Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/inat **HTTP Method:** POST

Response Payload:

```
{ "inat": [ { "__count": "#no"} ] }
```

inatparam

Configuration for INAT parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nat46v6prefix	<String>	Read-write	The prefix used for translating packets received from private IPv6 servers into IPv4 packets. This prefix has a length of 96 bits (128-32 = 96). The IPv6 servers embed the destination IP address of the IPv4 servers or hosts in the last 32 bits of the destination IP address field of the IPv6 packets. The first 96 bits of the destination IP address field are set as the IPv6 NAT prefix. IPv6 packets addressed to this prefix have to be routed to the Citrix ADC to ensure that the IPv6-IPv4 translation is done by the appliance.
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			domain, which has an ID of 0. Default value: 0 Minimum value = 0 Maximum value = 4094
nat46ignoretos	<String>	Read-write	Ignore TOS. Default value: NO Possible values = YES, NO
nat46zerochecksum	<String>	Read-write	Calculate checksum for UDP packets with zero checksum. Default value: ENABLED Possible values = ENABLED, DISABLED
nat46v6mtu	<Integer>	Read-write	MTU setting for the IPv6 side. If the incoming IPv4 packet greater than this, either fragment or send icmp need fragmentation error. Default value: 1280 Minimum value = 1280 Maximum value = 9216

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nat46fragheader	<String>	Read-write	When disabled, translator will not insert IPv6 fragmentation header for non fragmented IPv4 packets. Default value: ENABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

ip6tunnel

Configuration for ip6 Tunnel resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the IPv6 Tunnel. Cannot be changed after the service group is created. Must begin with a number or letter, and can consist of letters, numbers, and the @ _ - . (period) : (colon) # and space ( ) characters. Minimum length = 1 Maximum length = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
remote	<String>	Read-write	An IPv6 address of the remote Citrix ADC used to set up the tunnel. Minimum length = 1
local	<String>	Read-write	An IPv6 address of the local Citrix ADC used to set up the tunnel.
ownergroup	<String>	Read-write	The owner node group in a Cluster for the tunnel. Default value: DEFAULT_NG Minimum length = 1
remoteip	<String>	Read-only	The remote IP address or subnet of the tunnel.
type	<Integer>	Read-only	The type of this tunnel.
encapip	<String>	Read-only	The effective local IP address of the tunnel. Used as the source of the encapsulated packets.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ip6tunnel/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/ip6tunnel/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/ip6tunnel/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of ip6tunnel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "ip6tunnel": [ {

