]_value>,

"gslbservice_lbmonitor_binding":<gslbservice_lbmonitor_binding[]_value>

}]}
```

gslbservice_dnsview_binding

Binding object showing the dnsview that can be bound to gslbservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viewname	<String>	Read-write	Name of the DNS view of the service. A DNS view is used in global server load balancing (GSLB) to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			return a predetermined IP address to a specific group of clients, which are identified by using a DNS policy. Minimum length = 1
servicename	<String>	Read-write	Name of the GSLB service. Minimum length = 1
viewip	<String>	Read-write	IP address to be used for the given view.
__count	<Double>	Read-write	count parameter

gslbservice_lbmonitor_binding

Binding object showing the lbmonitor that can be bound to gslbservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monstate	<String>	Read-write	State of the monitor bound to gslb service. Possible values = ENABLED, DISABLED
weight	<Integer>	Read-write	Weight to assign to the monitor-service binding. A larger number specifies a greater weight. Contributes to the monitoring threshold, which determines the state of the service. Minimum value = 1 Maximum value = 100
servicename	<String>	Read-write	Name of the GSLB service. Minimum length = 1
monitor_name	<String>	Read-write	Monitor name.
totalfailedprobes	<Integer>	Read-only	The total number of failed probs.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monitortotalprobes	<Integer>	Read-only	Total number of probes sent to monitor this service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitortotalfailedprobes	<Integer>	Read-only	Total number of failed probes.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
failedprobes	<Integer>	Read-only	Number of the current failed monitoring probes.
lastresponse	<String>	Read-only	Displays the gslb monitor status in string format.
responsetime	<Integer>	Read-only	Response time of this monitor.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
monitor_state	<String>	Read-only	The running state of the monitor on this service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitorcurrentfailedprobes	<Integer>	Read-only	Total number of currently failed probes.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
__count	<Double>	Read-only	count parameter

gslbservicegroup

Configuration for GSLB service group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the GSLB service group. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the name is created. Minimum length = 1
servicetype	<String>	Read-write	Protocol used to exchange data with the GSLB service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxclient	<Integer>	Read-write	Maximum number of simultaneous open connections for the GSLB service group. Minimum value = 0 Maximum value = 4294967294
cip	<String>	Read-write	Insert the Client IP header in requests forwarded to the GSLB service. Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	Name of the HTTP header whose value must be set to the IP address of the client. Used with the Client IP parameter. If client IP insertion is enabled, and the client IP header is not specified, the value of Client IP Header parameter or the value set by the set ns config command is used as client's IP header name. Minimum length = 1
healthmonitor	<String>	Read-write	Monitor the health of this GSLB service.Available

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			settings function are as follows: YES - Send probes to check the health of the GSLB service. NO - Do not send probes to check the health of the GSLB service. With the NO option, the appliance shows the service as UP at all times. Default value: YES Possible values = YES, NO
clttimeout	<Integer>	Read-write	Time, in seconds, after which to terminate an idle client connection. Minimum value = 0 Maximum value = 31536000
svrtimeout	<Integer>	Read-write	Time, in seconds, after which to terminate an idle server connection. Minimum value = 0 Maximum value = 31536000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxbandwidth	<Integer>	Read-write	Maximum bandwidth, in Kbps, allocated for all the services in the GSLB service group. Minimum value = 0 Maximum value = 4294967287
monthreshold	<Integer>	Read-write	Minimum sum of weights of the monitors that are bound to this GSLB service. Used to determine whether to mark a GSLB service as UP or DOWN. Minimum value = 0 Maximum value = 65535
state	<String>	Read-write	Initial state of the GSLB service group. Default value: ENABLED Possible values = ENABLED, DISABLED
downstateflush	<String>	Read-write	Flush all active transactions associated with all the services in the GSLB service group whose state transitions from UP to DOWN. Do not enable this option for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			applications that must complete their transactions. Default value: ENABLED Possible values = ENABLED, DISABLED
comment	<String>	Read-write	Any information about the GSLB service group.
appflowlog	<String>	Read-write	Enable logging of AppFlow information for the specified GSLB service group. Default value: ENABLED Possible values = ENABLED, DISABLED
autoscale	<String>	Read-write	Auto scale option for a GSLB servicegroup. Default value: DISABLED Possible values = DISABLED, DNS
autodelayedtrofs	<String>	Read-write	Indicates graceful movement of the service to TROFS. System will wait for monitor response

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			time out before moving to TROFS. Default value: NO Possible values = YES, NO
sitename	<String>	Read-write	Name of the GSLB site to which the service group belongs. Minimum length = 1
sitepersistence	<String>	Read-write	Use cookie-based site persistence. Applicable only to HTTP and SSL non-autoscale enabled GSLB servicegroups. Possible values = ConnectionProxy, HTTPRedirect, NONE
servername	<String>	Read-write	Name of the server to which to bind the service group. Minimum length = 1
port	<Integer>	Read-write	Server port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
weight	<Integer>	Read-write	Weight to assign to the servers in the service group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Specifies the capacity of the servers relative to the other servers in the load balancing configuration. The higher the weight, the higher the percentage of requests sent to the service. Minimum value = 1 Maximum value = 100
hashid	<Integer>	Read-write	The hash identifier for the service. This must be unique for each service. This parameter is used by hash based load balancing methods. Minimum value = 1
publicip	<String>	Read-write	The public IP address that a NAT device translates to the GSLB service's private IP address. Optional. Minimum length = 1
publicport	<Integer>	Read-write	The public port associated with the GSLB service's public IP address. The port is mapped to the service's private port number. Applicable to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			local GSLB service. Optional.
siteprefix	<String>	Read-write	The site's prefix string. When the GSLB service group is bound to a GSLB virtual server, a GSLB site domain is generated internally for each bound serviceitem-domain pair by concatenating the site prefix of the service item and the name of the domain. If the special string NONE is specified, the site-prefix string is unset. When implementing HTTP redirect site persistence, the Citrix ADC redirects GSLB requests to GSLB services by using their site domains.
order	<Integer>	Read-write	Order number to be assigned to the gslb servicegroup member. Minimum value = 1 Maximum value = 8192
monitor_name_svc	<String>	Read-write	Name of the monitor bound to the GSLB

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service group. Used to assign a weight to the monitor. Minimum length = 1
dup_weight	<Integer>	Read-write	weight of the monitor that is bound to GSLB servicegroup. Minimum value = 1
delay	<Integer>	Read-write	The time allowed (in seconds) for a graceful shutdown. During this period, new connections or requests will continue to be sent to this service for clients who already have a persistent session on the system. Connections or requests from fresh or new clients who do not yet have a persistence sessions on the system will not be sent to the service. Instead, they will be load balanced among other available services. After the delay time expires, no new requests or connections will be sent to the service.
graceful	<String>	Read-write	Wait for all existing connections to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service to terminate before shutting down the service. Default value: NO Possible values = YES, NO
includemembers	<Boolean>	Read-write	Display the members of the listed GSLB service groups in addition to their settings. Can be specified when no service group name is provided in the command. In that case, the details displayed for each service group are identical to the details displayed when a service group name is provided, except that bound monitors are not displayed.
newname	<String>	Read-write	New name for the GSLB service group. Minimum length = 1
numofconnections	<Integer>	Read-only	This will tell the number of client side connections are still open.
serviceconftype	<Boolean>	Read-only	The configuration type of the GSLB service group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
value	<String>	Read-only	SSL Status. Possible values = Certkey/ Certkeybundle/Vault not bound/Cert-store not usable, SSL feature disabled
svrstate	<String>	Read-only	The state of the GSLB service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
ip	<String>	Read-only	IP Address.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
statechangetimemsec	<Integer>	Read-only	Time when last state change occurred. Milliseconds part.
stateupdatereason	<Integer>	Read-only	Checks state update reason on the secondary node.
clmonowner	<Integer>	Read-only	Tells the mon owner of the service.
clmonview	<Integer>	Read-only	Tells the view id of the monitoring owner.
groupcount	<Integer>	Read-only	Servicegroup Count.
serviceipstr	<String>	Read-only	This field has been intorduced to show the dbs services ip.
servicegroupeffectivestate	<String>	Read-only	Indicates the effective GSLB servicegroup state based on the state of the bound service items.If all services are UP the effective state is UP, if all are DOWN its DOWN,if all are OFS its OFS.If atleast one serviceis UP and rest are either DOWN or OFS, the effective state is PARTIAL-UP.If atleast one

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bound service is DOWN and rest are OFS the effective state is PARTIAL DOWN. Possible values = UP, DOWN, OUT OF SERVICE, PARTIAL-UP, PARTIAL-DOWN
gslb	<String>	Read-only	. Default value: GSLB Possible values = REMOTE, LOCAL
svreffgslbstate	<String>	Read-only	Effective state of the gslb svc. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
nodefaultbindings	<String>	Read-only	to determine if the configuration is from stylebooks. Default value: NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

Response Payload:

```
{ "gslbservicegroup": [ { "__count": "#no"} ] }
```

gslbservicegroup_binding

Binding object which returns the resources bound to gslbservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the GSLB service group. Minimum length = 1
gslbservicegroup_gslbservicegroupmember_binding	<gslbservicegroup_gslbservicegroupmember_binding[]>	Read-only	gslbservicegroupmember that can be bound to gslbservicegroup.
gslbservicegroup_servicegroupentitymonbindings_binding	<gslbservicegroup_servicegroupentitymonbindings_binding[]>	Read-only	servicegroupentitymonbindings that can be bound to gslbservicegroup.
gslbservicegroup_lbmonitor_binding	<gslbservicegroup_lbmonitor_binding[]>	Read-only	lbmonitor that can be bound to gslbservicegroup.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbservicegroup_binding/servicegroupname_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbservicegroup_binding": [ {

"servicegroupname":<String_value>,

"gslbservicegroup_gslbservicegroupmember_binding":<gslbservicegroup_gslbse
rvicegroupmember_binding[]_value>,

"gslbservicegroup_lbmonitor_binding":<gslbservicegroup_lbmonitor_binding[]
_value>,

"gslbservicegroup_servicegroupentitymonbindings_binding":<gslbservicegroup
_servicegroupentitymonbindings_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbservicegroup_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/gslbservicegroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbservicegroup_binding": [ {

"servicegroupname":<String_value>,

"gslbservicegroup_gslbservicegroupmember_binding":<gslbservicegroup_gslbse
rvicegroupmember_binding[]_value>,

"gslbservicegroup_lbmonitor_binding":<gslbservicegroup_lbmonitor_binding[]
_value>,

"gslbservicegroup_servicegroupentitymonbindings_binding":<gslbservicegroup
_servicegroupentitymonbindings_binding[]_value>

}]}
```

gslbservicegroup_gslbservicegroupmember_binding

Binding object showing the gslbservicegroupmember that can be bound to gslbservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servername	<String>	Read-write	Name of the server to which to bind the service group. Minimum length = 1
weight	<Integer>	Read-write	Weight to assign to the servers in the service group. Specifies the capacity of the servers relative to the other servers in the load balancing configuration. The higher the weight, the higher the percentage of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requests sent to the service. Minimum value = 1 Maximum value = 100
servicegroupname	<String>	Read-write	Name of the GSLB service group. Minimum length = 1
state	<String>	Read-write	Initial state of the GSLB service group. Default value: ENABLED Possible values = ENABLED, DISABLED
hashid	<Integer>	Read-write	The hash identifier for the service. This must be unique for each service. This parameter is used by hash based load balancing methods. Minimum value = 1
port	<Integer>	Read-write	Server port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
publicport	<Integer>	Read-write	The public port associated with the GSLB service's

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			public IP address. The port is mapped to the service's private port number. Applicable to the local GSLB service. Optional.
order	<Integer>	Read-write	Order number to be assigned to the gslb servicegroup member. Minimum value = 1 Maximum value = 8192
ip	<String>	Read-write	IP Address.
publicip	<String>	Read-write	The public IP address that a NAT device translates to the GSLB service's private IP address. Optional. Minimum length = 1
siteprefix	<String>	Read-write	The site's prefix string. When the GSLB service group is bound to a GSLB virtual server, a GSLB site domain is generated internally for each bound serviceitem-domain pair by concatenating the site prefix of the service item and the name of the domain.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the special string NONE is specified, the site-prefix string is unset. When implementing HTTP redirect site persistence, the Citrix ADC redirects GSLB requests to GSLB services by using their site domains.
statechangetimesec	<String>	Read-only	Time when last state change occurred. Seconds part.
delay	<Integer>	Read-only	The time allowed (in seconds) for a graceful shutdown. During this period, new connections or requests will continue to be sent to this service for clients who already have a persistent session on the system. Connections or requests from fresh or new clients who do not yet have a persistence sessions on the system will not be sent to the service. Instead, they will be load balanced among other available services. After the delay time

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expires, no new requests or connections will be sent to the service.
gslbthreshold	<Integer>	Read-only	Indicates if gslb svc has reached threshold.
tickssincelaststatechange	<Integer>	Read-only	Time in 10 millisecond ticks since the last state change.
orderstr	<String>	Read-only	Order number in string form assigned to the gslb servicegroup member.
trofsdelay	<Integer>	Read-only	Delay before moving to TROFS.
svrstate	<String>	Read-only	The state of the GSLB service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
threshold	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ABOVE, BELOW
preferredlocation	<String>	Read-only	Prefered location.
graceful	<String>	Read-only	Wait for all existing connections to the service to terminate before shutting down the service. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ gslbservicegroup_gslbservicegroupmember_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/ gslbservicegroup_gslbservicegroupmember_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

```

gslbservicegroup_lbmonitor_binding

Binding object showing the lbmonitor that can be bound to gslbservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
siteprefix	<String>	Read-write	The site's prefix string. When the GSLB service group is bound to a GSLB virtual server, a GSLB site domain is generated internally for each bound serviceitem-domain pair by concatenating the site prefix of the service item and the name of the domain. If the special string NONE is specified, the site-prefix string is unset. When implementing HTTP redirect site persistence, the Citrix ADC redirects GSLB requests to GSLB services by using their site domains.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitor_name	<String>	Read-write	Monitor name.
publicip	<String>	Read-write	The public IP address that a NAT device translates to the GSLB service's private IP address. Optional.
monstate	<String>	Read-write	Monitor state. Possible values = ENABLED, DISABLED
state	<String>	Read-write	Initial state of the service after binding. Default value: ENABLED Possible values = ENABLED, DISABLED
weight	<Integer>	Read-write	Weight to assign to the servers in the service group. Specifies the capacity of the servers relative to the other servers in the load balancing configuration. The higher the weight, the higher the percentage of requests sent to the service. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 100
servicegroupname	<String>	Read-write	Name of the GSLB service group. Minimum length = 1
port	<Integer>	Read-write	Port number of the GSLB service. Each service must have a unique port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
publicport	<Integer>	Read-write	The public port associated with the GSLB service's public IP address. The port is mapped to the service's private port number. Applicable to the local GSLB service. Optional.
order	<Integer>	Read-write	Order number to be assigned to the gslb servicegroup member.
passive	<Boolean>	Read-write	Indicates if load monitor is passive. A passive load monitor does not remove service from LB decision when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			threshold is breached.
hashid	<Integer>	Read-write	Unique numerical identifier used by hash based load balancing methods to identify a service. Minimum value = 1
monweight	<Integer>	Read-only	weight of the monitor that is bound to GSLB servicegroup.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/gslbservicegroup_lbmonitor_binding **HTTP Method:** PUT

Request Headers:

gslbsite

Configuration for GSLB site resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sitename	<String>	Read-write	Name for the GSLB site. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my gslbsite" or 'my gslbsite'). Minimum length = 1
sitetype	<String>	Read-write	Type of site to create. If the type is not specified, the appliance automatically detects and sets the type on the basis of the IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address being assigned to the site. If the specified site IP address is owned by the appliance (for example, a MIP address or SNIP address), the site is a local site. Otherwise, it is a remote site. Default value: NONE Possible values = REMOTE, LOCAL
siteipaddress	<String>	Read-write	IP address for the GSLB site. The GSLB site uses this IP address to communicate with other GSLB sites. For a local site, use any IP address that is owned by the appliance (for example, a SNIP or MIP address, or the IP address of the ADNS service). Minimum length = 1
publicip	<String>	Read-write	Public IP address for the local site. Required only if the appliance is deployed in a private address space and the site has a public IP address hosted on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			an external firewall or a NAT device. Minimum length = 1
metricexchange	<String>	Read-write	Exchange metrics with other sites. Metrics are exchanged by using Metric Exchange Protocol (MEP). The appliances in the GSLB setup exchange health information once every second. If you disable metrics exchange, you can use only static load balancing methods (such as round robin, static proximity, or the hash-based methods), and if you disable metrics exchange when a dynamic load balancing method (such as least connection) is in operation, the appliance falls back to round robin. Also, if you disable metrics exchange, you must use a monitor to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			determine the state of GSLB services. Otherwise, the service is marked as DOWN. Default value: ENABLED Possible values = ENABLED, DISABLED
nwmetricexchange	<String>	Read-write	Exchange, with other GSLB sites, network metrics such as round-trip time (RTT), learned from communications with various local DNS (LDNS) servers used by clients. RTT information is used in the dynamic RTT load balancing method, and is exchanged every 5 seconds. Default value: ENABLED Possible values = ENABLED, DISABLED
sessionexchange	<String>	Read-write	Exchange persistent session entries with other GSLB sites every five seconds.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
triggermonitor	<String>	Read-write	Specify the conditions under which the GSLB service must be monitored by a monitor, if one is bound. Available settings function as follows: * ALWAYS - Monitor the GSLB service at all times. * MEPDOWN - Monitor the GSLB service only when the exchange of metrics through the Metrics Exchange Protocol (MEP) is disabled. MEPDOWN_SVCDOWN - Monitor the service in either of the following situations: * The exchange of metrics through MEP is disabled.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* The exchange of metrics through MEP is enabled but the status of the service, learned through metrics exchange, is DOWN. Default value: ALWAYS Possible values = ALWAYS, MEPDOWN, MEPDOWN_SVCDOWN
parentsite	<String>	Read-write	Parent site of the GSLB site, in a parent-child topology.
clip	<String>	Read-write	Cluster IP address. Specify this parameter to connect to the remote cluster site for GSLB auto-sync. Note: The cluster IP address is defined when creating the cluster.
publicclip	<String>	Read-write	IP address to be used to globally access the remote cluster when it is deployed behind a NAT. It can be same

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			as the normal cluster IP address.
naptrreplacementsuffix	<String>	Read-write	The naptr replacement suffix configured here will be used to construct the naptr replacement field in NAPTR record. Minimum length = 1
backupparentlist	<String[]>	Read-write	The list of backup gslb sites configured in preferred order. Need to be parent gsb sites. Default value: "None"
sitepassword	<String>	Read-write	Password to be used for mep communication between gslb site nodes.
krpcnodesrcip	<String>	Read-write	Source IP address to be used to communicate with this GSLB site. Minimum length = 1
newname	<String>	Read-write	New name for the GSLB site. Minimum length = 1 Maximum length = 31
status	<String>	Read-only	Current metric exchange status.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ACTIVE, INACTIVE, DOWN
persistencemepstatus	<String>	Read-only	Network metric and persistence exchange MEP connection status. Possible values = ACTIVE, INACTIVE, DOWN
version	<Integer>	Read-only	will be true if the remote site's version is ncore compatible with the local site.(>= 9.2).
curbackupparentip	<String>	Read-only	Current active backup parent IP address since the configured is DOWN.
sitestate	<String>	Read-only	Site state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
oldname	<String>	Read-only	Old name for the GSLB site. Must begin with an ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my gslbsite" or 'my gslbsite'). Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

"backupparentlist":<String[]_value>,

"siteipaddress":<String_value>,
```

```
"publicip":<String_value>,

"krpcnodesrcip":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbsite? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"gslbsite":{

<b>"sitename":<String_value>,

</b>"metricexchange":true,

"nwmetricexchange":true,

"sessionexchange":true,

"triggermonitor":true,

"naptrreplacementsuffix":true,

"backupparentlist":true,

"krpcnodesrcip":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbsite? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"gslbsite":{

<b>"sitename":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbsite **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/gslbsite? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/gslbsite? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of gslbsite resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/gslbsite? **view=summary**

Use this query-parameter to get the summary output of gslbsite resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/gslbsite? **pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbsite resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbsite": [ {

"sitename":<String_value>,

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbsite? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbsite": [ { "__count": "#no"} ] }
```

gslbsite_binding

Binding object which returns the resources bound to gslbsite.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sitename	<String>	Read-write	Name of the GSLB site. If you specify a site name, details of all the site's constituent services are also displayed. Minimum length = 1
gslbsite_gslbservice_binding	<gslbsite_gslbservice_binding[]>	Read-only	gslbservice that can be bound to gslbsite.
gslbsite_gslbservicegroupmember_binding	<gslbsite_gslbservicegroupmember_binding[]>	Read-only	gslbservicegroupmember that can be bound to gslbsite.
gslbsite_gslbservicegroup_binding	<gslbsite_gslbservicegroup_binding[]>	Read-only	gslbservicegroup that can be bound to gslbsite.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbsite_binding/ sitename_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbsite_binding": [ {

"sitename":<String_value>,

"gslbsite_gslbservicegroup_binding":<gslbsite_gslbservicegroup_binding[]_value>,

"gslbsite_gslbservice_binding":<gslbsite_gslbservice_binding[]_value>,

"gslbsite_gslbservicegroupmember_binding":<gslbsite_gslbservicegroupmember_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbsite_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/gslbsite_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbsite_binding": [ {

"sitename":<String_value>,

"gslbsite_gslbservicegroup_binding":<gslbsite_gslbservicegroup_binding[]_value>,

"gslbsite_gslbservice_binding":<gslbsite_gslbservice_binding[]_value>,

"gslbsite_gslbservicegroupmember_binding":<gslbsite_gslbservicegroupmember_binding[]_value>

}]}
```

gslbsite_gslbservice_binding

Binding object showing the gslbservice that can be bound to gslbsite.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sitename	<String>	Read-write	Name of the GSLB site. If you specify a site name, details of all the site's constituent services are also displayed. Minimum length = 1
servicename	<String>	Read-write	Service name.
ipaddress	<String>	Read-only	IP Address of the gslb service.
port	<Integer>	Read-only	Port number of the gslb service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
servicetype	<String>	Read-only	Service type. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, DNS, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, RTSP, PUSH, SSL_PUSH, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, SMPP, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, PROXY, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM, MONGO, MONGO_TLS, MQTT, MQTT_TLS, QUIC_BRIDGE, HTTP_QUIC, DOT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL_PROXY, KAFKA_PRODUCER
cnameentry	<String>	Read-only	The cname of the gslb service. Minimum length = 1
state	<String>	Read-only	State of the gslb service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
__count	<Double>	Read-only	count parameter

Operations

gslbsite_gslbservicegroupmember_binding

Binding object showing the gslbservicegroupmember that can be bound to gslbsite.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Servicegroup name.
sitename	<String>	Read-write	Name of the GSLB site. If you specify a site name, details of all the site's constituent services are also displayed. Minimum length = 1
state	<String>	Read-only	State of the gslb service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
port	<Integer>	Read-only	Port number of the gslb service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicetype	<String>	Read-only	Service type. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, DNS, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, RTSP, PUSH, SSL_PUSH, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, SMPP, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, PROXY, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM, MONGO, MONGO_TLS, MQTT, MQTT_TLS, QUIC_BRIDGE, HTTP_QUIC, DOT, SSL_PROXY, KAFKA_PRODUCER
ipaddress	<String>	Read-only	IP Address of the gslb service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbsite_gslbservicegroupmember_binding/ sitename_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ gslbsite_gslbservicegroupmember_binding/ sitename_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of gslbsite_gslbservicegroupmember_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ gslbsite_gslbservicegroupmember_binding/ sitename_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbsite_gslbservicegroupmember_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "gslbsite_gslbservicegroupmember_binding": [ {

"servicegroupname":<String_value>,

```

gslbsyncstatus

Configuration for sync status resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
summary	<Boolean>	Read-write	sync status summary to be displayed in one line (Success/ Failure), in case of Failure stating reason for failure.
response	<String>	Read-only	gslb sync status as text blob.
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbsyncstatus

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/gslbsyncstatus? **args=summary: <Boolean_value>**

Use this query-parameter to get gslbsyncstatus resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbsyncstatus": [ {

summary:<Boolean_value>"response":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

gslbvserver

Configuration for Global Server Load Balancing Virtual Server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the GSLB virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicetype	<String>	Read-write	Protocol used by services bound to the virtual server. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
iptype	<String>	Read-write	The IP type for this GSLB vserver. Default value: IPV4 Possible values = IPV4, IPV6
dnsrecordtype	<String>	Read-write	DNS record type to associate with the GSLB virtual server's domain name. Default value: A Possible values = A, AAAA, CNAME, NAPTR
lbmethod	<String>	Read-write	Load balancing method for the GSLB virtual server. Default value: LEASTCONNECTION

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, SOURCEIPHASH, LEASTBANDWIDTH, LEASTPACKETS, STATICPROXIMITY, RTT, CUSTOMLOAD, API
backupsessiontimeout	<Integer>	Read-write	A non zero value enables the feature whose minimum value is 2 minutes. The feature can be disabled by setting the value to zero. The created session is in effect for a specific client per domain. Minimum value = 0 Maximum value = 1440
backuplbmethod	<String>	Read-write	Backup load balancing method. Becomes operational if the primary load balancing method fails or cannot be used. Valid only if the primary method is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			based on either round-trip time (RTT) or static proximity. Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, SOURCEIPHASH, LEASTBANDWIDTH, LEASTPACKETS, STATICPROXIMITY, RTT, CUSTOMLOAD, API
netmask	<String>	Read-write	IPv4 network mask for use in the SOURCEIPHASH load balancing method. Minimum length = 1
v6netmasklen	<Integer>	Read-write	Number of bits to consider, in an IPv6 source IP address, for creating the hash that is required by the SOURCEIPHASH load balancing method. Default value: 128 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 128
rule	<String>	Read-write	Expression, or name of a named expression, against which traffic is evaluated. This field is applicable only if gslb method or gslb backup method are set to API. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which case you do not have to escape the double quotation marks. Default value: "none"
tolerance	<Integer>	Read-write	Tolerance in milliseconds. Tolerance value is used in deciding which sites in a GSLB configuration must be considered for implementing the RTT load balancing method. The sites having the RTT value less than or equal to the sum of the lowest RTT and tolerance value are considered. NetScaler implements the round robin method of global server load balancing among these considered sites. The sites that have RTT value greater than this value are not considered. The logic is applied for each LDNS and based on the LDNS, the sites that are considered might change. For

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, a site that is considered for requests coming from LDNS1 might not be considered for requests coming from LDNS2. Minimum value = 0 Maximum value = 100
persistencetype	<String>	Read-write	Use source IP address based persistence for the virtual server. After the load balancing method selects a service for the first packet, the IP address received in response to the DNS query is used for subsequent requests from the same client. Possible values = SOURCEIP, NONE
persistenceid	<Integer>	Read-write	The persistence ID for the GSLB virtual server. The ID is a positive integer that enables GSLB sites to identify the GSLB virtual server, and is required if source IP address based or spill over based

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			persistence is enabled on the virtual server. Minimum value = 0 Maximum value = 65535
persistmask	<String>	Read-write	The optional IPv4 network mask applied to IPv4 addresses to establish source IP address based persistence. Minimum length = 1
v6persistmasklen	<Integer>	Read-write	Number of bits to consider in an IPv6 source IP address when creating source IP address based persistence sessions. Default value: 128 Minimum value = 1 Maximum value = 128
timeout	<Integer>	Read-write	Idle time, in minutes, after which a persistence entry is cleared. Default value: 2 Minimum value = 2 Maximum value = 1440

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
edr	<String>	Read-write	Send clients an empty DNS response when the GSLB virtual server is DOWN. Default value: DISABLED Possible values = ENABLED, DISABLED
ecs	<String>	Read-write	If enabled, respond with EDNS Client Subnet (ECS) option in the response for a DNS query with ECS. The ECS address will be used for persistence and spillover persistence (if enabled) instead of the LDNS address. Persistence mask is ignored if ECS is enabled. Default value: DISABLED Possible values = ENABLED, DISABLED
ecsaddrvalidation	<String>	Read-write	Validate if ECS address is a private or unroutable address and in such cases, use the LDNS IP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
mir	<String>	Read-write	Include multiple IP addresses in the DNS responses sent to clients. Default value: DISABLED Possible values = ENABLED, DISABLED
disableprimaryondown	<String>	Read-write	Continue to direct traffic to the backup chain even after the primary GSLB virtual server returns to the UP state. Used when spillover is configured for the virtual server. Default value: DISABLED Possible values = ENABLED, DISABLED
dynamicweight	<String>	Read-write	Specify if the appliance should consider the service count, service weights, or ignore both when using

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			weight-based load balancing methods. The state of the number of services bound to the virtual server help the appliance to select the service. Default value: DISABLED Possible values = SERVICECOUNT, SERVICEWEIGHT, DISABLED
state	<String>	Read-write	State of the GSLB virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
considereffectivestate	<String>	Read-write	If the primary state of all bound GSLB services is DOWN, consider the effective states of all the GSLB services, obtained through the Metrics Exchange Protocol (MEP), when determining the state of the GSLB virtual server. To consider the effective state, set the parameter to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			STATE_ONLY. To disregard the effective state, set the parameter to NONE. The effective state of a GSLB service is the ability of the corresponding virtual server to serve traffic. The effective state of the load balancing virtual server, which is transferred to the GSLB service, is UP even if only one virtual server in the backup chain of virtual servers is in the UP state. Default value: NONE Possible values = NONE, STATE_ONLY
comment	<String>	Read-write	Any comments that you might want to associate with the GSLB virtual server.
somethod	<String>	Read-write	Type of threshold that, when exceeded, triggers spillover. Available

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			settings function as follows: * CONNECTION - Spillover occurs when the number of client connections exceeds the threshold. * DYNAMICCONNECTION - Spillover occurs when the number of client connections at the GSLB virtual server exceeds the sum of the maximum client (Max Clients) settings for bound GSLB services. Do not specify a spillover threshold for this setting, because the threshold is implied by the Max Clients settings of the bound GSLB services. * BANDWIDTH - Spillover occurs when the bandwidth consumed by the GSLB virtual server's incoming

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and outgoing traffic exceeds the threshold. * HEALTH - Spillover occurs when the percentage of weights of the GSLB services that are UP drops below the threshold. For example, if services gslbSvc1, gslbSvc2, and gslbSvc3 are bound to a virtual server, with weights 1, 2, and 3, and the spillover threshold is 50%, spillover occurs if gslbSvc1 and gslbSvc3 or gslbSvc2 and gslbSvc3 transition to DOWN. * NONE - Spillover does not occur. Possible values = CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, LLMQUOTA, NONE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sopersistence	<String>	Read-write	If spillover occurs, maintain source IP address based persistence for both primary and backup GSLB virtual servers. Default value: DISABLED Possible values = ENABLED, DISABLED
sopersistencetimeout	<Integer>	Read-write	Timeout for spillover persistence, in minutes. Default value: 2 Minimum value = 2 Maximum value = 1440
sothreshold	<Integer>	Read-write	Threshold at which spillover occurs. Specify an integer for the CONNECTION spillover method, a bandwidth value in kilobits per second for the BANDWIDTH method (do not enter the units), or a percentage for the HEALTH method (do not enter the percentage symbol). Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 4294967287
sobackupaction	<String>	Read-write	Action to be performed if spillover is to take effect, but no backup chain to spillover is usable or exists. Possible values = DROP, ACCEPT, REDIRECT
appflowlog	<String>	Read-write	Enable logging appflow flow information. Default value: ENABLED Possible values = ENABLED, DISABLED
toggleorder	<String>	Read-write	Configure this option to toggle order preference. Default value: ASCENDING Possible values = ASCENDING, DESCENDING
orderthreshold	<Integer>	Read-write	This option is used to to specify the threshold of minimum number of services to be UP in an order, for it to be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			considered in Lb decision. Default value: 0 Minimum value = 0 Maximum value = 100
backupvserver	<String>	Read-write	Name of the backup GSLB virtual server to which the appliance should to forward requests if the status of the primary GSLB virtual server is down or exceeds its spillover threshold. Minimum length = 1
servicename	<String>	Read-write	Name of the GSLB service for which to change the weight. Minimum length = 1
weight	<Integer>	Read-write	Weight for the service. Minimum value = 1 Maximum value = 100
servicegroupname	<String>	Read-write	The GSLB service group name bound to the selected GSLB virtual server.
domainname	<String>	Read-write	Domain name for which to change the time to live (TTL)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and/or backup service IP address. Minimum length = 1
ttl	<Integer>	Read-write	Time to live (TTL) for the domain. Minimum value = 1
backupip	<String>	Read-write	The IP address of the backup service for the specified domain name. Used when all the services bound to the domain are down, or when the backup chain of virtual servers is down. Minimum length = 1
cookie_domain	<String>	Read-write	The cookie domain for the GSLB site. Used when inserting the GSLB site cookie in the HTTP response. Minimum length = 1
cookietimeout	<Integer>	Read-write	Timeout, in minutes, for the GSLB site cookie. Minimum value = 0 Maximum value = 1440
sitedomainttl	<Integer>	Read-write	TTL, in seconds, for all internally created site domains (created when a site prefix is configured

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			on a GSLB service) that are associated with this virtual server. Minimum value = 1
order	<Integer>	Read-write	Order number to be assigned to the service when it is bound to the lb vserver. Minimum value = 1 Maximum value = 8192
newname	<String>	Read-write	New name for the GSLB virtual server. Minimum length = 1
curstate	<String>	Read-only	State of the gslb vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
status	<Integer>	Read-only	Current status of the gslb vserver. During the initial phase if the configured lb method is not round robin ,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the vserver will adopt round robin to distribute traffic for a predefined number of requests.
lbrrreason	<Integer>	Read-only	Reason why a vserver is in RR. The following are the reasons: 1 - MEP is DOWN (GSLB) 2 - LB method has changed 3 - Bound service's state changed to UP 4 - A new service is bound 5 - Startup RR factor has changed 6 - LB feature is enabled 7 - Load monitor is not active on a service 8 - Vserver is Enabled 9 - SSL feature is Enabled

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			10 - All bound services have reached threshold. Using effective state to load balance (GSLB) 11 - Primary state of bound services are not UP. Using effective state to load balance (GSLB) 12 - No LB decision can be made as all bound services have either reached threshold or are not UP (GSLB) 13 - All load monitors are active .
iscname	<String>	Read-only	is cname feature set on vserver. Possible values = ENABLED, DISABLED
sitepersistence	<String>	Read-only	Type of Site Persistence set. Possible values = ConnectionProxy, HTTPRedirect, NONE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
totalservices	<Integer>	Read-only	Total number of services bound to the vserver.
activeservices	<Integer>	Read-only	Total number of active services bound to the vserver.
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
statechangetimemsec	<Integer>	Read-only	Time at which last state change happened. Milliseconds part.
tickssincelaststatechange	<Integer>	Read-only	Time in 10 millisecond ticks since the last state change.
health	<Integer>	Read-only	Health of vserver based on percentage of weights of active svcs/all svcs. This does not consider administratively disabled svcs.
policyname	<String>	Read-only	Name of the policy bound to the GSLB vserver.
priority	<Integer>	Read-only	Priority. Minimum value = 1 Maximum value = 2147483647

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE. o If gotoPriorityExpression is not present or if it is equal to END then the policy bank evaluation ends here o Else if the gotoPriorityExpression is equal to NEXT then the next policy in the priority order is evaluated. o Else gotoPriorityExpression is evaluated. The result of gotoPriorityExpression (which has to be a number) is processed as follows: - An UNDEF event is triggered if . gotoPriorityExpressi

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			on cannot be evaluated . gotoPriorityExpression evaluates to number which is smaller than the maximum priority in the policy bank but is not same as any policy's priority . gotoPriorityExpression evaluates to a priority that is smaller than the current policy's priority - If the gotoPriorityExpression evaluates to the priority of the current policy then the next policy in the priority order is evaluated. - If the gotoPriorityExpression evaluates to the priority of a policy further ahead in the list then that policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			will be evaluated next. This field is applicable only to rewrite and responder policies.
type	<String>	Read-only	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, MQTT_JUMBO_REQ
vsvrbindsvcip	<String>	Read-only	used for showing the ip of bound entities.
vsvrbindsvcport	<Integer>	Read-only	used for showing ports of bound entities. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
servername	<String>	Read-only	This field is used to display server name in case of GSLB servicegroup binding to GSLB vserver .
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CIPHER and ECC curve bindings. Default value: NO Possible values = YES, NO
currentactiveorder	<String>	Read-only	current order that takes the traffic in case service or servicegroup is bound with order.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of gslbvserver resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbvserver": [ { "__count": "#no"} ] }
```

gslbvserver_binding

Binding object which returns the resources bound to gslbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the GSLB virtual server. Minimum length = 1
gslbvserver_domain_binding	<gslbvserver_domain_binding[]>	Read-only	domain that can be bound to gslbvserver.
gslbvserver_spillover policy_binding	<gslbvserver_spillover policy_binding[]>	Read-only	spilloverpolicy that can be bound to gslbvserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslbvserver_gslbservicegroup_binding	<gslbvserver_gslbservicegroup_binding[]>	Read-only	gslbservicegroup that can be bound to gslbvserver.
gslbvserver_lbpolicy_binding	<gslbvserver_lbpolicy_binding[]>	Read-only	lbpolicy that can be bound to gslbvserver.
gslbvserver_gslbservice_binding	<gslbvserver_gslbservice_binding[]>	Read-only	gslbservice that can be bound to gslbvserver.
gslbvserver_gslbservicegroupmember_binding	<gslbvserver_gslbservicegroupmember_binding[]>	Read-only	gslbservicegroupmember that can be bound to gslbvserver.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbvserver_binding": [ {

"name":<String_value>,

"gslbvserver_gslbservice_binding":<gslbvserver_gslbservice_binding[]_value
>,

"gslbvserver_gslbservicegroup_binding":<gslbvserver_gslbservicegroup_bindi
ng[]_value>,

"gslbvserver_gslbservicegroupmember_binding":<gslbvserver_gslbservicegroup
```

```
member_binding[]_value>,

"gslbvserver_lbpolicy_binding":<gslbvserver_lbpolicy_binding[]_value>,

"gslbvserver_domain_binding":<gslbvserver_domain_binding[]_value>,

"gslbvserver_spilloverpolicy_binding":<gslbvserver_spilloverpolicy_binding
[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "gslbvserver_binding": [ {

"name":<String_value>,

"gslbvserver_gslbservice_binding":<gslbvserver_gslbservice_binding[]_value
```

```
>,

"gslbvserver_gslbservicegroup_binding":<gslbvserver_gslbservicegroup_bindi
ng[]_value>,

"gslbvserver_gslbservicegroupmember_binding":<gslbvserver_gslbservicegroup
member_binding[]_value>,

"gslbvserver_lbpolicy_binding":<gslbvserver_lbpolicy_binding[]_value>,

"gslbvserver_domain_binding":<gslbvserver_domain_binding[]_value>,

"gslbvserver_spilloverpolicy_binding":<gslbvserver_spilloverpolicy_binding
[]_value>

}]}
```

gslbvserver_domain_binding

Binding object showing the domain that can be bound to gslbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ttl	<Integer>	Read-write	Time to live (TTL) for the domain. Minimum value = 1
cookie_domain	<String>	Read-write	The cookie domain for the GSLB site. Used when inserting the GSLB site cookie in the HTTP response. Minimum length = 1
domainname	<String>	Read-write	Domain name for which to change the time to live (TTL)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and/or backup service IP address. Minimum length = 1
order	<Integer>	Read-write	Order number to be assigned to the service when it is bound to the lb vserver. Minimum value = 1 Maximum value = 8192
cookie_domainflag	<Boolean>	Read-write	The cookie domain for the GSLB site. Used when inserting the GSLB site cookie in the HTTP response.
backupip	<String>	Read-write	The IP address of the backup service for the specified domain name. Used when all the services bound to the domain are down, or when the backup chain of virtual servers is down. Minimum length = 1
backupipflag	<Boolean>	Read-write	The IP address of the backup service for the specified domain name. Used when all the services bound to the domain are down, or when the backup chain of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			virtual servers is down.
cookietimeout	<Integer>	Read-write	Timeout, in minutes, for the GSLB site cookie. Minimum value = 0 Maximum value = 1440
sitedomainttl	<Integer>	Read-write	TTL, in seconds, for all internally created site domains (created when a site prefix is configured on a GSLB service) that are associated with this virtual server. Minimum value = 1
name	<String>	Read-write	Name of the virtual server on which to perform the binding operation. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

gslbvserver_gslbservice_binding

Binding object showing the gslbservice that can be bound to gslbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name of the GSLB service for which to change the weight. Minimum length = 1
domainname	<String>	Read-write	Domain name for which to change the time to live (TTL) and/or backup service IP address. Minimum length = 1
order	<Integer>	Read-write	Order number to be assigned to the service when it is bound to the lb vserver. Minimum value = 1 Maximum value = 8192
name	<String>	Read-write	Name of the virtual server on which to perform the binding operation. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
weight	<Integer>	Read-write	Weight for the service. Minimum value = 1 Maximum value = 100
gslbthreshold	<Integer>	Read-only	Indicates if gslb svc has reached threshold.
thresholdvalue	<Integer>	Read-only	Tells whether threshold exceeded for this service participating in CUSTOMLB.
orderstr	<String>	Read-only	Order number in string form assigned to the service when it is bound to the lb vserver.
dynamicconfwt	<Integer>	Read-only	Weight obtained by the virtue of bound service count or weight.
svreffgslbstate	<String>	Read-only	Effective state of the gslb svc. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Unknown, DISABLED
preferredlocation	<String>	Read-only	The target site to be returned in the DNS response when a policy is successfully evaluated against the incoming DNS request. Target site is specified in dotted notation with up to 6 qualifiers. Wildcard `*' is accepted as a valid qualifier token.
iscname	<String>	Read-only	is cname feature set on vserver. Possible values = ENABLED, DISABLED
gslbboundsvctype	<String>	Read-only	Protocol used by services bound to the GSLBvirtual server. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
cnameentry	<String>	Read-only	The cname of the gslb service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svcsitepersistence	<String>	Read-only	Type of Site Persistence set on the bound service. Possible values = ConnectionProxy, HTTPRedirect, NONE
cumulativeweight	<Integer>	Read-only	Cumulative weight is the weight of GSLB service considering both its configured weight and dynamic weight. It is equal to product of dynamic weight and configured weight of the gslb service .
port	<Integer>	Read-only	Port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
ipaddress	<String>	Read-only	IP address.
sitepersistcookie	<String>	Read-only	This field is introduced for displaying the cookie in cluster setup. Minimum length = 1
curstate	<String>	Read-only	State of the gslb vserver. Possible values = UP, DOWN, UNKNOWN, BUSY,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/gslbvserver_gslbservicegroup_binding **HTTP Method:** PUT

```

gslbvserver_gslbservicegroupmember_binding

Binding object showing the gslbservicegroupmember that can be bound to gslbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
order	<Integer>	Read-write	Order number to be assigned to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service when it is bound to the lb vserver. Minimum value = 1 Maximum value = 8192
weight	<Integer>	Read-write	Weight for the service. Minimum value = 1 Maximum value = 100
servicegroupname	<String>	Read-write	The GSLB service group name bound to the selected GSLB virtual server.
name	<String>	Read-write	Name of the virtual server on which to perform the binding operation. Minimum length = 1
dynamicweight	<String>	Read-only	Specify if the appliance should consider the service count, service weights, or ignore both when using weight-based load balancing methods. The state of the number of services bound to the virtual server help the appliance to select the service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = SERVICECOUNT, SERVICEWEIGHT, DISABLED
orderstr	<String>	Read-only	Order number in string form assigned to the service when it is bound to the lb vserver.
thresholdvalue	<Integer>	Read-only	Tells whether threshold exceeded for this service participating in CUSTOMLB.
gslbthreshold	<Integer>	Read-only	Indicates if gslb svc has reached threshold.
svreffgslbstate	<String>	Read-only	Effective state of the gslb svc. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
preferredlocation	<String>	Read-only	The target site to be returned in the DNS response when a policy is successfully evaluated against the incoming DNS request. Target site is specified in dotted notation with up to 6 qualifiers. Wildcard `*' is accepted as a valid qualifier token.
svcsitepersistence	<String>	Read-only	Type of Site Persistence set on the bound service. Possible values = ConnectionProxy, HTTPRedirect, NONE
sitepersistcookie	<String>	Read-only	This field is introduced for displaying the cookie in cluster setup. Minimum length = 1
ipaddress	<String>	Read-only	IP address.
curstate	<String>	Read-only	State of the gslb vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NS_EMPTY_STR, Unknown, DISABLED
servicetype	<String>	Read-only	Protocol used by services bound to the virtual server. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
port	<Integer>	Read-only	Port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
__count	<Double>	Read-only	count parameter

Operations

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver_spilloverpolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver_spilloverpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "gslbvserver_spilloverpolicy_binding": [ {

"priority":<Integer_value>,

"name":<String_value>,

"order":<Integer_value>,

"type":<String_value>,

"gotopriorityexpression":<String_value>,

"policyname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/gslbvserver_spilloverpolicy_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"gslbvserver_spilloverpolicy_binding": [ { "__count": "#no"} ] }
```

ha

High Availability

High-availability commands.

NAME	DESCRIPTION
hafailover	Configuration for failover
hafiles	Configuration for files
hanode	Configuration for node
hanode_binding	Binding object showing the resources that can be bound to hanode
hanode_ci_binding	Binding object showing the ci that can be bound to hanode
hanode_fis_binding	Binding object showing the fis that can be bound to hanode

NAME	DESCRIPTION
hanode_partialfailureinterfaces_binding	Binding object showing the partialfailureinterfaces that can be bound to hanode
hanode_routemonitor6_binding	Binding object showing the routemonitor6 that can be bound to hanode
hanode_routemonitor_binding	Binding object showing the routemonitor that can be bound to hanode
hasync	Configuration for sync
hasyncfailures	Configuration for HA sync failures

hafailover

Configuration for failover resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
force	<Boolean>	Read-write	Force a failover without prompting for confirmation.

Operations

(click to see Properties)

- FORCE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

FORCE

URL: http:// <netscaler-ip-address> /nitro/v1/config/hafailover? **action=Force**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"hafailover":{

"force":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

hafiles

Configuration for files resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mode	<String[]>	Read-write	Specify one of the following modes of synchronization. * all - Synchronize files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, and Application Firewall XML objects. * bookmarks - Synchronize all Access Gateway bookmarks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ssl - Synchronize all certificates, keys, and CRLs for the SSL feature. * imports. Synchronize all XML objects (for example, WSDLs, schemas, error pages) configured for the application firewall. * misc - Synchronize all license files and the rc.conf file. * all_plus_misc - Synchronize files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, application firewall XML objects, licenses, and the rc.conf file. Possible values = all, bookmarks, ssl, imports, misc, dns, krb, AAA, app_catalog,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			all_plus_misc, all_minus_misc

Operations

(click to see Properties)

- SYNC

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

SYNC

URL: http:// <netscaler-ip-address> /nitro/v1/config/hafiles? **action=sync HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"hafiles":{

"mode":<String[]_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

hanode

Configuration for node resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	Number that uniquely identifies the node. For self node, it will always be 0. Peer node values can range from 1-64. Minimum value = 1 Maximum value = 64
ipaddress	<String>	Read-write	The NSIP or NSIP6 address of the node to be added for an HA configuration.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This setting is neither propagated nor synchronized. Minimum length = 1
inc	<String>	Read-write	This option is required if the HA nodes reside on different networks. When this mode is enabled, the following independent network entities and configurations are neither propagated nor synced to the other node: MIPs, SNIPs, VLANs, routes (except LLB routes), route monitors, RNAT rules (except any RNAT rule with a VIP as the NAT IP), and dynamic routing configurations. They are maintained independently on each node. Default value: DISABLED Possible values = ENABLED, DISABLED
rpcnodepassword	<String>	Read-write	Password to be used in authentication with the peer rpc node.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
hastatus	<String>	Read-write	The HA status of the node. The HA status STAYSECONDARY is used to force the secondary device stay as secondary independent of the state of the Primary device. For example, in an existing HA setup, the Primary node has to be upgraded and this process would take few seconds. During the upgradation, it is possible that the Primary node may suffer from a downtime for a few seconds. However, the Secondary should not take over as the Primary node. Thus, the Secondary node should remain as Secondary even if there is a failure in the Primary node. STAYPRIMARY configuration keeps the node in primary state in case if it is healthy, even if the peer node was the primary node initially. If the node with

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			STAYPRIMARY setting (and no peer node) is added to a primary node (which has this node as the peer) then this node takes over as the new primary and the older node becomes secondary. ENABLED state means normal HA operation without any constraints/ preferences. DISABLED state disables the normal HA operation of the node. Possible values = ENABLED, STAYSECONDARY, DISABLED, STAYPRIMARY
hasync	<String>	Read-write	Automatically maintain synchronization by duplicating the configuration of the primary node on the secondary node. This setting is not propagated. Automatic synchronization

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requires that this setting be enabled (the default) on the current secondary node. Synchronization uses TCP port 3010. Default value: ENABLED Possible values = ENABLED, DISABLED
haprop	<String>	Read-write	Automatically propagate all commands from the primary to the secondary node, except the following: * All HA configuration related commands. For example, add ha node, set ha node, and bind ha node. * All Interface related commands. For example, set interface and unset interface. * All channels related commands. For example, add channel, set

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			channel, and bind channel. The propagated command is executed on the secondary node before it is executed on the primary. If command propagation fails, or if command execution fails on the secondary, the primary node executes the command and logs an error. Command propagation uses port 3010. Note: After enabling propagation, run force synchronization on either node. Default value: ENABLED Possible values = ENABLED, DISABLED
hellointerval	<Integer>	Read-write	Interval, in milliseconds, between heartbeat messages sent to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the peer node. The heartbeat messages are UDP packets sent to port 3003 of the peer node. Default value: 200 Minimum value = 200 Maximum value = 1000
deadinterval	<Integer>	Read-write	Number of seconds after which a peer node is marked DOWN if heartbeat messages are not received from the peer node. Default value: 3 Minimum value = 3 Maximum value = 60
failsafe	<String>	Read-write	Keep one node primary if both nodes fail the health check, so that a partially available node can back up data and handle traffic. This mode is set independently on each node. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxflips	<Integer>	Read-write	Max number of flips allowed before becoming sticky primary. Default value: 0
maxfliptime	<Integer>	Read-write	Interval after which flipping of node states can again start. Default value: 0
syncvlan	<Integer>	Read-write	Vlan on which HA related communication is sent. This include sync, propagation , connection mirroring , LB persistency config sync, persistent session sync and session state sync. However HA heartbeats can go all interfaces. Minimum value = 1 Maximum value = 4094
syncstatusstrictmode	<String>	Read-write	strict mode flag for sync status. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-only	Node Name.
flags	<Integer>	Read-only	The flags for this entry.
state	<String>	Read-only	HA Master State. Possible values = Primary, Secondary, UNKNOWN
enaifaces	<String>	Read-only	Enabled interfaces.
disifaces	<String>	Read-only	Disabled interfaces.
hamonifaces	<String>	Read-only	HAMON ON interfaces.
haheartbeatifaces	<String>	Read-only	HAHEARTBEAT OFF interfaces.
pfifaces	<String>	Read-only	Interfaces causing Partial Failure.
ifaces	<String>	Read-only	Interfaces on which non-multicast is not seen.
netmask	<String>	Read-only	The netmask.
ssl2	<String>	Read-only	SSL card status. Possible values = DOWN, UP, NOT PRESENT, UNKNOWN
masterstatetime	<Integer>	Read-only	Time elapsed in current master state.
routemonitor	<String>	Read-only	The IP address (IPv4 or IPv6).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
curflips	<Integer>	Read-only	Keeps track of number of flips that have happened till now in current interval.
completedfliptime	<Integer>	Read-only	To inform user whether flip time is elapsed or not.
routemonitorstate	<String>	Read-only	State for route monitor. Possible values = UP, DOWN
hasyncfailurereason	<String>	Read-only	Displays the reason for HA SYNC Failure. Possible values =
secureheartbeatstate	<String>	Read-only	Displays the current state of HA secure heartbeats. Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/hanode_ci_binding/ id_value<Integer> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/hanode_ci_binding/ id_value<Integer> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of hanode_ci_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/hanode_ci_binding/ id_value<Integer> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the hanode_ci_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "hanode_ci_binding": [ {

"routemonitor":<String_value>,

"id":<Integer_value>,

"enaifaces":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/hanode_ci_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/hanode_ci_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "hanode_ci_binding": [ {

"routemonitor":<String_value>,

"id":<Integer_value>,

"enaifaces":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/hanode_ci_binding/ id_value<Integer> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"hanode_ci_binding": [ { "__count": "#no"} ] }
```

hanode_fis_binding

Binding object showing the fis that can be bound to hanode.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Node Name.
id	<Integer>	Read-write	Number that uniquely identifies the local node. The ID of the local node is always 0. Minimum value = 0 Maximum value = 64
routemonitor	<String>	Read-write	A route that you want the Citrix ADC to monitor in its internal routing table. You can specify an IPv4 address or network, or an IPv6 address or network prefix. If you specify an IPv4 network address or IPv6 network prefix, the appliance monitors any route that matches the network or prefix. Minimum length = 1
enaifaces	<String>	Read-only	Enabled interfaces.
__count	<Double>	Read-only	count parameter

Operations

hasync

Configuration for sync resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
force	<Boolean>	Read-write	Force synchronization regardless of the state of HA propagation and HA synchronization on either node.
save	<String>	Read-write	After synchronization, automatically save the configuration in the secondary node configuration file (ns.conf) without prompting for confirmation. Possible values = YES, NO

Operations

(click to see Properties)

- FORCE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

FORCE

URL: http:// <netscaler-ip-address> /nitro/v1/config/hasync? **action=Force HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"hasync":{

"force":<Boolean_value>,

"save":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

hasyncfailures

Configuration for HA sync failures resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
response	<String>	Read-write	Displays the list of commands failed during HA configuration synchronization.
_nextgenapiresource	<String>	Read-write	.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

}]}
```

ica

Ica

ICA configuration.

NAME	DESCRIPTION
icaaccessprofile	Configuration for ica accessprofile
icaaction	Configuration for ica action
icaglobal_binding	Binding object showing the resources that can be bound to icaglobal
icaglobal_icapolicy_binding	Binding object showing the icapolicy that can be bound to icaglobal
icalatencyprofile	Configuration for Profile for Latency monitoring
icaparameter	Configuration for Config Parameters for NS ICA
icapolicy	Configuration for ICA policy

NAME	DESCRIPTION
icapolicy_binding	Binding object showing the resources that can be bound to icapolicy
icapolicy_crvserver_binding	Binding object showing the crvserver that can be bound to icapolicy
icapolicy_icaglobal_binding	Binding object showing the icaglobal that can be bound to icapolicy
icapolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to icapolicy

icaaccessprofile

Configuration for ica accessprofile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the ICA accessprofile. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the ICA accessprofile is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ica accessprofile" or 'my ica accessprofile'). Each of the features can be configured as DEFAULT/ DISABLED. Here, DISABLED means that the policy settings on the backend XenApp/ XenDesktop server are overridden and the Citrix ADC makes the decision to deny access. Whereas DEFAULT means that the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix ADC allows the request to reach the XenApp/ XenDesktop that takes the decision to allow/deny access based on the policy configured on it. For example, if ClientAudioRedirect ion is enabled on the backend XenApp/ XenDesktop server, and the configured profile has ClientAudioRedirect ion as DISABLED, the Citrix ADC makes the decision to deny the request irrespective of the configuration on the backend. If the configured profile has ClientAudioRedirect ion as DEFAULT, then the Citrix ADC forwards the requests to the backend XenApp/ XenDesktop server.It then makes the decision to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			allow/deny access based on the policy configured on it. Minimum length = 1
connectclientlptports	<String>	Read-write	Allow Default access/Disable automatic connection of LPT ports from the client when the user logs on. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientaudioredirection	<String>	Read-write	Allow Default access/Disable applications hosted on the server to play sounds through a sound device installed on the client computer, also allows or prevents users to record audio input. Default value: DISABLED Possible values = DEFAULT, DISABLED
localremotedatasharing	<String>	Read-write	Allow Default access/Disable file/

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			data sharing via the Receiver for HTML5. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientclipboardredirection	<String>	Read-write	Allow Default access/Disable the clipboard on the client device to be mapped to the clipboard on the server. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientcomportredirection	<String>	Read-write	Allow Default access/Disable COM port redirection to and from the client. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientdriveredirection	<String>	Read-write	Allow Default access/Disables drive redirection to and from the client.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = DEFAULT, DISABLED
clientprinterredirection	<String>	Read-write	Allow Default access/Disable client printers to be mapped to a server when a user logs on to a session. Default value: DISABLED Possible values = DEFAULT, DISABLED
multistream	<String>	Read-write	Allow Default access/Disable the multistream feature for the specified users. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientusbdriveredirection	<String>	Read-write	Allow Default access/Disable the redirection of USB devices to and from the client. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DEFAULT, DISABLED
clienttwaindeviceredirection	<String>	Read-write	Allow default access or disable TWAIN devices, such as digital cameras or scanners, on the client device from published image processing applications. Default value: DISABLED Possible values = DEFAULT, DISABLED
wiaredirection	<String>	Read-write	Allow default access or disable WIA scanner redirection. Default value: DISABLED Possible values = DEFAULT, DISABLED
draganddrop	<String>	Read-write	Allow default access or disable drag and drop between client and remote applications and desktops. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DEFAULT, DISABLED
smartcardredirection	<String>	Read-write	Allow default access or disable smart card redirection. Smart card virtual channel is always allowed in CVAD. Default value: DISABLED Possible values = DEFAULT, DISABLED
fido2redirection	<String>	Read-write	Allow default access or disable FIDO2 redirection. Default value: DISABLED Possible values = DEFAULT, DISABLED
refcnt	<Integer>	Read-only	Number of entities using this accessprofile.
builtin	<String[]>	Read-only	Indicates that the ICA accessprofile is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default accessprofile.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/icaaccessprofile **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"icaaccessprofile":{

<b>"name":<String_value>,

</b>"connectclientlptports":<String_value>,

"clientaudioredirection":<String_value>,

"localremotedatasharing":<String_value>,

"clientclipboardredirection":<String_value>,

"clientcomportredirection":<String_value>,

"icaglobal_icapolicy_binding":<icaglobal_icapolicy_binding[]_value>

}]}
```

icaglobal_icapolicy_binding

Binding object showing the icapolicy that can be bound to icaglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-write	Specifies the priority of the policy.
type	<String>	Read-write	Global bind point for which to show detailed information about the policies bound to the bind point. Possible values = ICA_REQ_OVERRIDE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ICA_REQ_DEFAULT
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL, APPFW_GLOBAL, TM_GLOBAL
policyname	<String>	Read-write	Name of the ICA policy.
flowtype	<Integer>	Read-only	Flow type of the bound ICA policy.
numpol	<Integer>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE

- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/icaglobal_icapolicy_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"icaglobal_icapolicy_binding":{

<b>"policyname":<String_value>,

</b><b>"priority":<Integer_value>,

</b>"gotopriorityexpression":<String_value>,

"type":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/icaglobal_icapolicy_binding **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/icaglobal_icapolicy_binding? **args= policyname:<String_value>, type: <String_value> ,priority: <Integer_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/icaglobal_icapolicy_binding **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/icaglobal_icapolicy_binding? **args=type: <String_value>**

Use this query-parameter to get icaglobal_icapolicy_binding resources based on additional properties.

filter http:// <netscaler-ip-address> /nitro/v1/config/icaglobal_icapolicy_binding? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of icaglobal_icapolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/icaglobal_icapolicy_binding? **pagesize=#no;pageno=#no**

Use this query-parameter to get the icaglobal_icapolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "icaglobal_icapolicy_binding": [ {

"priority":<Integer_value>,

"type":<String_value>,

"gotopriorityexpression":<String_value>,

"globalbindtype":<String_value>,

"policyname":<String_value>,

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "icaglobal_icapolicy_binding": [ { "__count": "#no"} ] }
```

icalatencyprofile

Configuration for Profile for Latency monitoring resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the ICA latencyprofile. Must begin with a letter, number, or the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the ICA latency profile is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ica l7latencyprofile" or 'my ica l7latencyprofile'). Minimum length = 1
l7latencymonitoring	<String>	Read-write	Enable/Disable L7 Latency monitoring for L7 latency notifications.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
l7latencythresholdfactor	<Integer>	Read-write	L7 Latency threshold factor. This is the factor by which the active latency should be greater than the minimum observed value to determine that the latency is high and may need to be reported. Default value: 4 Minimum value = 2 Maximum value = 65535
l7latencywaittime	<Integer>	Read-write	L7 Latency Wait time. This is the time for which the Citrix ADC waits after the threshold is exceeded before it sends out a Notification to the Insight Center. Default value: 20 Minimum value = 1 Maximum value = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
l7latencynotifyinterval	<Integer>	Read-write	L7 Latency Notify Interval. This is the interval at which the Citrix ADC sends out notifications to the Insight Center after the wait time has passed. Default value: 20 Minimum value = 1 Maximum value = 65535
l7latencymaxnotifycount	<Integer>	Read-write	L7 Latency Max notify Count. This is the upper limit on the number of notifications sent to the Insight Center within an interval where the Latency is above the threshold. Default value: 5 Minimum value = 1 Maximum value = 65535
refcnt	<Integer>	Read-only	Number of entities using this l7latencyprofile.
builtin	<String[]>	Read-only	Indicates that the ICA latencyprofile is a built-in (SYSTEM INTERNAL) type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default l7latencyprofile.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

icapolicy

Configuration for ICA policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ica policy" or 'my ica policy').
rule	<String>	Read-write	Expression or other value against which the traffic is evaluated. Must be a Boolean expression. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Name of the ica action to be associated with this policy.
comment	<String>	Read-write	Any type of information about this ICA policy.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
newname	<String>	Read-write	New name for the policy. Must begin with an ASCII alphabetic or underscore (_)character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), s pace, colon (:), at (@), equals (=), and hyphen (-) characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ica policy" or 'my ica policy'). Minimum length = 1
hits	<Integer>	Read-only	Number of hits.
undefhits	<Integer>	Read-only	Number of policy UNDEF hits.
builtin	<String[]>	Read-only	Indicates that the ICA policy is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

URL: http:// <netscaler-ip-address> /nitro/v1/config/icapolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/icapolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/icapolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of icapolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/icapolicy? **view=summary**

Use this query-parameter to get the summary output of icapolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/icapolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the icapolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "icapolicy": [ {

"name":<String_value>,
```

```
"rule":<String_value>,

"action":<String_value>,

"hits":<Integer_value>,

"undefhits":<Integer_value>,

"comment":<String_value>,

"logaction":<String_value>,

"builtin":<String[]_value>,

"feature":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/icapolicy/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/icapolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/icapolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of icapolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "icapolicy": [ {

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/icapolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "icapolicy": [ { "__count": "#no"} ] }
```

icapolicy_binding

Binding object which returns the resources bound to icapolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the policy about which to display detailed information.
icapolicy_crvserver_binding	<icapolicy_crvserver_binding[]>	Read-only	crvserver that can be bound to icapolicy.
icapolicy_icaglobal_binding	<icapolicy_icaglobal_binding[]>	Read-only	icaglobal that can be bound to icapolicy.
icapolicy_vpnvserver_binding	<icapolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to icapolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/icapolicy_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "icapolicy_binding": [ {

"name":<String_value>,

"icapolicy_crvserver_binding":<icapolicy_crvserver_binding[]_value>,

"icapolicy_icaglobal_binding":<icapolicy_icaglobal_binding[]_value>,

"icapolicy_vpnvserver_binding":<icapolicy_vpnvserver_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/icapolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/icapolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "icapolicy_binding": [ {

"name":<String_value>,

"icapolicy_crvserver_binding":<icapolicy_crvserver_binding[]_value>,

"icapolicy_icaglobal_binding":<icapolicy_icaglobal_binding[]_value>,

"icapolicy_vpnvserver_binding":<icapolicy_vpnvserver_binding[]_value>

}]}
```

icapolicy_crvserver_binding

Binding object showing the crvserver that can be bound to icapolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the policy about which to display detailed information.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy rule evaluates to TRUE.
priority	<Integer>	Read-only	Specifies the priority of the policy.
__count	<Double>	Read-only	count parameter

Operations

ipsec

Ipsec

IPSEC configuration.

NAME	DESCRIPTION
ipsecparameter	Configuration for IPSEC paramter
ipsecprofile	Configuration for IPSEC profile

ipsecparameter

Configuration for IPSEC paramter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ikeversion	<String>	Read-write	IKE Protocol Version. Default value: V2 Possible values = V1, V2
encalgo	<String[]>	Read-write	Type of encryption algorithm (Note: Selection of AES enables AES128). Default value: AES

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = AES, AES192, AES256
hashalgo	<String[]>	Read-write	Type of hashing algorithm. Default value: HMAC_SHA256 Possible values = HMAC_SHA1, HMAC_SHA256, HMAC_SHA384, HMAC_SHA512, HMAC_MD5
lifetime	<Integer>	Read-write	Lifetime of IKE SA in seconds. Lifetime of IPSec SA will be (lifetime of IKE SA/ 8). Minimum value = 480 Maximum value = 31536000
livenesscheckinterval	<Integer>	Read-write	Number of seconds after which a notify payload is sent to check the liveliness of the peer. Additional retries are done as per retransmit interval setting. Zero value disables liveliness checks. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 64999
replaywindowsize	<Integer>	Read-write	IPSec Replay window size for the data traffic. Minimum value = 0 Maximum value = 16384
ikeretryinterval	<Integer>	Read-write	IKE retry interval for bringing up the connection. Minimum value = 60 Maximum value = 3600
perfectforwardsecrecy	<String>	Read-write	Enable/Disable PFS. Default value: DISABLE Possible values = ENABLE, DISABLE
retransmissiontime	<Integer>	Read-write	The interval in seconds to retry sending the IKE messages to peer, three consecutive attempts are done with doubled interval after every failure, increases for every retransmit till 6 retransmits. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 99
responderonly	<String>	Read-only	Responder Only config for IKED. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.

privatekey	<String>	Read-write	Private key file path.
peerpublickey	<String>	Read-write	Peer public key file path.
livenesscheckinterval	<Integer>	Read-write	Number of seconds after which a notify payload is sent to check the liveliness of the peer. Additional retries are done as per retransmit interval setting. Zero value disables liveliness checks. Minimum value = 0 Maximum value = 64999
replaywindowsize	<Integer>	Read-write	IPSec Replay window size for the data traffic.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 16384
ikeretryinterval	<Integer>	Read-write	IKE retry interval for bringing up the connection. Minimum value = 60 Maximum value = 3600
retransmissiontime	<Integer>	Read-write	The interval in seconds to retry sending the IKE messages to peer, three consecutive attempts are done with doubled interval after every failure. Minimum value = 1 Maximum value = 99
perfectforwardsecrecy	<String>	Read-write	Enable/Disable PFS. Possible values = ENABLE, DISABLE
responderonly	<String>	Read-only	Responder Only config for IKED. Possible values = YES, NO
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- GET (ALL)
- GET
- COUNT
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/ipsecprofile **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ipsecprofile":{

<b>"name":<String_value>,

</b>"ikeversion":<String_value>,

"encalgo":<String[]_value>,

"hashalgo":<String[]_value>,

ipsecalg

Ipsecalg

IPSECALG configuration.

NAME	DESCRIPTION
ipsecalgprofile	Configuration for IPSEC ALG profile
ipsecalgsession	Configuration for IPSEC ALG session

ipsecalgprofile

Configuration for IPSEC ALG profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the ipsec alg profile. Minimum length = 1 Maximum length = 32
ikesessiontimeout	<Integer>	Read-write	IKE session timeout in minutes. Default value: 60 Minimum value = 1 Maximum value = 1440
espsessiontimeout	<Integer>	Read-write	ESP session timeout in minutes. Default value: 60 Minimum value = 1 Maximum value = 1440

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
espgatetimeout	<Integer>	Read-write	Timeout ESP in seconds as no ESP packets are seen after IKE negotiation. Default value: 30 Minimum value = 3 Maximum value = 1200
connfailover	<String>	Read-write	Mode in which the connection failover feature must operate for the IPSec Alg. After a failover, established UDP connections and ESP packet flows are kept active and resumed on the secondary appliance. Recomended setting is ENABLED. Default value: ENABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

ipsecalgsession

Configuration for IPSEC ALG session resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sourceip_alg	<String>	Read-write	Original Source IP address. Minimum length = 1
natip_alg	<String>	Read-write	Natted Source IP address. Minimum length = 1
destip_alg	<String>	Read-write	Destination IP address. Minimum length = 1
sourceip	<String>	Read-write	Original Source IP address. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
natip	<String>	Read-write	Natted Source IP address. Minimum length = 1
destip	<String>	Read-write	Destination IP address. Minimum length = 1
spiin	<Integer>	Read-only	Client SPI for ESP.
spiout	<Integer>	Read-only	Server SPI for ESP.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- FLUSH

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/ipsecalgsession? **action=flush HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ipsecalgsession":{

"sourceip":<String_value>,

"natip":<String_value>,

"destip":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ipsecalgsession **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ipsecalgsession? **args=sourceip_alg: <String_value> ,natip_alg: <String_value> ,destip_alg: <String_value>**

Use this query-parameter to get ipsecalgsession resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/ipsecalgsession? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/ipsecalgsession? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of ipsecalgsession resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/ipsecalgsession? **view=summary**

Use this query-parameter to get the summary output of ipsecalgsession resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/ipsecalgsession? **pagesize=#no;pageno=#no**

Use this query-parameter to get the ipsecalgsession resources in chunks.

HTTP Method: GET

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "kafkacluster": [ {

"name":<String_value>,

"activesvc":<Integer_value>,

"totalsvc":<Integer_value>,

"topicname":<String_value>,

"numtopics":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/kafkacluster? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "kafkacluster": [ { "__count": "#no"} ] }
```

kafkacluster_binding

Binding object which returns the resources bound to kafkacluster.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Kafka cluster. Minimum length = 1 Maximum length = 127
kafkacluster_servicegroup_binding	<kafkacluster_servicegroup_binding[]>	Read-only	servicegroup that can be bound to kafkacluster.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/kafkacluster_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "kafkacluster_binding": [ {

"name":<String_value>,

"kafkacluster_servicegroup_binding":<kafkacluster_servicegroup_binding[]_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/kafkacluster_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/kafkacluster_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "kafkacluster_binding": [ {

"name":<String_value>,

"kafkacluster_servicegroup_binding":<kafkacluster_servicegroup_binding[]_value>

}]}
```

kafkacluster_servicegroup_binding

Binding object showing the servicegroup that can be bound to kafkacluster.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the bound servicegroup.
name	<String>	Read-write	Name for the Kafka cluster. Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT
- ADD
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/kafkacluster_servicegroup_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"kafkacluster_servicegroup_binding":{

<b>"name":<String_value>,

</b>"servicegroupname":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/kafkacluster_servicegroup_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ kafkacluster_servicegroup_binding/ name_value<String> ? **args=servicegroupname: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/kafkacluster_servicegroup_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ kafkacluster_servicegroup_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of kafkacluster_servicegroup_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/kafkacluster_servicegroup_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the kafkacluster_servicegroup_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "kafkacluster_servicegroup_binding": [ {

"servicegroupname":<String_value>,

"name":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/kafkacluster_servicegroup_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/kafkacluster_servicegroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

lb

Load Balancing

Load Balancing configuration. The load balancing methods manage the selection of an appropriate physical server in a server farm.