name:<String_value>,remote:<String_value>"remoteip":<String_value>,

"local":<String_value>,

"type":<Integer_value>,

"encapip":<String_value>,

"ownergroup":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ip6tunnel? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ip6tunnel": [ { "__count": "#no"} ] }
```

ip6tunnelparam

Configuration for ip6 tunnel parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcip	<String>	Read-write	Common source IPv6 address for all IPv6 tunnels. Must be a SNIP6 or VIP6 address. Minimum length = 1
dropfrag	<String>	Read-write	Drop any packet that requires fragmentation. Default value: NO Possible values = YES, NO
dropfragcputhreshold	<Integer>	Read-write	Threshold value, as a percentage of CPU usage, at which to drop packets that require fragmentation. Applies only if dropFragparameter is set to NO. Minimum value = 1 Maximum value = 100
srciproundrobin	<String>	Read-write	Use a different source IPv6 address for each new session through a particular IPv6 tunnel, as determined by round robin selection of one of the SNIP6

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			addresses. This setting is ignored if a common global source IPv6 address has been specified for all the IPv6 tunnels. This setting does not apply to a tunnel for which a source IPv6 address has been specified. Default value: NO Possible values = YES, NO
useclientsourceipv6	<String>	Read-write	Use client source IPv6 address as source IPv6 address for outer tunnel IPv6 header. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ip6tunnelparam **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ip6tunnelparam":{

"srcip":<String_value>,

"dropfrag":<String_value>,

"dropfragcputhreshold":<Integer_value>,

"srciproundrobin":<String_value>,

"useclientsourceipv6":<String_value>
```

```
}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ip6tunnelparam? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ip6tunnelparam":{

"srcip":true,

"dropfrag":true,

"dropfragcputhreshold":true,

"srciproundrobin":true,

"useclientsourceipv6":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ip6tunnelparam **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ip6tunnelparam": [ {

"srcip":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

ipset

Configuration for network ipset resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the IP set. Must begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the IP set is created. Choose a name that helps identify the IP set. Minimum length = 1
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

iptunnel

Configuration for ip Tunnel resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the IP tunnel. Leading character must be a number or letter. Other characters allowed, after the first character, are @ _ - . (period) : (colon) # and space ( ). Minimum length = 1
remote	<String>	Read-write	Public IPv4 address, of the remote device, used to set up the tunnel. For this parameter, you can alternatively specify a network address. Minimum length = 1
remotesubnetmask	<String>	Read-write	Subnet mask of the remote IP address of the tunnel.
local	<String>	Read-write	Type of Citrix ADC owned public IPv4 address, configured on the local Citrix ADC and used to set up the tunnel.
protocol	<String>	Read-write	Name of the protocol to be used on this tunnel. Default value: IPIP Possible values = IPIP, GRE, IPSEC, UDP, GENEVE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vnid	<Integer>	Read-write	Virtual network identifier (VNID) is the value that identifies a specific virtual network in the data plane. Minimum value = 1 Maximum value = 16777215
vlantagging	<String>	Read-write	Option to select Vlan Tagging. Default value: DISABLED Possible values = ENABLED, DISABLED
destport	<Integer>	Read-write	Specifies UDP destination port for Geneve packets. Default port is 6081. Default value: 6081 Minimum value = 1024 Maximum value = 65535
tosinherit	<String>	Read-write	Default behavior is to copy the ToS field of the internal IP Packet (Payload) to the outer IP packet (Transport packet). But the user can configure a new ToS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			field using this option. Default value: ENABLED Possible values = ENABLED, DISABLED
grepayload	<String>	Read-write	The payload GRE will carry. Default value: ETHERNETwithDOT1Q Possible values = ETHERNETwithDOT1Q, ETHERNET, IP
ipsecprofilename	<String>	Read-write	Name of IPSec profile to be associated. Default value: "ns_ipsec_default_profile"
vlan	<Integer>	Read-write	The vlan for mulicast packets. Minimum value = 1 Maximum value = 4094
ownergroup	<String>	Read-write	The owner node group in a Cluster for the iptunnel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DEFAULT_NG Minimum length = 1
sysname	<String>	Read-only	The name of the ip tunnel.
type	<Integer>	Read-only	The type of this tunnel.
encapip	<String>	Read-only	The effective local IP address of the tunnel. Used as the source of the encapsulated packets.
channel	<Integer>	Read-only	The tunnel that is bound to a netbridge.
tunneltype	<String[]>	Read-only	Indicates that a tunnel is User-Configured, Internal or DELETE-IN-PROGRESS. Possible values = Configured, Delete-In-Progress
ipsectunnelstatus	<String>	Read-only	Whether the ipsec on this tunnel is up or down. Possible values = DOWN, UP, PARTIAL-UP, UNKNOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
refcnt	<Integer>	Read-only	Number of PBRs to bound to this iptunnel.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

- DELETE
- GET (ALL)
- GET
- COUNT
- UPDATE
- UNSET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/iptunnel **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"iptunnel":{

<b>"name":<String_value>,

</b><b>"remote":<String_value>,

</b><b>"remotesubnetmask":<String_value>,

</b><b>"local":<String_value>,

</b>"protocol":<String_value>,

"vnid":<Integer_value>,

iptunnelparam

Configuration for ip tunnel parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcip	<String>	Read-write	Common source-IP address for all tunnels. For a specific tunnel, this global setting is overridden if you have specified another source IP address. Must be a MIP or SNIP address. Minimum length = 1
dropfrag	<String>	Read-write	Drop any IP packet that requires fragmentation before it is sent through the tunnel. Default value: NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
dropfragcputhreshold	<Integer>	Read-write	Threshold value, as a percentage of CPU usage, at which to drop packets that require fragmentation to use the IP tunnel. Applies only if dropFragparameter is set to NO. The default value, 0, specifies that this parameter is not set. Minimum value = 1 Maximum value = 100
srciproundrobin	<String>	Read-write	Use a different source IP address for each new session through a particular IP tunnel, as determined by round robin selection of one of the SNIP addresses. This setting is ignored if a common global source IP address has been specified for all the IP tunnels. This setting does not apply to a tunnel for which a source IP address has been specified.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
enablestrictrx	<String>	Read-write	Strict PBR check for IPSec packets received through tunnel. Default value: NO Possible values = YES, NO
enablestricttx	<String>	Read-write	Strict PBR check for packets to be sent IPSec protected. Default value: NO Possible values = YES, NO
mac	<String>	Read-write	The shared MAC used for shared IP between cluster nodes/HA peers.
useclientsourceip	<String>	Read-write	Use client source IP as source IP for outer tunnel IP header. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.

ipv6

Configuration for ip v6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ralearning	<String>	Read-write	Enable the Citrix ADC to learn about various routes from Router Advertisement (RA) and Router Solicitation (RS) messages sent by the routers. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
routerredirection	<String>	Read-write	Enable the Citrix ADC to do Router Redirection. Default value: DISABLED Possible values = ENABLED, DISABLED
ndbasereachtime	<Integer>	Read-write	Base reachable time of the Neighbor Discovery (ND6) protocol. The time, in milliseconds, that the Citrix ADC assumes an adjacent device is reachable after receiving a reachability confirmation. Default value: 30000 Minimum value = 1
ndretransmissiontime	<Integer>	Read-write	Retransmission time of the Neighbor Discovery (ND6) protocol. The time, in milliseconds, between retransmitted Neighbor Solicitation (NS) messages, to an adjacent device.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 1000 Minimum value = 1
natprefix	<String>	Read-write	Prefix used for translating packets from private IPv6 servers to IPv4 packets. This prefix has a length of 96 bits (128-32 = 96). The IPv6 servers embed the destination IP address of the IPv4 servers or hosts in the last 32 bits of the destination IP address field of the IPv6 packets. The first 96 bits of the destination IP address field are set as the IPv6 NAT prefix. IPv6 packets addressed to this prefix have to be routed to the Citrix ADC to ensure that the IPv6-IPv4 translation is done by the appliance.
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			default traffic domain, which has an ID of 0. Default value: 0 Minimum value = 0 Maximum value = 4094
dodad	<String>	Read-write	Enable the Citrix ADC to do Duplicate Address Detection (DAD) for all the Citrix ADC owned IPv6 addresses regardless of whether they are obtained through stateless auto configuration, DHCPv6, or manual configuration. Default value: DISABLED Possible values = ENABLED, DISABLED
usipnatprefix	<String>	Read-write	IPV6 NATPREFIX used in NAT46 scenario when USIP is turned on.
basereachtime	<Integer>	Read-only	ND6 base reachable time (ms).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reachtime	<Integer>	Read-only	ND6 computed reachable time (ms).
ndreachtime	<Integer>	Read-only	ND6 computed reachable time (ms).
retransmissiontime	<Integer>	Read-only	ND6 retransmission time (ms).
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

l2param

Configuration for Layer 2 related parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mbfpeermacupdate	<Integer>	Read-write	When mbf_instant_learning is enabled, learn any changes in peer's MAC after this time interval, which is in 10ms ticks. Default value: 10

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxbridgecollision	<Integer>	Read-write	Maximum bridge collision for loop detection . Default value: 20
bdggrpproxyarp	<String>	Read-write	Set/reset proxy ARP in bridge group deployment. Default value: ENABLED Possible values = ENABLED, DISABLED
bdgsetting	<String>	Read-write	Bridging settings for C2C behavior. If enabled, each PE will learn MAC entries independently. Otherwise, when L2 mode is ON, learned MAC entries on a PE will be broadcasted to all other PEs. Default value: DISABLED Possible values = ENABLED, DISABLED
garponvridintf	<String>	Read-write	Send GARP messagess on VRID-configured interfaces upon failover . Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
macmodefwdmypkt	<String>	Read-write	Allows MAC mode vserver to pick and forward the packets even if it is destined to Citrix ADC owned VIP. Default value: DISABLED Possible values = ENABLED, DISABLED
usemymac	<String>	Read-write	Use Citrix ADC MAC for all outgoing packets. Default value: DISABLED Possible values = ENABLED, DISABLED
proxyarp	<String>	Read-write	Proxies the ARP as Citrix ADC MAC for FreeBSD. Default value: ENABLED Possible values = ENABLED, DISABLED
garpreply	<String>	Read-write	Set/reset REPLY form of GARP .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
mbfinstlearning	<String>	Read-write	Enable instant learning of MAC changes in MBF mode. Default value: DISABLED Possible values = ENABLED, DISABLED
rstintfonhafo	<String>	Read-write	Enable the reset interface upon HA failover. Default value: DISABLED Possible values = ENABLED, DISABLED
skipproxyingbsdtrafficc	<String>	Read-write	Control source parameters (IP and Port) for FreeBSD initiated traffic. If Enabled, source parameters are retained. Else proxy the source parameters based on next hop.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
returntoethernetsender	<String>	Read-write	Return to ethernet sender. Default value: DISABLED Possible values = ENABLED, DISABLED
stopmacmoveupdate	<String>	Read-write	Stop Update of server mac change to NAT sessions. Default value: DISABLED Possible values = ENABLED, DISABLED
bridgeagetimeout	<Integer>	Read-write	Time-out value for the bridge table entries, in seconds. The new value applies only to the entries that are dynamically learned after the new value is set. Previously existing bridge table entries expire after the previously configured time-out value.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 300 Minimum value = 60 Maximum value = 300
usenetprofilebsdtraffic	<String>	Read-write	Control source parameters (IP and Port) for FreeBSD initiated traffic. If enabled proxy the source parameters based on netprofile source ip. If netprofile does not have ip configured, then it will continue to use NSIP as earlier. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/l2param **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

l3param

Configuration for Layer 3 related parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcnat	<String>	Read-write	Perform NAT if only the source is in the private network. Default value: ENABLED Possible values = ENABLED, DISABLED
icmpgenratethreshold	<Integer>	Read-write	NS generated ICMP pkts per 10ms rate threshold. Default value: 100
overridernat	<String>	Read-write	USNIP/USIP settings override RNAT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			settings for configured service/virtual server traffic.. . Default value: DISABLED Possible values = ENABLED, DISABLED
dropdfflag	<String>	Read-write	Enable dropping the IP DF flag. Default value: DISABLED Possible values = ENABLED, DISABLED
miproundrobin	<String>	Read-write	Enable round robin usage of mapped IPs. Default value: ENABLED Possible values = ENABLED, DISABLED
externalloopback	<String>	Read-write	Enable external loopback. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tnlpmtuwoconn	<String>	Read-write	Enable/Disable learning PMTU of IP tunnel when ICMP error does not contain connection information. Default value: ENABLED Possible values = ENABLED, DISABLED
usipserverstraypkt	<String>	Read-write	Enable detection of stray server side pkts in USIP mode. Default value: DISABLED Possible values = ENABLED, DISABLED
forwardicmpfragments	<String>	Read-write	Enable forwarding of ICMP fragments. Default value: DISABLED Possible values = ENABLED, DISABLED
dropipfragments	<String>	Read-write	Enable dropping of IP fragments. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
acllogtime	<Integer>	Read-write	Parameter to tune acl logging time. Default value: 5000
implicitaclallow	<String>	Read-write	Do not apply ACLs for internal ports. Default value: ENABLED Possible values = ENABLED, DISABLED
dynamicrouting	<String>	Read-write	Enable/Disable Dynamic routing on partition. This configuration is not applicable to default partition. Default value: DISABLED Possible values = ENABLED, DISABLED
ipv6dynamicrouting	<String>	Read-write	Enable/Disable IPv6 Dynamic routing. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
allowclasseipv4	<String>	Read-write	Enable/Disable IPv4 Class E address clients. Default value: DISABLED Possible values = ENABLED, DISABLED
implicitpbr	<String>	Read-write	Enable/Disable Policy Based Routing for control packets. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.

lacp

Configuration for Link aggregation control protocol resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
syspriority	<Integer>	Read-write	Priority number that determines which peer device of an LACP LA channel can have control over the LA channel. This parameter is globally applied to all LACP channels on the Citrix ADC. The lower the number, the higher the priority. Default value: 32768 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65535
ownernode	<Integer>	Read-write	The owner node in a cluster for which we want to set the lacp priority. Owner node can vary from 0 to 31. Ownernode value of 254 is used for Cluster. Default value: 255
devicename	<String>	Read-only	Name of the channel.
mac	<String>	Read-only	LACP system MAC.
flags	<Integer>	Read-only	Flags of this channel.
lacpkey	<Integer>	Read-only	LACP key of this channel.
clustersyspriority	<Integer>	Read-only	LACP system (Cluster) priority.
clustermac	<String>	Read-only	LACP system (Cluster) mac.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Response Payload:

```
{  "linkset": [ {

"id":<String_value>,

"ifnum":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/linkset? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "linkset": [ { "__count": "#no"} ] }
```

linkset_binding

Binding object which returns the resources bound to linkset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	ID of the linkset for which to display information. If an ID is not provided, the display includes information about all linksets that are available in the cluster.
linkset_interface_binding	<linkset_interface_binding[]>	Read-only	interface that can be bound to linkset.
linkset_channel_binding	<linkset_channel_binding[]>	Read-only	channel that can be bound to linkset.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/linkset_binding/ id_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "linkset_binding": [ {

"id":<String_value>,

"linkset_interface_binding":<linkset_interface_binding[]_value>,

"linkset_channel_binding":<linkset_channel_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/linkset_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/linkset_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "linkset_binding": [ {

"id":<String_value>,

"linkset_interface_binding":<linkset_interface_binding[]_value>,

"linkset_channel_binding":<linkset_channel_binding[]_value>

}]}
```

linkset_channel_binding

Binding object showing the channel that can be bound to linkset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ifnum	<String>	Read-write	The interfaces to be bound to the linkset.
id	<String>	Read-write	ID of the linkset to which to bind the interfaces.
__count	<Double>	Read-write	count parameter

mapbmr

Configuration for MAP-T Basic Mapping rule resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Basic Mapping Rule. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be changed after the MAP Basic Mapping Rule is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "add network MapBmr bmr1 -natprefix 2005::/64 -EAbitLength 16 -psidoffset 6 -portsharingratio 8"). The Basic Mapping Rule information allows a MAP BR to determine source IPv4 address from the IPv6 packet sent from MAP CE device. Also it allows to determine destination IPv6 address of MAP CE before sending packets to MAP CE. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ruleipv6prefix	<String>	Read-write	IPv6 prefix of Customer Edge(CE) device.MAP-T CE will send ipv6 packets with this ipv6 prefix as source ipv6 address prefix.
psidoffset	<Integer>	Read-write	Start bit position of Port Set Identifier(PSID) value in Embedded Address (EA) bits. Default value: 6 Minimum value = 1 Maximum value = 15
eabitlength	<Integer>	Read-write	The Embedded Address (EA) bit field encodes the CE-specific IPv4 address and port information. The EA bit field, which is unique for a given Rule IPv6 prefix. Default value: 16 Minimum value = 2 Maximum value = 47
psidlength	<Integer>	Read-write	Length of Port Set IdentifierPort Set Identifier(PSID) in