NAME	DESCRIPTION
lbaction	Configuration for lb action
lbglobal_binding	Binding object showing the resources that can be bound to lbglobal
lbglobal_lbpolicy_binding	Binding object showing the lbpolicy that can be bound to lbglobal
lbgroup	Configuration for LB group
lbgroup_binding	Binding object showing the resources that can be bound to lbgroup
lbgroup_lbvserver_binding	Binding object showing the lbvserver that can be bound to lbgroup
lbmetrictable	Configuration for metric table
lbmetrictable_binding	Binding object showing the resources that can be bound to lbmetrictable
lbmetrictable_metric_binding	Binding object showing the metric that can be bound to lbmetrictable
lbmonbindings	Configuration for monitro bindings
lbmonbindings_binding	Binding object showing the resources that can be bound to lbmonbindings
lbmonbindings_gslbservicegroup_binding	Binding object showing the gslbservicegroup that can be bound to lbmonbindings

NAME	DESCRIPTION
lbmonbindings_service_binding	Binding object showing the service that can be bound to lbmonbindings
lbmonbindings_servicegroup_binding	Binding object showing the servicegroup that can be bound to lbmonbindings
lbmonitor	Configuration for monitor
lbmonitor_binding	Binding object showing the resources that can be bound to lbmonitor
lbmonitor_metric_binding	Binding object showing the metric that can be bound to lbmonitor
lbmonitor_service_binding	Binding object showing the service that can be bound to lbmonitor
lbmonitor_servicegroup_binding	Binding object showing the servicegroup that can be bound to lbmonitor
lbmonitor_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to lbmonitor
lbparameter	Configuration for LB parameter
lbpersistentsessions	Configuration for persistence session
lbpolicy	Configuration for lb policy

NAME	DESCRIPTION
lbpolicy_binding	Binding object showing the resources that can be bound to lbpolicy
lbpolicy_gslbvserver_binding	Binding object showing the gslbvserver that can be bound to lbpolicy
lbpolicy_lbglobal_binding	Binding object showing the lbglobal that can be bound to lbpolicy
lbpolicy_lbpolicylabel_binding	Binding object showing the lbpolicylabel that can be bound to lbpolicy
lbpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to lbpolicy
lbpolicylabel	Configuration for lb policy label
lbpolicylabel_binding	Binding object showing the resources that can be bound to lbpolicylabel
lbpolicylabel_lbpolicy_binding	Binding object showing the lbpolicy that can be bound to lbpolicylabel
lbpolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to lbpolicylabel
lbprofile	Configuration for LB profile
lbroute	Configuration for LB route
lbroute6	Configuration for LB route6

NAME	DESCRIPTION
lbsipparameters	Configuration for SIP parameters
lbvserver	Configuration for Load Balancing Virtual Server
lbvserver_analyticsprofile_binding	Binding object showing the analyticsprofile that can be bound to lbvserver
lbvserver_appflowpolicy_binding	Binding object showing the appflowpolicy that can be bound to lbvserver
lbvserver_appfwpolicy_binding	Binding object showing the appfwpolicy that can be bound to lbvserver
lbvserver_appqoepolicy_binding	Binding object showing the appqoepolicy that can be bound to lbvserver
lbvserver_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to lbvserver
lbvserver_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to lbvserver
lbvserver_authorizationpolicy_binding	Binding object showing the authorizationpolicy that can be bound to lbvserver
lbvserver_binding	Binding object showing the resources that can be bound to lbvserver

NAME	DESCRIPTION
lbvserver_botpolicy_binding	Binding object showing the botpolicy that can be bound to lbvserver
lbvserver_cachepolicy_binding	Binding object showing the cachepolicy that can be bound to lbvserver
lbvserver_cmppolicy_binding	Binding object showing the cmppolicy that can be bound to lbvserver
lbvserver_contentinspectionpolicy_binding	Binding object showing the contentinspectionpolicy that can be bound to lbvserver
lbvserver_csvserver_binding	Binding object showing the csvserver that can be bound to lbvserver
lbvserver_dnspolicy64_binding	Binding object showing the dnspolicy64 that can be bound to lbvserver
lbvserver_feopolicy_binding	Binding object showing the feopolicy that can be bound to lbvserver
lbvserver_lbpolicy_binding	Binding object showing the lbpolicy that can be bound to lbvserver
lbvserver_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to lbvserver
lbvserver_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to lbvserver

NAME	DESCRIPTION
lbvserver_service_binding	Binding object showing the service that can be bound to lbvserver
lbvserver_servicegroup_binding	Binding object showing the servicegroup that can be bound to lbvserver
lbvserver_servicegroupmember_binding	Binding object showing the servicegroupmember that can be bound to lbvserver
lbvserver_spilloverpolicy_binding	Binding object showing the spilloverpolicy that can be bound to lbvserver
lbvserver_tmtrafficpolicy_binding	Binding object showing the tmtrafficpolicy that can be bound to lbvserver
lbvserver_transformpolicy_binding	Binding object showing the transformpolicy that can be bound to lbvserver
lbvserver_videooptimizationdetectionpolicy_binding	Binding object showing the videooptimizationdetectionpolicy that can be bound to lbvserver
lbvserver_videooptimizationpacingpolicy_binding	Binding object showing the videooptimizationpacingpolicy that can be bound to lbvserver
lbwlm	Configuration for web log manager
lbwlm_binding	Binding object showing the resources that can be bound to lbwlm

NAME	DESCRIPTION
lbwlm_lbvserver_binding	Binding object showing the lbvserver that can be bound to lbwlm

lbaction

Configuration for lb action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LB action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lb action" or 'my lb action').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of an LB action. Available settings function as follows: * NOLBACTION - Does not consider LB action in making LB decision. * SELECTIONORDER - services bound to vserver with order specified in value parameter is considerd for lb/gslb decision. Possible values = NOLBACTION, SELECTIONORDER
value	<Integer[]>	Read-write	The selection order list used during lb/gslb decision. Preference of services during lb/gslb decision is as follows - services corresponding to first order specified in the sequence is considered first, services corresponding to second order specified in the sequence is considered next and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			so on. For example, if -value 2 1 3 is specified here and service-1 bound to a vserver with order 1, service-2 bound to a vserver with order 2 and service-3 bound to a vserver with order 3. Then preference of selecting services in LB decision is as follows: service-2, service-1, service-3. Minimum value = 1
comment	<String>	Read-write	Comment. Any type of information about this LB action.
newname	<String>	Read-write	New name for the LB action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lb action" or my lb action'). Minimum length = 1
hits	<Integer>	Read-only	The number of times the action has been taken.
referencecount	<Integer>	Read-only	The number of references to the action.
undefhits	<Integer>	Read-only	The number of times the action resulted in UNDEF.
feature	<String>	Read-only	The feature to be checked while applying this config.
builtin	<String[]>	Read-only	Flag to determine whether LB action is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbaction **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbaction":{

<b>"name":<String_value>,

</b><b>"type":<String_value>,

</b>"value":<Integer[]_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbaction/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbaction **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbaction":{

<b>"name":<String_value>,

</b>"value":<Integer[]_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbaction? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbaction":{

<b>"name":<String_value>,

</b>"comment":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbaction? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbaction":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbaction **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/lbaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lbaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lbaction? **view=summary**

Use this query-parameter to get the summary output of lbaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbaction": [ { "__count": "#no"} ] }
```

lbglobal_binding

Binding object which returns the resources bound to lbglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lbglobal_lbpolicy_binding	<lbglobal_lbpolicy_binding[]>	Read-write	lbpolicy that can be bound to lbglobal.

Operations

(click to see Properties)

- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbglobal_binding": [ {

"lbglobal_lbpolicy_binding":<lbglobal_lbpolicy_binding[]_value>
```

```
}]}
```

lbglobal_lbpolicy_binding

Binding object showing the lbpolicy that can be bound to lbglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-write	Specifies the priority of the policy.
labeltype	<String>	Read-write	Type of invocation, Available settings function as follows: * vserver - Invokes the unnamed policy label associated with the specified virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, policylabel
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
type	<String>	Read-write	. Possible values = REQ_OVERRIDE, REQ_DEFAULT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, SIPUDP_REQ_OVERRIDE, SIPUDP_REQ_DEFAULT, SIPTCP_REQ_OVERRIDE, SIPTCP_REQ_DEFAULT, MSSQL_REQ_OVERRIDE, MSSQL_REQ_DEFAULT, MYSQL_REQ_OVERRIDE, MYSQL_REQ_DEFAULT, ORACLE_REQ_OVERRIDE, ORACLE_REQ_DEFAULT, NAT_REQ_OVERRIDE, NAT_REQ_DEFAULT, DIAMETER_REQ_OVERRIDE, DIAMETER_REQ_DEFAULT, RADIUS_REQ_OVERRIDE, RADIUS_REQ_DEFAULT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DNS_REQ_OVERRIDE, DNS_REQ_DEFAULT, MQTT_REQ_OVERRIDE, MQTT_REQ_DEFAULT, QUIC_OVERRIDE, QUIC_DEFAULT, HTTPQUIC_REQ_OVERRIDE, HTTPQUIC_REQ_DEFAULT, GSLB_REQ_OVERRIDE, GSLB_REQ_DEFAULT
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the LB policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL, APPFW_GLOBAL, TM_GLOBAL
flowtype	<Integer>	Read-only	flowtype of the bound LB policy.
numpol	<Integer>	Read-only	number of polices bound to label.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/lbglobal_lbpolicy_binding **HTTP Method:** PUT

Request Headers:

{ "lbglobal_lbpolicy_binding": [ { "__count": "#no"} ] }
```

lbgroup

Configuration for LB group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the load balancing virtual server group. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
persistencetype	<String>	Read-write	Type of persistence for the group. Available settings function as follows: * SOURCEIP - Create persistence sessions based on the client IP. * COOKIEINSERT - Create persistence sessions based on a cookie in client requests. The cookie is inserted by a Set-Cookie directive from the server, in its first response to a client. * RULE - Create persistence sessions based on a user defined rule. * NONE - Disable persistence for the group. Possible values = SOURCEIP, COOKIEINSERT, RULE, NONE
persistencebackup	<String>	Read-write	Type of backup persistence for the group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = SOURCEIP, NONE
backuppersistencetimeout	<Integer>	Read-write	Time period, in minutes, for which backup persistence is in effect. Default value: 2 Minimum value = 2 Maximum value = 1440
persistmask	<String>	Read-write	Persistence mask to apply to source IPv4 addresses when creating source IP based persistence sessions. Minimum length = 1
cookiename	<String>	Read-write	Use this parameter to specify the cookie name for COOKIE peristence type. It specifies the name of cookie with a maximum of 32 characters. If not specified, cookie name is internally generated.
v6persistmasklen	<Integer>	Read-write	Persistence mask to apply to source IPv6 addresses when creating source IP based persistence sessions.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 128 Minimum value = 1 Maximum value = 128
cookiedomain	<String>	Read-write	Domain attribute for the HTTP cookie. Minimum length = 1
timeout	<Integer>	Read-write	Time period for which a persistence session is in effect. Default value: 2 Minimum value = 0 Maximum value = 1440
rule	<String>	Read-write	Expression, or name of a named expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks. Default value: "None"
mastervserver	<String>	Read-write	When USE_VSERVER_PERSISTENCE is enabled, one can use this setting to designate a member vserver as master which is responsible to create the persistence sessions.
usevserverpersistency	<String>	Read-write	Use this parameter to enable vserver level persistence on group members. This allows member vservers to have their own persistence, but need to be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			compatible with other members persistence rules. When this setting is enabled persistence sessions created by any of the members can be shared by other member vservers. Default value: DISABLED Possible values = ENABLED, DISABLED
newname	<String>	Read-write	New name for the load balancing virtual server group. Minimum length = 1
td	<Integer>	Read-only	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

lbgroup_binding

Binding object which returns the resources bound to lbgroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the load balancing virtual server group. Minimum length = 1
lbgroup_lbvserver_binding	<lbgroup_lbvserver_binding[]>	Read-only	lbvserver that can be bound to lbgroup.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbgroup_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbgroup_binding": [ {

"name":<String_value>,

"lbgroup_lbvserver_binding":<lbgroup_lbvserver_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbgroup_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbgroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbgroup_binding": [ {

"name":<String_value>,

"lbgroup_lbvserver_binding":<lbgroup_lbvserver_binding[]_value>

}]}
```

lbgroup_lbvserver_binding

Binding object showing the lbvserver that can be bound to lbgroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	Virtual server name.
name	<String>	Read-write	Name for the load balancing virtual server group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the virtual server is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lbgroup" or 'my lbgroup').

Minimum length = 1

			underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my metrictable" or 'my metrictable'). Minimum length = 1 Maximum length = 31
metric	<String>	Read-write	Name of the metric for which to change the SNMP OID. Minimum length = 1
Snmpoid	<String>	Read-write	New SNMP OID of the metric. Minimum length = 1
metrictype	<String>	Read-only	Indication if it is a configured or internal.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = INTERNAL, CONFIGURED
builtin	<String[]>	Read-only	. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbmetrictable":{

<b>"metrictable":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable/ metrictable_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbmetrictable":{

<b>"metrictable":<String_value>,

</b><b>"metric":<String_value>,

</b><b>"Snmpoid":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbmetrictable resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable? **view=summary**

Use this query-parameter to get the summary output of lbmetrictable resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbmetrictable resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbmetrictable_binding": [ {

"metrictable":<String_value>,

"lbmetrictable_metric_binding":<lbmetrictable_metric_binding[]_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbmetrictable_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbmetrictable_binding": [ {

"metrictable":<String_value>,

"lbmetrictable_metric_binding":<lbmetrictable_metric_binding[]_value>

}]}
```

lbmetrictable_metric_binding

Binding object showing the metric that can be bound to lbmetrictable.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
Snmpoid	<String>	Read-write	New SNMP OID of the metric. Minimum length = 1
metric	<String>	Read-write	Name of the metric for which to change the SNMP OID. Minimum length = 1
metrictable	<String>	Read-write	Name of the metric table. Minimum length = 1 Maximum length = 31
metrictype	<String>	Read-only	Indication if it is a configured or internal. Possible values = INTERNAL, CONFIGURED
__count	<Double>	Read-only	count parameter

lbmonbindings_binding

Binding object which returns the resources bound to lbmonbindings.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitorname	<String>	Read-write	The name of the monitor. Minimum length = 1
lbmonbindings_servicegroup_binding	<lbmonbindings_servicegroup_binding[]>	Read-only	servicegroup that can be bound to lbmonbindings.
lbmonbindings_gslbservicegroup_binding	<lbmonbindings_gslbservicegroup_binding[]>	Read-only	gslbservicegroup that can be bound to lbmonbindings.
lbmonbindings_service_binding	<lbmonbindings_service_binding[]>	Read-only	service that can be bound to lbmonbindings.

Operations

(click to see Properties)

- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonbindings_binding/ monitorname_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbmonbindings_binding": [ {

"monitorname":<String_value>,

```

lbmonbindings_service_binding

Binding object showing the service that can be bound to lbmonbindings.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	The name of the service.
monitorname	<String>	Read-write	The name of the monitor. Minimum length = 1
servicetype	<String>	Read-only	The type of service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, ORACLE, MONGO, MONGO_TLS, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM, LOGSTREAM_SSL, MQTT, MQTT_TLS, QUIC_BRIDGE, DOT, ADNS_DOT, HTTP_QUIC, ADNS_DOH, KAFKA_BROKER
port	<Integer>	Read-only	The port of the service. Range 1 - 65535 * in CLI is represented as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			65535 in NITRO API
ipaddress	<String>	Read-only	The IPAddress of the service.
svrstate	<String>	Read-only	The state of the service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
monsvcstate	<String>	Read-only	The configured state (enable/disable) of Monitor on this service. Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

lbmonitor

Configuration for monitor resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitorname	<String>	Read-write	Name for the monitor. Must begin with an ASCII alphanumeric or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my monitor" or 'my monitor'). Minimum length = 1
type	<String>	Read-write	Type of monitor that you want to create. Possible values = PING, TCP, HTTP, TCP-ECV, HTTP-ECV, UDP-ECV, DNS, FTP, LDNS-PING, LDNS-TCP, LDNS-DNS, RADIUS, USER, HTTP-INLINE, SIP-UDP, SIP-TCP, LOAD, FTP-EXTENDED, SMTP, SNMP, NNTP, MYSQL, MYSQL-ECV, MSSQL-ECV, ORACLE-ECV,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LDAP, POP3, CITRIX-XML-SERVICE, CITRIX-WEB-INTERFACE, DNS-TCP, RTSP, ARP, CITRIX-AG, CITRIX-AAC-LOGINPAGE, CITRIX-AAC-LAS, CITRIX-XD-DDC, ND6, CITRIX-WI-EXTENDED, DIAMETER, RADIUS_ACCOUNTING, STOREFRONT, APPC, SMPP, CITRIX-XNC-ECV, CITRIX-XDM, CITRIX-STA-SERVICE, CITRIX-STA-SERVICE-NHOP, MQTT, HTTP2, DTLS, QUIC, KAFKA-AUTODISCOVER
action	<String>	Read-write	Action to perform when the response to an inline monitor (a monitor of type HTTP-INLINE) indicates that the service is down. A service monitored by an inline monitor is considered DOWN if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the response code is not one of the codes that have been specified for the Response Code parameter. Available settings function as follows: * NONE - Do not take any action. However, the show service command and the show lb monitor command indicate the total number of responses that were checked and the number of consecutive error responses received after the last successful probe. * LOG - Log the event in NSLOG or SYSLOG. * DOWN - Mark the service as being down, and then do not direct any traffic to the service until the configured down time has expired. Persistent connections to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service are terminated as soon as the service is marked as DOWN. Also, log the event in NSLOG or SYSLOG. Default value: DOWN Possible values = NONE, LOG, DOWN
respcode	<String[]>	Read-write	Response codes for which to mark the service as UP. For any other response code, the action performed depends on the monitor type. HTTP monitors and RADIUS monitors mark the service as DOWN, while HTTP-INLINE monitors perform the action indicated by the Action parameter.
httprequest	<String>	Read-write	HTTP request to send to the server (for example, "HEAD /file.html").
rtsprequest	<String>	Read-write	RTSP request to send to the server (for example, "OPTIONS *").

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
customheaders	<String>	Read-write	Custom header string to include in the monitoring probes.
maxforwards	<Integer>	Read-write	Maximum number of hops that the SIP request used for monitoring can traverse to reach the server. Applicable only to monitors of type SIP-UDP. Default value: 1 Minimum value = 0 Maximum value = 255
sipmethod	<String>	Read-write	SIP method to use for the query. Applicable only to monitors of type SIP-UDP. Possible values = OPTIONS, INVITE, REGISTER
sipuri	<String>	Read-write	SIP URI string to send to the service (for example, sip:sip.test). Applicable only to monitors of type SIP-UDP. Minimum length = 1
sipreguri	<String>	Read-write	SIP user to be registered. Applicable only if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			monitor is of type SIP-UDP and the SIP Method parameter is set to REGISTER. Minimum length = 1
send	<String>	Read-write	String to send to the service. Applicable to TCP-ECV, HTTP-ECV, and UDP-ECV monitors.
recv	<String>	Read-write	String expected from the server for the service to be marked as UP. Applicable to TCP-ECV, HTTP-ECV, and UDP-ECV monitors.
query	<String>	Read-write	Domain name to resolve as part of monitoring the DNS service (for example, example.com).
querytype	<String>	Read-write	Type of DNS record for which to send monitoring queries. Set to Address for querying A records, AAAA for querying AAAA records, and Zone for querying the SOA record. Possible values = Address, Zone, AAAA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
scriptname	<String>	Read-write	Path and name of the script to execute. The script must be available on the Citrix ADC, in the /nsconfig/monitors/ directory. Minimum length = 1
scriptargs	<String>	Read-write	String of arguments for the script. The string is copied verbatim into the request.
secureargs	<String>	Read-write	List of arguments for the script which should be secure.
dispatcherip	<String>	Read-write	IP address of the dispatcher to which to send the probe.
dispatcherport	<Integer>	Read-write	Port number on which the dispatcher listens for the monitoring probe.
username	<String>	Read-write	User name with which to probe the RADIUS, NNTP, FTP, FTP-EXTENDED, MYSQL, MSSQL, POP3, CITRIX-AG, CITRIX-XD-DDC, CITRIX-WI-EXTENDED, CITRIX-XNC or CITRIX-XDM server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
password	<String>	Read-write	Password that is required for logging on to the RADIUS, NNTP, FTP, FTP-EXTENDED, MYSQL, MSSQL, POP3, CITRIX-AG, CITRIX-XD-DDC, CITRIX-WI-EXTENDED, CITRIX-XNC-ECV or CITRIX-XDM server. Used in conjunction with the user name specified for the User Name parameter. Minimum length = 1
secondarypassword	<String>	Read-write	Secondary password that users might have to provide to log on to the Access Gateway server. Applicable to CITRIX-AG monitors.
logonpointname	<String>	Read-write	Name of the logon point that is configured for the Citrix Access Gateway Advanced Access Control software. Required if you want to monitor the associated login page or Logon Agent. Applicable to CITRIX-AAC-LAS and CITRIX-AAC-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LOGINPAGE monitors.
lasversion	<String>	Read-write	Version number of the Citrix Advanced Access Control Logon Agent. Required by the CITRIX-AAC-LAS monitor.
radkey	<String>	Read-write	Authentication key (shared secret text string) for RADIUS clients and servers to exchange. Applicable to monitors of type RADIUS and RADIUS_ACCOUNTING. Minimum length = 1
radnasid	<String>	Read-write	NAS-Identifier to send in the Access-Request packet. Applicable to monitors of type RADIUS. Minimum length = 1
radnasip	<String>	Read-write	Network Access Server (NAS) IP address to use as the source IP address when monitoring a RADIUS server. Applicable to monitors of type RADIUS and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RADIUS_ACCOUNTING.
radaccounttype	<Integer>	Read-write	Account Type to be used in Account Request Packet. Applicable to monitors of type RADIUS_ACCOUNTING. Default value: 1 Minimum value = 0 Maximum value = 15
radframedip	<String>	Read-write	Source ip with which the packet will go out . Applicable to monitors of type RADIUS_ACCOUNTING.
radapn	<String>	Read-write	Called Station Id to be used in Account Request Packet. Applicable to monitors of type RADIUS_ACCOUNTING. Minimum length = 1
radmsisdn	<String>	Read-write	Calling Stations Id to be used in Account Request Packet. Applicable to monitors of type RADIUS_ACCOUNTING. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
radaccountsession	<String>	Read-write	Account Session ID to be used in Account Request Packet. Applicable to monitors of type RADIUS_ACCOUNTING. Minimum length = 1
lrtm	<String>	Read-write	Calculate the least response times for bound services. If this parameter is not enabled, the appliance does not learn the response times of the bound services. Also used for LRTM load balancing. Possible values = ENABLED, DISABLED
deviation	<Integer>	Read-write	Time value added to the learned average response time in dynamic response time monitoring (DRTM). When a deviation is specified, the appliance learns the average response time of bound services and adds the deviation to the average. The final value is then continually adjusted

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to accommodate response time variations over time. Specified in milliseconds, seconds, or minutes. Minimum value = 0 Maximum value = 20939
units1	<String>	Read-write	Unit of measurement for the Deviation parameter. Cannot be changed after the monitor is created. Default value: SEC Possible values = SEC, MSEC, MIN
interval	<Integer>	Read-write	Time interval between two successive probes. Must be greater than the value of Response Time-out. Default value: 5 Minimum value = 1 Maximum value = 20940
units3	<String>	Read-write	monitor interval units. Default value: SEC Possible values = SEC, MSEC, MIN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
resptimeout	<Integer>	Read-write	Amount of time for which the appliance must wait before it marks a probe as FAILED. Must be less than the value specified for the Interval parameter. Note: For UDP-ECV monitors for which a receive string is not configured, response timeout does not apply. For UDP-ECV monitors with no receive string, probe failure is indicated by an ICMP port unreachable error received from the service. Default value: 2 Minimum value = 1 Maximum value = 20939
units4	<String>	Read-write	monitor response timeout units. Default value: SEC Possible values = SEC, MSEC, MIN
resptimeoutthresh	<Integer>	Read-write	Response time threshold, specified

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			as a percentage of the Response Time-out parameter. If the response to a monitor probe has not arrived when the threshold is reached, the appliance generates an SNMP trap called monRespTimeoutAboveThresh. After the response time returns to a value below the threshold, the appliance generates a monRespTimeoutBelowThresh SNMP trap. For the traps to be generated, the "MONITOR-RTO-THRESHOLD" alarm must also be enabled. Minimum value = 0 Maximum value = 100
retries	<Integer>	Read-write	Maximum number of probes to send to establish the state of a service for which a monitoring probe failed. Default value: 3 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 127
failureretries	<Integer>	Read-write	Number of retries that must fail, out of the number specified for the Retries parameter, for a service to be marked as DOWN. For example, if the Retries parameter is set to 10 and the Failure Retries parameter is set to 6, out of the ten probes sent, at least six probes must fail if the service is to be marked as DOWN. The default value of 0 means that all the retries must fail if the service is to be marked as DOWN. Minimum value = 0 Maximum value = 32
alertretries	<Integer>	Read-write	Number of consecutive probe failures after which the appliance generates an SNMP trap called monProbeFailed. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 32
successretries	<Integer>	Read-write	Number of consecutive successful probes required to transition a service's state from DOWN to UP. Default value: 1 Minimum value = 1 Maximum value = 32
downtime	<Integer>	Read-write	Time duration for which to wait before probing a service that has been marked as DOWN. Expressed in milliseconds, seconds, or minutes. Default value: 30 Minimum value = 1 Maximum value = 20939
units2	<String>	Read-write	Unit of measurement for the Down Time parameter. Cannot be changed after the monitor is created. Default value: SEC Possible values = SEC, MSEC, MIN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
destip	<String>	Read-write	IP address of the service to which to send probes. If the parameter is set to 0, the IP address of the server to which the monitor is bound is considered the destination IP address.
destport	<Integer>	Read-write	TCP or UDP port to which to send the probe. If the parameter is set to 0, the port number of the service to which the monitor is bound is considered the destination port. For a monitor of type USER, however, the destination port is the port number that is included in the HTTP request sent to the dispatcher. Does not apply to monitors of type PING.
state	<String>	Read-write	State of the monitor. The DISABLED setting disables not only the monitor being configured, but all monitors of the same type, until the parameter is set to ENABLED. If the monitor is bound to a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service, the state of the monitor is not taken into account when the state of the service is determined. Default value: ENABLED Possible values = ENABLED, DISABLED
reverse	<String>	Read-write	Mark a service as DOWN, instead of UP, when probe criteria are satisfied, and as UP instead of DOWN when probe criteria are not satisfied. Default value: NO Possible values = YES, NO
transparent	<String>	Read-write	The monitor is bound to a transparent device such as a firewall or router. The state of a transparent device depends on the responsiveness of the services behind it. If a transparent device is being monitored, a destination IP address must be specified. The probe is sent to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified IP address by using the MAC address of the transparent device. Default value: NO Possible values = YES, NO
iptunnel	<String>	Read-write	Send the monitoring probe to the service through an IP tunnel. A destination IP address must be specified. Default value: NO Possible values = YES, NO
tos	<String>	Read-write	Probe the service by encoding the destination IP address in the IP TOS (6) bits. Possible values = YES, NO
tosid	<Integer>	Read-write	The TOS ID of the specified destination IP. Applicable only when the TOS parameter is set. Minimum value = 1 Maximum value = 63
secure	<String>	Read-write	Use a secure SSL connection when monitoring a service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Applicable only to TCP based monitors. The secure option cannot be used with a CITRIX-AG monitor, because a CITRIX-AG monitor uses a secure connection by default. Default value: NO Possible values = YES, NO
validatecred	<String>	Read-write	Validate the credentials of the Xen Desktop DDC server user. Applicable to monitors of type CITRIX-XD-DDC. Default value: NO Possible values = YES, NO
domain	<String>	Read-write	Domain in which the XenDesktop Desktop Delivery Controller (DDC) servers or Web Interface servers are present. Required by CITRIX-XD-DDC and CITRIX-WI-EXTENDED monitors for logging on to the DDC servers and Web

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Interface servers, respectively.
ipaddress	<String[]>	Read-write	Set of IP addresses expected in the monitoring response from the DNS server, if the record type is A or AAAA. Applicable to DNS monitors. Minimum length = 1
group	<String>	Read-write	Name of a newsgroup available on the NNTP service that is to be monitored. The appliance periodically generates an NNTP query for the name of the newsgroup and evaluates the response. If the newsgroup is found on the server, the service is marked as UP. If the newsgroup does not exist or if the search fails, the service is marked as DOWN. Applicable to NNTP monitors. Minimum length = 1
filename	<String>	Read-write	Name of a file on the FTP server. The appliance monitors the FTP service by periodically checking the existence of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			file on the server. Applicable to FTP-EXTENDED monitors. Minimum length = 1
basedn	<String>	Read-write	The base distinguished name of the LDAP service, from where the LDAP server can begin the search for the attributes in the monitoring query. Required for LDAP service monitoring. Minimum length = 1
binddn	<String>	Read-write	The distinguished name with which an LDAP monitor can perform the Bind operation on the LDAP server. Optional. Applicable to LDAP monitors. Minimum length = 1
filter	<String>	Read-write	Filter criteria for the LDAP query. Optional. Minimum length = 1
attribute	<String>	Read-write	Attribute to evaluate when the LDAP server responds to the query. Success or failure of the monitoring probe depends on whether the attribute exists in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the response. Optional. Minimum length = 1
database	<String>	Read-write	Name of the database to connect to during authentication. Minimum length = 1
oraclesid	<String>	Read-write	Name of the service identifier that is used to connect to the Oracle database during authentication. Minimum length = 1
sqlquery	<String>	Read-write	SQL query for a MYSQL-ECV or MSSQL-ECV monitor. Sent to the database server after the server authenticates the connection. Minimum length = 1
evalrule	<String>	Read-write	Expression that evaluates the database server's response to a MYSQL-ECV or MSSQL-ECV monitoring query. Must produce a Boolean result. The result determines the state of the server. If the expression

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			returns TRUE, the probe succeeds. For example, if you want the appliance to evaluate the error message to determine the state of the server, use the rule MYSQL.RES.ROW(10) .TEXT_ELEM(2).EQ("MySQL").
mssqlprotocolversion	<String>	Read-write	Version of MSSQL server that is to be monitored. Default value: 70 Possible values = 70, 2000, 2000SP1, 2005, 2008, 2008R2, 2012, 2014
Snmpoid	<String>	Read-write	SNMP OID for SNMP monitors. Minimum length = 1
snmpcommunity	<String>	Read-write	Community name for SNMP monitors. Minimum length = 1
snmpthreshold	<String>	Read-write	Threshold for SNMP monitors. Minimum length = 1
snmpversion	<String>	Read-write	SNMP version to be used for SNMP monitors.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = V1, V2
metrictable	<String>	Read-write	Metric table to which to bind metrics. Minimum length = 1 Maximum length = 99
application	<String>	Read-write	Name of the application used to determine the state of the service. Applicable to monitors of type CITRIX-XML-SERVICE. Minimum length = 1
sitepath	<String>	Read-write	URL of the logon page. For monitors of type CITRIX-WEB-INTERFACE, to monitor a dynamic page under the site path, terminate the site path with a slash (/). Applicable to CITRIX-WEB-INTERFACE, CITRIX-WI-EXTENDED and CITRIX-XDM monitors. Minimum length = 1
storename	<String>	Read-write	Store Name. For monitors of type STOREFRONT, STORENAME is an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			optional argument defining storefront service store name. Applicable to STOREFRONT monitors. Minimum length = 1
storefrontacctservice	<String>	Read-write	Enable/Disable probing for Account Service. Applicable only to Store Front monitors. For multi-tenancy configuration users my skip account service. Default value: YES Possible values = YES, NO
hostname	<String>	Read-write	Hostname in the FQDN format (Example: porche.cars.org). Applicable to STOREFRONT monitors. Minimum length = 1
netprofile	<String>	Read-write	Name of the network profile. Minimum length = 1 Maximum length = 127
originhost	<String>	Read-write	Origin-Host value for the Capabilities-Exchange-Request

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(CER) message to use for monitoring Diameter servers. Minimum length = 1
originrealm	<String>	Read-write	Origin-Realm value for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. Minimum length = 1
hostipaddress	<String>	Read-write	Host-IP-Address value for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. If Host-IP-Address is not specified, the appliance inserts the mapped IP (MIP) address or subnet IP (SNIP) address from which the CER request (the monitoring probe) is sent. Minimum length = 1
vendorid	<Integer>	Read-write	Vendor-Id value for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers.
productname	<String>	Read-write	Product-Name value for the Capabilities-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Exchange-Request (CER) message to use for monitoring Diameter servers. Minimum length = 1
firmwarerevision	<Integer>	Read-write	Firmware-Revision value for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers.
authapplicationid	<Integer[]>	Read-write	List of Auth-Application-Id attribute value pairs (AVPs) for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. A maximum of eight of these AVPs are supported in a monitoring CER message. Minimum value = 0 Maximum value = 4294967295
acctapplicationid	<Integer[]>	Read-write	List of Acct-Application-Id attribute value pairs (AVPs) for the Capabilities-Exchange-Request (CER) message to use for monitoring

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Diameter servers. A maximum of eight of these AVPs are supported in a monitoring message. Minimum value = 0 Maximum value = 4294967295
inbandsecurityid	<String>	Read-write	Inband-Security-Id for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. Possible values = NO_INBAND_SECURITY, TLS
supportedvendorids	<Integer[]>	Read-write	List of Supported-Vendor-Id attribute value pairs (AVPs) for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. A maximum eight of these AVPs are supported in a monitoring message. Minimum value = 1 Maximum value = 4294967295
vendorspecificvendorid	<Integer>	Read-write	Vendor-Id to use in the Vendor-Specific-Application-Id grouped attribute-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value pair (AVP) in the monitoring CER message. To specify Auth-Application-Id or Acct-Application-Id in Vendor-Specific-Application-Id, use vendorSpecificAuthApplicationIds or vendorSpecificAcctApplicationIds, respectively. Only one Vendor-Id is supported for all the Vendor-Specific-Application-Id AVPs in a CER monitoring message. Minimum value = 1
vendorspecificauthapplicationids	<Integer[]>	Read-write	List of Vendor-Specific-Auth-Application-Id attribute value pairs (AVPs) for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. A maximum of eight of these AVPs are supported in a monitoring message. The specified value is combined with the value of vendorSpecificVendorId to obtain the Vendor-Specific-Application-Id AVP in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the CER monitoring message. Minimum value = 0 Maximum value = 4294967295
vendorspecificacctapplicationids	<Integer[]>	Read-write	List of Vendor-Specific-Acct-Application-Id attribute value pairs (AVPs) to use for monitoring Diameter servers. A maximum of eight of these AVPs are supported in a monitoring message. The specified value is combined with the value of vendorSpecificVendorId to obtain the Vendor-Specific-Application-Id AVP in the CER monitoring message. Minimum value = 0 Maximum value = 4294967295
kcdaccount	<String>	Read-write	KCD Account used by MSSQL monitor. Minimum length = 1 Maximum length = 32
storedb	<String>	Read-write	Store the database list populated with

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the responses to monitor probes. Used in database specific load balancing if MSSQL-ECV/MYSQL-ECV monitor is configured. Default value: DISABLED Possible values = ENABLED, DISABLED
storefrontcheckbackendservices	<String>	Read-write	This option will enable monitoring of services running on storefront server. Storefront services are monitored by probing to a Windows service that runs on the Storefront server and exposes details of which storefront services are running. Default value: NO Possible values = YES, NO
trofscode	<Integer>	Read-write	Code expected when the server is under maintenance.
trofsstring	<String>	Read-write	String expected from the server for the service to be marked as trofs. Applicable

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to HTTP-ECV/TCP-ECV monitors.
sslprofile	<String>	Read-write	SSL Profile associated with the monitor. Minimum length = 1 Maximum length = 127
mqttclientidentifier	<String>	Read-write	Client id to be used in Connect command.
mqttversion	<Integer>	Read-write	Version of MQTT protocol used in connect message, default is version 3.1.1 [4]. Default value: 4 Minimum value = 3
grpchealthcheck	<String>	Read-write	Option to enable or disable gRPC health check service. Default value: NO Possible values = YES, NO
grpcstatuscode	<Integer[]>	Read-write	gRPC status codes for which to mark the service as UP. The default value is 12(health check unimplemented). If the gRPC status code 0 is received from the backend

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this configuration is ignored.
grpcservicename	<String>	Read-write	Option to specify gRPC service name on which gRPC health check need to be performed.
metric	<String>	Read-write	Metric name in the metric table, whose setting is changed. A value zero disables the metric and it will not be used for load calculation. Minimum length = 1 Maximum length = 37
metricthreshold	<Integer>	Read-write	Threshold to be used for that metric.
metricweight	<Integer>	Read-write	The weight for the specified service metric with respect to others. Minimum value = 1 Maximum value = 100
servicename	<String>	Read-write	The name of the service to which the monitor is bound. Minimum length = 1
servicegroupname	<String>	Read-write	The name of the service group to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which the monitor is to be bound. Minimum length = 1
lrtmconf	<Integer>	Read-only	State of LRTM configuration on the monitor.
lrtmconfstr	<String>	Read-only	State of LRTM configuration on the monitor as STRING. Possible values = ENABLED, DISABLED
dynamicresponsetimeout	<Integer>	Read-only	Response timeout of the DRTM enabled monitor , calculated dynamically based on the history and current response time.
dynamicinterval	<Integer>	Read-only	Interval between monitoring probes for DRTM enabled monitor , calculated dynamically based monitor response time.
multimetrictable	<String[]>	Read-only	Metric table to which to bind metrics, to be used only for output purposes.
dup_state	<String>	Read-only	. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dup_weight	<Integer>	Read-only	. Default value: 1 Minimum value = 1 Maximum value = 100
weight	<Integer>	Read-only	. Minimum value = 1 Maximum value = 100
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor? **args=monitorname: <String_value> ,type: <String_value>**

Use this query-parameter to get lbmonitor resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbmonitor resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor? **view=summary**

Use this query-parameter to get the summary output of lbmonitor resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbmonitor resources in chunks.

get

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor/ monitorname_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor/ monitorname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor/ monitorname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of lbmonitor resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

count

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbmonitor": [ { "__count": "#no"} ] }
```

lbmonitor_binding

Binding object which returns the resources bound to lbmonitor.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitorname	<String>	Read-write	Name of the monitor. Minimum length = 1
lbmonitor_sslcertkey_binding	<lbmonitor_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to lbmonitor.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lbmonitor_metric_binding	<lbmonitor_metric_binding[]>	Read-only	metric that can be bound to lbmonitor.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_binding/ monitorname_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbmonitor_binding": [ {

"monitorname":<String_value>,

"lbmonitor_sslcertkey_binding":<lbmonitor_sslcertkey_binding[]_value>,

"lbmonitor_metric_binding":<lbmonitor_metric_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbmonitor_binding": [ {

"monitorname":<String_value>,

"lbmonitor_sslcertkey_binding":<lbmonitor_sslcertkey_binding[]_value>,

"lbmonitor_metric_binding":<lbmonitor_metric_binding[]_value>

}]}
```

lbmonitor_metric_binding

Binding object showing the metric that can be bound to lbmonitor.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
metric	<String>	Read-write	Metric name in the metric table, whose setting is changed. A value zero disables the metric and it will not be used for load calculation. Minimum length = 1 Maximum length = 37

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
metricthreshold	<Integer>	Read-write	Threshold to be used for that metric.
metricweight	<Integer>	Read-write	The weight for the specified service metric with respect to others. Minimum value = 1 Maximum value = 100
monitorname	<String>	Read-write	Name of the monitor. Minimum length = 1
metric_unit	<String>	Read-only	Giving the unit of the metric. Possible values = Bytes/s, ms, pkts/s, users
metrictable	<String>	Read-only	Metric table to which to bind metrics. Minimum length = 1 Maximum length = 99
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/lbmonitor_metric_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"lbmonitor_metric_binding":{

<b>"monitorname":<String_value>,
```

```
</b>"metric":<String_value>,

"metricthreshold":<Integer_value>,

"metricweight":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_metric_binding/ monitorname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/ config/lbmonitor_metric_binding/ monitorname_value<String> ? **args=metric: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_metric_binding/ monitorname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/ config/lbmonitor_metric_binding/ monitorname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbmonitor_metric_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_metric_binding/ monitorname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbmonitor_metric_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbmonitor_metric_binding": [ {

"metric":<String_value>,

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_sslcertkey_binding/ monitorname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/ config/lbmonitor_sslcertkey_binding/ monitorname_value<String> ? **args=certkeyname: <String_value> ,ca: <Boolean_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_sslcertkey_binding/ monitorname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/ config/lbmonitor_sslcertkey_binding/ monitorname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbmonitor_sslcertkey_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_sslcertkey_binding/ monitorname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbmonitor_sslcertkey_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbmonitor_sslcertkey_binding": [ {

"crlcheck":<String_value>,

"ocspcheck":<String_value>,

"monitorname":<String_value>,

"certkeyname":<String_value>,

"ca":<Boolean_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_sslcertkey_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_sslcertkey_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbmonitor_sslcertkey_binding": [ {

"crlcheck":<String_value>,

"ocspcheck":<String_value>,

"monitorname":<String_value>,

"certkeyname":<String_value>,

"ca":<Boolean_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbmonitor_sslcertkey_binding/ monitorname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"lbmonitor_sslcertkey_binding": [ { "__count": "#no"} ] }
```

lbparameter

Configuration for LB parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httponlycookieflag	<String>	Read-write	Include the HttpOnly attribute in persistence cookies. The HttpOnly attribute limits the scope of a cookie to HTTP requests and helps mitigate the risk of cross-site scripting attacks. Default value: ENABLED Possible values = ENABLED, DISABLED
usesecuredpersistencecookie	<String>	Read-write	Encode persistence cookie values using SHA2 hash. Default value: DISABLED Possible values = ENABLED, DISABLED
useencryptedpersistencecookie	<String>	Read-write	Encode persistence cookie values using SHA2 hash. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
cookiepassphrase	<String>	Read-write	Use this parameter to specify the passphrase used to generate secured persistence cookie value. It specifies the passphrase with a maximum of 31 characters.
consolidatedlconn	<String>	Read-write	To find the service with the fewest connections, the virtual server uses the consolidated connection statistics from all the packet engines. The NO setting allows consideration of only the number of connections on the packet engine that received the new connection. Default value: YES Possible values = YES, NO
useportforhashlb	<String>	Read-write	Include the port number of the service when creating a hash for hash based load balancing methods. With the NO setting,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only the IP address of the service is considered when creating a hash. Default value: YES Possible values = YES, NO
preferdirectroute	<String>	Read-write	Perform route lookup for traffic received by the Citrix ADC, and forward the traffic according to configured routes. Do not set this parameter if you want a wildcard virtual server to direct packets received by the appliance to an intermediary device, such as a firewall, even if their destination is directly connected to the appliance. Route lookup is performed after the packets have been processed and returned by the intermediary device. Default value: YES Possible values = YES, NO
startuprrfactor	<Integer>	Read-write	Number of requests, per service, for which

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to apply the round robin load balancing method before switching to the configured load balancing method, thus allowing services to ramp up gradually to full load. Until the specified number of requests is distributed, the Citrix ADC is said to be implementing the slow start mode (or startup round robin). Implemented for a virtual server when one of the following is true: * The virtual server is newly created. * One or more services are newly bound to the virtual server. * One or more services bound to the virtual server are enabled. * The load balancing method is changed. This parameter applies to all the load balancing

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			virtual servers configured on the Citrix ADC, except for those virtual servers for which the virtual server-level slow start parameters (New Service Startup Request Rate and Increment Interval) are configured. If the global slow start parameter and the slow start parameters for a given virtual server are not set, the appliance implements a default slow start for the virtual server, as follows: * For a newly configured virtual server, the appliance implements slow start for the first 100 requests received by the virtual server. * For an existing virtual server, if one or more services are newly bound or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			newly enabled, or if the load balancing method is changed, the appliance dynamically computes the number of requests for which to implement startup round robin. It obtains this number by multiplying the request rate by the number of bound services (it includes services that are marked as DOWN). For example, if the current request rate is 20 requests/s and ten services are bound to the virtual server, the appliance performs startup round robin for 200 requests. Not applicable to a virtual server for which a hash based load balancing method is configured.
monitorskipmaxclient	<String>	Read-write	When a monitor initiates a connection to a service, do not

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			check to determine whether the number of connections to the service has reached the limit specified by the service's Max Clients setting. Enables monitoring to continue even if the service has reached its connection limit. Default value: DISABLED Possible values = ENABLED, DISABLED
monitorconnectionclose	<String>	Read-write	Close monitoring connections by sending the service a connection termination message with the specified bit set. Default value: FIN Possible values = RESET, FIN
vserverspecificmac	<String>	Read-write	Allow a MAC-mode virtual server to accept traffic returned by an intermediary device, such as a firewall, to which the traffic was previously forwarded by another MAC-mode virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The second virtual server can then distribute that traffic across the destination server farm. Also useful when load balancing Branch Repeater appliances. Note: The second virtual server can also send the traffic to another set of intermediary devices, such as another set of firewalls. If necessary, you can configure multiple MAC-mode virtual servers to pass traffic successively through multiple sets of intermediary devices. Default value: DISABLED Possible values = ENABLED, DISABLED
allowboundsvcremoval	<String>	Read-write	This is used, to enable/disable the option of svc/svcgroup removal, if it is bound to one or more vserver. If it is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enabled, the svc/svcgroup can be removed, even if it bound to vservers. If disabled, an error will be thrown, when the user tries to remove a svc/svcgroup without unbinding from its vservers. Default value: ENABLED Possible values = ENABLED, DISABLED
retainservicestate	<String>	Read-write	This option is used to retain the original state of service or servicegroup member when an enable server command is issued. Default value: OFF Possible values = ON, OFF
dbsttl	<Integer>	Read-write	Specify the TTL for DNS record for domain based service. The default value of ttl is 0 which indicates to use the TTL received in DNS response for monitors. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxpipelinenat	<Integer>	Read-write	Maximum number of concurrent requests to allow on a single client connection, which is identified by the <clientip:port>-<vserver ip:port> tuple. This parameter is applicable to ANY service type and all UDP service types (except DNS) and only when "svrTimeout" is set to zero. A value of 0 (zero) applies no limit to the number of concurrent requests allowed on a single client connection.
literaladccookieattribute	<String>	Read-write	String configured as LiteralADCCookieAttribute will be appended as attribute for Citrix ADC cookie (for example: LB cookie persistence , GSLB site persistence, CS cookie persistence, LB group cookie persistence). Sample usage - set lb parameter -LiteralADCCookieAttribute ";SameSite=None".

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
computedadccookieattribute	<String>	Read-write	ComputedADCCookieAttribute accepts ns variable as input in form of string starting with $ (to understand how to configure ns variable, please check man add ns variable). policies can be configured to modify this variable for every transaction and the final value of the variable after policy evaluation will be appended as attribute to Citrix ADC cookie (for example: LB cookie persistence , GSLB sitepersistence, CS cookie persistence, LB group cookie persistence). Only one of ComputedADCCookieAttribute, LiteralADCCookieAttribute can be set. Sample usage - add ns variable lbvar -type TEXT(100) -scope Transaction add ns assignment lbassign -variable $lbvar -set "\

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			\";SameSite=Strict\ \"" add rewrite policy lbpol <valid policy expression> lbassign bind rewrite global lbpol 100 next -type RES_OVERRIDE set lb param -ComputedADCCookieAttribute "$lbvar" For incoming client request, if above policy evaluates TRUE, then SameSite=Strict will be appended to ADC generated cookie.
storemqttclientidandusername	<String>	Read-write	This option allows to store the MQTT clientid and username in transactional logs. Default value: NO Possible values = YES, NO
dropmqttjumbomessage	<String>	Read-write	When this option is enabled, MQTT messages of length greater than 64k will be dropped and the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			client/server connections will be reset. Default value: YES Possible values = YES, NO
lbhashalgorithm	<String>	Read-write	This option dictates the hashing algorithm used for hash based LB methods (URLHASH, DOMAINHASH, SOURCEIPHASH, DESTINATIONIPHASH, SRCIPDESTIPHASH, SRCIPSRCPORTHASH, TOKEN, USER_TOKEN, CALLIDHASH). Default value: DEFAULT Possible values = DEFAULT, PRAC, JARH
lbhashfingers	<Integer>	Read-write	This option is used to specify the number of fingers to be used in PRAC and JARH algorithms for hash based LB methods. Increasing the number of fingers might give better distribution of traffic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			at the expense of additional memory. Default value: 256 Minimum value = 1 Maximum value = 1024
undefaction	<String>	Read-write	Action to perform when policy evaluation creates an UNDEF condition. Available settings function as follows: * NOLBACTION - Does not consider LB action in making LB decision. * RESET - Reset the request and notify the user, so that the user can resend the request. * DROP - Drop the request without sending a response to the user. Default value: "NOLBACTION"
proximityfromself	<String>	Read-write	Use the ADC location instead of client IP for static proximity LB or GSLB decision.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
radiusmessageauthenticator	<String>	Read-write	If enabled, NetScaler will verify the message authenticator and also generate message authenticator if not present. Default value: NO Possible values = YES, NO
sessionsthreshold	<Integer>	Read-only	This option is used to get the upper-limit on the number of persistent sessions set by the administrator for this system. Minimum value = 1
builtin	<String[]>	Read-only	. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
adccookieattributewarningmsg	<String>	Read-only	Used to describe any configuration issue with respect to ns

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			variable configured as part of set lb parameter.
lbhashalgowinsize	<Integer>	Read-only	This options allows to increase window size used in LB hashing algorithm(DEFAULT) . Default value: 16
overridepersistencyfororder	<String>	Read-only	This option is used to override persistency when order is configured for services or servicegroups. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbparameter **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbparameter":{

lbpersistentsessions

Configuration for persistence session resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserver	<String>	Read-write	The name of the virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
persistenceparameter	<String>	Read-write	The persistence parameter whose persistence sessions are to be flushed.
type	<Integer>	Read-only	Type of Persistence.
typestring	<String>	Read-only	Type of Persistence as String.
srcip	<String>	Read-only	SOURCE IP.
srcipv6	<String>	Read-only	SOURCE IPv6 ADDRESS.
destip	<String>	Read-only	DESTINATION IP.
destipv6	<String>	Read-only	DESTINATION IPv6 ADDRESS.
flags	<Boolean>	Read-only	IPv6 FLAGS.
destport	<Integer>	Read-only	Destination port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
vservername	<String>	Read-only	Virtual server name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeout	<Integer>	Read-only	Persistent Session timeout.
referencecount	<Integer>	Read-only	Reference Count.
persistenceparam	<String>	Read-only	Specific persistence information . Callid in case of SIP_CALLID persistence entry , RTSP session id in case of RTSP_SESSIONID persistence entry.
cnamepersparam	<String>	Read-only	The cname that is selected incase of gslb service.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- CLEAR

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpersistentsessions? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbpersistentsessions":{

"vserver":<String_value>,

"persistenceparameter":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpersistentsessions **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/lbpersistentsessions? **args=vserver: <String_value> ,nodeid: <Integer_value>**

Use this query-parameter to get lbpersistentsessions resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/lbpersistentsessions? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lbpersistentsessions? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbpersistentsessions resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lbpersistentsessions? **view=summary**

Use this query-parameter to get the summary output of lbpersistentsessions resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbpersistentsessions? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbpersistentsessions resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

lbpolicy

Configuration for lb policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the LB policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			characters. Can be changed after the LB policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lb policy" or 'my lb policy').
rule	<String>	Read-write	Expression against which traffic is evaluated.
action	<String>	Read-write	Name of action to use if the request matches this LB policy.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Available settings function as follows: * NOLBACTION - Does not consider

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LB actions in making LB decision. * RESET - Reset the request and notify the user, so that the user can resend the request. * DROP - Drop the request without sending a response to the user.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
comment	<String>	Read-write	Any type of information about this LB policy.
newname	<String>	Read-write	New name for the LB policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lb policy" or 'my lb policy'). Minimum length = 1
hits	<Integer>	Read-only	Number of hits.
undefhits	<Integer>	Read-only	Number of policy UNDEF hits.
feature	<String>	Read-only	The feature to be checked while applying this config.
builtin	<String[]>	Read-only	Flag to determine if LB policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>,

</b>"undefaction":<String_value>,

"logaction":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>,

"undefaction":<String_value>,

"logaction":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbpolicy":{

<b>"name":<String_value>,

</b>"undefaction":true,

"logaction":true,

"comment":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbpolicy":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy? **view=summary**

Use this query-parameter to get the summary output of lbpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbpolicy": [ {

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbpolicy": [ { "__count": "#no"} ] }
```

lbpolicy_binding

Binding object which returns the resources bound to lbpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the LB policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the LB policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lb policy" or 'my lb policy').
lbpolicy_lbpolicylabel_binding	<lbpolicy_lbpolicylabel_binding[]>	Read-only	lbpolicylabel that can be bound to lbpolicy.
lbpolicy_lbglobal_binding	<lbpolicy_lbglobal_binding[]>	Read-only	lbglobal that can be bound to lbpolicy.
lbpolicy_lbvserver_binding	<lbpolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to lbpolicy.
lbpolicy_gslbvserver_binding	<lbpolicy_gslbvserver_binding[]>	Read-only	gslbvserver that can be bound to lbpolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbpolicy_binding": [ {

"name":<String_value>,

"lbpolicy_gslbvserver_binding":<lbpolicy_gslbvserver_binding[]_value>,

"lbpolicy_lbpolicylabel_binding":<lbpolicy_lbpolicylabel_binding[]_value>,

"lbpolicy_lbvserver_binding":<lbpolicy_lbvserver_binding[]_value>,

"lbpolicy_lbglobal_binding":<lbpolicy_lbglobal_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbpolicy_binding": [ {

"name":<String_value>,

"lbpolicy_gslbvserver_binding":<lbpolicy_gslbvserver_binding[]_value>,

"lbpolicy_lbpolicylabel_binding":<lbpolicy_lbpolicylabel_binding[]_value>,

"lbpolicy_lbvserver_binding":<lbpolicy_lbvserver_binding[]_value>,

"lbpolicy_lbglobal_binding":<lbpolicy_lbglobal_binding[]_value>

}]}
```

lbpolicy_gslbvserver_binding

Binding object showing the gslbvserver that can be bound to lbpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the LB policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the LB policy is added. The following

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lb policy" or 'my lb policy').
boundto	<String>	Read-write	Location where policy is bound.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
priority	<Integer>	Read-only	Specifies the priority of the policy.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lb policy" or 'my lb policy').
boundto	<String>	Read-write	Location where policy is bound.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, policylabel
priority	<Integer>	Read-only	Specifies the priority of the policy.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy_lbvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ lbpolicy_lbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbpolicy_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy_lbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbpolicy_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbpolicy_lbvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>,

"labelname":<String_value>,
```

```
"gotopriorityexpression":<String_value>,

"activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy_lbvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbpolicy_lbvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>,
```

```
"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"activepolicy":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicy_lbvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"lbpolicy_lbvserver_binding": [ { "__count": "#no"} ] }
```

lbpolicylabel

Configuration for lb policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the LB policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lb policy label" or 'my lb policy label').
policylabeltype	<String>	Read-write	Protocols supported by the policylabel. Available Types are : * HTTP - HTTP requests. * DNS - DNS request.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* OTHERTCP - OTHERTCP request. * SIP_UDP - SIP_UDP request. * SIP_TCP - SIP_TCP request. * MYSQL - MYSQL request. * MSSQL - MSSQL request. * ORACLE - ORACLE request. * NAT - NAT request. * DIAMETER - DIAMETER request. * RADIUS - RADIUS request. * MQTT - MQTT request. * QUIC_BRIDGE - QUIC_BRIDGE request. * HTTP_QUIC - HTTP_QUIC request.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: HTTP Possible values = HTTP, OTHERTCP, SIP_UDP, SIP_TCP, MYSQL, MSSQL, ORACLE, NAT, DIAMETER, RADIUS, DNS, MQTT, QUIC_BRIDGE, HTTP_QUIC
comment	<String>	Read-write	Any comments to preserve information about this LB policy label.
newname	<String>	Read-write	New name for the LB policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1
numpol	<Integer>	Read-only	number of polices bound to label.
hits	<Integer>	Read-only	Number of times policy label was invoked.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label to invoke. Available settings function as follows: * vserver - Invokes the unnamed policy label associated with the specified virtual server. * policylabel - Invoke a user-defined policy label. Possible values = reqvserver, policylabel
invoke_labelname	<String>	Read-only	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver, name of the virtual server.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbpolicylabel_policybinding_binding": [ {

"priority":<Integer_value>,
```

```
"labeltype":<String_value>,

"labelname":<String_value>,

"invoke":<Boolean_value>,

"gotopriorityexpression":<String_value>,

"policyname":<String_value>,

"invoke_labelname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicylabel_policybinding_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbpolicylabel_policybinding_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbpolicylabel_policybinding_binding": [ {