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/mapbmr_bmrv4network_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"mapbmr_bmrv4network_binding":{

<b>"name":<String_value>,

</b><b>"network":<String_value>,

</b>"netmask":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/mapbmr_bmrv4network_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ mapbmr_bmrv4network_binding/ name_value<String> ? **args= network:<String_value>, netmask: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/mapbmr_bmrv4network_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ mapbmr_bmrv4network_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of mapbmr_bmrv4network_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/mapbmr_bmrv4network_binding/name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the mapbmr_bmrv4network_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "mapbmr_bmrv4network_binding": [ {

"netmask":<String_value>,

"network":<String_value>,

"name":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/mapbmr_bmrv4network_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/mapbmr_bmrv4network_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "mapbmr_bmrv4network_binding": [ {

"netmask":<String_value>,

"network":<String_value>,

"name":<String_value>

}]}
```

COUNT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"mapbmr_bmrv4network_binding": [ { "__count": "#no"} ] }
```

mapdmr

Configuration for MAP-T Default Mapping rule resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Default Mapping Rule. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the MAP Default Mapping Rule is created. The following requirement applies only to the Citrix ADC CLI: If the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name includes one or more spaces, enclose the name in double or single quotation marks (for example, "add network MapDmr map1 -BRIpv6Prefix 2003::/96"). Default Mapping Rule (DMR) is defined in terms of the IPv6 prefix advertised by one or more BRs, which provide external connectivity. A typical MAP-T CE will install an IPv4 default route using this rule. A BR will use this rule when translating all outside IPv4 source addresses to the IPv6 MAP domain. Minimum length = 1 Maximum length = 127
bripv6prefix	<String>	Read-write	IPv6 prefix of Border Relay (Citrix ADC) device.MAP-T CE will send ipv6 packets to this ipv6 prefix.The DMR IPv6 prefix length

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SHOULD be 64 bits long by default and in any case MUST NOT exceed 96 bits.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

nat64

Configuration for nat64 config resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the NAT64 rule. Must begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(=), colon (:), and underscore characters. Cannot be changed after the rule is created. Choose a name that helps identify the NAT64 rule. Minimum length = 1
acl6name	<String>	Read-write	Name of any configured ACL6 whose action is ALLOW. IPv6 Packets matching the condition of this ACL6 rule and destination IP address of these packets matching the NAT64 IPv6 prefix are considered for NAT64 translation. Minimum length = 1
netprofile	<String>	Read-write	Name of the configured netprofile. The Citrix ADC selects one of the IP address in the netprofile as the source IP address of the translated IPv4 packet to be sent to the IPv4 server. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- UPDATE
- UNSET
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nat64 **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nat64":{

<b>"name":<String_value>,

</b><b>"acl6name":<String_value>,

</b>"netprofile":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nat64 **HTTP Method:** PUT

Request Headers:

Content-Type:application/json

Request Payload:

```
{"nat64":{

<b>"name":<String_value>,

</b>"acl6name":<String_value>,

"netprofile":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nat64? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nat64":{

<b>"name":<String_value>,

</b>"netprofile":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nat64/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nat64 **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nat64? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nat64? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nat64 resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nat64? **view=summary**

Use this query-parameter to get the summary output of nat64 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nat64? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nat64 resources in chunks.

```

nat64param

Configuration for NAT64 parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Default value: 0 Minimum value = 0 Maximum value = 4094
nat64ignoretos	<String>	Read-write	Ignore TOS. Default value: NO Possible values = YES, NO
nat64zerochecksum	<String>	Read-write	Calculate checksum for UDP packets with zero checksum. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
nat64v6mtu	<Integer>	Read-write	MTU setting for the IPv6 side. If the incoming IPv4 packet greater than this, either fragment or send icmp need fragmentation error. Default value: 1280 Minimum value = 1280 Maximum value = 9216
nat64fragheader	<String>	Read-write	When disabled, translator will not insert IPv6 fragmentation header for non fragmented IPv4 packets. Default value: ENABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

nd6

Configuration for nd6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
neighbor	<String>	Read-write	Link-local IPv6 address of the adjacent network device to add to the ND6 table.
mac	<String>	Read-write	MAC address of the adjacent network device.
ifnum	<String>	Read-write	Interface through which the adjacent network device is available, specified in slot/port notation (for example, 1/3). Use spaces to separate multiple entries.
vlan	<Integer>	Read-write	Integer value that uniquely identifies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the VLAN on which the adjacent network device exists. Minimum value = 1 Maximum value = 4094
vxlan	<Integer>	Read-write	ID of the VXLAN on which the IPv6 address of this ND6 entry is reachable. Minimum value = 1 Maximum value = 16777215
vtep	<String>	Read-write	IP address of the VXLAN tunnel endpoint (VTEP) through which the IPv6 address of this ND6 entry is reachable. Minimum length = 1
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 4094
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
state	<String>	Read-only	ND6 state. Default value: REACHABLE Possible values = INCOMPLETE, REACHABLE, STALE, DELAY, PROBE
timeout	<Integer>	Read-only	Time elapsed.
flags	<Integer>	Read-only	flag for static/ permanent entry.
controlplane	<Boolean>	Read-only	This nd6 entry is populated by a control plane protocol.
channel	<Integer>	Read-only	The tunnel that is bound to a netbridge.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

nd6ravariables

Configuration for nd6 Router Advertisment configuration variables resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Integer>	Read-write	The VLAN number. Minimum value = 1 Maximum value = 4094
ceaserouteradv	<String>	Read-write	Cease router advertisements on this vlan. Default value: NO Possible values = YES, NO
sendrouteradv	<String>	Read-write	whether the router sends periodic RAs and responds to Router Solicitations. Default value: NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
srclinklayeraddroption	<String>	Read-write	Include source link layer address option in RA messages. Default value: YES Possible values = YES, NO
onlyunicastrtadvresponse	<String>	Read-write	Send only Unicast Router Advertisements in respond to Router Solicitations. Default value: NO Possible values = YES, NO
managedaddrconfig	<String>	Read-write	Value to be placed in the Managed address configuration flag field. Default value: NO Possible values = YES, NO
otheraddrconfig	<String>	Read-write	Value to be placed in the Other configuration flag field. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
currhoplimit	<Integer>	Read-write	Current Hop limit. Default value: 64 Minimum value = 0 Maximum value = 255
maxrtadvinterval	<Integer>	Read-write	Maximum time allowed between unsolicited multicast RAs, in seconds. Default value: 600 Minimum value = 4 Maximum value = 1800
minrtadvinterval	<Integer>	Read-write	Minimum time interval between RA messages, in seconds. Default value: 198 Minimum value = 3 Maximum value = 1350
linkmtu	<Integer>	Read-write	The Link MTU. Default value: 0 Minimum value = 0 Maximum value = 1500
reachabletime	<Integer>	Read-write	Reachable time, in milliseconds.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 3600000
retranstime	<Integer>	Read-write	Retransmission time, in milliseconds. Default value: 0
defaultlifetime	<Integer>	Read-write	Default life time, in seconds. Default value: 1800 Minimum value = 0 Maximum value = 9000
lastrtadvtime	<Integer>	Read-only	Last RA sent timestamp.
nextrtadvdelay	<Integer>	Read-only	Next RA delay.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nd6ravariables resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables? **view=summary**

Use this query-parameter to get the summary output of nd6ravariables resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nd6ravariables resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nd6ravariables": [ {

"vlan":<Integer_value>,

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nd6ravariables": [ { "__count": "#no"} ] }
```

nd6ravariables_binding

Binding object which returns the resources bound to nd6ravariables.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Integer>	Read-write	The VLAN number. Minimum value = 1 Maximum value = 4094
nd6ravariables_onlinkipv6prefix_binding	<nd6ravariables_onlinkipv6prefix_binding[]>	Read-only	onlinkipv6prefix that can be bound to nd6ravariables.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables_binding/ vlan_value<Integer>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nd6ravariables_binding": [ {

"vlan":<Integer_value>,

"nd6ravariables_onlinkipv6prefix_binding":<nd6ravariables_onlinkipv6prefix
_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nd6ravariables_binding": [ {

"vlan":<Integer_value>,

"nd6ravariables_onlinkipv6prefix_binding":<nd6ravariables_onlinkipv6prefix
_binding[]_value>

}]}
```

nd6ravariables_onlinkipv6prefix_binding

Binding object showing the onlinkipv6prefix that can be bound to nd6ravariables.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Integer>	Read-write	The VLAN number.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 4094
ipv6prefix	<String>	Read-write	Onlink prefixes for RA messages.
__count	<Double>	Read-write	count parameter

Operations

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/nd6ravariables_onlinkipv6prefix_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"nd6ravariables_onlinkipv6prefix_binding":{

<b>"vlan":<Integer_value>,

</b><b>"ipv6prefix":<String_value></b>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables_onlinkipv6prefix_binding/ vlan_value<Integer> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ nd6ravariables_onlinkipv6prefix_binding/ vlan_value<Integer> ? **args= ipv6prefix:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables_onlinkipv6prefix_binding/ vlan_value<Integer> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ nd6ravariables_onlinkipv6prefix_binding/ vlan_value<Integer> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of nd6ravariables_onlinkipv6prefix_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables_onlinkipv6prefix_binding/ vlan_value<Integer> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nd6ravariables_onlinkipv6prefix_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nd6ravariables_onlinkipv6prefix_binding": [ {

"vlan":<Integer_value>,
```

```
"ipv6prefix":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables_onlinkipv6prefix_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/nd6ravariables_onlinkipv6prefix_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/netbridge? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/netbridge? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of netbridge resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/netbridge? **view=summary**

Use this query-parameter to get the summary output of netbridge resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/netbridge? **pagesize=#no;pageno=#no**

Use this query-parameter to get the netbridge resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "netbridge": [ {

"name":<String_value>,

"vxlanvlanmap":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/netbridge/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/netbridge/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of netbridge resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "netbridge": [ {

"name":<String_value>,

```

netbridge_binding

Binding object which returns the resources bound to netbridge.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the network bridge.
netbridge_vlan_binding	<netbridge_vlan_binding[]>	Read-only	vlan that can be bound to netbridge.
netbridge_nsip6_binding	<netbridge_nsip6_binding[]>	Read-only	nsip6 that can be bound to netbridge.
netbridge_nsip_binding	<netbridge_nsip_binding[]>	Read-only	nsip that can be bound to netbridge.
netbridge_iptunnel_binding	<netbridge_iptunnel_binding[]>	Read-only	iptunnel that can be bound to netbridge.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "netbridge_binding": [ {

"name":<String_value>,

"netbridge_nsip_binding":<netbridge_nsip_binding[]_value>,

"netbridge_iptunnel_binding":<netbridge_iptunnel_binding[]_value>,
```

```
"netbridge_vlan_binding":<netbridge_vlan_binding[]_value>,

"netbridge_nsip6_binding":<netbridge_nsip6_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/netbridge_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "netbridge_binding": [ {

"name":<String_value>,

"netbridge_nsip_binding":<netbridge_nsip_binding[]_value>,

"netbridge_iptunnel_binding":<netbridge_iptunnel_binding[]_value>,

"netbridge_vlan_binding":<netbridge_vlan_binding[]_value>,
```

```
"netbridge_nsip6_binding":<netbridge_nsip6_binding[]_value>

}]}
```

netbridge_iptunnel_binding

Binding object showing the iptunnel that can be bound to netbridge.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the network bridge.
tunnel	<String>	Read-write	The name of the tunnel that is a part of this bridge.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT
- ADD
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/netbridge_iptunnel_binding

HTTP Method: PUT

Request Headers:

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge_iptunnel_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/netbridge_iptunnel_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of netbridge_iptunnel_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/netbridge_iptunnel_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the netbridge_iptunnel_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "netbridge_iptunnel_binding": [ {

"name":<String_value>,

"tunnel":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge_iptunnel_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/netbridge_iptunnel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "netbridge_iptunnel_binding": [ {

"name":<String_value>,

"tunnel":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge_iptunnel_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"netbridge_iptunnel_binding": [ { "__count": "#no"} ] }
```

netbridge_nsip6_binding

Binding object showing the nsip6 that can be bound to netbridge.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	The subnet that is extended by this network bridge. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the network bridge.
netmask	<String>	Read-write	The network mask for the subnet.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT
- ADD
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/netbridge_nsip6_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"netbridge_nsip6_binding":{

<b>"name":<String_value>,

</b>"ipaddress":<String_value>,

"netmask":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge_nsip6_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/netbridge_nsip6_binding/ name_value<String> ? **args=ipaddress: <String_value> ,netmask: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge_nsip6_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/netbridge_nsip6_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of netbridge_nsip6_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/netbridge_nsip6_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the netbridge_nsip6_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "netbridge_nsip6_binding": [ {

"ipaddress":<String_value>,
```

```
"name":<String_value>,

"netmask":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/netbridge_nsip6_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/netbridge_nsip6_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

```

netprofile

Configuration for Network profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the net profile. Must begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created. Choose a name that helps identify the net profile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcip	<String>	Read-write	IP address or the name of an IP set.
srcippersistency	<String>	Read-write	When the net profile is associated with a virtual server or its bound services, this option enables the Citrix ADC to use the same address, specified in the net profile, to communicate to servers for all sessions initiated from a particular client to the virtual server. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
overridelsn	<String>	Read-write	USNIP/USIP settings override LSN settings for configured service/virtual server traffic.. . Default value: DISABLED Possible values = ENABLED, DISABLED
mbf	<String>	Read-write	Response will be sent using learnt info if enabled. When creating a netprofile, if you do not set this parameter, the netprofile inherits the global MBF setting (available in the enable ns mode and disable ns mode CLI commands, or in the System > Settings > Configure modes > Configure Modes dialog box). However, you can override this setting after you create the netprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
proxyprotocol	<String>	Read-write	Proxy Protocol Action (Enabled/ Disabled). Default value: DISABLED Possible values = ENABLED, DISABLED
proxyprotocoltxversion	<String>	Read-write	Proxy Protocol Version (V1/V2). Default value: V1 Possible values = V1, V2
proxyprotocolaftertls handshake	<String>	Read-write	ADC doesnt look for proxy header before TLS handshake, if enabled. Proxy protocol parsed after TLS handshake. Default value: DISABLED Possible values = ENABLED, DISABLED
badipactionthreshold	<Integer>	Read-write	Number of protocol violation from an IP address before taking action. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 100000
proxyprotocoltlvoptions	<String[]>	Read-only	Proxy protocol TLV options. Possible values = cert-cn
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

"proxyprotocolaftertlshandshake":<String_value>,

"proxyprotocoltlvoptions":<String[]_value>,

"badipactionthreshold":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/netprofile? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "netprofile": [ { "__count": "#no"} ] }
```

netprofile_binding

Binding object which returns the resources bound to netprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the net profile whose details you want to display. Minimum length = 1
netprofile_natrule_binding	<netprofile_natrule_binding[]>	Read-only	natrule that can be bound to netprofile.
netprofile_srcportset_binding	<netprofile_srcportset_binding[]>	Read-only	srcportset that can be bound to netprofile.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/netprofile_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "netprofile_binding": [ {

"name":<String_value>,

"netprofile_natrule_binding":<netprofile_natrule_binding[]_value>,
```

```
"netprofile_srcportset_binding":<netprofile_srcportset_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/netprofile_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/netprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "netprofile_binding": [ {

"name":<String_value>,

"netprofile_natrule_binding":<netprofile_natrule_binding[]_value>,

"netprofile_srcportset_binding":<netprofile_srcportset_binding[]_value>

}]}
```

netprofile_natrule_binding

Binding object showing the natrule that can be bound to netprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
netmask	<String>	Read-write	.
natrule	<String>	Read-write	IPv4 network address on whose traffic you want the Citrix ADC to do rewrite ip prefix.
name	<String>	Read-write	Name of the netprofile to which to bind port ranges. Minimum length = 1
rewriteip	<String>	Read-write	.
__count	<Double>	Read-write	count parameter

Operations

```

onlinkipv6prefix

Configuration for on-link IPv6 global prefixes for Router Advertisment resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipv6prefix	<String>	Read-write	Onlink prefixes for RA messages.
onlinkprefix	<String>	Read-write	RA Prefix onlink flag. Default value: YES Possible values = YES, NO
autonomusprefix	<String>	Read-write	RA Prefix Autonomus flag. Default value: YES Possible values = YES, NO
depricateprefix	<String>	Read-write	Depricate the prefix. Default value: NO Possible values = YES, NO
decrementprefixlifetimes	<String>	Read-write	RA Prefix Autonomus flag. Default value: NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
prefixvalidelifetime	<Integer>	Read-write	Valide life time of the prefix, in seconds. Default value: 2592000
prefixpreferredlifetime	<Integer>	Read-write	Preferred life time of the prefix, in seconds. Default value: 604800
prefixcurrvalidelft	<Integer>	Read-only	Prefix current valid life time.
prefixcurrpreferredlft	<Integer>	Read-only	Prefix current prefered life time.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

portallocation

Configuration for portallocation resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcip	<String>	Read-write	IP address for which Port allocation needs to be seen. IP address can be SNIP/VIP/NSIP.
destip	<String>	Read-write	Destination IP address or Server IP for which Port allocation needs to be seen.
destport	<Integer>	Read-write	Destination Port or Server port configuration. Minimum value = 1 Maximum value = 65535
protocol	<Integer>	Read-write	Protocol for the traffic. TCP traffic: 1, All other protocol traffic: 0. Minimum value = 0 Maximum value = 1
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
freeports	<Integer>	Read-only	Freeports for the desired IP address and other parameters. Minimum value = 0 Maximum value = 2147483647
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/portallocation **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/portallocation? **args=srcip: <String_value> , destip:<String_value>, destport:<Integer_value>, protocol:<Integer_value>, nodeid: <Integer_value>**

Use this query-parameter to get portallocation resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/portallocation? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/portallocation? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of portallocation resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/portallocation? **view=summary**

Use this query-parameter to get the summary output of portallocation resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/portallocation? **pagesize=#no;pageno=#no**

Use this query-parameter to get the portallocation resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "portallocation": [ {

srcip:<String_value>,<b>destip:<String_value>,</
b><b>destport:<Integer_value>,</b><b>protocol:<Integer_value>,</
b>nodeid:<Integer_value>"freeports":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/portallocation? **args=srcip: <String_value> , destip:<String_value>, destport:<Integer_value>, protocol:<Integer_value>, nodeid: <Integer_value> ;count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "portallocation": [ { "__count": "#no"} ] }
```

ptp

Configuration for Precision Time Protocol resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Enables or disables Precision Time Protocol (PTP) on the appliance. If you disable PTP, make sure you enable Network Time Protocol (NTP) on the cluster. Default value: ENABLE Possible values = DISABLE, ENABLE
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ptp **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ptp":{