"priority":<Integer_value>,

"labeltype":<String_value>,

"labelname":<String_value>,

"invoke":<Boolean_value>,

"gotopriorityexpression":<String_value>,

"policyname":<String_value>,

"invoke_labelname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbpolicylabel_policybinding_binding/ labelname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"lbpolicylabel_policybinding_binding": [ { "__count": "#no"} ] }
```

lbprofile

Configuration for LB profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lbprofilename	<String>	Read-write	Name of the LB profile. Minimum length = 1
dbslb	<String>	Read-write	Enable database specific load balancing for MySQL and MSSQL service types. Default value: DISABLED Possible values = ENABLED, DISABLED
processlocal	<String>	Read-write	By turning on this option packets destined to a vserver in a cluster will not under go any steering. Turn this option for single pa cket request response mode or when the upstream device is performing a proper RSS for connection based distribution.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
httponlycookieflag	<String>	Read-write	Include the HttpOnly attribute in persistence cookies. The HttpOnly attribute limits the scope of a cookie to HTTP requests and helps mitigate the risk of cross-site scripting attacks. Default value: ENABLED Possible values = ENABLED, DISABLED
cookiepassphrase	<String>	Read-write	Use this parameter to specify the passphrase used to generate secured persistence cookie value. It specifies the passphrase with a maximum of 31 characters.
usesecuredpersistencecookie	<String>	Read-write	Encode persistence cookie values using SHA2 hash. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
useencryptedpersistencecookie	<String>	Read-write	Encode persistence cookie values using SHA2 hash. Default value: DISABLED Possible values = ENABLED, DISABLED
literaladccookieattribute	<String>	Read-write	String configured as LiteralADCCookieAttribute will be appended as attribute for Citrix ADC cookie (for example: LB cookie persistence , GSLB site persistence, CS cookie persistence, LB group cookie persistence). Sample usage - add lb profile lbprof -LiteralADCCookieAttribute ";SameSite=None".
computedadccookieattribute	<String>	Read-write	ComputedADCCookieAttribute accepts ns variable as input in form of string starting with $ (to understand how to configure ns variable, please

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			check man add ns variable). policies can be configured to modify this variable for every transaction and the final value of the variable after policy evaluation will be appended as attribute to Citrix ADC cookie (for example: LB cookie persistence , GSLB sitepersistence, CS cookie persistence, LB group cookie persistence). Only one of ComputedADCCookieAttribute, LiteralADCCookieAttribute can be set. Sample usage - add ns variable lbvar -type TEXT(100) -scope Transaction add ns assignment lbassign -variable $lbvar -set "\\";SameSite=Strict\\"" add rewrite policy lbpol <valid policy expression> lbassign

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bind rewrite global lbpol 100 next -type RES_OVERRIDE add lb profile lbprof -ComputedADCCookieAttribute "$lbvar" For incoming client request, if above policy evaluates TRUE, then SameSite=Strict will be appended to ADC generated cookie.
storemqttclientidandusername	<String>	Read-write	This option allows to store the MQTT clientid and username in transactional logs. Default value: NO Possible values = YES, NO
lbhashalgorithm	<String>	Read-write	This option dictates the hashing algorithm used for hash based LB methods (URLHASH, DOMAINHASH, SOURCEIPHASH, DESTINATIONIPHASH, SRCIPDESTIPHASH, SRCIPSRCPORTHA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SH, TOKEN, USER_TOKEN, CALLIDHASH). Default value: DEFAULT Possible values = DEFAULT, PRAC, JARH
lbhashfingers	<Integer>	Read-write	This option is used to specify the number of fingers to be used in PRAC and JARH algorithms for hash based LB methods. Increasing the number of fingers might give better distribution of traffic at the expense of additional memory. Default value: 256 Minimum value = 1 Maximum value = 1024
proximityfromself	<String>	Read-write	Use the ADC location instead of client IP for static proximity LB or GSLB decision. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vsvrcount	<Integer>	Read-only	Total number of vservers , the profile is bound to.
adccookieattributewarningmsg	<String>	Read-only	Used to describe any configuration issue with respect to ns variable configured as part of add/set lb profile.
lbhashalgowinsize	<Integer>	Read-only	This options allows to increase window size used in LB hashing algorithm(DEFAULT) . Default value: 16
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbprofile **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbprofile":{

<b>"lbprofilename":<String_value>,

</b>"dbslb":<String_value>,

"processlocal":<String_value>,
```

```
"httponlycookieflag":<String_value>,

"cookiepassphrase":<String_value>,

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbsipparameters **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbsipparameters":{

"rnatsrcport":<Integer_value>,

"rnatdstport":<Integer_value>,

"retrydur":<Integer_value>,

"addrportvip":<String_value>,

"sip503ratethreshold":<Integer_value>,

"rnatsecuresrcport":<Integer_value>,

"rnatsecuredstport":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbsipparameters? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbsipparameters":{

"rnatsrcport":true,

"rnatdstport":true,

"retrydur":true,

"addrportvip":true,

"sip503ratethreshold":true,

"rnatsecuresrcport":true,

"rnatsecuredstport":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbsipparameters **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbsipparameters": [ {

"rnatsrcport":<Integer_value>,

"rnatdstport":<Integer_value>,

"retrydur":<Integer_value>,

"addrportvip":<String_value>,

"sip503ratethreshold":<Integer_value>,

"rnatsecuresrcport":<Integer_value>,

"rnatsecuredstport":<Integer_value>,

"builtin":<String[]_value>,

"feature":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

lbvserver

Configuration for Load Balancing Virtual Server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
servicetype	<String>	Read-write	Protocol used by the service (also called the service type). Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL_TCP, DTLS, NNTP, DNS, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, RTSP, PUSH, SSL_PUSH, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, SMPP, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, PROXY, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM, MONGO, MONGO_TLS, MQTT, MQTT_TLS, QUIC_BRIDGE, HTTP_QUIC, DOT, SSL_PROXY, KAFKA_PRODUCER
ipv46	<String>	Read-write	IPv4 or IPv6 address to assign to the virtual server.
ippattern	<String>	Read-write	IP address pattern, in dotted decimal notation, for identifying packets to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be accepted by the virtual server. The IP Mask parameter specifies which part of the destination IP address is matched against the pattern. Mutually exclusive with the IP Address parameter. For example, if the IP pattern assigned to the virtual server is 198.51.100.0 and the IP mask is 255.255.240.0 (a forward mask), the first 20 bits in the destination IP addresses are matched with the first 20 bits in the pattern. The virtual server accepts requests with IP addresses that range from 198.51.96.1 to 198.51.111.254. You can also use a pattern such as 0.0.2.2 and a mask such as 0.0.255.255 (a reverse mask). If a destination IP address matches

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			more than one IP pattern, the pattern with the longest match is selected, and the associated virtual server processes the request. For example, if virtual servers vs1 and vs2 have the same IP pattern, 0.0.100.128, but different IP masks of 0.0.255.255 and 0.0.224.255, a destination IP address of 198.51.100.128 has the longest match with the IP pattern of vs1. If a destination IP address matches two or more virtual servers to the same extent, the request is processed by the virtual server whose port number matches the port number in the request.
ipmask	<String>	Read-write	IP mask, in dotted decimal notation, for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the IP Pattern parameter. Can have leading or trailing non-zero octets (for example, 255.255.240.0 or 0.0.255.255). Accordingly, the mask specifies whether the first n bits or the last n bits of the destination IP address in a client request are to be matched with the corresponding bits in the IP pattern. The former is called a forward mask. The latter is called a reverse mask.
port	<Integer>	Read-write	Port number for the virtual server. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
ipset	<String>	Read-write	The list of IPv4/IPv6 addresses bound to ipset would form a part of listening service on the current lb vserver. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
range	<Integer>	Read-write	Number of IP addresses that the appliance must generate and assign to the virtual server. The virtual server then functions as a network virtual server, accepting traffic on any of the generated IP addresses. The IP addresses are generated automatically, as follows: * For a range of n, the last octet of the address specified by the IP Address parameter increments n-1 times. * If the last octet exceeds 255, it rolls over to 0 and the third octet increments by 1. Note: The Range parameter assigns multiple IP addresses to one virtual server. To generate an array of virtual servers, each of which owns only

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			one IP address, use brackets in the IP Address and Name parameters to specify the range. For example: add lb vserver my_vserver[1-3] HTTP 192.0.2.[1-3] 80. Default value: 1 Minimum value = 1 Maximum value = 254
persistencetype	<String>	Read-write	Type of persistence for the virtual server. Available settings function as follows: * SOURCEIP - Connections from the same client IP address belong to the same persistence session. * COOKIEINSERT - Connections that have the same HTTP Cookie, inserted by a Set-Cookie directive from a server, belong to the same

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			persistence session. * SSLSESSION - Connections that have the same SSL Session ID belong to the same persistence session. * CUSTOMSERVERID - Connections with the same server ID form part of the same session. For this persistence type, set the Server ID (CustomServerID) parameter for each service and configure the Rule parameter to identify the server ID in a request. * RULE - All connections that match a user defined rule belong to the same persistence session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* URLPASSIVE - Requests that have the same server ID in the URL query belong to the same persistence session. The server ID is the hexadecimal representation of the IP address and port of the service to which the request must be forwarded. This persistence type requires a rule to identify the server ID in the request. * DESTIP - Connections to the same destination IP address belong to the same persistence session. * SRCIPDESTIP - Connections that have the same source IP address and destination IP address belong to the same persistence session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* CALLID - Connections that have the same CALL-ID SIP header belong to the same persistence session. * RTSPSID - Connections that have the same RTSP Session ID belong to the same persistence session. * FIXSESSION - Connections that have the same SenderCompID and TargetCompID values belong to the same persistence session. * USERSESSION - Persistence session is created based on the persistence parameter value provided from an extension. Possible values = SOURCEIP, COOKIEINSERT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSLSESSION, RULE, URLPASSIVE, CUSTOMSERVERID, DESTIP, SRCIPDESTIP, CALLID, RTSPSID, DIAMETER, FIXSESSION, USERSESSION, NONE
timeout	<Integer>	Read-write	Time period for which a persistence session is in effect. Default value: 2 Minimum value = 0 Maximum value = 1440
persistencebackup	<String>	Read-write	Backup persistence type for the virtual server. Becomes operational if the primary persistence mechanism fails. Possible values = SOURCEIP, NONE
backuppersistencetimeout	<Integer>	Read-write	Time period for which backup persistence is in effect. Default value: 2 Minimum value = 2

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 1440
lbmethod	<String>	Read-write	Load balancing method. The available settings function as follows: * ROUNDROBIN - Distribute requests in rotation, regardless of the load. Weights can be assigned to services to enforce weighted round robin distribution. * LEASTCONNECTION (default) - Select the service with the fewest connections. * LEASTRESPONSETIME - Select the service with the lowest average response time. * LEASTBANDWIDTH - Select the service currently handling the least traffic.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* LEASTPACKETS - Select the service currently serving the lowest number of packets per second. * CUSTOMLOAD - Base service selection on the SNMP metrics obtained by custom load monitors. * LRTM - Select the service with the lowest response time. Response times are learned through monitoring probes. This method also takes the number of active connections into account. Also available are a number of hashing methods, in which the appliance extracts a predetermined portion of the request, creates a hash of the portion, and then checks whether any previous requests

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			had the same hash value. If it finds a match, it forwards the request to the service that served those previous requests. Following are the hashing methods: * URLHASH - Create a hash of the request URL (or part of the URL). * DOMAINHASH - Create a hash of the domain name in the request (or part of the domain name). The domain name is taken from either the URL or the Host header. If the domain name appears in both locations, the URL is preferred. If the request does not contain a domain name, the load balancing method defaults to LEASTCONNECTION.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DESTINATIONIPHASH - Create a hash of the destination IP address in the IP header. * SOURCEIPHASH - Create a hash of the source IP address in the IP header. * TOKEN - Extract a token from the request, create a hash of the token, and then select the service to which any previous requests with the same token hash value were sent. * SRCIPDESTIPHASH - Create a hash of the string obtained by concatenating the source IP address and destination IP address in the IP header.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* SRCIPSRCPORTHASH - Create a hash of the source IP address and source port in the IP header. * CALLIDHASH - Create a hash of the SIP Call-ID header. * USER_TOKEN - Same as TOKEN LB method but token needs to be provided from an extension. * LEASTLLMTOKENLATENCY - Select the service with the least LLM token latency. Default value: LEASTCONNECTION Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, URLHASH, DOMAINHASH,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DESTINATIONIPHASH, SOURCEIPHASH, SRCIPDESTIPHASH, LEASTBANDWIDTH, LEASTPACKETS, TOKEN, SRCIPSRCPORTHASH, LRTM, CALLIDHASH, CUSTOMLOAD, LEASTREQUEST, AUDITLOGHASH, STATICPROXIMITY, USER_TOKEN, LEASTLLMTOKEN LATENCY
hashlength	<Integer>	Read-write	Number of bytes to consider for the hash value used in the URLHASH and DOMAINHASH load balancing methods. Default value: 80 Minimum value = 1 Maximum value = 4096
netmask	<String>	Read-write	IPv4 subnet mask to apply to the destination IP address or source IP address when the load balancing

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			method is DESTINATIONIPHASH or SOURCEIPHASH. Minimum length = 1
v6netmasklen	<Integer>	Read-write	Number of bits to consider in an IPv6 destination or source IP address, for creating the hash that is required by the DESTINATIONIPHASH and SOURCEIPHASH load balancing methods. Default value: 128 Minimum value = 1 Maximum value = 128
backuplbmethod	<String>	Read-write	Backup load balancing method. Becomes operational if the primary load balancing me thod fails or cannot be used. Valid only if the primary method is based on static proximity. Default value: ROUNDROBIN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, SOURCEIPHASH, LEASTBANDWIDTH, LEASTPACKETS, CUSTOMLOAD
aigwprofilename	<String>	Read-write	Name of the AIGW frontend profile. For the LB vserver to function as AI gateway, this parameter must be set. Once this parameter is set using add lb vserver, it cannot be unset. Minimum length = 1 Maximum length = 255
cookiename	<String>	Read-write	Use this parameter to specify the cookie name for COOKIE peristence type. It specifies the name of cookie with a maximum of 32 characters. If not specified, cookie name is internally generated.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rule	<String>	Read-write	Expression, or name of a named expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks. Default value: "none"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
listenpolicy	<String>	Read-write	Expression identifying traffic accepted by the virtual server. Can be either an expression (for example, CLIENT.IP.DST.IN_SUBNET(192.0.2.0/24) or the name of a named expression. In the above example, the virtual server accepts all requests whose destination IP address is in the 192.0.2.0/24 subnet. Default value: "NONE"
listenpriority	<Integer>	Read-write	Integer specifying the priority of the listen policy. A higher number specifies a lower priority. If a request matches the listen policies of more than one virtual server the virtual server whose listen policy has the highest priority (the lowest priority number) accepts the request. Default value: 101 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 101
resrule	<String>	Read-write	Expression specifying which part of a server's response to use for creating rule based persistence sessions (persistence type RULE). Can be either an expression or the name of a named expression. Example: HTTP.RES.HEADER("setcookie").VALUE(0).TYPECAST_NVLIST_T('=',';').VALUE("server1"). Default value: "none"
persistmask	<String>	Read-write	Persistence mask for IP based persistence types, for IPv4 virtual servers. Minimum length = 1
v6persistmasklen	<Integer>	Read-write	Persistence mask for IP based persistence types, for IPv6 virtual servers. Default value: 128 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 128
rtspnat	<String>	Read-write	Use network address translation (NAT) for RTSP data connections. Default value: OFF Possible values = ON, OFF
m	<String>	Read-write	Redirection mode for load balancing. Available settings function as follows: * IP - Before forwarding a request to a server, change the destination IP address to the server's IP address. * MAC - Before forwarding a request to a server, change the destination MAC address to the server's MAC address. The destination IP address is not changed. MAC-based redirection mode is used mostly in firewall

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			load balancing deployments. * IPTUNNEL - Perform IP-in-IP encapsulation for client IP packets. In the outer IP headers, set the destination IP address to the IP address of the server and the source IP address to the subnet IP (SNIP). The client IP packets are not modified. Applicable to both IPv4 and IPv6 packets. * TOS - Encode the virtual server's TOS ID in the TOS field of the IP header. You can use either the IPTUNNEL or the TOS option to implement Direct Server Return (DSR). Default value: IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = IP, MAC, IPTUNNEL, TOS
tosid	<Integer>	Read-write	TOS ID of the virtual server. Applicable only when the load balancing redirection mode is set to TOS. Minimum value = 1 Maximum value = 63
datalength	<Integer>	Read-write	Length of the token to be extracted from the data segment of an incoming packet, for use in the token method of load balancing. The length of the token, specified in bytes, must not be greater than 24 KB. Applicable to virtual servers of type TCP. Minimum value = 1 Maximum value = 100
dataoffset	<Integer>	Read-write	Offset to be considered when extracting a token from the TCP payload. Applicable to virtual servers, of type TCP, using the token method of load balancing. Must be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			within the first 24 KB of the TCP payload. Minimum value = 0 Maximum value = 25400
sessionless	<String>	Read-write	Perform load balancing on a per-packet basis, without establishing sessions. Recommended for load balancing of intrusion detection system (IDS) servers and scenarios involving direct server return (DSR), where session information is unnecessary. Default value: DISABLED Possible values = ENABLED, DISABLED
trofspersistence	<String>	Read-write	When value is ENABLED, Trofs persistence is honored. When value is DISABLED, Trofs persistence is not honored. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
state	<String>	Read-write	State of the load balancing virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
connfailover	<String>	Read-write	Mode in which the connection failover feature must operate for the virtual server. After a failover, established TCP connections and UDP packet flows are kept active and resumed on the secondary appliance. Clients remain connected to the same servers. Available settings function as follows: * STATEFUL - The primary appliance shares state information with the secondary appliance, in real time, resulting in some runtime

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			processing overhead. * STATELESS - State information is not shared, and the new primary appliance tries to re-create the packet flow on the basis of the information contained in the packets it receives. * DISABLED - Connection failover does not occur. Default value: DISABLED Possible values = DISABLED, STATEFUL, STATELESS
redirurl	<String>	Read-write	URL to which to redirect traffic if the virtual server becomes unavailable. WARNING! Make sure that the domain in the URL does not match the domain specified for a content switching policy. If it does,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requests are continuously redirected to the unavailable virtual server. Minimum length = 1
cacheable	<String>	Read-write	Route cacheable requests to a cache redirection virtual server. The load balancing virtual server can forward requests only to a transparent cache redirection virtual server that has an IP address and port combination of *:80, so such a cache redirection virtual server must be configured on the appliance. Default value: NO Possible values = YES, NO
clttimeout	<Integer>	Read-write	Idle time, in seconds, after which a client connection is terminated. Minimum value = 0 Maximum value = 31536000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
somethod	<String>	Read-write	Type of threshold that, when exceeded, triggers spillover. Available settings function as follows: * CONNECTION - Spillover occurs when the number of client connections exceeds the threshold. * DYNAMICCONNECTION - Spillover occurs when the number of client connections at the virtual server exceeds the sum of the maximum client (Max Clients) settings for bound services. Do not specify a spillover threshold for this setting, because the threshold is implied by the Max Clients settings of bound services. * BANDWIDTH - Spillover occurs when the bandwidth consumed by the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			virtual server's incoming and outgoing traffic exceeds the threshold. * HEALTH - Spillover occurs when the percentage of weights of the services that are UP drops below the threshold. For example, if services svc1, svc2, and svc3 are bound to a virtual server, with weights 1, 2, and 3, and the spillover threshold is 50%, spillover occurs if svc1 and svc3 or svc2 and svc3 transition to DOWN. * LLMQUOTA - Spillover occurs when the LLM token quota of all the services bound the vserver is exhausted. Do not specify a spillover threshold for this setting, because the threshold is implied

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by the max tokens settings on the bound services. * NONE - Spillover does not occur. Possible values = CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, LLMQUOTA, NONE
sopersistence	<String>	Read-write	If spillover occurs, maintain source IP address based persistence for both primary and backup virtual servers. Default value: DISABLED Possible values = ENABLED, DISABLED
sopersistencetimeout	<Integer>	Read-write	Timeout for spillover persistence, in minutes. Default value: 2 Minimum value = 2 Maximum value = 1440
healththreshold	<Integer>	Read-write	Threshold in percent of active services

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			below which vserver state is made down. If this threshold is 0, vserver state will be up even if one bound service is up. Default value: 0 Minimum value = 0 Maximum value = 100
sothreshold	<Integer>	Read-write	Threshold at which spillover occurs. Specify an integer for the CONNECTION spillover method, a bandwidth value in kilobits per second for the BANDWIDTH method (do not enter the units), or a percentage for the HEALTH method (do not enter the percentage symbol). Minimum value = 1 Maximum value = 4294967287
sobackupaction	<String>	Read-write	Action to be performed if spillover is to take effect, but no backup chain to spillover is usable or exists.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DROP, ACCEPT, REDIRECT
redirectportrewrite	<String>	Read-write	Rewrite the port and change the protocol to ensure successful HTTP redirects from services. Default value: DISABLED Possible values = ENABLED, DISABLED
downstateflush	<String>	Read-write	Flush all active transactions associated with a virtual server whose state transitions from UP to DOWN. Do not enable this option for applications that must complete their transactions. Default value: ENABLED Possible values = ENABLED, DISABLED
backupvserver	<String>	Read-write	Name of the backup virtual server to which to forward requests if the primary virtual server goes DOWN or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			reaches its spillover threshold. Minimum length = 1
disableprimaryondown	<String>	Read-write	If the primary virtual server goes down, do not allow it to return to primary status until manually enabled. Default value: DISABLED Possible values = ENABLED, DISABLED
insertvserveripport	<String>	Read-write	Insert an HTTP header, whose value is the IP address and port number of the virtual server, before forwarding a request to the server. The format of the header is <vipHeader>: <virtual server IP address>_<port number >, where vipHeader is the name that you specify for the header. If the virtual server has an IPv6 address, the address in the header is enclosed in brackets ([and]) to separate it from the port number. If you have mapped an IPv4

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address to a virtual server's IPv6 address, the value of this parameter determines which IP address is inserted in the header, as follows: * VIPADDR - Insert the IP address of the virtual server in the HTTP header regardless of whether the virtual server has an IPv4 address or an IPv6 address. A mapped IPv4 address, if configured, is ignored. * V6TOV4MAPPING - Insert the IPv4 address that is mapped to the virtual server's IPv6 address. If a mapped IPv4 address is not configured, insert the IPv6 address. * OFF - Disable header insertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = OFF, VIPADDR, V6TOV4MAPPING
vipheader	<String>	Read-write	Name for the inserted header. The default name is vip-header. Minimum length = 1
authenticationhost	<String>	Read-write	Fully qualified domain name (FQDN) of the authentication virtual server to which the user must be redirected for authentication. Make sure that the Authentication parameter is set to ENABLED. Minimum length = 3 Maximum length = 252
authentication	<String>	Read-write	Enable or disable user authentication. Default value: OFF Possible values = ON, OFF
authn401	<String>	Read-write	Enable or disable user authentication with HTTP 401 responses. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
authnvsname	<String>	Read-write	Name of an authentication virtual server with which to authenticate users. Minimum length = 1 Maximum length = 252
push	<String>	Read-write	Process traffic with the push virtual server that is bound to this load balancing virtual server. Default value: DISABLED Possible values = ENABLED, DISABLED
pushvserver	<String>	Read-write	Name of the load balancing virtual server, of type PUSH or SSL_PUSH, to which the server pushes updates received on the load balancing virtual server that you are configuring. Minimum length = 1
pushlabel	<String>	Read-write	Expression for extracting a label from the server's response. Can be either an expression

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or the name of a named expression. Default value: "none"
pushmulticlients	<String>	Read-write	Allow multiple Web 2.0 connections from the same client to connect to the virtual server and expect updates. Default value: NO Possible values = YES, NO
tcpprofilename	<String>	Read-write	Name of the TCP profile whose settings are to be applied to the virtual server. Minimum length = 1 Maximum length = 127
httpprofilename	<String>	Read-write	Name of the HTTP profile whose settings are to be applied to the virtual server. Minimum length = 1 Maximum length = 127
dbprofilename	<String>	Read-write	Name of the DB profile whose settings are to be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			applied to the virtual server. Minimum length = 1 Maximum length = 127
mcpprofilename	<String>	Read-write	Name of the MCP profile to attach to this lb vserver. Enables MCP protocol processing.
comment	<String>	Read-write	Any comments that you might want to associate with the virtual server.
l2conn	<String>	Read-write	Use Layer 2 parameters (channel number, MAC address, and VLAN ID) in addition to the 4-tuple (<source IP>:<source port>::<destination IP>:<destination port>) that is used to identify a connection. Allows multiple TCP and non-TCP connections with the same 4-tuple to co-exist on the Citrix ADC. Possible values = ON, OFF
oracleserverversion	<String>	Read-write	Oracle server version.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 10G Possible values = 10G, 11G
mssqlserverversion	<String>	Read-write	For a load balancing virtual server of type MSSQL, the Microsoft SQL Server version. Set this parameter if you expect some clients to run a version different from the version of the database. This setting provides compatibility between the client-side and server-side connections by ensuring that all communication conforms to the server's version. Default value: 2008R2 Possible values = 70, 2000, 2000SP1, 2005, 2008, 2008R2, 2012, 2014
mysqlprotocolversion	<Integer>	Read-write	MySQL protocol version that the virtual server advertises to clients.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mysqlserverversion	<String>	Read-write	MySQL server version string that the virtual server advertises to clients. Minimum length = 1 Maximum length = 31
mysqlcharacterset	<Integer>	Read-write	Character set that the virtual server advertises to clients.
mysqlservercapabilities	<Integer>	Read-write	Server capabilities that the virtual server advertises to clients.
appflowlog	<String>	Read-write	Apply AppFlow logging to the virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
netprofile	<String>	Read-write	Name of the network profile to associate with the virtual server. If you set this parameter, the virtual server uses only the IP addresses in the network profile as source IP addresses when initiating connections with servers.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
icmpvsrresponse	<String>	Read-write	How the Citrix ADC responds to ping requests received for an IP address that is common to one or more virtual servers. Available settings function as follows: * If set to PASSIVE on all the virtual servers that share the IP address, the appliance always responds to the ping requests. * If set to ACTIVE on all the virtual servers that share the IP address, the appliance responds to the ping requests if at least one of the virtual servers is UP. Otherwise, the appliance does not respond. * If set to ACTIVE on some virtual servers and PASSIVE on the others, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			appliance responds if at least one virtual server with the ACTIVE setting is UP. Otherwise, the appliance does not respond. Note: This parameter is available at the virtual server level. A similar parameter, ICMP Response, is available at the IP address level, for IPv4 addresses of type VIP. To set that parameter, use the add ip command in the CLI or the Create IP dialog box in the GUI. Default value: PASSIVE Possible values = PASSIVE, ACTIVE
rhistate	<String>	Read-write	Route Health Injection (RHI) functionality of the NetSaler appliance for advertising the route of the VIP address associated with the virtual

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server. When Vserver RHI Level (RHI) parameter is set to VSVR_CNTRLD, the following are different RHI behaviors for the VIP address on the basis of RHIstate (RHI STATE) settings on the virtual servers associated with the VIP address: * If you set RHI STATE to PASSIVE on all virtual servers, the Citrix ADC always advertises the route for the VIP address. * If you set RHI STATE to ACTIVE on all virtual servers, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers is in UP state. * If you set RHI STATE to ACTIVE on some and PASSIVE on others,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers, whose RHI STATE set to ACTIVE, is in UP state. Default value: PASSIVE Possible values = PASSIVE, ACTIVE
newservicerequest	<Integer>	Read-write	Number of requests, or percentage of the load on existing services, by which to increase the load on a new service at each interval in slow-start mode. A non-zero value indicates that slow-start is applicable. A zero value indicates that the global RR startup parameter is applied. Changing the value to zero will cause services currently in slow start to take the full traffic as determined by the LB method. Subsequently, any new services added

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			will use the global RR factor. Default value: 0
newservicerequestunit	<String>	Read-write	Units in which to increment load at each interval in slow-start mode. Default value: PER_SECOND Possible values = PER_SECOND, PERCENT
newservicerequestincrementinterval	<Integer>	Read-write	Interval, in seconds, between successive increments in the load on a new service or a service whose state has just changed from DOWN to UP. A value of 0 (zero) specifies manual slow start. Default value: 0 Minimum value = 0 Maximum value = 3600
minautoscalemembers	<Integer>	Read-write	Minimum number of members expected to be present when vserver is used in Autoscale. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 5000
maxautoscalemembers	<Integer>	Read-write	Maximum number of members expected to be present when vserver is used in Autoscale. Default value: 0 Minimum value = 0 Maximum value = 5000
persistavpno	<Integer[]>	Read-write	Persist AVP number for Diameter Persistency. In case this AVP is not defined in Base RFC 3588 and it is nested inside a Grouped AVP, define a sequence of AVP numbers (max 3) in order of parent to child. So say persist AVP number X is nested inside AVP Y which is nested in Z, then define the list as Z Y X. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
skippersistency	<String>	Read-write	This argument decides the behavior incase the service which is selected from an existing persistence session has reached threshold. Default value: None Possible values = Bypass, ReLb, None
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
authnprofile	<String>	Read-write	Name of the authentication profile to be used when authentication is turned on.
macmoderetainvlan	<String>	Read-write	This option is used to retain vlan information of incoming packet

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			when macmode is enabled. Default value: DISABLED Possible values = ENABLED, DISABLED
dbslb	<String>	Read-write	Enable database specific load balancing for MySQL and MSSQL service types. Default value: DISABLED Possible values = ENABLED, DISABLED
dns64	<String>	Read-write	This argument is for enabling/disabling the dns64 on lbvserver. Possible values = ENABLED, DISABLED
bypassaaaa	<String>	Read-write	If this option is enabled while resolving DNS64 query AAAA queries are not sent to back end dns server. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
recursionavailable	<String>	Read-write	When set to YES, this option causes the DNS replies from this vserver to have the RA bit turned on. Typically one would set this option to YES, when the vserver is load balancing a set of DNS servers thatsupport recursive queries. Default value: NO Possible values = YES, NO
processlocal	<String>	Read-write	By turning on this option packets destined to a vserver in a cluster will not under go any steering. Turn this option for single packet request response mode or when the upstream device is performing a proper RSS for connection based distribution. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dnsprofilename	<String>	Read-write	Name of the DNS profile to be associated with the VServer. DNS profile properties will be applied to the transactions processed by a VServer. This parameter is valid only for DNS and DNS-TCP VServers. Minimum length = 1 Maximum length = 127
lbprofilename	<String>	Read-write	Name of the LB profile which is associated to the vserver.
redirectfromport	<Integer>	Read-write	Port number for the virtual server, from which we absorb the traffic for http redirect. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
httpsredirecturl	<String>	Read-write	URL to which all HTTP traffic received on the port specified in the -redirectFromPort

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parameter is redirected.
retainconnectionsoncluster	<String>	Read-write	This option enables you to retain existing connections on a node joining a Cluster system or when a node is being configured for passive timeout. By default, this option is disabled. Default value: NO Possible values = YES, NO
adfsproxyprofile	<String>	Read-write	Name of the adfsProxy profile to be used to support ADFSPIP protocol for ADFS servers.
tcpprobeport	<Integer>	Read-write	Port number for external TCP probe. NetScaler provides support for external TCP health check of the vserver status over the selected port. This option is only supported for vservers assigned with an IPAddress or ipset. Minimum value = 1 Range 1 - 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* in CLI is represented as 65535 in NITRO API
quicprofilename	<String>	Read-write	Name of QUIC profile which will be attached to the VServer. Minimum length = 1 Maximum length = 255
quicbridgeprofilename	<String>	Read-write	Name of the QUIC Bridge profile whose settings are to be applied to the virtual server. Minimum length = 1 Maximum length = 127
probeprotocol	<String>	Read-write	Citrix ADC provides support for external health check of the vserver status. Select HTTP or TCP probes for healthcheck. Possible values = TCP, HTTP
probesuccessresponsecode	<String>	Read-write	HTTP code to return in SUCCESS case. Default value: "200 OK"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 64
probeport	<Integer>	Read-write	Citrix ADC provides support for external health check of the vserver status. Select port for HTTP/ TCP monitring. Default value: 0 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
toggleorder	<String>	Read-write	Configure this option to toggle order preference. Default value: ASCENDING Possible values = ASCENDING, DESCENDING
orderthreshold	<Integer>	Read-write	This option is used to to specify the threshold of minimum number of services to be UP in an order, for it to be considered in Lb decision. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 100
apiprofile	<String>	Read-write	The API profile where one or more API specs are bounded to. Minimum length = 1
dnsoverhttps	<String>	Read-write	This option is used to enable/disable DNS over HTTPS (DoH) processing. Default value: DISABLED Possible values = ENABLED, DISABLED
wasmmodule	<String>	Read-write	Name of the WASM module to assign to this virtual server.
servicename	<String>	Read-write	Service to bind to the virtual server. Minimum length = 1
weight	<Integer>	Read-write	Weight to assign to the specified service. Minimum value = 1 Maximum value = 100
order	<Integer>	Read-write	Order number to be assigned to the service when it is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bound to the lb vserver. Minimum value = 1 Maximum value = 8192
redirurlflags	<Boolean>	Read-write	The redirect URL to be unset.
newname	<String>	Read-write	New name for the virtual server. Minimum length = 1
value	<String>	Read-only	SSL status. Possible values = Certkey/ Certkeybundle/Vault not bound/Cert-store not usable, SSL feature disabled
ipmapping	<String>	Read-only	The permanent mapping for the V6 Address.
ngname	<String>	Read-only	Nodegroup name to which this lbvsever belongs to.
type	<String>	Read-only	Type of LB vserver. Possible values = CONTENT, ADDRESS
curstate	<String>	Read-only	Current LB vserver state.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
effectivestate	<String>	Read-only	Effective state of the LB vserver , based on the state of backup vservers. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
status	<Integer>	Read-only	Current status of the lb vserver. During the initial phase if the configured lb method is not round robin , the vserver will adopt round robin to distribute traffic for a predefined number of requests.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lbrrreason	<Integer>	Read-only	Reason why a vserver is in RR. The following are the reasons: 1 - MEP is DOWN (GSLB) 2 - LB method has changed 3 - Bound service's state changed to UP 4 - A new service is bound 5 - Startup RR factor has changed 6 - LB feature is enabled 7 - Load monitor is not active on a service 8 - Vserver is Enabled 9 - SSL feature is Enabled 10 - All bound services have reached threshold. Using effective state to load balance (GSLB)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			11 - Primary state of bound services are not UP. Using effective state to load balance (GSLB) 12 - No LB decision can be made as all bound services have either reached threshold or are not UP (GSLB) 13 - All load monitors are active .
redirect	<String>	Read-only	Cache redirect type. Possible values = CACHE, POLICY, ORIGIN
precedence	<String>	Read-only	Precedence. Possible values = RULE, URL
homepage	<String>	Read-only	Home page.
dnsvservername	<String>	Read-only	DNS vserver name.
domain	<String>	Read-only	Domain.
cachevserver	<String>	Read-only	Cache virtual server.
health	<Integer>	Read-only	Health of vserver based on percentage of weights of active svcs/all svcs. This

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			does not consider administratively disabled svcs.
ruletype	<Integer>	Read-only	Rule type.
groupname	<String>	Read-only	LB group to which the lb vserver is to be bound.
cookiedomain	<String>	Read-only	Domain name to be used in the set cookie header in case of cookie persistence.
map	<String>	Read-only	Map. Possible values = ON, OFF
gt2gb	<String>	Read-only	Allow for greater than 2 GB transactions on this vserver. Default value: DISABLED Possible values = ENABLED, DISABLED
consolidatedlconn	<String>	Read-only	Use consolidated stats for LeastConnection. Default value: GLOBAL Possible values = GLOBAL, NO, YES

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
consolidatedlconngbl	<String>	Read-only	Fetches Global setting. Possible values = YES, NO
thresholdvalue	<Integer>	Read-only	Tells whether threshold exceeded for this service participating in CUSTOMLB.
bindpoint	<String>	Read-only	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, MQTT_JUMBO_REQ
version	<Integer>	Read-only	Cookie version.
totalservices	<Integer>	Read-only	Total number of services bound to the vserver.
activeservices	<Integer>	Read-only	Total number of active services bound to the vserver.
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
statechangetimeseconds	<Integer>	Read-only	Time when last state change happened. Seconds part.
statechangetimemsec	<Integer>	Read-only	Time at which last state change

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			happened. Milliseconds part.
tickssincelaststatechange	<Integer>	Read-only	Time in 10 millisecond ticks since the last state change.
isgslb	<Boolean>	Read-only	This field is set to true if it is a GSLBVserver.
vsvrdynconnsothreshold	<Integer>	Read-only	Spillover threshold for dynamic connection.
backupvserverstatus	<String>	Read-only	Staus of BackUp Vserver .
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings. Default value: NO Possible values = YES, NO
currentactiveorder	<String>	Read-only	current order that takes the traffic in case service or servicegroup is bound with order.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver **HTTP Method:** POST

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lbvserver":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/lbvserver? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lbvserver? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbvserver resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lbvserver? **view=summary**

Use this query-parameter to get the summary output of lbvserver resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbvserver? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbvserver resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lbvserver": [ { "__count": "#no"} ] }
```

lbvserver_analyticsprofile_binding

Binding object showing the analyticsprofile that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). .

Minimum length = 1

Minimum value = 1

Maximum value = 8192

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/lbvserver_analyticsprofile_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"lbvserver_analyticsprofile_binding":{

<b>"name":<String_value>,

</b>"analyticsprofile":<String_value>,

"order":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_analyticsprofile_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ lbvserver_analyticsprofile_binding/ name_value<String> ? **args=analyticsprofile: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_analyticsprofile_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/

lbvserver_analyticsprofile_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbvserver_analyticsprofile_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_analyticsprofile_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbvserver_analyticsprofile_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbvserver_analyticsprofile_binding": [ {

"name":<String_value>,

"analyticsprofile":<String_value>,

lbvserver_appflowpolicy_binding

Binding object showing the appflowpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resvserver, policylabel
priority	<Integer>	Read-write	Priority.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, MQTT_JUMBO_REQ
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). .

lbvserver_appfwpolicy_binding

Binding object showing the appfwpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labelname	<String>	Read-write	Name of the label invoked.
order	<Integer>	Read-write	Integer specifying the order of the service. A larger

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number specifies a lower order. Defines the order of the service relative to the other services in the load balancing vserver's bindings. Determines the priority given to the service among all the services bound. Minimum value = 1 Maximum value = 8192
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). .

Minimum length = 1

Possible values = REQUEST, RESPONSE, MQTT_JUMBO_REQ

Possible values = reqvserver, resvserver, policylabel

Operations

- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

lbvserver_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-)

Operations

(click to see Properties)

- ADD

- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/lbvserver_auditsyslogpolicy_binding **HTTP Method:** PUT

Request Headers:

lbvserver_cachepolicy_binding

Binding object showing the cachepolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
order	<Integer>	Read-write	Integer specifying the order of the service. A larger number specifies a lower order. Defines the order of the service relative to the other services in the load balancing vserver's bindings. Determines the priority given to the service among all the services bound. Minimum value = 1 Maximum value = 8192
labelname	<String>	Read-write	Name of the label invoked.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver, resvserver, policylabel
priority	<Integer>	Read-write	Priority.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, MQTT_JUMBO_REQ
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). .

Minimum length = 1

Operations

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

```

lbvserver_dnspolicy64_binding

Binding object showing the dnspolicy64 that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
order	<Integer>	Read-write	Integer specifying the order of the service. A larger number specifies a lower order. Defines the order of the service relative to the other services in the load balancing vserver's bindings. Determines the priority given to the service among all the services bound. Minimum value = 1 Maximum value = 8192
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). .

Minimum length = 1

Possible values = REQUEST, RESPONSE, MQTT_JUMBO_REQ

Possible values = reqvserver, resvserver, policylabel

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

lbvserver_servicegroup_binding

Binding object showing the servicegroup that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
weight	<Integer>	Read-write	Integer specifying the weight of the service. A larger number specifies a greater weight. Defines the capacity of the service relative to the other services in the load balancing configuration. Determines the priority given to the service in load balancing decisions. Default value: 1 Minimum value = 1 Maximum value = 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The service group name bound to the selected load balancing virtual server.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). .

Minimum value = 1

Maximum value = 100

Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, DNS, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, RTSP, PUSH, SSL_PUSH, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, SMPP, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, PROXY, USER_TCP, USER_SSL_TCP, QUIC, IPFIX,

LOGSTREAM, MONGO, MONGO_TLS, MQTT, MQTT_TLS, QUIC_BRIDGE, HTTP_QUIC, DOT, SSL_PROXY, KAFKA_PRODUCER

Range 1 - 65535

* in CLI is represented as 65535 in NITRO API

Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_servicegroupmember_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ lbvserver_servicegroupmember_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbvserver_servicegroupmember_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_servicegroupmember_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbvserver_servicegroupmember_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbvserver_servicegroupmember_binding": [ {

"order":<Integer_value>,

"servicegroupname":<String_value>,

"name":<String_value>,

"weight":<Integer_value>,

"dynamicweight":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_servicegroupmember_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_servicegroupmember_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbvserver_servicegroupmember_binding": [ {

"order":<Integer_value>,

"servicegroupname":<String_value>,

lbvserver_tmtrafficpolicy_binding

Binding object showing the tmtrafficpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
order	<Integer>	Read-write	Integer specifying the order of the service. A larger number specifies a lower order. Defines the order of the service relative to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			other services in the load balancing vserver's bindings. Determines the priority given to the service among all the services bound. Minimum value = 1 Maximum value = 8192
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_transformpolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_transformpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbvserver_transformpolicy_binding": [ {

"invoke":<Boolean_value>,

"gotopriorityexpression":<String_value>,

"policyname":<String_value>,

"name":<String_value>,

"priority":<Integer_value>,

"labeltype":<String_value>,

"bindpoint":<String_value>,

"labelname":<String_value>,

"order":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbvserver_transformpolicy_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"lbvserver_transformpolicy_binding": [ { "__count": "#no"} ] }
```

lbvserver_videooptimizationdetectionpolicy_binding

Binding object showing the videooptimizationdetectionpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
order	<Integer>	Read-write	Integer specifying the order of the service. A larger number specifies a lower order. Defines the order of the service relative to the other services in the load balancing vserver's bindings.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Determines the priority given to the service among all the services bound. Minimum value = 1 Maximum value = 8192
labelname	<String>	Read-write	Name of the label invoked.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created.

CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). .

Minimum length = 1

Possible values = REQUEST, RESPONSE, MQTT_JUMBO_REQ

Possible values = reqvserver, resvserver, policylabel

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

lbwlm

Configuration for web log manager resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wlmname	<String>	Read-write	The name of the Work Load Manager. Minimum length = 1
ipaddress	<String>	Read-write	The IP address of the WLM.
port	<Integer>	Read-write	The port of the WLM. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
lbuid	<String>	Read-write	The LBUID for the Load Balancer to communicate to the Work Load Manager.
katimeout	<Integer>	Read-write	The idle time period after which Citrix ADC would probe the WLM. The value ranges from 1 to 1440 minutes. Default value: 2 Minimum value = 0 Maximum value = 1440

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
secure	<String>	Read-only	Use this parameter to enable secure mode of communication with WLM. Possible values = YES, NO
state	<String>	Read-only	State of the WLM. Possible values = ACTIVE, INACTIVE, UNKNOWN
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Content-Type:application/json

Response Payload:

```
{ "lbwlm_binding": [ {

"wlmname":<String_value>,

"lbwlm_lbvserver_binding":<lbwlm_lbvserver_binding[]_value>

}]}
```

lbwlm_lbvserver_binding

Binding object showing the lbvserver that can be bound to lbwlm.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wlmname	<String>	Read-write	The name of the Work Load Manager. Minimum length = 1
vservername	<String>	Read-write	Name of the virtual server which is to be bound to the WLM.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT
- ADD
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/lbwlm_lbvserver_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"lbwlm_lbvserver_binding":{

<b>"wlmname":<String_value>,

</b><b>"vservername":<String_value></b>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbwlm_lbvserver_binding/ wlmname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ lbwlm_lbvserver_binding/ wlmname_value<String> ? **args= vservername:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbwlm_lbvserver_binding/ wlmname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/

lbwlm_lbvserver_binding/ wlmname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbwlm_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lbwlm_lbvserver_binding/ wlmname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lbwlm_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbwlm_lbvserver_binding": [ {

"wlmname":<String_value>,

"vservername":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbwlm_lbvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lbwlm_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lbwlm_lbvserver_binding": [ {

"wlmname":<String_value>,

"vservername":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lbwlm_lbvserver_binding/wlmname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"lbwlm_lbvserver_binding": [ { "__count": "#no"} ] }
```

lldp

LLDP

Link Layer Discovery Protocol.

NAME	DESCRIPTION
lldpneighbors	Configuration for lldp neighbors
lldpparam	Configuration for lldp params

lldpneighbors

Configuration for lldp neighbors resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ifnum	<String>	Read-write	Interface Name.
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 31
chassisidsubtype	<String>	Read-only	Chassis id sub type. Possible values = NONE, Component, Interface Alias, Port Component, MAC Address, Network Address, Interface Name, Locally Assigned
chassisid	<String>	Read-only	Chassis Id.
portidsubtype	<String>	Read-only	Port id subtype. Possible values = NONE, Interface Alias, Port Component, MAC Address, Network Address, Interface Name, Agent Circuit ID, Locally Assigned
portid	<String>	Read-only	Port Id.
ttl	<Integer>	Read-only	Time to Live.
portdescription	<String>	Read-only	Port Description.
sys	<String>	Read-only	System Name.
sysdesc	<String>	Read-only	System Description.
mgmtaddresssubtype	<String>	Read-only	Management Address Type. Possible values = OTHER, IPv4, IPv6

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mgmtaddress	<String>	Read-only	Management Address.
iftype	<String>	Read-only	Interface subtype. Possible values = UNKNOWN, ifIndex, system port number
ifnumber	<Integer>	Read-only	Interface Number.
vlan	<String>	Read-only	vlan name.
vlanid	<Integer>	Read-only	Vlan Id.
portprotosupported	<Integer>	Read-only	Flag to show Port Protocol Support.
portprotoenabled	<Integer>	Read-only	Flag to show Port Protocol support enabled.
portprotoid	<Integer>	Read-only	Port Protocol ID.
portvlanid	<Integer>	Read-only	Port Vlan Id.
protocolid	<String>	Read-only	port vlan id name.
linkaggrcapable	<String>	Read-only	Is neighbor Link Aggregation Capable. Possible values = NO, YES
linkaggrenabled	<String>	Read-only	Is link aggregation Enabled. Possible values = NO, YES
linkaggrid	<Integer>	Read-only	Link Aggregation Id.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flag	<Integer>	Read-only	.
syscapabilities	<String>	Read-only	Acronyms for remote system capabilities: OT : Other. RE : Repeater(IETF RFC 2108). BR : MAC Bridge(IEEE Std 802.1D). WL : WLAN Access Point(IEEE Std 802.11 MIB). RO : ROuter(IETF RFC 1812). TE : Telephone(IETF RFC 4293). DO : DOCSIS cable device(IETF RFC 4639 and IETF RFC 4546). ST : STation only(IETF RFC 4293). CV : C-VLAN component of a VLAN Bridge(IEEE Std 802.1Q).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SV : S-VLAN component of a VLAN Bridge(IEEE Std 802.1Q). MR : Two port MAC Relay(IEEE Std 802.1Q).
syscapenabled	<String>	Read-only	Acronyms for remote system enabled capabilities: OT : Other. RE : Repeater(IETF RFC 2108). BR : MAC Bridge(IEEE Std 802.1D). NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ST : STation only(IETF RFC 4293). CV : C-VLAN component of a VLAN Bridge(IEEE Std 802.1Q). SV : S-VLAN component of a VLAN Bridge(IEEE Std 802.1Q). MR : Two port MAC Relay(IEEE Std 802.1Q).
autonegsupport	<String>	Read-only	MAC/PHY autonegotiation support. Possible values = NO, YES
autonegenabled	<String>	Read-only	MAC/PHY autonegotiation enabled. Possible values = NO, YES
autonegadvertised	<String>	Read-only	MAC/PHY autonegotiation advetised.
autonegmautype	<String>	Read-only	MAC/PHY Medium Attachment Unit (MAU) type of the port. Description listed below:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			AUI - no internal MAU, view from AUI 10Base5 - thick coax MAU Foirl - FOIRL MAU 10Base2 - thin coax MAU 10BaseT - UTP MAU 10BaseFP - passive fiber MAU 10BaseFB - sync fiber MAU 10BaseFL - async fiber MAU 10Broad36 - broadband DTE MAU 10BaseTHD - UTP MAU, half duplex mode 10BaseTFD - UTP MAU, full duplex mode 10BaseFLHD - async fiber MAU, half duplex mode

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			10BaseFLDF - async fiber MAU, full duplex mode 10BaseT4 - 4 pair category 3 UTP 100BaseTXHD - 2 pair category 5 UTP, half duplex mode 100BaseTXFD - 2 pair category 5 UTP, full duplex mode 100BaseFXHD - X fiber over PMT, half duplex mode 100BaseFXFD - X fiber over PMT, full duplex mode 100BaseT2HD - 2 pair category 3 UTP, half duplex mode 100BaseT2DF - 2 pair category 3 UTP, full duplex mode 1000BaseXHD - PCS/PMA,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			unknown PMD, half duplex mode 1000BaseXFD - PCS/PMA, unknown PMD, full duplex mode 1000BaseLXHD - Fiber over long-wavelength laser, half duplex mode 1000BaseLXFD - Fiber over long-wavelength laser, full duplex mode 1000BaseSXHD - Fiber over short-wavelength laser, half duplex mode 1000BaseSXFD - Fiber over short-wavelength laser, full duplex mode 1000BaseCXHD - Copper over 150-Ohm balanced cable, half duplex mode 1000BaseCXFD - Copper over 150-Ohm balanced

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cable, full duplex mode 1000BaseTHD - Four-pair Category 5 UTP, half duplex mode 1000BaseTFD - Four-pair Category 5 UTP, full duplex mode 10GigBaseX - X PCS/PMA, unknown PMD 10GigBaseLX4 - X fiber over WWDM optics 10GigBaseR - R PCS/PMA, unknown PMD 10GigBaseER - R fiber over 1550 nm optics 10GigBaseLR - R fiber over 1310 nm optics 10GigBaseSR - R fiber over 850 nm optics

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			10GigBaseW - W PCS/PMA, unknown PMD 10GigBaseEW - W fiber over 1550 nm optics 10GigBaseLW - W fiber over 1310 nm optics 10GigBaseSW - W fiber over 850 nm optics. Possible values = Not Recieved, AUI, 10Base5, Foirl, 10Base2, 10BaseT, 10BaseFP, 10BaseFB, 10BaseFL, 10Broad36, 10BaseTHD, 10BaseTFD, 10BaseFLHD, 10BaseFLDF, 10BaseT4, 100BaseTXHD, 100BaseTXFD, 100BaseFXHD, 100BaseFXFD, 100BaseT2HD, 100BaseT2DF, 1000BaseXHD, 1000BaseXFD,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			1000BaseLXHD, 1000BaseLXFD, 1000BaseSXHD, 1000BaseSXFD, 1000BaseCXHD, 1000BaseCXFD, 1000BaseTHD, 1000BaseTFD, 10GigBaseX, 10GigBaseLX4, 10GigBaseR, 10GigBaseER, 10GigBaseLR, 10GigBaseSR, 10GigBaseW, 10GigBaseEW, 10GigBaseLW, 10GigBaseSW
mtu	<Integer>	Read-only	MTU of Remote Device.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- GET
- COUNT
- CLEAR

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/lldpneighbors? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lldpneighbors":{

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lldpneighbors **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/lldpneighbors? **args=ifnum: <String_value> ,nodeid: <Integer_value>**

Use this query-parameter to get lldpneighbors resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/lldpneighbors? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lldpneighbors? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lldpneighbors resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lldpneighbors? **view=summary**

Use this query-parameter to get the summary output of lldpneighbors resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lldpneighbors? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lldpneighbors resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lldpneighbors": [ {

lsnrtspalgsession_binding	Binding object showing the resources that can be bound to lsnrtspalgsession
lsnrtspalgsession_datachannel_binding	Binding object showing the datachannel that can be bound to lsnrtspalgsession
lsnsession	Configuration for lsn session
lsnsipalgcall	Configuration for LSN SIPALG call
lsnsipalgcall_binding	Binding object showing the resources that can be bound to lsnsipalgcall
lsnsipalgcall_controlchannel_binding	Binding object showing the controlchannel that can be bound to lsnsipalgcall
lsnsipalgcall_datachannel_binding	Binding object showing the datachannel that can be bound to lsnsipalgcall
lsnsipalgprofile	Configuration for LSN SIPALG Profile
lsnstatic	Configuration for static mapping
lsntransportprofile	Configuration for LSN Transport Profile

lsnappsattributes

Configuration for LSN Application Attributes resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LSN Application Port ATTRIBUTES. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
transportprotocol	<String>	Read-write	Name of the protocol(TCP,UDP) for which the parameters of this LSN application port ATTRIBUTES applies. Possible values = TCP, UDP, ICMP
port	<String>	Read-write	This is used for Displaying Port/Port range in CLI/ Nitro.Lowport, Highport values are populated and used for displaying.Port numbers or range of port numbers to match against the destination port of the incoming packet from a subscriber. When the destination port is matched, the LSN application profile is applied for the LSN session. Separate a range of ports with a hyphen. For example, 40-90. Minimum length = 1
sessiontimeout	<Integer>	Read-write	Timeout, in seconds, for an idle LSN session. If an LSN session is idle for a time that exceeds

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this value, the Citrix ADC removes the session.This timeout does not apply for a TCP LSN session when a FIN or RST message is received from either of the endpoints. Default value: 30 Minimum value = 5 Maximum value = 600
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnappsattributes **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lsnappsattributes":{

<b>"name":<String_value>,

</b><b>"transportprotocol":<String_value>,

</b>"port":<String_value>,

"sessiontimeout":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnappsattributes/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnappsattributes **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lsnappsattributes":{

<b>"name":<String_value>,

</b>"sessiontimeout":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnappsattributes? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lsnappsattributes":{

<b>"name":<String_value>,

</b>"sessiontimeout":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnappsattributes **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/lsnappsattributes? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lsnappsattributes? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lsnappsattributes resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lsnappsattributes? **view=summary**

Use this query-parameter to get the summary output of lsnappsattributes resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lsnappsattributes? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnappsattributes resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnappsattributes": [ {

"name":<String_value>,

"transportprotocol":<String_value>,

"sessiontimeout":<Integer_value>,

"port":<String_value>,

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnappsattributes": [ { "__count": "#no"} ] }
```

lsnappsprofile

Configuration for LSN Application Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appsprofilename	<String>	Read-write	Name for the LSN application profile. Must begin with an ASCII alphanumeric

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1'). Minimum length = 1 Maximum length = 127
transportprotocol	<String>	Read-write	Name of the protocol for which the parameters of this LSN application profile applies. Possible values = TCP, UDP, ICMP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ippooling	<String>	Read-write	NAT IP address allocation options for sessions associated with the same subscriber. Available options function as follows: * Paired - The Citrix ADC allocates the same NAT IP address for all sessions associated with the same subscriber. When all the ports of a NAT IP address are used in LSN sessions (for same or multiple subscribers), the Citrix ADC ADC drops any new connection from the subscriber. * Random - The Citrix ADC allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber. This parameter is applicable to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			dynamic NAT allocation only. Default value: RANDOM Possible values = PAIRED, RANDOM
mapping	<String>	Read-write	Type of LSN mapping to apply to subsequent packets originating from the same subscriber IP address and port. Consider an example of an LSN mapping that includes the mapping of the subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y). Available options function as follows: * ENDPOINT-INDEPENDENT - Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(X:x) to any external IP address and port. * ADDRESS-DEPENDENT - Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port. * ADDRESS-PORT-DEPENDENT - Reuse the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active. Default value: ADDRESS-PORT-DEPENDENT Possible values = ENDPOINT-INDEPENDENT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT
filtering	<String>	Read-write	Type of filter to apply to packets originating from external hosts. Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y). Available options function as follows: * ENDPOINT INDEPENDENT - Filters out only packets not destined to the subscriber IP address and port X:x, regardless of the external host IP address and port source (Z:z). The Citrix ADC forwards any packets destined to X:x. In other words, sending packets

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from the subscriber to any external IP address is sufficient to allow packets from any external hosts to the subscriber. * ADDRESS DEPENDENT - Filters out packets not destined to subscriber IP address and port X:x. In addition, the ADC filters out packets from Y:y destined for the subscriber (X:x) if the client has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address. * ADDRESS PORT DEPENDENT (the default) - Filters out

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packets not destined to subscriber IP address and port (X:x). In addition, the Citrix ADC filters out packets from Y:y destined for the subscriber (X:x) if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets first to that external IP address and port. Default value: ADDRESS-PORT-DEPENDENT Possible values = ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT
tcpproxy	<String>	Read-write	Enable TCP proxy, which enables the Citrix ADC to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			optimize the TCP traffic by using Layer 4 features. Default value: DISABLED Possible values = ENABLED, DISABLED
td	<Integer>	Read-write	ID of the traffic domain through which the Citrix ADC sends the outbound traffic after performing LSN. If you do not specify an ID, the ADC sends the outbound traffic through the default traffic domain, which has an ID of 0. Default value: 4095
l2info	<String>	Read-write	Enable l2info by creating natpcbs for LSN, which enables the Citrix ADC to use L2CONN/MBF with LSN. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnappsprofile_lsnappsattributes_binding/ appsprofilename_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/ config/lsnappsprofile_lsnappsattributes_binding/ appsprofilename_value<String> ? **args=appsattributesname: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnappsprofile_lsnappsattributes_binding/ appsprofilename_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/ config/lsnappsprofile_lsnappsattributes_binding/ appsprofilename_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lsnappsprofile_lsnappsattributes_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lsnappsprofile_lsnappsattributes_binding/ appsprofilename_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnappsprofile_lsnappsattributes_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lsnappsprofile_lsnappsattributes_binding": [ {

"appsprofilename":<String_value>,

"appsattributesname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnappsprofile_lsnappsattributes_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lsnappsprofile_lsnappsattributes_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lsnappsprofile_lsnappsattributes_binding": [ {

"appsprofilename":<String_value>,

"appsattributesname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnappsprofile_lsnappsattributes_binding/appsprofilename_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"lsnappsprofile_lsnappsattributes_binding": [ { "__count": "#no"} ] }
```

lsnappsprofile_port_binding

Binding object showing the port that can be bound to lsnappsprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lsnport	<String>	Read-write	Port numbers or range of port numbers to match against the destination port of the incoming packet from a subscriber. When the destination port is matched, the LSN application profile is applied for the LSN session. Separate a range of ports with a hyphen. For example, 40-90. Minimum length = 1
appsprofilename	<String>	Read-write	Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1'). Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/lsnappsprofile_port_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"lsnappsprofile_port_binding":{

<b>"appsprofilename":<String_value>,

</b>"lsnport":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn client1" or 'lsn client1'). . Minimum length = 1 Maximum length = 127
netmask	<String>	Read-write	Subnet mask for the IPv4 address specified in the Network parameter.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	IPv4 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you want the Citrix ADC to perform Large Scale NAT. Minimum length = 1
td	<Integer>	Read-write	ID of the traffic domain on which this subscriber or the subscriber network (as specified by the network parameter) belongs. If you do not specify an ID, the subscriber or the subscriber network becomes part of the default traffic domain. Default value: 0 Minimum value = 0 Maximum value = 4094
__count	<Double>	Read-write	count parameter

Operations

- ADD
- DELETE
- GET
- GET (ALL)

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/lsnclient_network_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"lsnclient_network_binding":{
```

```
<b>"clientname":<String_value>,

</b>"network":<String_value>,

"netmask":<String_value>,

"td":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnclient_network_binding/ clientname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ lsnclient_network_binding/ clientname_value<String> ? **args=network: <String_value> ,netmask: <String_value> ,td: <Integer_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnclient_network_binding/ clientname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ lsnclient_network_binding/ clientname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lsnclient_network_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lsnclient_network_binding/ clientname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnclient_network_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lsnclient_network_binding": [ {

lsngroup

Configuration for LSN group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupname	<String>	Read-write	Name for the LSN group. Must begin with an ASCII alphanumeric or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1'). Minimum length = 1 Maximum length = 127
clientname	<String>	Read-write	Name of the LSN client entity to be associated with the LSN group. You can associate only one LSN client entity with an LSN group.You cannot remove this association or replace with another LSN client entity

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			once the LSN group is created.
nattype	<String>	Read-write	Type of NAT IP address and port allocation (from the bound LSN pools) for subscribers: Available options function as follows: * Deterministic - Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The Citrix ADC sequentially allocates NAT resources to these subscribers. The Citrix ADC ADC assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port. The maximum number of LSN subscribers allowed, globally, is 1 million.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Dynamic - Allocate a random NAT IP address and a port from the LSN NAT pool for a subscriber's connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the Citrix ADC allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The ADC allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscriber's connections) from the subscriber's allocated port block, the ADC allocates a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			new random port block for the subscriber. Default value: DYNAMIC Possible values = DYNAMIC, DETERMINISTIC
allocpolicy	<String>	Read-write	NAT IP and PORT block allocation policy for Deterministic NAT. Supported Policies are, 1: PORTS: Port blocks from single NATIP will be allocated to LSN subscribers sequentially. After all blocks are exhausted, port blocks from next NATIP will be allocated and so on. 2: IPADDRS(Default): One port block from each NATIP will be allocated and once all the NATIPs are over second port block from each

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NATIP will be allocated and so on. To understand better if we assume port blocks of all NAT IPs as two dimensional array, PORTS policy follows "row major order" and IPADDRS policy follows "column major order" while allocating port blocks. Example: Client IPs: 2.2.2.1, 2.2.2.2 and 2.2.2.3 NAT IPs and PORT Blocks: 4.4.4.1:PB1, PB2, PB3,., PBn 4.4.4.2: PB1, PB2, PB3,., PBn PORTS Policy: 2.2.2.1 => 4.4.4.1:PB1 2.2.2.2 => 4.4.4.1:PB2

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			2.2.2.3 => 4.4.4.1:PB3 IPADDRS Policy: 2.2.2.1 => 4.4.4.1:PB1 2.2.2.2 => 4.4.4.2:PB1 2.2.2.3 => 4.4.4.1:PB2. Default value: PORTS Possible values = PORTS, IPADDRS
portblocksize	<Integer>	Read-write	Size of the NAT port block to be allocated for each subscriber. To set this parameter for Dynamic NAT, you must enable the port block allocation parameter in the bound LSN pool. For Deterministic NAT, the port block allocation parameter is always enabled, and you cannot disable it.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			In Dynamic NAT, the Citrix ADC allocates a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber. For a subscriber, if all the ports are allocated from the subscriber's allocated port block, the ADC allocates a new random port block for the subscriber. The default port block size is 256 for Deterministic NAT, and 0 for Dynamic NAT. Default value: 0 Minimum value = 256 Maximum value = 65536
logging	<String>	Read-write	Log mapping entries and sessions created or deleted for this LSN group. The Citrix ADC logs LSN sessions for this LSN group only when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			both logging and session logging parameters are enabled. The ADC uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the Citrix ADC generates log messages related to LSN mappings and LSN sessions of this LSN group. The ADC then sends these log messages to servers associated with the NSLOG action and SYSLOG actions entities. A log message for an LSN mapping entry consists of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			following information: * NSIP address of the Citrix ADC * Time stamp * Entry type (MAPPING or SESSION) * Whether the LSN mapping entry is created or deleted * Subscriber's IP address, port, and traffic domain ID * NAT IP address and port * Protocol name * Destination IP address, port, and traffic domain ID might be present, depending on the following conditions: ** Destination IP address and port are not logged for Endpoint-Independent mapping

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			** Only Destination IP address (and not port) is logged for Address-Dependent mapping ** Destination IP address and port are logged for Address-Port-Dependent mapping. Default value: DISABLED Possible values = ENABLED, DISABLED
sessionlogging	<String>	Read-write	Log sessions created or deleted for the LSN group. The Citrix ADC logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled. A log message for an LSN session consists of the following information: * NSIP address of the Citrix ADC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Time stamp * Entry type (MAPPING or SESSION) * Whether the LSN session is created or removed * Subscriber's IP address, port, and traffic domain ID * NAT IP address and port * Protocol name * Destination IP address, port, and traffic domain ID. Default value: DISABLED Possible values = ENABLED, DISABLED
sessionsync	<String>	Read-write	In a high availability (HA) deployment, synchronize information of all LSN sessions related to this LSN group with the secondary node. After a failover, established TCP connections and UDP packet flows

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are kept active and resumed on the secondary node (new primary). For this setting to work, you must enable the global session synchronization parameter. Default value: ENABLED Possible values = ENABLED, DISABLED
snmptraplimit	<Integer>	Read-write	Maximum number of SNMP Trap messages that can be generated for the LSN group in one minute. Default value: 100 Minimum value = 0 Maximum value = 10000
ftp	<String>	Read-write	Enable Application Layer Gateway (ALG) for the FTP protocol. For some application-layer protocols, the IP addresses and protocol port numbers are usually

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			communicated in the packet's payload. When acting as an ALG, the Citrix ADC changes the packet's payload to ensure that the protocol continues to work over LSN. Note: The Citrix ADC also includes ALG for ICMP and TFTP protocols. ALG for the ICMP protocol is enabled by default, and there is no provision to disable it. ALG for the TFTP protocol is disabled by default. ALG is enabled automatically for an LSN group when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port for TFTP), to the LSN group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
pptp	<String>	Read-write	Enable the PPTP Application Layer Gateway. Default value: DISABLED Possible values = ENABLED, DISABLED
sipalg	<String>	Read-write	Enable the SIP ALG. Default value: DISABLED Possible values = ENABLED, DISABLED
rtspalg	<String>	Read-write	Enable the RTSP ALG. Default value: DISABLED Possible values = ENABLED, DISABLED
ip6profile	<String>	Read-write	Name of the LSN ip6 profile to associate with the specified LSN group. An ip6 profile can be associated with a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			group only during group creation. By default, no LSN ip6 profile is associated with an LSN group during its creation. Only one ip6profile can be associated with a group. Minimum length = 1 Maximum length = 127
ftpcm	<String>	Read-write	Enable the FTP connection mirroring for specified LSN group. Connection mirroring (CM or connection failover) refers to keeping active an established TCP or UDP connection when a failover occurs. Default value: DISABLED Possible values = ENABLED, DISABLED
groupid	<Integer>	Read-only	. Minimum value = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsngroup **HTTP Method:** POST

Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotation marks (for example, "lsn group1" or 'lsn group1'). Minimum length = 1 Maximum length = 127
appsprofilename	<String>	Read-write	Name of the LSN application profile to bind to the specified LSN group. For each set of destination ports, bind a profile for each protocol for which you want to specify settings.

By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile.

When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that protocol at that set of destination ports.

Operations

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/lsngroup_lsnappsprofile_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"lsngroup_lsnappsprofile_binding":{

<b>"groupname":<String_value>,
```

```
</b>"appsprofilename":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnappsprofile_binding/ groupname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ lsngroup_lsnappsprofile_binding/ groupname_value<String> ? **args=appsprofilename: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnappsprofile_binding/ groupname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ lsngroup_lsnappsprofile_binding/ groupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lsngroup_lsnappsprofile_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnappsprofile_binding/ groupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lsngroup_lsnappsprofile_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnrtspalgprofile_binding/ groupname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ lsngroup_lsnrtspalgprofile_binding/ groupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lsngroup_lsnrtspalgprofile_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnrtspalgprofile_binding/groupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lsngroup_lsnrtspalgprofile_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lsngroup_lsnrtspalgprofile_binding": [ {

"rtspalgprofilename":<String_value>,

"groupname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnrtspalgprofile_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnrtspalgprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lsngroup_lsnrtspalgprofile_binding": [ {

"rtspalgprofilename":<String_value>,

"groupname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnrtspalgprofile_binding/groupname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"lsngroup_lsnrtspalgprofile_binding": [ { "__count": "#no"} ] }
```

lsngroup_lsnsipalgprofile_binding

Binding object showing the lsnsipalgprofile that can be bound to lsngroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupname	<String>	Read-write	Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotation marks (for example, "lsn group1" or 'lsn group1'). Minimum length = 1 Maximum length = 127
sipalgprofilename	<String>	Read-write	The name of the LSN SIP ALG Profile.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/lsngroup_lsnsipalgprofile_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"lsngroup_lsnsipalgprofile_binding":{

<b>"groupname":<String_value>,

</b>"sipalgprofilename":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnsipalgprofile_binding/ groupname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ lsngroup_lsnsipalgprofile_binding/ groupname_value<String> ? **args=sipalgprofilename: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnsipalgprofile_binding/ groupname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ lsngroup_lsnsipalgprofile_binding/ groupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lsngroup_lsnsipalgprofile_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnsipalgprofile_binding/ groupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lsngroup_lsnsipalgprofile_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lsngroup_lsnsipalgprofile_binding": [ {

"groupname":<String_value>,

"sipalgprofilename":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnsipalgprofile_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lsngroup_lsnsipalgprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"lsngroup_lsnsipalgprofile_binding": [ { "__count": "#no"} ] }
```

lsngroup_lsntransportprofile_binding

Binding object showing the lsntransportprofile that can be bound to lsngroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
transportprofilename	<String>	Read-write	Name of the LSN transport profile to bind to the specified LSN group. Bind a profile for each protocol for which you want to specify settings.

By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called a default transport.

An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.

Minimum length = 1

Maximum length = 127

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnhttphdrlogprofile": [ { "__count": "#no"} ] }
```

lsnip6profile

Configuration for LSN ip6 Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LSN ip6 profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN ip6 profile is created. The following requirement applies only to the Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn ip6 profile1" or 'lsn ip6 profile1'). Minimum length = 1 Maximum length = 127
type	<String>	Read-write	IPv6 translation type for which to set the LSN IP6 profile parameters. Possible values = DS-Lite, NAT64
natprefix	<String>	Read-write	IPv6 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you want the Citrix ADC to perform Large Scale NAT.
network6	<String>	Read-write	IPv6 address of the Citrix ADC AFTR device.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnip6profile **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lsnip6profile":{

<b>"name":<String_value>,

</b><b>"type":<String_value>,

</b>"natprefix":<String_value>,

"network6":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnip6profile/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnip6profile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/lsnip6profile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lsnip6profile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lsnip6profile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lsnip6profile? **view=summary**

Use this query-parameter to get the summary output of lsnip6profile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lsnip6profile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnip6profile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

lsnparameter

Configuration for LSN parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
memlimit	<Integer>	Read-write	Amount of Citrix ADC memory to reserve for the LSN feature, in multiples of 2MB. Note: If you later reduce the value of this parameter, the amount of active memory is not reduced. Changing the configured memory limit can only increase the amount of active memory. This command is deprecated, use 'set extendedmemoryparam -memlimit' instead.
sessionsync	<String>	Read-write	Synchronize all LSN sessions with the secondary node in a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			high availability (HA) deployment (global synchronization). After a failover, established TCP connections and UDP packet flows are kept active and resumed on the secondary node (new primary). The global session synchronization parameter and session synchronization parameters (group level) of all LSN groups are enabled by default. For a group, when both the global level and the group level LSN session synchronization parameters are enabled, the primary node synchronizes information of all LSN sessions related to this LSN group with the secondary node.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
subscrsessionremoval	<String>	Read-write	LSN global setting for controlling subscriber aware session removal, when this is enabled, when ever the subscriber info is deleted from subscriber database, sessions corresponding to that subscriber will be removed. if this setting is disabled, subscriber sessions will be timed out as per the idle time out settings. Default value: DISABLED Possible values = ENABLED, DISABLED
memlimitactive	<Integer>	Read-only	Amount of actual memory reserved for the LSN feature. The amount of active memory for the LSN feature might be less than the configured

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			memory, because the available memory is shared across features.
maxmemlimit	<Integer>	Read-only	Maximum amount of Citrix ADC memory that can be reserved for the LSN feature.
_nextgenapiresource	<String>	Read-only	.

```

lsnpool

Configuration for LSN pool resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
poolname	<String>	Read-write	Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1'). Minimum length = 1 Maximum length = 127
nattype	<String>	Read-write	Type of NAT IP address and port allocation (from the LSN pools bound to an LSN group) for subscribers (of the LSN client entity bound to the LSN group): Available options function as follows: * Deterministic - Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The Citrix ADC sequentially allocates NAT resources to these subscribers. The Citrix ADC ADC assigns the first block of ports (block size determined by the port block size

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and the destination IP address and port. * Dynamic - Allocate a random NAT IP address and a port from the LSN NAT pool for a subscriber's connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the Citrix ADC allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The ADC allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscriber's connections) from

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the subscriber's allocated port block, the ADC allocates a new random port block for the subscriber. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an LSN group. A maximum of 16 LSN pools can be bound to an LSN group. . Default value: DYNAMIC Possible values = DYNAMIC, DETERMINISTIC
portblockallocation	<String>	Read-write	Allocate a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber when the NAT allocation is set as Dynamic NAT. For any connection initiated from a subscriber, the Citrix ADC allocates a NAT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			port from the subscriber's allocated NAT port block to create the LSN session. You must set the port block size in the bound LSN group. For a subscriber, if all the ports are allocated from the subscriber's allocated port block, the Citrix ADC allocates a new random port block for the subscriber. For Deterministic NAT, this parameter is enabled by default, and you cannot disable it. Default value: DISABLED Possible values = ENABLED, DISABLED
portrealloctimeout	<Integer>	Read-write	The waiting time, in seconds, between deallocating LSN NAT ports (when an LSN mapping is removed) and reallocating them for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a new LSN session. This parameter is necessary in order to prevent collisions between old and new mappings and sessions. It ensures that all established sessions are broken instead of redirected to a different subscriber. This is not applicable for ports used in: * Deterministic NAT * Address-Dependent filtering and Address-Port-Dependent filtering * Dynamic NAT with port block allocation In these cases, ports are immediately reallocated. Default value: 0 Minimum value = 0 Maximum value = 600
maxportrealloctmq	<Integer>	Read-write	Maximum number of ports for which the port reallocation timeout applies for each NAT IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address. In other words, the maximum deallocated-port queue size for which the reallocation timeout applies for each NAT IP address. When the queue size is full, the next port deallocated is reallocated immediately for a new LSN session. Default value: 65536 Minimum value = 0 Maximum value = 65536
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnpool/ poolname_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnpool **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lsnpool":{

<b>"poolname":<String_value>,

</b>"portrealloctimeout":<Integer_value>,
```

```
"maxportrealloctmq":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnpool? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lsnpool":{

<b>"poolname":<String_value>,

</b>"portrealloctimeout":true,

"maxportrealloctmq":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnpool **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/lsnpool? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/lsnpool? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lsnpool resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/lsnpool? **view=summary**

Use this query-parameter to get the summary output of lsnpool resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/lsnpool? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnpool resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnpool": [ {

"poolname":<String_value>,

"nattype":<String_value>,

"portrealloctimeout":<Integer_value>,

"maxportrealloctmq":<Integer_value>,
```

```
"portblockallocation":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnpool/ poolname_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/lsnpool/ poolname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/lsnpool/ poolname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of lsnpool resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lsnpool": [ {

"poolname":<String_value>,
```

```
"nattype":<String_value>,

"portrealloctimeout":<Integer_value>,

"maxportrealloctmq":<Integer_value>,

"portblockallocation":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnpool? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnpool": [ { "__count": "#no"} ] }
```

lsnpool_binding

Binding object which returns the resources bound to lsnpool.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
poolname	<String>	Read-write	Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1'). Minimum length = 1 Maximum length = 127
lsnpool_lsnip_binding	<lsnpool_lsnip_binding[]>	Read-only	lsnip that can be bound to lsnpool.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnpool_binding/ poolname_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnpool_binding": [ {

"poolname":<String_value>,

"lsnpool_lsnip_binding":<lsnpool_lsnip_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnpool_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/lsnpool_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnpool_binding": [ {

"poolname":<String_value>,
```

```
"lsnpool_lsnip_binding":<lsnpool_lsnip_binding[]_value>

}]}
```

lsnpool_lsnip_binding

Binding object showing the lsnip that can be bound to lsnpool.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lsnip	<String>	Read-write	IPv4 address or a range of IPv4 addresses to be used as NAT IP address(es) for LSN. After the pool is created, these IPv4 addresses are added to the Citrix ADC as Citrix ADC owned IP address of type LSN. A maximum of 4096 IP addresses can be bound to an LSN pool. An LSN IP address associated with an LSN pool cannot be shared with other LSN pools. IP addresses specified for this parameter must not already exist on the Citrix ADC as any Citrix ADC owned IP addresses. In the command line interface, separate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the range with a hyphen. For example: 10.102.29.30-10.102 .29.189. You can later remove some or all the LSN IP addresses from the pool, and add IP addresses to the LSN pool. By default , arp is enabled on LSN IP address but, you can disable it using command - "set ns ip" . Minimum length = 1
poolname	<String>	Read-write	Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1'). Minimum length = 1 Maximum length = 127
ownernode	<Integer>	Read-write	ID(s) of cluster node(s) on which command is to be executed. Minimum value = 0 Maximum value = 31
__count	<Double>	Read-write	count parameter

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnrtspalgsession": [ {

sessionid:<String_value>,nodeid:<Integer_value>"callflags":<Integer_value>
,

"xlatip":<String_value>,

"callrefcount":<Integer_value>,

"calltimer":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnrtspalgsession/ sessionid_value<String>
Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/lsnrtspalgsession/ sessionid_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/lsnrtspalgsession/ sessionid_value<String> ? **view=summary**

Use this query-parameter to get the summary output of lsnrtspalgsession resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lsnrtspalgsession": [ {

sessionid:<String_value>,nodeid:<Integer_value>"callflags":<Integer_value>
,

"xlatip":<String_value>,

"callrefcount":<Integer_value>,

"calltimer":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnrtspalgsession? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnrtspalgsession": [ { "__count": "#no"} ] }
```

lsnrtspalgsession_binding

Binding object which returns the resources bound to lsnrtspalgsession.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessionid	<String>	Read-write	Session ID for the RTSP call.
lsnrtspalgsession_datachannel_binding	<lsnrtspalgsession_datachannel_binding[]>	Read-only	datachannel that can be bound to lsnrtspalgsession.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnrtspalgsession_binding/sessionid_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnrtspalgsession_binding": [ {

"sessionid":<String_value>,

"lsnrtspalgsession_datachannel_binding":<lsnrtspalgsession_datachannel_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnrtspalgsession_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/lsnrtspalgsession_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnrtspalgsession_binding": [ {

"sessionid":<String_value>,

"lsnrtspalgsession_datachannel_binding":<lsnrtspalgsession_datachannel_binding[]_value>

}]}
```

lsnrtspalgsession_datachannel_binding

Binding object showing the datachannel that can be bound to lsnrtspalgsession.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessionid	<String>	Read-write	Session ID for the RTSP call.
channelip	<String>	Read-write	IP address of the channel.
channelprotocol	<String>	Read-only	Channel transport protocol. Possible values = HTTP, FTP, TCP, UDP, SSL,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL_BRIDGE, SSL_TCP, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, HTTPSVR, HTTPCLIENT, NAT, HA, AAA, SINCTCP, VPN AFTP, MONITORS, SSLVPN UDP, SINCUDP, RIP, UDP CLNT, SASP, RPCCLNTS, ROUTE, AUDIT, STA HTTP, STA SSL, DNS RESOLVE, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, ICA, RADIUS, RADIUSListener, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, QUIC, TFTP_DATA, USER_TCP, USER_SSL_TCP, MONGO,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			MONGO_TLS, MQTT, MQTT_TLS, QUIC_BRIDGE, HTTP_QUIC, CT_TCP, CT_UDP, DOT, ADNS_DOT, ADNS_DOH, KAFKA_BROKER, KAFKA_PRODUCER
channelflags	<Integer>	Read-only	Flags for the call entry.
channelnatport	<Integer>	Read-only	Natted port for the channel.
channeltimeout	<Integer>	Read-only	Timeout for the channel.
channelnatip	<String>	Read-only	Natted IP address of the channel.
channelport	<Integer>	Read-only	port for the channel.
__count	<Double>	Read-only	count parameter

Operations

{"lsnrtspalgsession_datachannel_binding": [ { "__count": "#no"} ] }
```

lsnsession

Configuration for lsn session resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nattype	<String>	Read-write	Type of sessions to be displayed. Default value: NAT44 Possible values = NAT44, DS-Lite, NAT64
clientname	<String>	Read-write	Name of the LSN Client entity.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	IP address or network address of subscriber(s).
netmask	<String>	Read-write	Subnet mask for the IP address specified by the network parameter.
network6	<String>	Read-write	IPv6 address of the LSN subscriber or B4 device.
td	<Integer>	Read-write	Traffic domain ID of the LSN client entity. Default value: 0 Minimum value = 0 Maximum value = 4094
natip	<String>	Read-write	Mapped NAT IP address used in LSN sessions.
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
natport2	<Integer>	Read-write	Mapped NAT port used in the LSN sessions.
natprefix	<String>	Read-only	IPv6 address of the LSN subscriber(s) or subscriber

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			network(B4-Device) on whose traffic the Citrix ADC perform Large Scale NAT.
subscrip	<String>	Read-only	The Source IP address.
subscrport	<Integer>	Read-only	The Source Port.
destip	<String>	Read-only	The Destination IP address.
destport	<Integer>	Read-only	The Destination Port.
natport	<Integer>	Read-only	The NAT Port.
transportprotocol	<String>	Read-only	The Transport Protocol for the session. Possible values = TCP, UDP, ICMP
sessionestdir	<String>	Read-only	The Session establishment direction, session was established for outbound or inbound packet. Possible values = OUT, IN
dsttd	<Integer>	Read-only	.
srctd	<Integer>	Read-only	.
ipv6address	<String>	Read-only	IPv6 address of v6 vserver.
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- FLUSH

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnsession? **action=flush HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lsnsession":{

"nattype":<String_value>,

"clientname":<String_value>,

"network":<String_value>,

"netmask":<String_value>,

"network6":<String_value>,

"td":<Integer_value>,

"natip":<String_value>,

"natport2":<Integer_value>,

lsnsipalgcall_binding

Binding object which returns the resources bound to lsnsipalgcall.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
callid	<String>	Read-write	Call ID for the SIP call.
lsnsipalgcall_controlchannel_binding	<lsnsipalgcall_controlchannel_binding[]>	Read-only	controlchannel that can be bound to lsnsipalgcall.
lsnsipalgcall_datachannel_binding	<lsnsipalgcall_datachannel_binding[]>	Read-only	datachannel that can be bound to lsnsipalgcall.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnsipalgcall_binding/ callid_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnsipalgcall_binding": [ {

"callid":<String_value>,

"lsnsipalgcall_controlchannel_binding":<lsnsipalgcall_controlchannel_binding[]_value>,

"lsnsipalgcall_datachannel_binding":<lsnsipalgcall_datachannel_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnsipalgcall_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/lsnsipalgcall_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnsipalgcall_binding": [ {

"callid":<String_value>,

"lsnsipalgcall_controlchannel_binding":<lsnsipalgcall_controlchannel_binding[]_value>,

"lsnsipalgcall_datachannel_binding":<lsnsipalgcall_datachannel_binding[]_value>

}]}
```

lsnsipalgcall_controlchannel_binding

Binding object showing the controlchannel that can be bound to lsnsipalgcall.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
callid	<String>	Read-write	Call ID for the SIP call.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
channelip	<String>	Read-write	IP address of the channel.
channelnatport	<Integer>	Read-only	Natted port for the channel.
channelflags	<Integer>	Read-only	Flags for the call entry.
channelprotocol	<String>	Read-only	Channel transport protocol. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, HTTPSVR, HTTPCLIENT, NAT, HA, AAA, SINCTCP, VPN AFTP, MONITORS, SSLVPN UDP, SINCUDP, RIP, UDP CLNT, SASP, RPCCLNTS, ROUTE, AUDIT, STA HTTP, STA SSL, DNS RESOLVE, RDP, MYSQL, MSSQL,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DIAMETER, SSL_DIAMETER, TFTP, ORACLE, ICA, RADIUS, RADIUSListener, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, QUIC, TFTP_DATA, USER_TCP, USER_SSL_TCP, MONGO, MONGO_TLS, MQTT, MQTT_TLS, QUIC_BRIDGE, HTTP_QUIC, CT_TCP, CT_UDP, DOT, ADNS_DOT, ADNS_DOH, KAFKA_BROKER, KAFKA_PRODUCER
channelport	<Integer>	Read-only	port for the channel.
channelnatip	<String>	Read-only	Natted IP address of the channel.
channeltimeout	<Integer>	Read-only	Timeout for the channel.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnsipalgcall_controlchannel_binding/ callid_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ lsnsipalgcall_controlchannel_binding/ callid_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lsnsipalgcall_controlchannel_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/lsnsipalgcall_controlchannel_binding/ callid_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnsipalgcall_controlchannel_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "lsnsipalgcall_controlchannel_binding": [ {

"callid":<String_value>,

"channelip":<String_value>,

"channelnatport":<Integer_value>,

"channelflags":<Integer_value>,

lsnstatic

Configuration for static mapping resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn static1" or 'lsn static1'). Minimum length = 1 Maximum length = 127
transportprotocol	<String>	Read-write	Protocol for the LSN mapping entry.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = TCP, UDP, ICMP, ALL
subscrip	<String>	Read-write	IPv4(NAT44 ; DS-Lite)/IPv6(NAT64) address of an LSN subscriber for the LSN static mapping entry.
subscrport	<Integer>	Read-write	Port of the LSN subscriber for the LSN mapping entry. * represents all ports being used. Used in case of static wildcard. Minimum value = 0 Maximum value = 65535 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
network6	<String>	Read-write	B4 address in DS-Lite setup. Minimum length = 1
td	<Integer>	Read-write	ID of the traffic domain to which the subscriber belongs. If you do not specify an ID, the subscriber is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			assumed to be a part of the default traffic domain. Default value: 0 Minimum value = 0 Maximum value = 4094
natip	<String>	Read-write	IPv4 address, already existing on the Citrix ADC as type LSN, to be used as NAT IP address for this mapping entry.
natport	<Integer>	Read-write	NAT port for this LSN mapping entry. * represents all ports being used. Used in case of static wildcard. Minimum value = 0 Maximum value = 65535 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
destip	<String>	Read-write	Destination IP address for the LSN mapping entry.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dsttd	<Integer>	Read-write	ID of the traffic domain through which the destination IP address for this LSN mapping entry is reachable from the Citrix ADC. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0. Default value: 0 Minimum value = 0 Maximum value = 4094
nattype	<String>	Read-write	Type of sessions to be displayed. Possible values = NAT44, DS-Lite, NAT64
status	<String>	Read-only	The status of the Mapping. Status could be Inactive, if mapping addition failed due to already existing dynamic/ static mapping, port allocation failure.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ACTIVE, INACTIVE
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsnstatic **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lsnstatic":{

<b>"name":<String_value>,

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "lsnstatic": [ { "__count": "#no"} ] }
```

lsntransportprofile

Configuration for LSN Transport Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
transportprofilename	<String>	Read-write	Name for the LSN transport profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN transport profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn transport profile1" or 'lsn transport profile1'). Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
transportprotocol	<String>	Read-write	Protocol for which to set the LSN transport profile parameters. Possible values = TCP, UDP, ICMP
sessiontimeout	<Integer>	Read-write	Timeout, in seconds, for an idle LSN session. If an LSN session is idle for a time that exceeds this value, the Citrix ADC removes the session. This timeout does not apply for a TCP LSN session when a FIN or RST message is received from either of the endpoints. . Default value: 120 Minimum value = 60
finrsttimeout	<Integer>	Read-write	Timeout, in seconds, for a TCP LSN session after a FIN or RST message is received from one of the endpoints. If a TCP LSN session is idle (after the Citrix ADC receives a FIN or RST message) for a time that exceeds this value, the Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADC ADC removes the session. Since the LSN feature of the Citrix ADC does not maintain state information of any TCP LSN sessions, this timeout accommodates the transmission of the FIN or RST, and ACK messages from the other endpoint so that both endpoints can properly close the connection. Default value: 30
stuntimeout	<Integer>	Read-write	STUN protocol timeout. Default value: 600 Minimum value = 120 Maximum value = 1200
synidletimeout	<Integer>	Read-write	SYN Idle timeout. Default value: 60 Minimum value = 30 Maximum value = 120

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
portquota	<Integer>	Read-write	Maximum number of LSN NAT ports to be used at a time by each subscriber for the specified protocol. For example, each subscriber can be limited to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the Citrix ADC does not allocate additional NAT ports for that subscriber. Default value: 0 Minimum value = 0 Maximum value = 65535
sessionquota	<Integer>	Read-write	Maximum number of concurrent LSN sessions allowed for each subscriber for the specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the Citrix ADC does not allow the subscriber to open additional sessions.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 65535
groupsessionlimit	<Integer>	Read-write	Maximum number of concurrent LSN sessions(for the specified protocol) allowed for all subscriber of a group to which this profile has bound. This limit will get split across the Citrix ADCs packet engines and rounded down. When the number of LSN sessions reaches the limit for a group in packet engine, the Citrix ADC does not allow the subscriber of that group to open additional sessions through that packet engine. Default value: 0
portpreserveparity	<String>	Read-write	Enable port parity between a subscriber port and its mapped LSN NAT port. For example, if a subscriber initiates a connection from an odd numbered port, the Citrix ADC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			allocates an odd numbered LSN NAT port for this connection. You must set this parameter for proper functioning of protocols that require the source port to be even or odd numbered, for example, in peer-to-peer applications that use RTP or RTCP protocol. Default value: DISABLED Possible values = ENABLED, DISABLED
portpreserverange	<String>	Read-write	If a subscriber initiates a connection from a well-known port (0-1023), allocate a NAT port from the well-known port range (0-1023) for this connection. For example, if a subscriber initiates a connection from port 80, the Citrix ADC can allocate port 100 as the NAT port for this connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This parameter applies to dynamic NAT without port block allocation. It also applies to Deterministic NAT if the range of ports allocated includes well-known ports. When all the well-known ports of all the available NAT IP addresses are used in different subscriber's connections (LSN sessions), and a subscriber initiates a connection from a well-known port, the Citrix ADC drops this connection. Default value: DISABLED Possible values = ENABLED, DISABLED
syncheck	<String>	Read-write	Silently drop any non-SYN packets for connections for which there is no LSN-NAT session present on the Citrix ADC.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If you disable this parameter, the Citrix ADC accepts any non-SYN packets and creates a new LSN session entry for this connection. Following are some reasons for the Citrix ADC to receive such packets: * LSN session for a connection existed but the Citrix ADC removed this session because the LSN session was idle for a time that exceeded the configured session timeout. * Such packets can be a part of a DoS attack. Default value: ENABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/lsntransportprofile **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"lsntransportprofile":{

<b>"transportprofilename":<String_value>,

</b><b>"transportprotocol":<String_value>,

</b>"sessiontimeout":<Integer_value>,

"finrsttimeout":<Integer_value>,

metrics

Metrics

Metrics configuration.