<b>"state":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ptp **HTTP Method:** GET

Request Headers:

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ptp": [ {

"state":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

rnat

Configuration for RNAT configured route resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	The network address defined for the RNAT entry. Minimum length = 1
netmask	<String>	Read-write	The subnet mask for the network address. Minimum length = 1
aclname	<String>	Read-write	An extended ACL defined for the RNAT entry. Minimum length = 1
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
ownergroup	<String>	Read-write	The owner node group in a Cluster for this rnat rule. Default value: DEFAULT_NG Minimum length = 1
name	<String>	Read-write	Name for the RNAT4 rule. Must begin with a letter, number, or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the rule is created. Choose a name that helps identify the RNAT4 rule. Minimum length = 1
redirectport	<Integer>	Read-write	Port number to which the IPv4 packets are redirected. Applicable to TCP and UDP protocols. Minimum value = 1 Maximum value = 65535
natip	<String>	Read-write	Any NetScaler-owned IPv4 address except the NSIP address. The NetScaler appliance replaces the source IP addresses of server-generated packets with the IP address specified. The IP address must be a public NetScaler-owned IP address. If you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specify multiple addresses for this field, NATIP selection uses the round robin algorithm for each session. By specifying a range of IP addresses, you can specify all NetScaler-owned IP addresses, except the NSIP, that fall within the specified range. Minimum length = 1
srcippersistency	<String>	Read-write	Enables the Citrix ADC to use the same NAT IP address for all RNAT sessions initiated from a particular server. Default value: DISABLED Possible values = ENABLED, DISABLED
useproxyport	<String>	Read-write	Enable source port proxying, which enables the Citrix ADC to use the RNAT ips using proxied source port. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
connfailover	<String>	Read-write	Synchronize all connection-related information for the RNAT sessions with the secondary ADC in a high availability (HA) pair. Default value: DISABLED Possible values = ENABLED, DISABLED
newname	<String>	Read-write	New name for the RNAT4 rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

rnat6

Configuration for IPv6 RNAT configured route resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the RNAT6 rule. Must begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the rule is created. Choose a name that helps identify the RNAT6 rule. Minimum length = 1
network	<String>	Read-write	IPv6 address of the network on whose traffic you want the Citrix ADC to do RNAT processing. Minimum length = 1
acl6name	<String>	Read-write	Name of any configured ACL6 whose action is ALLOW. The rule of the ACL6 is used as an RNAT6 rule. Minimum length = 1
redirectport	<Integer>	Read-write	Port number to which the IPv6 packets are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			redirected. Applicable to TCP and UDP protocols. Minimum value = 1 Maximum value = 65535
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcippersistency	<String>	Read-write	Enable source ip persistency, which enables the Citrix ADC to use the RNAT ips using source ip. Default value: DISABLED Possible values = ENABLED, DISABLED
ownergroup	<String>	Read-write	The owner node group in a Cluster for this rnat rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DEFAULT_NG Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

rnat6_binding

Binding object which returns the resources bound to rnat6.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the RNAT6 rule whose details you want to display. Minimum length = 1
rnat6_nsip6_binding	<rnat6_nsip6_binding[]>	Read-only	nsip6 that can be bound to rnat6.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rnat6_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rnat6_binding": [ {

"name":<String_value>,

"rnat6_nsip6_binding":<rnat6_nsip6_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rnat6_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/rnat6_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rnat6_binding": [ {

"name":<String_value>,

"rnat6_nsip6_binding":<rnat6_nsip6_binding[]_value>

}]}
```

rnat6_nsip6_binding

Binding object showing the nsip6 that can be bound to rnat6.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
natip6	<String>	Read-write	Nat IP Address. Minimum length = 1
ownergroup	<String>	Read-write	The owner node group in a Cluster for this rnat rule. Default value: DEFAULT_NG Minimum length = 1
name	<String>	Read-write	Name of the RNAT6 rule to which to bind NAT IPs. Minimum length = 1
td	<Integer>	Read-only	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
__count	<Double>	Read-only	count parameter

Operations

Binding object which returns the resources bound to rnatglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rnatglobal_auditsyslogpolicy_binding	<rnatglobal_auditsyslogpolicy_binding[]>	Read-write	auditsyslogpolicy that can be bound to rnatglobal.

Operations

(click to see Properties)

- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rnatglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rnatglobal_binding": [ {

"rnatglobal_auditsyslogpolicy_binding":<rnatglobal_auditsyslogpolicy_binding[]_value>

}]}
```

rnatparam

Configuration for RNAT parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tcpproxy	<String>	Read-write	Enable TCP proxy, which enables the Citrix ADC to optimize the RNAT TCP traffic by using Layer 4 features. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
srcippersistency	<String>	Read-write	Enable source ip persistency, which enables the Citrix ADC to use the RNAT ips using source ip. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.

Operations

- FLUSH

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/rnatsession? **action=flush HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rnatsession":{

"network":<String_value>,

"netmask":<String_value>,

"natip":<String_value>,

"aclname":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

route

Configuration for route resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	IPv4 network address for which to add a route entry in the routing table of the Citrix ADC.
netmask	<String>	Read-write	The subnet mask associated with the network address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gateway	<String>	Read-write	IP address of the gateway for this route. Can be either the IP address of the gateway, or can be null to specify a null interface route. Minimum length = 1
vlan	<Integer>	Read-write	VLAN as the gateway for this route. Minimum value = 1 Maximum value = 4094
cost	<Integer>	Read-write	Positive integer used by the routing algorithms to determine preference for using this route. The lower the cost, the higher the preference. Minimum value = 0 Maximum value = 65535
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
distance	<Integer>	Read-write	Administrative distance of this route, which determines the preference of this route over other routes, with same destination, from different routing protocols. A lower value is preferred. Default value: 1 Minimum value = 0 Maximum value = 255
cost1	<Integer>	Read-write	The cost of a route is used to compare routes of the same type. The route having the lowest cost is the most preferred route. Possible values: 0 through 65535. Default: 0. Minimum value = 0 Maximum value = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
weight	<Integer>	Read-write	Positive integer used by the routing algorithms to determine preference for this route over others of equal cost. The lower the weight, the higher the preference. Default value: 1 Minimum value = 1 Maximum value = 65535
advertise	<String>	Read-write	Advertise this route. Possible values = DISABLED, ENABLED
protocol	<String[]>	Read-write	Routing protocol used for advertising this route. Default value: ADV_ROUTE_FLAGS Possible values = OSPF, ISIS, RIP, BGP
msr	<String>	Read-write	Monitor this route using a monitor of type ARP or PING. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	Name of the monitor, of type ARP or PING, configured on the Citrix ADC to monitor this route. Minimum length = 1
ownergroup	<String>	Read-write	The owner node group in a Cluster for this route. If owner node group is not specified then the route is treated as Striped route. Default value: DEFAULT_NG Minimum length = 1
mgmt	<Boolean>	Read-write	Route in management plane.
routetype	<String>	Read-write	Protocol used by routes that you want to remove from the routing table of the Citrix ADC. Possible values = CONNECTED, STATIC, DYNAMIC, OSPF, ISIS, RIP, BGP
detail	<Boolean>	Read-write	Display a detailed view.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gatewayname	<String>	Read-only	The name of the gateway for this route. For a route other than a link load balancing (LLB) route, this value is null.
type	<Boolean>	Read-only	State of the RNAT.
dynamic	<Boolean>	Read-only	State of the route.
Static	<Boolean>	Read-only	.
permanent	<Boolean>	Read-only	.
direct	<Boolean>	Read-only	.
nat	<Boolean>	Read-only	.
lbroute	<Boolean>	Read-only	.
adv	<Boolean>	Read-only	.
tunnel	<Boolean>	Read-only	Show whether it is a tunnel route or not.
data	<Boolean>	Read-only	Internal data of this route.
data0	<Boolean>	Read-only	Internal route type is stored, used for get.
flags	<Boolean>	Read-only	If this route is dynamic, the name of the routing protocol from which it was learned.
routeowners	<String[]>	Read-only	Use this option with -dynamic and in a cluster only to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specify the set of nodes from which this dynamic route has been learnt. Possible values = 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31
retain	<Integer>	Read-only	.
ospf	<Boolean>	Read-only	OSPF protocol.
isis	<Boolean>	Read-only	ISIS protocol.
rip	<Boolean>	Read-only	RIP protocol.
bgp	<Boolean>	Read-only	BGP protocol.
dhcp	<Boolean>	Read-only	.
advospf	<Boolean>	Read-only	Advertised through OSPF protocol.
advisis	<Boolean>	Read-only	Advertised through ISIS protocol.
advrip	<Boolean>	Read-only	Advertised through RIP protocol.
advbgp	<Boolean>	Read-only	Advertised through BGP protocol.
state	<Integer>	Read-only	The state of the static route. Possible values: UP, DOWN.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
totalprobes	<Integer>	Read-only	The total number of probes sent.
totalfailedprobes	<Integer>	Read-only	The total number of failed probes.
failedprobes	<Integer>	Read-only	Number of the current failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter used with the message code.
monstatparam2	<Integer>	Read-only	Second parameter used with the message code.
monstatparam3	<Integer>	Read-only	Third parameter used with the message code.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

route6

Configuration for route 6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	IPv6 network address for which to add a route entry to the routing table of the Citrix ADC.
gateway	<String>	Read-write	The gateway for this route. The value for this parameter is either an IPv6 address or null. Default value: 0
vlan	<Integer>	Read-write	Integer value that uniquely identifies a VLAN through which the Citrix ADC forwards the packets for this route. Default value: 0 Minimum value = 0 Maximum value = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vxlan	<Integer>	Read-write	Integer value that uniquely identifies a VXLAN through which the Citrix ADC forwards the packets for this route. Minimum value = 1 Maximum value = 16777215
weight	<Integer>	Read-write	Positive integer used by the routing algorithms to determine preference for this route over others of equal cost. The lower the weight, the higher the preference. Default value: 1 Minimum value = 1 Maximum value = 65535
distance	<Integer>	Read-write	Administrative distance of this route from the appliance. Default value: 1 Minimum value = 1 Maximum value = 254
cost	<Integer>	Read-write	Positive integer used by the routing algorithms to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			determine preference for this route. The lower the cost, the higher the preference. Default value: 1 Minimum value = 0 Maximum value = 65535
advertise	<String>	Read-write	Advertise this route. Possible values = DISABLED, ENABLED
msr	<String>	Read-write	Monitor this route with a monitor of type ND6 or PING. Default value: DISABLED Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	Name of the monitor, of type ND6 or PING, configured on the Citrix ADC to monitor this route. Minimum length = 1
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
ownergroup	<String>	Read-write	The owner node group in a Cluster for this route6. If owner node group is not specified then the route is treated as Striped route. Default value: DEFAULT_NG Minimum length = 1
mgmt	<Boolean>	Read-write	Route in management plane.
routetype	<String>	Read-write	Type of IPv6 routes to remove from the routing table of the Citrix ADC. Possible values = CONNECTED, STATIC, DYNAMIC, OSPF, ISIS, BGP, RIP, ND-RA-ROUTE, FIB6
detail	<Boolean>	Read-write	To get a detailed view.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gatewayname	<String>	Read-only	The name of the gateway for this route.
type	<Boolean>	Read-only	State of the RNAT.
dynamic	<Boolean>	Read-only	Whether this route is dynamically learned or not.
data	<Boolean>	Read-only	Internal data of this route.
flags	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
state	<Integer>	Read-only	Whether this route is UP or DOWN.
totalprobes	<Integer>	Read-only	The total number of probes sent.
totalfailedprobes	<Integer>	Read-only	The total number of failed probes.
failedprobes	<Integer>	Read-only	Current number of failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
data1	<String>	Read-only	Internal data of this route. Possible values = ENABLED, DISABLED
routeowners	<String[]>	Read-only	Use this option with -dynamic and in a cluster only to specify the set of nodes from which this dynamic route has been learnt. Possible values = 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31
retain	<Integer>	Read-only	.
Static	<Boolean>	Read-only	Static route.
permanent	<Boolean>	Read-only	Permanent Route.
connected	<Boolean>	Read-only	Connected Route.
ospfv3	<Boolean>	Read-only	For a dynamic route, the routing protocol

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from which the route was learned.
isis	<Boolean>	Read-only	If this route is dynamic then which routing protocol was it learnt from.
active	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
bgp	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
rip	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
raroute	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/route6 **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"route6":{

<b>"network":<String_value>,

</b>"gateway":<String_value>,

"vlan":<Integer_value>,

"vxlan":<Integer_value>,

"weight":<Integer_value>,

"distance":<Integer_value>,

"cost":<Integer_value>,

"advertise":<String_value>,

"msr":<String_value>,

"monitor":<String_value>,

"td":<Integer_value>,

"ownergroup":<String_value>,

"mgmt":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/route6? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"route6":{

<b>"routetype":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/route6/ network_value<String> **Query-parameters: args=gateway: <String_value> ,vlan: <Integer_value> ,vxlan: <Integer_value> ,td: <Integer_value> ,ownergroup: <String_value> ,mgmt: <Boolean_value>**
update
URL: http:// <netscaler-ip-address> /nitro/v1/config/route6 **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"route6":{

<b>"network":<String_value>,

</b>"gateway":<String_value>,

"vlan":<Integer_value>,

"vxlan":<Integer_value>,

"weight":<Integer_value>,
```

```
"distance":<Integer_value>,

"cost":<Integer_value>,

"advertise":<String_value>,

"msr":<String_value>,

"td":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

unset

URL: http:// <netscaler-ip-address> /nitro/v1/config/route6? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"route6":{

<b>"network":<String_value>,

</b>"gateway":<String_value>,

"vlan":<Integer_value>,

"vxlan":<Integer_value>,

"td":<Integer_value>,
```

```
"weight":true,

"distance":true,

"cost":true,

"advertise":true,

"msr":true,

"monitor":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error
get (all)
URL: http:// <netscaler-ip-address> /nitro/v1/config/route6 **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/route6? **args=network: <String_value> ,gateway: <String_value> ,vlan: <Integer_value> ,vxlan: <Integer_value> ,td: <Integer_value> ,routetype: <String_value> ,detail: <Boolean_value> ,mgmt: <Boolean_value>**

Use this query-parameter to get route6 resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/route6? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/route6? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of route6 resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/route6? **view=summary**

Use this query-parameter to get the summary output of route6 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/route6? **pagesize=#no;pageno=#no**

Use this query-parameter to get the route6 resources in chunks.

HTTP Method: GET

Request Headers:

count

URL: http:// <netscaler-ip-address> /nitro/v1/config/route6? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "route6": [ { "__count": "#no"} ] }
```

rsskeytype

Configuration for RSS key type resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rsstype	<String>	Read-write	Type of RSS key, possible values are SYMMETRIC and ASYMMETRIC. Default value: ASYMMETRIC Possible values = ASYMMETRIC, SYMMETRIC
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/rsskeytype **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rsskeytype":{

<b>"rsstype":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rsskeytype **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rsskeytype": [ {

"rsstype":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

vlan

Configuration for "VLAN" resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	A positive integer that uniquely identifies a VLAN. Minimum value = 1 Maximum value = 4094
aliasname	<String>	Read-write	A name for the VLAN. Must begin with a letter, a number, or the underscore symbol, and can consist of from 1 to 31 letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(=), colon (:), and underscore (_) characters. You should choose a name that helps identify the VLAN. However, you cannot perform any VLAN operation by specifying this name instead of the VLAN ID. Maximum length = 31
dynamicrouting	<String>	Read-write	Enable dynamic routing on this VLAN. Default value: DISABLED Possible values = ENABLED, DISABLED
ipv6dynamicrouting	<String>	Read-write	Enable all IPv6 dynamic routing protocols on this VLAN. Note: For the ENABLED setting to work, you must configure IPv6 dynamic routing protocols from the VTYSH command line. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
mtu	<Integer>	Read-write	Specifies the maximum transmission unit (MTU), in bytes. The MTU is the largest packet size, excluding 14 bytes of ethernet header and 4 bytes of crc, that can be transmitted and received over this VLAN. Default value: 0 Minimum value = 500 Maximum value = 9216
sharing	<String>	Read-write	If sharing is enabled, then this vlan can be shared across multiple partitions by binding it to all those partitions. If sharing is disabled, then this vlan can be bound to only one of the partitions. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linklocalipv6addr	<String>	Read-only	The link-local IP address assigned to the VLAN.
rnat	<Boolean>	Read-only	Temporary flag used for internal purpose.
portbitmap	<Integer>	Read-only	Member interfaces of this vlan.
lsbitmap	<Integer>	Read-only	Member linksets of this vlan.
tagbitmap	<Integer>	Read-only	Tagged members of this vlan.
lstagbitmap	<Integer>	Read-only	Tagged linksets of this vlan.
ifaces	<String>	Read-only	Names of all member interfaces of this vlan.
tagifaces	<String>	Read-only	Names of all tagged member interfaces of this vlan.
ifnum	<String>	Read-only	The interface to be bound to the VLAN, specified in slot/port notation (for example, 1/3). Minimum length = 1
tagged	<Boolean>	Read-only	Make the interface an 802.1q tagged interface. Packets sent on this interface on this VLAN have an additional 4-byte 802.1q tag, which

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			identifies the VLAN. To use 802.1q tagging, you must also configure the switch connected to the appliance's interfaces.
vlantd	<Integer>	Read-only	Traffic domain associated with vlan. Minimum value = 0 Maximum value = 4094
sdxvlan	<String>	Read-only	SDX vlan. Default value: NO Possible values = YES, NO
partitionname	<String>	Read-only	Name of the Partition to which this vlan bound to. Minimum length = 1
vxlan	<Integer>	Read-only	The VXLAN that extends this vlan.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

vlan_binding

Binding object which returns the resources bound to vlan.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	Integer that uniquely identifies the VLAN for which the details are to be displayed. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 4094
vlan_channel_binding	<vlan_channel_binding[]>	Read-only	channel that can be bound to vlan.
vlan_nsip_binding	<vlan_nsip_binding[]>	Read-only	nsip that can be bound to vlan.
vlan_linkset_binding	<vlan_linkset_binding[]>	Read-only	linkset that can be bound to vlan.
vlan_nsip6_binding	<vlan_nsip6_binding[]>	Read-only	nsip6 that can be bound to vlan.
vlan_interface_binding	<vlan_interface_binding[]>	Read-only	interface that can be bound to vlan.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_binding/ id_value<Integer> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vlan_binding": [ {

"id":<Integer_value>,

"vlan_linkset_binding":<vlan_linkset_binding[]_value>,

"vlan_channel_binding":<vlan_channel_binding[]_value>,

"vlan_nsip6_binding":<vlan_nsip6_binding[]_value>,

"vlan_interface_binding":<vlan_interface_binding[]_value>,
```

```
"vlan_nsip_binding":<vlan_nsip_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vlan_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vlan_binding": [ {

"id":<Integer_value>,

"vlan_linkset_binding":<vlan_linkset_binding[]_value>,

"vlan_channel_binding":<vlan_channel_binding[]_value>,

"vlan_nsip6_binding":<vlan_nsip6_binding[]_value>,

"vlan_interface_binding":<vlan_interface_binding[]_value>,
```

```
"vlan_nsip_binding":<vlan_nsip_binding[]_value>

}]}
```