NAME	DESCRIPTION
metricsprofile	Configuration for Metrics profile
metricsprofile_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to metricsprofile
metricsprofile_binding	Binding object showing the resources that can be bound to metricsprofile
metricsprofile_crvserver_binding	Binding object showing the crvserver that can be bound to metricsprofile
metricsprofile_csvserver_binding	Binding object showing the csvserver that can be bound to metricsprofile
metricsprofile_gslbvserver_binding	Binding object showing the gslbvserver that can be bound to metricsprofile
metricsprofile_lbvserver_binding	Binding object showing the lbvserver that can be bound to metricsprofile

NAME	DESCRIPTION
metricsprofile_service_binding	Binding object showing the service that can be bound to metricsprofile
metricsprofile_servicegroup_binding	Binding object showing the servicegroup that can be bound to metricsprofile
metricsprofile_uservserver_binding	Binding object showing the uservserver that can be bound to metricsprofile
metricsprofile_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to metricsprofile

metricsprofile

Configuration for Metrics profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the metrics profile. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.!.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
collector	<String>	Read-write	The collector should be a HTTP/HTTPS service. . Minimum length = 1
outputmode	<String>	Read-write	This option indicates the format in which metrics data is generated. Default value: avro, Possible values = avro, prometheus, influx, json
metrics	<String>	Read-write	This option is used enable or disable metrics . Default value: DISABLED Possible values = ENABLED, DISABLED
servemode	<String>	Read-write	This option is to configure metrics pull or push mode. In push mode metricscollector exports metrics to configured collector. In pull mode, metricscollector only generates the metrics which will be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			pulled by external agent. No collector configuration is required in pull mode and it is applicable only for output mode Prometheus. Default value: Push Possible values = Push, Pull
schemafile	<String>	Read-write	This option is for configuring json schema file containing a list of counters to be exported by metricscollector. Schema file should be present under /var/metrics_conf path. Maximum length = 64
metricsexportfrequency	<Integer>	Read-write	This option is for configuring the metrics export frequency in seconds, frequency value must be in [30,300] seconds range. Default value: 30 Minimum value = 30 Maximum value = 300

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
metricsauthtoken	<String>	Read-write	Token for authenticating with the endpoint. If the endpoint requires the Authorization header in a particular format, specify the complete format as the value to this parameter. For eg., in case of splunk, the Authorizaiton header is required to be of the form - Splunk <auth-token>. Maximum length = 512
metricsendpointurl	<String>	Read-write	The URL at which to upload the metrics data on the endpoint. Maximum length = 256
refcnt	<Integer>	Read-only	The number of references to the profile.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "metricsprofile": [ {

"name":<String_value>,

"collector":<String_value>,

"refcnt":<Integer_value>,

"outputmode":<String_value>,

"metrics":<String_value>,
```

```
"servemode":<String_value>,

"schemafile":<String_value>,

"metricsexportfrequency":<Integer_value>,

"metricsauthtoken":<String_value>,

"metricsendpointurl":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of metricsprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "metricsprofile": [ {

"name":<String_value>,

"collector":<String_value>,

"refcnt":<Integer_value>,

"outputmode":<String_value>,

"metrics":<String_value>,

"servemode":<String_value>,

"schemafile":<String_value>,

"metricsexportfrequency":<Integer_value>,

"metricsauthtoken":<String_value>,

"metricsendpointurl":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "metricsprofile": [ { "__count": "#no"} ] }
```

metricsprofile_authenticationvserver_binding

Binding object showing the authenticationvserver that can be bound to metricsprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
entitytype	<String>	Read-write	Type of the entity bound to the metrics profile. Possible values = lbvserver, csvserver, crvserver, vpnvserver, authvserver, gslbvserver, uservserver, service, servicegroup
name	<String>	Read-write	Name for the metrics profile. Must begin with an ASCII alphabetic or underscore (_)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.!. Minimum length = 1 Maximum length = 127
entityname	<String>	Read-write	Name of the entity bound to the metrics profile. Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT
- ADD
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/metricsprofile_authenticationvserver_binding
HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"metricsprofile_authenticationvserver_binding":{

<b>"name":<String_value>,

</b>"entityname":<String_value>,

"entitytype":<String_value>
```

```
}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_authenticationvserver_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ metricsprofile_authenticationvserver_binding/ name_value<String> ? **args=entityname: <String_value> ,entitytype: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_authenticationvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ metricsprofile_authenticationvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of metricsprofile_authenticationvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ metricsprofile_authenticationvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the metricsprofile_authenticationvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "metricsprofile_authenticationvserver_binding": [ {

"entitytype":<String_value>,

"name":<String_value>,

"entityname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_authenticationvserver_binding
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_authenticationvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "metricsprofile_authenticationvserver_binding": [ {

"entitytype":<String_value>,

"name":<String_value>,

"entityname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_authenticationvserver_binding/name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"metricsprofile_authenticationvserver_binding": [ { "__count": "#no"} ] }
```

metricsprofile_binding

Binding object which returns the resources bound to metricsprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the profile about which to display information. Minimum length = 1 Maximum length = 127
metricsprofile_csvserver_binding	<metricsprofile_csvserver_binding[]>	Read-only	csvserver that can be bound to metricsprofile.
metricsprofile_vpnvserver_binding	<metricsprofile_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to metricsprofile.
metricsprofile_gslbvserver_binding	<metricsprofile_gslbvserver_binding[]>	Read-only	gslbvserver that can be bound to metricsprofile.
metricsprofile_servicegroup_binding	<metricsprofile_servicegroup_binding[]>	Read-only	servicegroup that can be bound to metricsprofile.
metricsprofile_authenticationvserver_binding	<metricsprofile_authenticationvserver_binding[]>	Read-only	authenticationvserver that can be bound to metricsprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
metricsprofile_crvserver_binding	<metricsprofile_crvserver_binding[]>	Read-only	crvserver that can be bound to metricsprofile.
metricsprofile_uservserver_binding	<metricsprofile_uservserver_binding[]>	Read-only	uservserver that can be bound to metricsprofile.
metricsprofile_lbvserver_binding	<metricsprofile_lbvserver_binding[]>	Read-only	lbvserver that can be bound to metricsprofile.
metricsprofile_service_binding	<metricsprofile_service_binding[]>	Read-only	service that can be bound to metricsprofile.

- COUNT
- ADD
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/metricsprofile_gslbvserver_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"metricsprofile_gslbvserver_binding":{

<b>"name":<String_value>,

</b>"entityname":<String_value>,

"entitytype":<String_value>
```

```
}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_gslbvserver_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ metricsprofile_gslbvserver_binding/ name_value<String> ? **args=entityname: <String_value> ,entitytype: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_gslbvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ metricsprofile_gslbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of metricsprofile_gslbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_gslbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the metricsprofile_gslbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "metricsprofile_gslbvserver_binding": [ {

"entityname":<String_value>,

Response Payload:

```
{  "metricsprofile_uservserver_binding": [ {

"entitytype":<String_value>,

"name":<String_value>,

"entityname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_uservserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_uservserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "metricsprofile_uservserver_binding": [ {

"entitytype":<String_value>,

"name":<String_value>,

"entityname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_uservserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"metricsprofile_uservserver_binding": [ { "__count": "#no"} ] }
```

metricsprofile_vpnvserver_binding

Binding object showing the vpnvserver that can be bound to metricsprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
entitytype	<String>	Read-write	Type of the entity bound to the metrics profile. Possible values = lbvserver, csvserver, crvserver, vpnvserver, authvserver, gslbvserver, uservserver, service, servicegroup
name	<String>	Read-write	Name for the metrics profile. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.!. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
entityname	<String>	Read-write	Name of the entity bound to the metrics profile. Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT
- ADD
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/metricsprofile_vpnvserver_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"metricsprofile_vpnvserver_binding":{

<b>"name":<String_value>,

</b>"entityname":<String_value>,

"entitytype":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_vpnvserver_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ metricsprofile_vpnvserver_binding/ name_value<String> ? **args=entityname: <String_value> ,entitytype: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_vpnvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ metricsprofile_vpnvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of metricsprofile_vpnvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_vpnvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the metricsprofile_vpnvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "metricsprofile_vpnvserver_binding": [ {

"entitytype":<String_value>,

"name":<String_value>,

"entityname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_vpnvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_vpnvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "metricsprofile_vpnvserver_binding": [ {

"entitytype":<String_value>,
```

```
"name":<String_value>,

"entityname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/metricsprofile_vpnvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"metricsprofile_vpnvserver_binding": [ { "__count": "#no"} ] }
```

network

Network

Networking commands.

NAME	DESCRIPTION
Interface	Configuration for interface

NAME	DESCRIPTION
appalgparam	Configuration for AppAlg Param
arp	Configuration for arp
arpparam	Configuration for Global arp parameters
bridgegroup	Configuration for bridge group
bridgegroup_binding	Binding object showing the resources that can be bound to bridgegroup
bridgegroup_nsip6_binding	Binding object showing the nsip6 that can be bound to bridgegroup
bridgegroup_nsip_binding	Binding object showing the nsip that can be bound to bridgegroup
bridgegroup_vlan_binding	Binding object showing the vlan that can be bound to bridgegroup
bridgetable	Configuration for bridge table entry
channel	Configuration for channel
channel_binding	Binding object showing the resources that can be bound to channel
channel_interface_binding	Binding object showing the interface that can be bound to channel

NAME	DESCRIPTION
ci	Configuration for "CI"
fis	Configuration for "FIS"
fis_binding	Binding object showing the resources that can be bound to fis
fis_channel_binding	Binding object showing the channel that can be bound to fis
fis_interface_binding	Binding object showing the interface that can be bound to fis
forwardingsession	Configuration for session forward
inat	Configuration for inbound nat
inatparam	Configuration for INAT parameter
interfacepair	Configuration for "Interface Pair"
ip6tunnel	Configuration for ip6 Tunnel
ip6tunnelparam	Configuration for ip6 tunnel parameter
ipset	Configuration for network ipset
ipset_binding	Binding object showing the resources that can be bound to ipset

NAME	DESCRIPTION
ipset_nsip6_binding	Binding object showing the nsip6 that can be bound to ipset
ipset_nsip_binding	Binding object showing the nsip that can be bound to ipset
iptunnel	Configuration for ip Tunnel
iptunnelparam	Configuration for ip tunnel parameter
ipv6	Configuration for ip v6
l2param	Configuration for Layer 2 related parameter
l3param	Configuration for Layer 3 related parameter
l4param	Configuration for Layer 4 related parameter
lacp	Configuration for Link aggregation control protocol
linkset	Configuration for link set
linkset_binding	Binding object showing the resources that can be bound to linkset
linkset_channel_binding	Binding object showing the channel that can be bound to linkset

NAME	DESCRIPTION
linkset_interface_binding	Binding object showing the interface that can be bound to linkset
mapbmr	Configuration for MAP-T Basic Mapping rule
mapbmr_binding	Binding object showing the resources that can be bound to mapbmr
mapbmr_bmrv4network_binding	Binding object showing the bmrv4network that can be bound to mapbmr
mapdmr	Configuration for MAP-T Default Mapping rule
mapdomain	Configuration for MAP-T Map Domain
mapdomain_binding	Binding object showing the resources that can be bound to mapdomain
mapdomain_mapbmr_binding	Binding object showing the mapbmr that can be bound to mapdomain
nat64	Configuration for nat64 config
nat64param	Configuration for NAT64 parameter
nd6	Configuration for nd6
nd6ravariables	Configuration for nd6 Router Advertisment configuration variables

NAME	DESCRIPTION
nd6ravariables_binding	Binding object showing the resources that can be bound to nd6ravariables
nd6ravariables_onlinkipv6prefix_binding	Binding object showing the onlinkipv6prefix that can be bound to nd6ravariables
netbridge	Configuration for network bridge
netbridge_binding	Binding object showing the resources that can be bound to netbridge
netbridge_iptunnel_binding	Binding object showing the iptunnel that can be bound to netbridge
netbridge_nsip6_binding	Binding object showing the nsip6 that can be bound to netbridge
netbridge_nsip_binding	Binding object showing the nsip that can be bound to netbridge
netbridge_vlan_binding	Binding object showing the vlan that can be bound to netbridge
netprofile	Configuration for Network profile
netprofile_binding	Binding object showing the resources that can be bound to netprofile
netprofile_natrule_binding	Binding object showing the natrule that can be bound to netprofile

NAME	DESCRIPTION
netprofile_srcportset_binding	Binding object showing the srcportset that can be bound to netprofile
onlinkipv6prefix	Configuration for on-link IPv6 global prefixes for Router Advertisment
portallocation	Configuration for portallocation
ptp	Configuration for Precision Time Protocol
rnat	Configuration for RNAT configured route
rnat6	Configuration for IPv6 RNAT configured route
rnat6_binding	Binding object showing the resources that can be bound to rnat6
rnat6_nsip6_binding	Binding object showing the nsip6 that can be bound to rnat6
rnat_binding	Binding object showing the resources that can be bound to rnat
rnat_nsip_binding	Binding object showing the nsip that can be bound to rnat
rnat_retainsourceportset_binding	Binding object showing the retainsourceportset that can be bound to rnat

NAME	DESCRIPTION
rnatglobal_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to rnatglobal
rnatglobal_binding	Binding object showing the resources that can be bound to rnatglobal
rnatparam	Configuration for RNAT parameter
rnatsession	Configuration for RNAT session
route	Configuration for route
route6	Configuration for route 6
rsskeytype	Configuration for RSS key type
vlan	Configuration for "VLAN"
vlan_binding	Binding object showing the resources that can be bound to vlan
vlan_channel_binding	Binding object showing the channel that can be bound to vlan
vlan_interface_binding	Binding object showing the interface that can be bound to vlan
vlan_linkset_binding	Binding object showing the linkset that can be bound to vlan

NAME	DESCRIPTION
vlan_nsip6_binding	Binding object showing the nsip6 that can be bound to vlan
vlan_nsip_binding	Binding object showing the nsip that can be bound to vlan
vrid	Configuration for Virtual Router ID
vrid6	Configuration for Virtual Router ID for IPv6
vrid6_binding	Binding object showing the resources that can be bound to vrid6
vrid6_channel_binding	Binding object showing the channel that can be bound to vrid6
vrid6_interface_binding	Binding object showing the interface that can be bound to vrid6
vrid6_nsip6_binding	Binding object showing the nsip6 that can be bound to vrid6
vrid6_nsip_binding	Binding object showing the nsip that can be bound to vrid6
vrid6_trackinterface_binding	Binding object showing the trackinterface that can be bound to vrid6
vrid_binding	Binding object showing the resources that can be bound to vrid

NAME	DESCRIPTION
vrid_channel_binding	Binding object showing the channel that can be bound to vrid
vrid_interface_binding	Binding object showing the interface that can be bound to vrid
vrid_nsip6_binding	Binding object showing the nsip6 that can be bound to vrid
vrid_nsip_binding	Binding object showing the nsip that can be bound to vrid
vrid_trackinterface_binding	Binding object showing the trackinterface that can be bound to vrid
vridparam	Configuration for VR ID parameter
vxlan	Configuration for "VXLAN"
vxlan_binding	Binding object showing the resources that can be bound to vxlan
vxlan_iptunnel_binding	Binding object showing the iptunnel that can be bound to vxlan
vxlan_nsip6_binding	Binding object showing the nsip6 that can be bound to vxlan
vxlan_nsip_binding	Binding object showing the nsip that can be bound to vxlan

NAME	DESCRIPTION
vxlan_srcip_binding	Binding object showing the srcip that can be bound to vxlan
vxlanvlanmap	Configuration for vxlan vlan mapping
vxlanvlanmap_binding	Binding object showing the resources that can be bound to vxlanvlanmap
vxlanvlanmap_vxlan_binding	Binding object showing the vxlan that can be bound to vxlanvlanmap

Interface

Configuration for interface resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	Interface number, in C/U format, where C can take one of the following values: * 0 - Indicates a management interface. * 1 - Indicates a 1 Gbps port. * 10 - Indicates a 10 Gbps port.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* LA - Indicates a link aggregation port. * LO - Indicates a loop back port. U is a unique integer for representing an interface in a particular port group.
speed	<String>	Read-write	Ethernet speed of the interface, in Mbps. Notes: * If you set the speed as AUTO, the Citrix ADC attempts to auto-negotiate or auto-sense the link speed of the interface when it is UP. You must enable auto negotiation on the interface. * If you set a speed other than AUTO, you must specify the same speed for the peer network device. Mismatched speed and duplex

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			settings between the peer devices of a link lead to link errors, packet loss, and other errors. Some interfaces do not support certain speeds. If you specify an unsupported speed, an error message appears. Default value: AUTO Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000, 200000
duplex	<String>	Read-write	The duplex mode for the interface. Notes:* If you set the duplex mode to AUTO, the Citrix ADC attempts to auto-negotiate the duplex mode of the interface when it is UP. You must enable auto negotiation on the interface. If you set a duplex mode other than AUTO, you must specify the same duplex mode

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for the peer network device. Mismatched speed and duplex settings between the peer devices of a link lead to link errors, packet loss, and other errors. Default value: AUTO Possible values = AUTO, HALF, FULL
flowctl	<String>	Read-write	802.3x flow control setting for the interface. The 802.3x specification does not define flow control for 10 Mbps and 100 Mbps speeds, but if a Gigabit Ethernet interface operates at those speeds, the flow control settings can be applied. The flow control setting that is finally applied to an interface depends on auto-negotiation. With the ON option, the peer negotiates the flow control, but the appliance then forces two-way flow control for the interface. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = OFF, RX, TX, RXTX, ON
autoneg	<String>	Read-write	Auto-negotiation state of the interface. With the ENABLED setting, the Citrix ADC auto-negotiates the speed and duplex settings with the peer network device on the link. The Citrix ADC appliance auto-negotiates the settings of only those parameters (speed or duplex mode) for which the value is set as AUTO. Default value: NSA_DVC_AUTONEG_ON Possible values = DISABLED, ENABLED
hamonitor	<String>	Read-write	In a High Availability (HA) configuration, monitor the interface for failure events. In an HA configuration, an interface that has HA MON enabled and is not bound to any Failover Interface Set (FIS), is a critical interface.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Failure or disabling of any critical interface triggers HA failover. Default value: ON Possible values = ON, OFF
haheartbeat	<String>	Read-write	In a High Availability (HA) or Cluster configuration, configure the interface for sending heartbeats. In an HA or Cluster configuration, an interface that has HA Heartbeat disabled should not send the heartbeats. Default value: ON Possible values = OFF, ON
mtu	<Integer>	Read-write	The Maximum Transmission Unit (MTU) is the largest packet size, measured in bytes excluding 14 bytes ethernet header and 4 bytes CRC, that can be transmitted and received by an interface. The default value of MTU is 1500 on all the interface of Citrix ADC, some Cloud Platforms will

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			restrict Citrix ADC to use the lesser default value. Any MTU value more than 1500 is called Jumbo MTU and will make the interface as jumbo enabled. The Maximum Jumbo MTU in Citrix ADC is 9216, however, some Virtualized / Cloud Platforms will have lesser Maximum Jumbo MTU Value (9000). In the case of Cluster, the Backplane interface requires an MTU value of 78 bytes more than the Max MTU configured on any other Data-Plane Interface. When the Data plane interfaces are all at default 1500 MTU, Cluster Back Plane will be automatically set to 1578 (1500 + 78) MTU. If a Backplane interface is reset to Data Plane Interface, then the 1578 MTU will be automatically reset to the default MTU of 1500(or whatever lesser default value). If any data plane interface

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of a Cluster is configured with a Jumbo MTU (> 1500), then all backplane interfaces require to be configured with a minimum MTU of 'Highest Data Plane MTU in the Cluster + 78'. That makes the maximum Jumbo MTU for any Data-Plane Interface in a Cluster System to be '9138 (9216 - 78)., where 9216 is the maximum Jumbo MTU. On certain Virtualized / Cloud Platforms, the maximum possible MTU is restricted to a lesser value, Similar calculation can be applied, Maximum Data Plane MTU in Cluster = (Maximum possible MTU - 78). Default value: 1500 Minimum value = 1500 Maximum value = 9216
ringsize	<Integer>	Read-write	The receive ringsize of the interface. A higher number

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			provides more number of buffers in handling incoming traffic. Default value: 2048 Minimum value = 512 Maximum value = 16384
ringtype	<String>	Read-write	The receive ringtype of the interface (Fixed or Elastic). A fixed ring type pre-allocates configured number of buffers irrespective of traffic rate. In contrast, an elastic ring, expands and shrinks based on incoming traffic rate. Default value: Elastic Possible values = Elastic, Fixed
tagall	<String>	Read-write	Add a four-byte 802.1q tag to every packet sent on this interface. The ON setting applies the tag for this interface's native VLAN. OFF applies the tag for all VLANs

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			other than the native VLAN. Default value: OFF Possible values = ON, OFF
trunk	<String>	Read-write	This argument is deprecated by tagall. Default value: OFF Possible values = ON, OFF
trunkmode	<String>	Read-write	Accept and send 802.1q VLAN tagged packets, based on Allowed Vlan List of this interface. Default value: OFF Possible values = ON, OFF
trunkallowedvlan	<String[]>	Read-write	VLAN ID or range of VLAN IDs will be allowed on this trunk interface. In the command line interface, separate the range with a hyphen. For example: 40-90. Minimum length = 1 Maximum length = 4094
lacpmode	<String>	Read-write	Bind the interface to a LA channel created by the Link

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Aggregation control protocol (LACP). Available settings function as follows: * Active - The LA channel port of the Citrix ADC generates LACPDU messages on a regular basis, regardless of any need expressed by its peer device to receive them. * Passive - The LA channel port of the Citrix ADC does not transmit LACPDU messages unless the peer device port is in the active mode. That is, the port does not speak unless spoken to. * Disabled - Unbinds the interface from the LA channel. If this is the only interface in the LA channel, the LA channel is removed.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = DISABLED, ACTIVE, PASSIVE
lacpkey	<Integer>	Read-write	Integer identifying the LACP LA channel to which the interface is to be bound. For an LA channel of the Citrix ADC, this digit specifies the variable x of an LA channel in LA/x notation, where x can range from 1 to 8. For example, if you specify 3 as the LACP key for an LA channel, the interface is bound to the LA channel LA/3. For an LA channel of a cluster configuration, this digit specifies the variable y of a cluster LA channel in CLA/(y-4) notation, where y can range from 5 to 8. For example, if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			you specify 6 as the LACP key for a cluster LA channel, the interface is bound to the cluster LA channel CLA/2. Minimum value = 1 Maximum value = 8
lagtype	<String>	Read-write	Type of entity (Citrix ADC or cluster configuration) for which to create the channel. Default value: NODE Possible values = NODE, CLUSTER
lacppriority	<Integer>	Read-write	LACP port priority, expressed as an integer. The lower the number, the higher the priority. The Citrix ADC limits the number of interfaces in an LA channel to sixteen. Default value: 32768 Minimum value = 1 Maximum value = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lacptimeout	<String>	Read-write	Interval at which the Citrix ADC sends LACPDU messages to the peer device on the LA channel. Available settings function as follows: LONG - 30 seconds. SHORT - 1 second. Default value: NSA_LACP_TIMEOUT_LONG Possible values = LONG, SHORT
ifalias	<String>	Read-write	Alias name for the interface. Used only to enhance readability. To perform any operations, you have to specify the interface ID. Default value: " " Maximum length = 31
throughput	<Integer>	Read-write	Low threshold value for the throughput of the interface, in Mbps. In an HA configuration, failover is triggered if the interface has HA MON enabled and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the throughput is below the specified the threshold. Minimum value = 0 Maximum value = 500000
linkredundancy	<String>	Read-write	Link Redundancy for Cluster LAG. Default value: OFF Possible values = ON, OFF
bandwidthhigh	<Integer>	Read-write	High threshold value for the bandwidth usage of the interface, in Mbps. The Citrix ADC generates an SNMP trap message when the bandwidth usage of the interface is greater than or equal to the specified high threshold value. Minimum value = 0 Maximum value = 500000
bandwidthnormal	<Integer>	Read-write	Normal threshold value for the bandwidth usage of the interface, in Mbps. When the bandwidth usage of the interface becomes less than or equal to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified normal threshold after exceeding the high threshold, the Citrix ADC generates an SNMP trap message to indicate that the bandwidth usage has returned to normal. Minimum value = 0 Maximum value = 500000
lldpmode	<String>	Read-write	Link Layer Discovery Protocol (LLDP) mode for an interface. The resultant LLDP mode of an interface depends on the LLDP mode configured at the global and the interface levels. Possible values = NONE, TRANSMITTER, RECEIVER, TRANSCEIVER
lrsetpriority	<Integer>	Read-write	LRSET port priority, expressed as an integer ranging from 1 to 1024. The highest priority is 1. The Citrix ADC limits the number of interfaces in an LRSET to 8. Within a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LRSET the highest LR Priority Interface is considered as the first candidate for the Active interface, if the interface is UP. Default value: 1024 Minimum value = 1 Maximum value = 1024
devicename	<String>	Read-only	Name of the interface.
unit	<Integer>	Read-only	Unit number for this interface, signifying the sequence number in which this interface is discovered on this Citrix ADC.
description	<String>	Read-only	Display the type of interface, the speeds at which this interface can operate, and, if applicable, the type of SFP,.
flags	<Integer>	Read-only	Flags for this interface. Used for communicating the device states.
actualmtu	<Integer>	Read-only	MTU for this interface (the largest frame that can transit this interface).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Integer>	Read-only	Native VLAN for this interface.
mac	<String>	Read-only	MAC address for this interface.
uptime	<Integer>	Read-only	Duration for which the interface has been UP (Example: 3 hours 1 minute 1 second). This value is reset when the interface state changes to DOWN..
downtime	<Integer>	Read-only	Duration for which the interface has been DOWN. This value is reset when the interface state changes to UP. (Example: 3 hours 1 minute 1 second).
actualringsize	<Integer>	Read-only	Actual receive ringsize of the interface. This will be same as configured receive ringsize when ringtype is Fixed whereas it denotes the current number of receive buffers allocated when ringtype is Elastic.
reqmedia	<String>	Read-only	Requested media setting for this interface.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = AUTO, UTP, FIBER
reqspeed	<String>	Read-only	Requested speed setting for this interface. Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000, 200000
reqduplex	<String>	Read-only	Requested duplex setting for this interface. Possible values = AUTO, HALF, FULL
reqflowcontrol	<String>	Read-only	Requested flow control setting for this interface. Possible values = OFF, RX, TX, RXTX, ON
actmedia	<String>	Read-only	Actual media setting for this interface. Possible values = AUTO, UTP, FIBER
actspeed	<String>	Read-only	Actual speed setting for this interface. Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			50000, 100000, 200000
actduplex	<String>	Read-only	Actual duplex setting for this interface. Possible values = AUTO, HALF, FULL
actflowctl	<String>	Read-only	Actual flow control setting for this interface. Possible values = OFF, RX, TX, RXTX, ON
mode	<String>	Read-only	Interface Link Aggregation mode (Auto/Manual) setting. Possible values = MANUAL, AUTO
state	<String>	Read-only	Link state of the interface (UP/DOWN). Default value: ENABLED Possible values = ENABLED, DISABLED
autonegresult	<Integer>	Read-only	Actual auto-negotiation setting for this interface.
tagged	<Integer>	Read-only	VLAN tags setting on this channel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
taggedany	<Integer>	Read-only	Interface setting to accept/drop all tagged packets.
taggedautolearn	<Integer>	Read-only	Dynamic VLAN membership autolearning enabled or disabled on this interface.
hangdetect	<Integer>	Read-only	Hang detection enabled or disabled for this interface.
hangreset	<Integer>	Read-only	Hang reset enabled or disabled for this interface.
linkstate	<Integer>	Read-only	The current state of the link associated with the interface. For logical interfaces (LA), the state of the link is dependent on the state of the slave interfaces. For the link to be UP at least one of the slave interfaces needs to be UP.
intfstate	<Integer>	Read-only	Current state of the specified interface. The interface state set to UP only if the link state is UP and administrative state is ENABLED.
rxpackets	<Integer>	Read-only	Number of packets received by an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interface since the Citrix ADC was started or the interface statistics were cleared.
rxbytes	<Integer>	Read-only	Number of bytes received by an interface since the Citrix ADC was started or the interface statistics were cleared.
rxerrors	<Integer>	Read-only	Number of inbound packets dropped by the hardware on a specified interface since the Citrix ADC was started or the interface statistics were cleared. Packets can be dropped because of CRC, length (undersize or oversize), or alignment errors.
rxdrops	<Integer>	Read-only	Number of inbound packets dropped by the specified interface. Commonly dropped packets are multicast frames, spanning tree BPDUs, packets destined to a MAC not owned by the Citrix ADC when L2 mode is disabled, or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packets tagged for a VLAN that is not bound to the interface. In most healthy networks, this statistic increments at a steady rate regardless of traffic load. A sharp spike in dropped packets generally indicates an issue with connected L2 switches, such as a forwarding database overflow resulting in packets being broadcast on all ports.
txpackets	<Integer>	Read-only	Number of packets transmitted by an interface since the Citrix ADC was started or the interface statistics were cleared.
txbytes	<Integer>	Read-only	Number of bytes transmitted by an interface since the Citrix ADC was started or the interface statistics were cleared.
txerrors	<Integer>	Read-only	Number of outbound packets dropped by the hardware on a specified interface

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			since the Citrix ADC was started or the interface statistics were cleared. Packets can be dropped because of length (undersize or oversize) errors or a lack of resources. This statistic is available only for: (1) Loop back interface (LO) of all platforms. (2) All data ports on the Citrix ADC 12000 platform. (3) Management ports on the Citrix ADC MPX 15000 and 17000 platforms. .
txdrops	<Integer>	Read-only	Number of packets dropped in transmission by the specified interface for one of the following reasons. (1) VLAN mismatch. (2) Oversized packets.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(3) Interface congestion. (4) Loopback packets sent on non loop back interface. .
indisc	<Integer>	Read-only	Number of error-free inbound packets discarded by the specified interface because of a lack of resources (for example, insufficient receive buffers).
outdisc	<Integer>	Read-only	Number of error-free outbound packets discarded by the specified interface because of a lack of resources. This statistic is not available on: (1) 10G ports of Citrix ADC MPX 12500/12500/15500 -10G platforms. (2) 10G data ports on Citrix ADC MPX 17500/19500/21500 platforms. .
fctls	<Integer>	Read-only	Number of times flow control is performed on the specified

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interface because of received pause frames.
hangs	<Integer>	Read-only	Number of times the specified interface detected hangs in the transmit and receive paths since the Citrix ADC was started or the interface statistics were cleared.
stsstalls	<Integer>	Read-only	Number of times the status updates for a specified interface were stalled since the Citrix ADC was started or the interface statistics were cleared. A status stall is detected when the status of the interface is not updated by the NIC hardware within 0.8 seconds of the last update.
txstalls	<Integer>	Read-only	Number of times the interface stalled, when transmitting packets, since the Citrix ADC was started or the interface statistics were cleared. Transmit (Tx) stalls are detected when a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packet posted for transmission is not transmitted in 4 seconds.
rxstalls	<Integer>	Read-only	Number of times the interface stalled, when receiving packets, since the Citrix ADC was started or the interface statistics were cleared. Receive (Rx) stalls are detected when the following conditions are met: (1)The link is up for more than 10 minutes. (2)Packets are transmitted, but no packets are received for 16 seconds. .
bdgmacmoved	<Integer>	Read-only	Number of MAC moves between ports. A high rate of MAC moves typically indicates a bridge loop between two interfaces.
bdgmuted	<Integer>	Read-only	Number of times the specified interface stopped transmitting and receiving

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packets because of MAC moves between ports.
vmac	<String>	Read-only	Virtual MAC of this interface.
vmac6	<String>	Read-only	Virtual MAC for IPv6 of this interface.
reqthroughput	<Integer>	Read-only	Minimum required throughput for an interface. Failover is triggered if the operating throughput of a Link Aggregation (LA) channel for which HAMON is ON falls below this value. The possible values are: 1. 1000Mbps for 1G interfaces. 2. 10000Mbps for 10G interfaces. 3. 500000Mbps for Link Aggregation channels. Minimum value = 0 Maximum value = 500000
actthroughput	<Integer>	Read-only	Actual throughput for the interface.
backplane	<String>	Read-only	The cluster backplane status of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the interface. If the status is enabled, the interface is part of the cluster backplane. By default, the backplane status is disabled. Possible values = ENABLED, DISABLED
ifnum	<String[]>	Read-only	Contains the LA Master, if the interface is part of LA channel.
cleartime	<Integer>	Read-only	Time since the interface stats are cleared last time.
slavestate	<Integer>	Read-only	State of the member interfaces.
slavemedia	<Integer>	Read-only	Media type of the member interfaces.
slavespeed	<Integer>	Read-only	Speed of the member interfaces.
slaveduplex	<Integer>	Read-only	Duplex of the member interfaces.
slaveflowctl	<Integer>	Read-only	Flowcontrol of the member interfaces.
slavetime	<Integer>	Read-only	UP time of the member interfaces.
intftype	<String>	Read-only	Interface Type, this field will have the interface type either

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			it is virtual, physical or loopback. . Possible values = BROADCOM 5700/5701, TIGON1/TIGON2, INTEL 82546, INTEL 8255X(PRO), Link Aggregate, Loopback, Intel 82541/47, Broadcom 5704, Chelsio 1G, Intel 8247X, Intel 82576 VF, Xen Virtual, Intel 10G, Intel 82599 VF, Mellanox 100G, Mellanox 50G, Mellanox 25G, Intel FVL 40G, Intel FVL 25G, Intel FVL 10G, Intel FVL 40G VF, Mellanox VF, CX4 VF SMART NIC, CX3 VF, CX3 VF SMART NIC, Hyper v, Cluster LAG, Intel 8247X SFP, XEN Interface, Chelsio 10G, KVM Virtio, VMXNET3, Google Virtual NIC, Microsoft Azure MANA NIC, DPDK, Linux

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svmcmd	<Integer>	Read-only	New attribute added to identify the source of cmd, when SVM fires the nitro cmd, it will set the value of SVMCMD to be 1. . Default value: 0
lacpactormode	<String>	Read-only	* Active - The LA channel port of the Citrix ADC generates LACPDU messages on a regular basis, regardless of any need expressed by its peer device to receive them. * Passive - The LA channel port of the Citrix ADC does not transmit LACPDU messages unless the peer device port is in the active mode. That is, the port does not speak unless spoken to. * Disabled - Unbinds the interface from the LA channel. If this is the only interface in the LA channel, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LA channel is removed. Possible values = DISABLED, ACTIVE, PASSIVE
lacpactortimeout	<String>	Read-only	Interval at which the Citrix ADC sends LACPDU messages to the peer device on the LA channel. Available settings function as follows: LONG - 30 seconds. SHORT - 1 second. Possible values = LONG, SHORT
lacpactorpriority	<Integer>	Read-only	LACP Actor Priority. A LACP port priority is configured on each port using LACP. LACP uses the port priority with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lacpactorportno	<Integer>	Read-only	LACP Actor port number. LACP uses the port priority with the port number to form the port identifier.
lacppartnerstate	<String>	Read-only	LACP Partner State. Whether the port is in Active or Passive negotiating state. Possible values = MANUAL, AUTO
lacppartnertimeout	<String>	Read-only	The timeout value for the information revieved in LACPDUs. It can have values as SHORT or LONG. The SHORT timeout is 3s and the LONG timeout is 90s. Possible values = LONG, SHORT
lacppartneraggregation	<String>	Read-only	The Aggregation flag indicates that the participant will allow the link to be used as part of an aggregate. Otherwise the link is to be used as an individual link, i.e. not aggregated with any other. Possible values = NS_EMPTY_STR, AGG

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lacppartnerinsync	<String>	Read-only	The Synchronization flag indicates that the transmitting participant.s mux component is in sync with the system id and key information transmitted. Possible values = NS_EMPTY_STR, SYNC
lacppartnercollecting	<String>	Read-only	The Collecting flag indicates that the participant.s collector, i.e. the reception component of the mux, is definitely on. If set the flag communicates collecting. Possible values = NS_EMPTY_STR, COLLECTING
lacppartnerdistributing	<String>	Read-only	The Distributing flag indicates that the participant.s distributor is not definitely off. If reset the flag indicates not distributing. Possible values = NS_EMPTY_STR, DISTRIBUTING
lacppartnerdefaulted	<String>	Read-only	If the timer expires in the Expired state, the Receive Machine

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enters the Defaulted state. Possible values = NS_EMPTY_STR, DEFAULTED
lacppartnerexpired	<String>	Read-only	If the LACPDUs are received for timeout period, the Receive Machine enters the Expired state and the timer is restarted with the timeout value of SHORT timeout. Possible values = NS_EMPTY_STR, EXPIRED
lacppartnerpriority	<Integer>	Read-only	LACP Partner Priority. A LACP port priority is configured on each port using LACP. LACP uses the port priority with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lacppartnersystemmac	<String>	Read-only	LACP Partner System MAC.
lacppartnersystempriority	<Integer>	Read-only	LACP Partner System Priority. The LACP partner's system priority. The values for the priority range from 0 to 65535. The lower the value, the higher the system priority. The switch with the lower system priority value determines which links between LACP partner are active and which are in the standby for each LACP Channel.
lacppartnerportno	<Integer>	Read-only	LACP Partner Port number. LACP uses the port priority with the port number to form the port identifier.
lacppartnerkey	<Integer>	Read-only	LACP Partner Key. The LACP key used by the partner port.
lacpactoraggregation	<String>	Read-only	The Aggregation flag indicates that the participant will allow the link to be used as part of an aggregate. Otherwise the link is to be used as an individual link, i.e.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			not aggregated with any other. Possible values = NS_EMPTY_STR, AGG
lacpactorinsync	<String>	Read-only	The Synchronization flag indicates that the transmitting participant.s mux component is in sync with the system id and key information transmitted. Possible values = NS_EMPTY_STR, SYNC
lacpactorcollecting	<String>	Read-only	The Collecting flag indicates that the participant.s collector, i.e. the reception component of the mux, is definitely on. If set the flag communicates collecting. Possible values = NS_EMPTY_STR, COLLECTING
lacpactordistributing	<String>	Read-only	The Distributing flag indicates that the participant.s distributor is not definitely off. If reset the flag indicates not distributing.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NS_EMPTY_STR, DISTRIBUTING
lacpportmuxstate	<String>	Read-only	LACP Port MUX state. The state of the MUX control machine. The Mux Control Machine attaches the physical port to an aggregate port, using the Selection Logic to choose an appropriate port, and turns the distributor and collector for the physical port on or off as required by protocol information. Possible values = DETACHED, WAITING, ATTACHED, COLLECTING, DISTRIBUTING
lacpportrxstat	<String>	Read-only	LACP Port RX state. The state of the Receive machine. The Receive Machine maintains partner information, recording protocol information from LACPDUs sent by remote partner(s). Received information is subject to a timeout, and if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			sufficient time elapses the receive machine will revert to using default partner information. Possible values = INIT, PORT_DISABLED, LACP_DISABLED, EXPIRED, DEFAULTED, CURRENT
lacpportselectstate	<String>	Read-only	LACP Port SELECT state. The state of the SELECT state machine, It could be SELECTED or UNSELECTED. Possible values = UNSELECTED, SELECTED, STANDBY
lractiveintf	<Integer>	Read-only	LR set member interface state(active/inactive).
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- CLEAR
- UPDATE
- UNSET

- ENABLE
- DISABLE
- RESET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/Interface? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"Interface":{

<b>"id":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/Interface **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"Interface":{

<b>"id":<String_value>,

</b>"speed":<String_value>,

"duplex":<String_value>,

"flowctl":<String_value>,

"autoneg":<String_value>,

"hamonitor":<String_value>,

"haheartbeat":<String_value>,
```

```
"mtu":<Integer_value>,

"ringsize":<Integer_value>,

"ringtype":<String_value>,

"tagall":<String_value>,

"trunk":<String_value>,

"trunkmode":<String_value>,

"trunkallowedvlan":<String[]_value>,

"lacpmode":<String_value>,

"lacpkey":<Integer_value>,

"lagtype":<String_value>,

"lacppriority":<Integer_value>,

"lacptimeout":<String_value>,

"ifalias":<String_value>,

"throughput":<Integer_value>,

"linkredundancy":<String_value>,

"bandwidthhigh":<Integer_value>,

"bandwidthnormal":<Integer_value>,

"lldpmode":<String_value>,

"lrsetpriority":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/Interface? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"Interface":{

<b>"id":<String_value>,

</b>"speed":true,

"duplex":true,

"flowctl":true,

"autoneg":true,

"hamonitor":true,

"haheartbeat":true,

"mtu":true,

"ringsize":true,

"ringtype":true,

"tagall":true,

"trunk":true,

"trunkmode":true,

"trunkallowedvlan":true,
```

```
"lacpmode":true,

"lacppriority":true,

"lacptimeout":true,

"ifalias":true,

"throughput":true,

"linkredundancy":true,

"bandwidthhigh":true,

"bandwidthnormal":true,

"lldpmode":true,

"lrsetpriority":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/Interface? **action=enable HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"Interface":{

<b>"id":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DISABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/Interface? **action=disable HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"Interface":{

<b>"id":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RESET

URL: http:// <netscaler-ip-address> /nitro/v1/config/Interface? **action=reset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"Interface":{

<b>"id":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/Interface **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/Interface? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/Interface? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of Interface resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/Interface? **view=summary**

Use this query-parameter to get the summary output of Interface resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/Interface? **pagesize=#no;pageno=#no**

Use this query-parameter to get the Interface resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/Interface? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "Interface": [ { "__count": "#no"} ] }
```

appalgparam

Configuration for AppAlg Param resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pptpgreidletimeout	<Integer>	Read-write	Interval in sec, after which data sessions of PPTP GRE is cleared. Default value: 9000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 9000
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/appalgparam **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appalgparam":{