vlan_channel_binding

Binding object showing the channel that can be bound to vlan.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tagged	<Boolean>	Read-write	Make the interface an 802.1q tagged interface. Packets sent on this interface on this VLAN have an additional 4-byte 802.1q tag, which identifies the VLAN. To use 802.1q tagging, you must also configure the switch connected to the appliance's interfaces.
ownergroup	<String>	Read-write	The owner node group in a Cluster for this vlan. Default value: DEFAULT_NG Minimum length = 1
id	<Integer>	Read-write	Specifies the virtual LAN ID. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 4094
ifnum	<String>	Read-write	The interface to be bound to the VLAN, specified in slot/port notation (for example, 1/3). Minimum length = 1
__count	<Double>	Read-write	count parameter

Content-Type:application/json

Request Payload:

```
{

"vlan_channel_binding":{

<b>"id":<Integer_value>,

</b>"ifnum":<String_value>,

"tagged":<Boolean_value>,

"ownergroup":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_channel_binding/ id_value<Integer>
Query-parameters: args http:// <netscaler-ip-address> /nitro/v1/config/vlan_channel_binding/ id_value<Integer> ? **args=ifnum: <String_value> ,tagged: <Boolean_value> ,ownergroup: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_channel_binding/ id_value<Integer>
Query-parameters: filter http:// <netscaler-ip-address> /nitro/v1/config/vlan_channel_binding/ id_value<Integer> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vlan_channel_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/vlan_channel_binding/ id_value<Integer> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vlan_channel_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vlan_channel_binding": [ {

"tagged":<Boolean_value>,

"ownergroup":<String_value>,

"id":<Integer_value>,

"ifnum":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_channel_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vlan_channel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vlan_channel_binding": [ {

"tagged":<Boolean_value>,

"ownergroup":<String_value>,

"id":<Integer_value>,

"ifnum":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_channel_binding/ id_value<Integer> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vlan_channel_binding": [ { "__count": "#no"} ] }
```

vlan_interface_binding

Binding object showing the interface that can be bound to vlan.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tagged	<Boolean>	Read-write	Make the interface an 802.1q tagged interface. Packets sent on this interface on this VLAN have an additional 4-byte 802.1q tag, which identifies the VLAN. To use 802.1q tagging, you must also configure the switch connected to the appliance's interfaces.
ifnum	<String>	Read-write	The interface to be bound to the VLAN, specified in slot/port notation (for example, 1/3). Minimum length = 1
id	<Integer>	Read-write	Specifies the virtual LAN ID. Minimum value = 1 Maximum value = 4094
ownergroup	<String>	Read-write	The owner node group in a Cluster for this vlan. Default value: DEFAULT_NG Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vlan_interface_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_nsip_binding/ id_value<Integer> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vlan_nsip_binding": [ { "__count": "#no"} ] }
```

vrid

Configuration for Virtual Router ID resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	Integer that uniquely identifies the VMAC address. The generic VMAC address is in the form of 00:00:5e:00:01:<VRID>. For example, if you add a VRID with a value of 60 and bind it to an interface, the resulting VMAC address is 00:00:5e:00:01:3c, where 3c is the hexadecimal representation of 60. Minimum value = 1 Maximum value = 255
priority	<Integer>	Read-write	Base priority (BP), in an active-active mode configuration, which ordinarily determines the master VIP address. Default value: 255 Minimum value = 0 Maximum value = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
preemption	<String>	Read-write	In an active-active mode configuration, make a backup VIP address the master if its priority becomes higher than that of a master VIP address bound to this VMAC address. If you disable pre-emption while a backup VIP address is the master, the backup VIP address remains master until the original master VIP's priority becomes higher than that of the current master. Default value: ENABLED Possible values = ENABLED, DISABLED
sharing	<String>	Read-write	In an active-active mode configuration, enable the backup VIP address to process any traffic instead of dropping it. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tracking	<String>	Read-write	The effective priority (EP) value, relative to the base priority (BP) value in an active-active mode configuration. When EP is set to a value other than None, it is EP, not BP, which determines the master VIP address. Available settings function as follows: * NONE - No tracking. EP = BP * ALL - If the status of all virtual servers is UP, EP = BP. Otherwise, EP = 0. * ONE - If the status of at least one virtual server is UP, EP = BP. Otherwise, EP = 0. * PROGRESSIVE - If the status of all virtual servers is UP, EP = BP. If the status of all virtual servers is DOWN, EP = 0. Otherwise

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			EP = BP (1 - K/N), where N is the total number of virtual servers associated with the VIP address and K is the number of virtual servers for which the status is DOWN. Default: NONE. Default value: NONE Possible values = NONE, ONE, ALL, PROGRESSIVE
ownernode	<Integer>	Read-write	In a cluster setup, assign a cluster node as the owner of this VMAC address for IP based VRRP configuration. If no owner is configured, owner node is displayed as ALL and one node is dynamically elected as the owner. Minimum value = 0 Maximum value = 31
trackifnumpriority	<Integer>	Read-write	Priority by which the Effective priority will be reduced if any of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the tracked interfaces goes down in an active-active configuration. Default value: 0 Minimum value = 1 Maximum value = 255
preemptiondelaytimer	<Integer>	Read-write	Preemption delay time, in seconds, in an active-active configuration. If any high priority node will come in network, it will wait for these many seconds before becoming master. Default value: 0 Minimum value = 1 Maximum value = 36000
all	<Boolean>	Read-write	Remove all the configured VMAC addresses from the Citrix ADC.
ifaces	<String>	Read-only	Interfaces bound to this VRID.
type	<String>	Read-only	Indicates whether this VRID entry was added manually or dynamically. When you manually add a VRID entry, the value

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for this parameter is STATIC. Otherwise, it is DYNAMIC. Possible values = STATIC, DYNAMIC
effectivepriority	<Integer>	Read-only	The effective priority of this VRID.
flags	<Integer>	Read-only	Flags.
ipaddress	<String>	Read-only	The IP address bound to the VRID.
state	<Integer>	Read-only	State of this VRID.
operationalownernode	<Integer>	Read-only	Run time owner node of the vrid. Minimum value = 0 Maximum value = 31
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vrid":{

<b>"id":<Integer_value>,

</b>"priority":<Integer_value>,
```

```
"preemption":<String_value>,

"sharing":<String_value>,

"tracking":<String_value>,

"ownernode":<Integer_value>,

"trackifnumpriority":<Integer_value>,

"preemptiondelaytimer":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid/ id_value<Integer> **Query-parameters: args=all: <Boolean_value>**
update
URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vrid":{

<b>"id":<Integer_value>,

</b>"priority":<Integer_value>,

"preemption":<String_value>,
```

```
"sharing":<String_value>,

vrid6_binding

Binding object which returns the resources bound to vrid6.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	Integer value that uniquely identifies a VMAC6 address. Minimum value = 1 Maximum value = 255
vrid6_nsip_binding	<vrid6_nsip_binding[]>	Read-only	nsip that can be bound to vrid6.
vrid6_nsip6_binding	<vrid6_nsip6_binding[]>	Read-only	nsip6 that can be bound to vrid6.
vrid6_channel_binding	<vrid6_channel_binding[]>	Read-only	channel that can be bound to vrid6.
vrid6_trackinterface_binding	<vrid6_trackinterface_binding[]>	Read-only	trackinterface that can be bound to vrid6.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vrid6_interface_binding	<vrid6_interface_binding[]>	Read-only	interface that can be bound to vrid6.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_binding/ id_value<Integer> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vrid6_binding": [ {

"id":<Integer_value>,

"vrid6_nsip_binding":<vrid6_nsip_binding[]_value>,

"vrid6_nsip6_binding":<vrid6_nsip6_binding[]_value>,

"vrid6_interface_binding":<vrid6_interface_binding[]_value>,

"vrid6_trackinterface_binding":<vrid6_trackinterface_binding[]_value>,

"vrid6_channel_binding":<vrid6_channel_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vrid6_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vrid6_binding": [ {

"id":<Integer_value>,