"pptpgreidletimeout":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/appalgparam? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"appalgparam":{

"pptpgreidletimeout":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/appalgparam **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "appalgparam": [ {

"pptpgreidletimeout":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

arp

Configuration for arp resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the network device that you want to add to the ARP table. Minimum length = 1
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
mac	<String>	Read-write	MAC address of the network device.
ifnum	<String>	Read-write	Interface through which the network device is accessible. Specify the interface in (slot/port) notation. For example, 1/3.
vxlan	<Integer>	Read-write	ID of the VXLAN on which the IP address of this ARP entry is reachable. Minimum value = 1 Maximum value = 16777215

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vtep	<String>	Read-write	IP address of the VXLAN tunnel endpoint (VTEP) through which the IP address of this ARP entry is reachable. Minimum length = 1
vlan	<Integer>	Read-write	The VLAN ID through which packets are to be sent after matching the ARP entry. This is a numeric value.
ownernode	<Integer>	Read-write	The owner node for the Arp entry. Minimum value = 0 Maximum value = 31
all	<Boolean>	Read-write	Remove all ARP entries from the ARP table of the Citrix ADC.
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
timeout	<Integer>	Read-only	The time, in seconds, after which the entry times out.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<Integer>	Read-only	The state of the ARP entry.
flags	<Integer>	Read-only	The flags for the entry.
type	<String>	Read-only	Indicates whether this ARP entry was added manually or dynamically. When you manually add an ARP entry, the value for this parameter is STATIC. Otherwise, it is DYNAMIC. For the NSIP and loopback IP addresses, the value is PERMANENT. Possible values = STATIC, PERMANENT, DYNAMIC
channel	<Integer>	Read-only	The tunnel, channel, or physical interface through which the ARP entry is identified.
controlplane	<Boolean>	Read-only	This arp entry is populated by a control plane protocol.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

bridgegroup_binding

Binding object which returns the resources bound to bridgegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	The name of the bridge group. Minimum value = 1 Maximum value = 1000
bridgegroup_nsip_binding	<bridgegroup_nsip_binding[]>	Read-only	nsip that can be bound to bridgegroup.
bridgegroup_nsip6_binding	<bridgegroup_nsip6_binding[]>	Read-only	nsip6 that can be bound to bridgegroup.
bridgegroup_vlan_binding	<bridgegroup_vlan_binding[]>	Read-only	vlan that can be bound to bridgegroup.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/bridgegroup_binding/ id_value<Integer> **HTTP Method:** GET

Request Headers:

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/bridgegroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "bridgegroup_binding": [ {

"id":<Integer_value>,

"bridgegroup_nsip6_binding":<bridgegroup_nsip6_binding[]_value>,

"bridgegroup_vlan_binding":<bridgegroup_vlan_binding[]_value>,

"bridgegroup_nsip_binding":<bridgegroup_nsip_binding[]_value>
```

```
}]}
```

bridgegroup_nsip6_binding

Binding object showing the nsip6 that can be bound to bridgegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
netmask	<String>	Read-write	A subnet mask associated with the network address. Minimum length = 1
ipaddress	<String>	Read-write	The IP address assigned to the bridge group.
ownergroup	<String>	Read-write	The owner node group in a Cluster for this vlan. Default value: DEFAULT_NG Minimum length = 1
id	<Integer>	Read-write	The integer that uniquely identifies the bridge group. Minimum value = 1 Maximum value = 1000
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
rnat	<Boolean>	Read-only	Temporary flag used for internal purpose.
__count	<Double>	Read-only	count parameter

Operations

- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/bridgegroup_nsip6_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"bridgegroup_nsip6_binding":{

<b>"id":<Integer_value>,

</b>"ipaddress":<String_value>,

"netmask":<String_value>,

"td":<Integer_value>,

"ownergroup":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/bridgegroup_nsip6_binding/ id_value<Integer> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/bridgegroup_nsip6_binding/ id_value<Integer> ? **args=ipaddress: <String_value> ,netmask: <String_value> ,td: <Integer_value> ,ownergroup: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/bridgegroup_nsip6_binding/ id_value<Integer> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/bridgegroup_nsip6_binding/ id_value<Integer> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of bridgegroup_nsip6_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/bridgegroup_nsip6_binding/ id_value<Integer> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the bridgegroup_nsip6_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

bridgetable

Configuration for bridge table entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mac	<String>	Read-write	The MAC address of the target.
vxlan	<Integer>	Read-write	The VXLAN to which this address is associated. Minimum value = 1 Maximum value = 16777215
vtep	<String>	Read-write	The IP address of the destination VXLAN tunnel endpoint where the Ethernet MAC ADDRESS resides. Minimum length = 1
vni	<Integer>	Read-write	The VXLAN VNI Network Identifier (or VXLAN Segment ID) to use to connect to the remote VXLAN tunnel endpoint. If omitted the value specified as vxlan will be used. Minimum value = 1 Maximum value = 16777215

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
devicevlan	<Integer>	Read-write	The vlan on which to send multicast packets when the VXLAN tunnel endpoint is a muticast group address. Minimum value = 1 Maximum value = 4094
bridgeage	<Integer>	Read-write	Time-out value for the bridge table entries, in seconds. The new value applies only to the entries that are dynamically learned after the new value is set. Previously existing bridge table entries expire after the previously configured time-out value. Default value: 300 Minimum value = 60 Maximum value = 300
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Integer>	Read-write	VLAN whose entries are to be removed. Minimum value = 1 Maximum value = 4094
ifnum	<String>	Read-write	INTERFACE whose entries are to be removed.
flags	<Integer>	Read-only	Display flags,.
type	<String>	Read-only	Whether static or dynamic. Possible values = STATIC, PERMANENT, DYNAMIC
channel	<Integer>	Read-only	The Tunnel through which bridge entry is learned.
controlplane	<Boolean>	Read-only	This bridge table entry is populated by a control plane protocol.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	ID for the LA channel or cluster LA channel or LR channel to be created. Specify an LA channel in LA/x notation, where x can range from 1 to 8 or cluster LA channel in CLA/x

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			notation or Link redundant channel in LR/x notation, where x can range from 1 to 4. Cannot be changed after the LA channel is created.
ifnum	<String[]>	Read-write	Interfaces to be bound to the LA channel of a Citrix ADC or to the LA channel of a cluster configuration. For an LA channel of a Citrix ADC, specify an interface in C/U notation (for example, 1/3). For an LA channel of a cluster configuration, specify an interface in N/C/U notation (for example, 2/1/3). where C can take one of the following values: * 0 - Indicates a management interface. * 1 - Indicates a 1 Gbps port.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* 10 - Indicates a 10 Gbps port. U is a unique integer for representing an interface in a particular port group. N is the ID of the node to which an interface belongs in a cluster configuration. Use spaces to separate multiple entries.
state	<String>	Read-write	Enable or disable the LA channel. Default value: ENABLED Possible values = ENABLED, DISABLED
mode	<String>	Read-write	The initital mode for the LA channel. Possible values = MANUAL, AUTO
conndistr	<String>	Read-write	The 'connection' distribution mode for the LA channel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DISABLED, ENABLED
macdistr	<String>	Read-write	The 'MAC' distribution mode for the LA channel. Possible values = SOURCE, DESTINATION, BOTH
lamac	<String>	Read-write	Specifies a MAC address for the LA channels configured in Citrix ADC virtual appliances (VPX). This MAC address is persistent after each reboot. If you don't specify this parameter, a MAC address is generated randomly for each LA channel. These MAC addresses change after each reboot.
speed	<String>	Read-write	Ethernet speed of the channel, in Mbps. If the speed of any bound interface is greater than or equal to the value set for this parameter, the state of the interface is UP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Otherwise, the state is INACTIVE. Bound Interfaces whose state is INACTIVE do not process any traffic. Default value: AUTO Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000, 200000
flowctl	<String>	Read-write	Specifies the flow control type for this LA channel to manage the flow of frames. Flow control is a function as mentioned in clause 31 of the IEEE 802.3 standard. Flow control allows congested ports to pause traffic from the peer device. Flow control is achieved by sending PAUSE frames. Default value: OFF Possible values = OFF, RX, TX, RXTX, ON
hamonitor	<String>	Read-write	In a High Availability (HA) configuration,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			monitor the LA channel for failure events. Failure of any LA channel that has HA MON enabled triggers HA failover. Default value: ON Possible values = ON, OFF
haheartbeat	<String>	Read-write	In a High Availability (HA) configuration, configure the LA channel for sending heartbeats. LA channel that has HA Heartbeat disabled should not send the heartbeats. Default value: ON Possible values = OFF, ON
tagall	<String>	Read-write	Adds a four-byte 802.1q tag to every packet sent on this channel. The ON setting applies tags for all VLANs that are bound to this channel. OFF applies the tag for all VLANs other than the native VLAN. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
trunk	<String>	Read-write	This is deprecated by tagall. Default value: OFF Possible values = ON, OFF
ifalias	<String>	Read-write	Alias name for the LA channel. Used only to enhance readability. To perform any operations, you have to specify the LA channel ID. Default value: " " Maximum length = 31
throughput	<Integer>	Read-write	Low threshold value for the throughput of the LA channel, in Mbps. In an high availability (HA) configuration, failover is triggered when the LA channel has HA MON enabled and the throughput is below the specified threshold. Minimum value = 0 Maximum value = 500000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bandwidthhigh	<Integer>	Read-write	High threshold value for the bandwidth usage of the LA channel, in Mbps. The Citrix ADC generates an SNMP trap message when the bandwidth usage of the LA channel is greater than or equal to the specified high threshold value. Minimum value = 0 Maximum value = 500000
bandwidthnormal	<Integer>	Read-write	Normal threshold value for the bandwidth usage of the LA channel, in Mbps. When the bandwidth usage of the LA channel returns to less than or equal to the specified normal threshold after exceeding the high threshold, the Citrix ADC generates an SNMP trap message to indicate that the bandwidth usage has returned to normal. Minimum value = 0 Maximum value = 500000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mtu	<Integer>	Read-write	The Maximum Transmission Unit (MTU) is the largest packet size, measured in bytes excluding 14 bytes ethernet header and 4 bytes CRC, that can be transmitted and received by an interface. The default value of MTU is 1500 on all the interface of Citrix ADC, some Cloud Platforms will restrict Citrix ADC to use the lesser default value. Any MTU value more than 1500 is called Jumbo MTU and will make the interface as jumbo enabled. The Maximum Jumbo MTU in Citrix ADC is 9216, however, some Virtualized / Cloud Platforms will have lesser Maximum Jumbo MTU Value (9000). In the case of Cluster, the Backplane interface requires an MTU value of 78 bytes more than the Max MTU configured on any other Data-Plane Interface. When the Data plane interfaces

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are all at default 1500 MTU, Cluster Back Plane will be automatically set to 1578 (1500 + 78) MTU. If a Backplane interface is reset to Data Plane Interface, then the 1578 MTU will be automatically reset to the default MTU of 1500(or whatever lesser default value). If any data plane interface of a Cluster is configured with a Jumbo MTU (> 1500), then all backplane interfaces require to be configured with a minimum MTU of 'Highest Data Plane MTU in the Cluster + 78'. That makes the maximum Jumbo MTU for any Data-Plane Interface in a Cluster System to be '9138 (9216 - 78)., where 9216 is the maximum Jumbo MTU. On certain Virtualized / Cloud Platforms, the maximum possible MTU is restricted to a lesser value, Similar calculation can be applied,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum Data Plane MTU in Cluster = (Maximum possible MTU - 78). . Default value: 1500 Minimum value = 1500 Maximum value = 9216
lrminthroughput	<Integer>	Read-write	Specifies the minimum throughput threshold (in Mbps) to be met by the active subchannel. Setting this parameter automatically divides an LACP channel into logical subchannels, with one subchannel active and the others in standby mode. When the maximum supported throughput of the active channel falls below the lrMinThroughput value, link failover occurs and a standby subchannel becomes active. Minimum value = 0 Maximum value = 80000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linkredundancy	<String>	Read-write	Link Redundancy for Cluster LAG. Default value: OFF Possible values = ON, OFF
devicename	<String>	Read-only	LA channel name in form LA/x, where x is channel ID, which ranges from 1 to 8 or LR channel name in form LR/x, where x is channel ID, which ranges from 1 to 4.
unit	<Integer>	Read-only	Unit number of the channel. This is an internal reference number that the Citrix ADC uses to identify the channel.
description	<String>	Read-only	The IEEE standard that the channel is based on.
flags	<Integer>	Read-only	Flags of this channel.
actualmtu	<Integer>	Read-only	MTU of the channel. This is the maximum frame size that the channel can process.
vlan	<Integer>	Read-only	Native VLAN of the channel.
mac	<String>	Read-only	MAC address of the channel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
uptime	<Integer>	Read-only	Duration for which the channel is UP. (Example: 3 hours 1 minute 1 second). This value is reset when the channel state changes to DOWN.
downtime	<Integer>	Read-only	Duration for which the channel is DOWN. (Example: 3 hours 1 minute 1 second). This value is reset when the channel state changes to UP.
reqmedia	<String>	Read-only	Requested media setting for this channel. Since there is no media associated with LA, the displayed values carry no significance. Possible values = AUTO, UTP, FIBER
reqspeed	<String>	Read-only	Requested speed setting for this channel. Since no media are associated with LA, this speed is used to determine the threshold for the slave interfaces. If the speed of the member interface is less than the requested speed,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that interface is considered inactive. Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000, 200000
reqduplex	<String>	Read-only	Requested duplex setting for this channel. Since no media are associated with LA, the displayed values carry no significance. Possible values = AUTO, HALF, FULL
reqflowcontrol	<String>	Read-only	Requested flow control setting for this channel. Since no media are associated with LA, the displayed values carry no significance. Possible values = OFF, RX, TX, RXTX, ON
media	<String>	Read-only	Requested media setting for this interface. Possible values = AUTO, UTP, FIBER
actspeed	<String>	Read-only	Actual speed setting for this channel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000, 200000
duplex	<String>	Read-only	Actualduplex setting for this interface. Possible values = AUTO, HALF, FULL
actflowctl	<String>	Read-only	Actual flow control setting for this channel. Possible values = OFF, RX, TX, RXTX, ON
lamode	<String>	Read-only	The mode(AUTO/MANNUAL) for the LA channel. Possible values = MANUAL, AUTO
autoneg	<Integer>	Read-only	Requested auto negotiation setting for this channel. Since no media are associated with LA, this setting has no effect.
autonegresult	<Integer>	Read-only	Actual auto negotiation setting for this channel.
tagged	<Integer>	Read-only	VLAN tags setting on this channel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
taggedany	<Integer>	Read-only	Channel setting to accept/drop all tagged packets.
taggedautolearn	<Integer>	Read-only	Dynaminc vlan membership on this channel.
hangdetect	<Integer>	Read-only	Hang detect for this channel.
hangreset	<Integer>	Read-only	Hang reset for this channel.
linkstate	<Integer>	Read-only	The current state of the link associated with the interface. For logical interfaces (LA), the state of the link is dependent on the state of the slave interfaces. For the link to be UP at least one of the slave interfaces needs to be UP.
intfstate	<Integer>	Read-only	Current state of the specified interface. The interface state set to UP only if the link state is UP and administrative state is ENABLED.
rxpackets	<Integer>	Read-only	Number of bytes received by all the slave interfaces of the channel since the Citrix ADC was started or the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interface statistics were cleared.
rxbytes	<Integer>	Read-only	Number of packets received by all member interfaces since the Citrix ADC was started or the interface statistics were cleared.
rxerrors	<Integer>	Read-only	Number of inbound packets dropped by the hardware of the slave interfaces since the Citrix ADC was started or the interface statistics were cleared. Possible causes of dropped packets are CRC, length (undersize or oversize), and alignment errors.
rxdrops	<Integer>	Read-only	Number of inbound packets dropped by the channel's slave interfaces. Commonly dropped packets are multicast frames, spanning tree BPDUs, packets destined to a MAC not owned by the Citrix ADC when L2 mode is disabled, or packets tagged for a VLAN that is not bound to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interface. In most healthy networks, this statistic increments at a steady rate regardless of traffic load. A sharp spike in dropped packets generally indicates an issue with connected L2 switches, such as a forwarding database overflow resulting in packets being broadcast on all ports.
txpackets	<Integer>	Read-only	Number of packets transmitted by slave interfaces of a channel since the Citrix ADC was started or the interface statistics were cleared.
txbytes	<Integer>	Read-only	Number of bytes transmitted by slave interfaces of a channel since the Citrix ADC was started or the interface statistics were cleared.
txerrors	<Integer>	Read-only	Number of outbound packets dropped by the hardware of a channel's slave interfaces since the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix ADC was started or the interface statistics were cleared. Possible causes of dropped packets are length (undersize or oversize) errors and lack of resources.
txdrops	<Integer>	Read-only	Number of packets dropped in transmission by a channel's slave interfaces for one of the following reasons: (1) VLAN mismatch. (2) Oversized packets. (3) Interface congestion. (4) Loopback packets sent on non-loopback interface.
indisc	<Integer>	Read-only	Number of error-free inbound packets discarded by a channel's slave interfaces because of a lack of resources (for example, insufficient receive buffers).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
outdisc	<Integer>	Read-only	Number of error-free outbound packets discarded by a channel's slave interfaces because of a lack of resources. This statistic is not available on: (1) 10G ports of Citrix ADC MPX 12500/12500/15500 -10G platforms. (2) 10G data ports on Citrix ADC MPX 17500/19500/21500 platforms.
fctls	<Integer>	Read-only	Number of times flow control is performed on a channel's slave interfaces because of pause frames.
hangs	<Integer>	Read-only	Number of hangs that occurred on the channel's slave interfaces.
stsstalls	<Integer>	Read-only	Number of status stalls that occurred on the channel's slave interfaces.
txstalls	<Integer>	Read-only	Number of Tx stalls happened that occurred on the channel's slave interfaces.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rxstalls	<Integer>	Read-only	Number of Rx stalls that occurred on the channel's slave interfaces.
bdgmuted	<Integer>	Read-only	Number of times a channel's slave interfaces stopped transmitting and receiving packets because of MAC moves between ports.
vmac	<String>	Read-only	Virtual MAC of this channel.
vmac6	<String>	Read-only	Virtual MAC for IPv6 on this interface.
reqthroughput	<Integer>	Read-only	Minimum required throughput for an interface. Failover is triggered if the operating throughput of a Link Aggregation (LA) channel for which HAMON is ON falls below this value. Minimum value = 0 Maximum value = 500000
actthroughput	<Integer>	Read-only	Actual throughput for the interface.
backplane	<String>	Read-only	The cluster backplane status of the LA. If the status is enabled, the LA is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			part of the cluster backplane. By default, the backplane status is disabled. Possible values = ENABLED, DISABLED
cleartime	<Integer>	Read-only	Time since the interface stats are cleared last time.
lacpmode	<String>	Read-only	The LACP mode of the specified interface. The possible values are: 1. Active: A port in active mode generates LACP protocol messages on a regular basis, regardless of any need expressed by its partner to receive them. 2. Passive: A port in passive mode generally does not transmit LACP messages unless its partner is in the active mode; that is, it does not speak unless spoken to.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			3. Disabled: Removes the interface from the LA channel. If this is only interface in the LA channel, the LA channel is also deleted. . Possible values = DISABLED, ACTIVE, PASSIVE
lacptimeout	<String>	Read-only	Time to wait for the LACPDU. If a LACPDU is not received within this interval, the Citrix ADC markes the link partner port as DOWN. Possible values: Long and Short. Long lacptimeout is 90 sec and Short LACP timeout is 3 sec. Possible values = LONG, SHORT
lacpactorpriority	<Integer>	Read-only	LACP Actor Priority. A LACP port priority is configured on each port using LACP. LACP uses the port priority with the port number to form the port identifier. The port

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.
lacpactorportno	<Integer>	Read-only	LACP Actor port number. LACP uses the port priority with the port number to form the port identifier.
lacppartnerstate	<String>	Read-only	LACP Partner State. Whether the port is in Active or Passive negotiating state. Possible values = MANUAL, AUTO
lacppartnertimeout	<String>	Read-only	The timeout value for the information revieved in LACPDUs. It can have values as SHORT or LONG. The SHORT timeout is 3s and the LONG timeout is 90s. Possible values = LONG, SHORT
lacppartneraggregation	<String>	Read-only	The Aggregation flag indicates that the participant will allow the link to be used as part of an aggregate. Otherwise the link is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to be used as an individual link, i.e. not aggregated with any other. Possible values = NS_EMPTY_STR, AGG
lacppartnerinsync	<String>	Read-only	The Synchronization flag indicates that the transmitting participant.s mux component is in sync with the system id and key information transmitted. Possible values = NS_EMPTY_STR, SYNC
lacppartnercollecting	<String>	Read-only	The Collecting flag indicates that the participant.s collector, i.e. the reception component of the mux, is definitely on. If set the flag communicates collecting. Possible values = NS_EMPTY_STR, COLLECTING
lacppartnerdistributing	<String>	Read-only	The Distributing flag indicates that the participant.s distributor is not definitely off. If reset

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the flag indicates not distributing. Possible values = NS_EMPTY_STR, DISTRIBUTING
lacppartnerdefaulted	<String>	Read-only	If the timer expires in the Expired state, the Receive Machine enters the Defaulted state. Possible values = NS_EMPTY_STR, DEFAULTED
lacppartnerexpired	<String>	Read-only	If the LACPDUs are received for timeout period, the Receive Machine enters the Expired state and the timer is restarted with the timeout value of SHORT timeout. Possible values = NS_EMPTY_STR, EXPIRED
lacppartnerpriority	<Integer>	Read-only	LACP Partner Priority. A LACP port priority is configured on each port using LACP. LACP uses the port priority with the port number to form the port identifier. The port priority determines which ports should be put

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.
lacppartnersystemmac	<String>	Read-only	LACP Partner System MAC.
lacppartnersystempriority	<Integer>	Read-only	LACP Partner System Priority. The LACP partner's system priority. The values for the priority range from 0 to 65535. The lower the value, the higher the system priority. The switch with the lower system priority value determines which links between LACP partner are active and which are in the standby for each LACP Channel.
lacppartnerportno	<Integer>	Read-only	LACP Partner Port number. LACP uses the port priority with the port number to form the port identifier.
lacppartnerkey	<Integer>	Read-only	LACP Partner Key. The LACP key used by the partner port.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lacpactoraggregation	<String>	Read-only	The Aggregation flag indicates that the participant will allow the link to be used as part of an aggregate. Otherwise the link is to be used as an individual link, i.e. not aggregated with any other. Possible values = NS_EMPTY_STR, AGG
lacpactorinsync	<String>	Read-only	The Synchronization flag indicates that the transmitting participant.s mux component is in sync with the system id and key information transmitted. Possible values = NS_EMPTY_STR, SYNC
lacpactorcollecting	<String>	Read-only	The Collecting flag indicates that the participant.s collector, i.e. the reception component of the mux, is definitely on. If set the flag communicates collecting. Possible values = NS_EMPTY_STR, COLLECTING

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lacpactordistributing	<String>	Read-only	The Distributing flag indicates that the participant.s distributor is not definitely off. If reset the flag indicates not distributing. Possible values = NS_EMPTY_STR, DISTRIBUTING
lacpportmuxstate	<String>	Read-only	LACP Port MUX state. The state of the MUX control machine. The Mux Control Machine attaches the physical port to an aggregate port, using the Selection Logic to choose an appropriate port, and turns the distributor and collector for the physical port on or off as required by protocol information. Possible values = DETACHED, WAITING, ATTACHED, COLLECTING, DISTRIBUTING
lacpportrxstat	<String>	Read-only	LACP Port RX state. The state of the Receive machine. The Receive Machine maintains partner information,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			recording protocol information from LACPDUs sent by remote partner(s). Received information is subject to a timeout, and if sufficient time elapses the receive machine will revert to using default partner information. Possible values = INIT, PORT_DISABLED, LACP_DISABLED, EXPIRED, DEFAULTED, CURRENT
lacpportselectstate	<String>	Read-only	LACP Port SELECT state. The state of the SELECT state machine, It could be SELECTED or UNSELECTED. Possible values = UNSELECTED, SELECTED, STANDBY
lldpmode	<String>	Read-only	Link Layer Discovery Protocol (LLDP) mode for an interface. The resultant LLDP mode of an interface depends on the LLDP mode configured at the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			global and the interface levels. Possible values = NONE, TRANSMITTER, RECEIVER, TRANSCEIVER
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/channel **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"channel":{

<b>"id":<String_value>,

</b>"ifnum":<String[]_value>,

"state":<String_value>,

```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/channel **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/channel? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/channel? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of channel resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/channel? **view=summary**

Use this query-parameter to get the summary output of channel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/channel? **pagesize=#no;pageno=#no**

Use this query-parameter to get the channel resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/channel/ id_value<String> **Query-parameters:**
attrs http:// <netscaler-ip-address> /nitro/v1/config/channel/ id_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/channel/ id_value<String> ? **view=summary**

Use this query-parameter to get the summary output of channel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/channel? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "channel": [ { "__count": "#no"} ] }
```

channel_binding

Binding object which returns the resources bound to channel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	ID of an LA channel or LA channel in cluster configuration whose details you want the Citrix ADC to display. Specify an LA channel in LA/x notation, where x can range from 1 to 8 or a cluster LA channel in CLA/x notation or Link redundant channel in LR/x notation , where x can range from 1 to 4. Minimum length = 1
channel_interface_binding	<channel_interface_binding[]>	Read-only	interface that can be bound to channel.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/channel_binding/ id_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "channel_binding": [ {

"id":<String_value>,

"channel_interface_binding":<channel_interface_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/channel_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/channel_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "channel_binding": [ {

"id":<String_value>,

"channel_interface_binding":<channel_interface_binding[]_value>

}]}
```

channel_interface_binding

Binding object showing the interface that can be bound to channel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svmcmd	<Integer>	Read-write	New attribute added to identify the source of cmd, when SVM fires the nitro cmd, it will set the value of SVMCMD to be 1. . Default value: 0
id	<String>	Read-write	ID of the LA channel or the cluster LA channel to which you want to bind interfaces. Specify an LA channel in LA/x notation, where x can range from 1 to 8 or a cluster LA channel in CLA/x notation or Link redundant channel in LR/x notation , where

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			x can range from 1 to 4.
ifnum	<String[]>	Read-write	Interfaces to be bound to the LA channel of a Citrix ADC or to the LA channel of a cluster configuration. For an LA channel of a Citrix ADC, specify an interface in C/U notation (for example, 1/3). For an LA channel of a cluster configuration, specify an interface in N/C/U notation (for example, 2/1/3). where C can take one of the following values: * 0 - Indicates a management interface. * 1 - Indicates a 1 Gbps port. * 10 - Indicates a 10 Gbps port. U is a unique integer for representing an interface in a particular port group. N is the ID of the node to which an interface belongs in a cluster configuration. Use spaces to separate multiple entries.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
slavemedia	<Integer>	Read-only	Media type of the member interfaces.
slaveflowctl	<Integer>	Read-only	Flowcontrol of the member interfaces.
slavespeed	<Integer>	Read-only	Speed of the member interfaces.
lractiveintf	<Integer>	Read-only	LR set member interface state(active/inactive).
lamode	<String>	Read-only	The mode(AUTO/ MANNUAL) for the LA channel. Possible values = MANUAL, AUTO
slavetime	<Integer>	Read-only	UP time of the member interfaces.
slavestate	<Integer>	Read-only	State of the member interfaces.
slaveduplex	<Integer>	Read-only	Duplex of the member interfaces.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/fis_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "fis_binding": [ {

"name":<String_value>,

"fis_channel_binding":<fis_channel_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/fis_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/fis_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "fis_binding": [ {

"name":<String_value>,

"fis_channel_binding":<fis_channel_binding[]_value>

}]}
```

fis_channel_binding

Binding object showing the channel that can be bound to fis.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ifnum	<String>	Read-write	Interface to be bound to the FIS, specified in slot/port notation (for example, 1/3).
name	<String>	Read-write	The name of the FIS to which you want to bind interfaces. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ownernode	<Integer>	Read-write	ID of the cluster node for which you are creating the FIS. Can be configured only through the cluster IP address. Minimum value = 0 Maximum value = 31
__count	<Double>	Read-write	count parameter

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/fis_channel_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"fis_channel_binding":{

<b>"name":<String_value>,

</b><b>"ifnum":<String_value></b>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/fis_channel_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/fis_channel_binding/ name_value<String> ? **args= ifnum:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/fis_channel_binding/ name_value<String>
Query-parameters: filter http:// <netscaler-ip-address> /nitro/v1/config/fis_channel_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of fis_channel_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/fis_channel_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the fis_channel_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "fis_channel_binding": [ {

"ifnum":<String_value>,

"name":<String_value>,

"ownernode":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/fis_channel_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/fis_channel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/fis_interface_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/fis_interface_binding/ name_value<String> ? **args= ifnum:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

forwardingsession

Configuration for session forward resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the forwarding session rule. Can begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the rule is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			single quotation marks (for example, "my rule" or 'my rule'). Minimum length = 1
network	<String>	Read-write	An IPv4 network address or IPv6 prefix of a network from which the forwarded traffic originates or to which it is destined. Minimum length = 1
netmask	<String>	Read-write	Subnet mask associated with the network. Minimum length = 1
acl6name	<String>	Read-write	Name of any configured ACL6 whose action is ALLOW. The rule of the ACL6 is used as a forwarding session rule. Minimum length = 1
aclname	<String>	Read-write	Name of any configured ACL whose action is ALLOW. The rule of the ACL is used as a forwarding session rule. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
connfailover	<String>	Read-write	Synchronize connection information with the secondary appliance in a high availability (HA) pair. That is, synchronize all connection-related information for the forwarding session. Default value: DISABLED Possible values = ENABLED, DISABLED
sourceroutecache	<String>	Read-write	Cache the source ip address and mac address of the DA servers. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
processlocal	<String>	Read-write	Enabling this option on forwarding session will not steer the packet to flow processor. Instead, packet will be routed. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

inat

Configuration for inbound nat resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Inbound NAT (INAT) entry. Leading character must be a number or letter. Other characters allowed, after the first character, are @ _ - . (period) : (colon) # and space ( ). Minimum length = 1
publicip	<String>	Read-write	Public IP address of packets received on the Citrix ADC. Can be aNetScaler-owned VIP or VIP6 address. Minimum length = 1
privateip	<String>	Read-write	IP address of the server to which the packet is sent by the Citrix ADC. Can be an IPv4 or IPv6 address. Minimum length = 1
mode	<String>	Read-write	Stateless translation. Possible values = STATELESS
tcpproxy	<String>	Read-write	Enable TCP proxy, which enables the Citrix ADC to optimize the RNAT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			TCP traffic by using Layer 4 features. Default value: DISABLED Possible values = ENABLED, DISABLED
ftp	<String>	Read-write	Enable the FTP protocol on the server for transferring files between the client and the server. Default value: DISABLED Possible values = ENABLED, DISABLED
tftp	<String>	Read-write	To enable/disable TFTP (Default DISABLED). Default value: DISABLED Possible values = ENABLED, DISABLED
usip	<String>	Read-write	Enable the Citrix ADC to retain the source IP address of packets before sending the packets to the server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
usnip	<String>	Read-write	Enable the Citrix ADC to use a SNIP address as the source IP address of packets before sending the packets to the server. Possible values = ON, OFF
proxyip	<String>	Read-write	Unique IP address used as the source IP address in packets sent to the server. Must be a MIP or SNIP address.