```

vrid6_channel_binding

Binding object showing the channel that can be bound to vrid6.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	Integer value that uniquely identifies a VMAC6 address. Minimum value = 1 Maximum value = 255
ifnum	<String>	Read-write	Interfaces to bind to the VMAC6, specified in (slot/port) notation (for example, 1/2).Use spaces to separate multiple entries.
vlan	<Integer>	Read-only	The VLAN in which this VRID resides.
flags	<Integer>	Read-only	Flags.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vrid6_channel_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"vrid6_channel_binding":{

<b>"id":<Integer_value>,

</b>"ifnum":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Integer>
Query-parameters: args http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Integer> ? **args=ifnum: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Integer>
Query-parameters: filter http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Integer> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vrid6_channel_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Integer> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vrid6_channel_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vrid6_channel_binding": [ {

"id":<Integer_value>,

"ifnum":<String_value>,

"vlan":<Integer_value>,

"flags":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_binding/ id_value<Integer> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vrid_binding": [ {

"id":<Integer_value>,

"vrid_nsip_binding":<vrid_nsip_binding[]_value>,

"vrid_interface_binding":<vrid_interface_binding[]_value>,

"vrid_channel_binding":<vrid_channel_binding[]_value>,

"vrid_nsip6_binding":<vrid_nsip6_binding[]_value>,

"vrid_trackinterface_binding":<vrid_trackinterface_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vrid_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vrid_binding": [ {

"id":<Integer_value>,

"vrid_nsip_binding":<vrid_nsip_binding[]_value>,

"vrid_interface_binding":<vrid_interface_binding[]_value>,

"vrid_channel_binding":<vrid_channel_binding[]_value>,

"vrid_nsip6_binding":<vrid_nsip6_binding[]_value>,

"vrid_trackinterface_binding":<vrid_trackinterface_binding[]_value>

}]}
```

vrid_channel_binding

Binding object showing the channel that can be bound to vrid.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ifnum	<String>	Read-write	Interfaces to bind to the VMAC, specified in (slot/port) notation (for example, 1/2).Use spaces to separate multiple entries.
id	<Integer>	Read-write	Integer that uniquely identifies the VMAC address. The generic VMAC address is in the form of 00:00:5e:00:01:<VRID>. For example, if you add a VRID with a value of 60 and bind it to an interface, the resulting VMAC address is 00:00:5e:00:01:3c, where 3c is the hexadecimal representation of 60. Minimum value = 1 Maximum value = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Integer>	Read-only	The VLAN in which this VRID resides.
flags	<Integer>	Read-only	Flags.
__count	<Double>	Read-only	count parameter

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding/ id_value<Integer>
Query-parameters: filter http:// <netscaler-ip-address> /nitro/v1/config/ vrid_trackinterface_binding/ id_value<Integer> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vrid_trackinterface_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding/ id_value<Integer> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vrid_trackinterface_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vrid_trackinterface_binding": [ {

"trackifnum":<String_value>,

"id":<Integer_value>,

"flags":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vrid_trackinterface_binding": [ {

"trackifnum":<String_value>,
```

```
"id":<Integer_value>,

"flags":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding/ id_value<Integer> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vrid_trackinterface_binding": [ { "__count": "#no"} ] }
```

vridparam

Configuration for VR ID parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sendtomaster	<String>	Read-write	Forward packets to the master node, in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			an active-active mode configuration, if the virtual server is in the backup state and sharing is disabled. Default value: DISABLED Possible values = ENABLED, DISABLED
hellointerval	<Integer>	Read-write	Interval, in milliseconds, between vrrp advertisement messages sent to the peer node in active-active mode. Default value: 1000 Minimum value = 200 Maximum value = 1000
deadinterval	<Integer>	Read-write	Number of seconds after which a peer node in active-active mode is marked down if vrrp advertisements are not received from the peer node. Default value: 3 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 60
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vridparam **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vridparam":{

"sendtomaster":<String_value>,

"hellointerval":<Integer_value>,

"deadinterval":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vridparam? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vridparam":{

"sendtomaster":true,
```

```
"hellointerval":true,

"deadinterval":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vridparam **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vridparam": [ {

"sendtomaster":<String_value>,

"hellointerval":<Integer_value>,

"deadinterval":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

vxlan

Configuration for "VXLAN" resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	A positive integer, which is also called VXLAN Network Identifier (VNI), that uniquely identifies a VXLAN. Minimum value = 1 Maximum value = 16777215
vlan	<Integer>	Read-write	ID of VLANs whose traffic is allowed over this VXLAN. If you do not specify any VLAN IDs, the Citrix ADC allows traffic of all VLANs that are not part of any other VXLANs. Minimum value = 2 Maximum value = 4094
port	<Integer>	Read-write	Specifies UDP destination port for VXLAN packets. Default value: 4789 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65534
dynamicrouting	<String>	Read-write	Enable dynamic routing on this VXLAN. Default value: DISABLED Possible values = ENABLED, DISABLED
ipv6dynamicrouting	<String>	Read-write	Enable all IPv6 dynamic routing protocols on this VXLAN. Note: For the ENABLED setting to work, you must configure IPv6 dynamic routing protocols from the VTYSH command line. Default value: DISABLED Possible values = ENABLED, DISABLED
type	<String>	Read-write	VXLAN encapsulation type. VXLAN, VXLANGPE. Default value: VXLAN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = VXLAN, VXLANGPE
protocol	<String>	Read-write	VXLAN-GPE next protocol. RESERVED, IPv4, IPv6, ETHERNET, NSH. Default value: ETHERNET Possible values = IPv4, IPv6, ETHERNET, NSH
innervlantagging	<String>	Read-write	Specifies whether Citrix ADC should generate VXLAN packets with inner VLAN tag. Default value: DISABLED Possible values = ENABLED, DISABLED
td	<Integer>	Read-only	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-only	The Partition to which this vxlan is bound. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

vxlan_binding

Binding object which returns the resources bound to vxlan.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	A positive integer, which is also called VXLAN Network Identifier (VNI), that uniquely identifies a VXLAN. Minimum value = 1 Maximum value = 16777215
vxlan_iptunnel_binding	<vxlan_iptunnel_binding[]>	Read-only	iptunnel that can be bound to vxlan.
vxlan_nsip_binding	<vxlan_nsip_binding[]>	Read-only	nsip that can be bound to vxlan.
vxlan_nsip6_binding	<vxlan_nsip6_binding[]>	Read-only	nsip6 that can be bound to vxlan.
vxlan_srcip_binding	<vxlan_srcip_binding[]>	Read-only	srcip that can be bound to vxlan.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_binding/ id_value<Integer> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vxlan_binding": [ {

"id":<Integer_value>,

"vxlan_nsip_binding":<vxlan_nsip_binding[]_value>,

"vxlan_iptunnel_binding":<vxlan_iptunnel_binding[]_value>,

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip6_binding/ id_value<Integer>
Query-parameters: filter http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip6_binding/ id_value<Integer> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vxlan_nsip6_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip6_binding/ id_value<Integer> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vxlan_nsip6_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vxlan_nsip6_binding": [ {

"ipaddress":<String_value>,

"id":<Integer_value>,
```

```
"netmask":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip6_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip6_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vxlan_nsip6_binding": [ {

"ipaddress":<String_value>,

"id":<Integer_value>,

"netmask":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip6_binding/ id_value<Integer> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vxlan_nsip6_binding": [ { "__count": "#no"} ] }
```

vxlan_nsip_binding

Binding object showing the nsip that can be bound to vxlan.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
netmask	<String>	Read-write	Subnet mask for the network address defined for this VXLAN.
id	<Integer>	Read-write	A positive integer, which is also called VXLAN Network Identifier (VNI), that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			uniquely identifies a VXLAN. Minimum value = 1 Maximum value = 16777215
ipaddress	<String>	Read-write	The IP address assigned to the VXLAN.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vxlan_nsip_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"vxlan_nsip_binding":{

<b>"id":<Integer_value>,

</b>"ipaddress":<String_value>,

"netmask":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip_binding/ id_value<Integer> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip_binding/ id_value<Integer> ? **args=ipaddress: <String_value> ,netmask: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip_binding/ id_value<Integer> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip_binding/ id_value<Integer> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vxlan_nsip_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/vxlan_nsip_binding/ id_value<Integer> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vxlan_nsip_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

```

vxlanvlanmap_binding

Binding object which returns the resources bound to vxlanvlanmap.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the mapping table. Minimum length = 1
vxlanvlanmap_vxlan_binding	<vxlanvlanmap_vxlan_binding[]>	Read-only	vxlan that can be bound to vxlanvlanmap.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vxlanvlanmap_binding": [ {

"name":<String_value>,

"vxlanvlanmap_vxlan_binding":<vxlanvlanmap_vxlan_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_binding **HTTP Method:** GET

nsxmlnamespace	Configuration for XML namespace
reboot	
shutdown	

nsacl

Configuration for ACL entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclname	<String>	Read-write	Name for the extended ACL rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
aclaction	<String>	Read-write	Action to perform on incoming IPv4 packets that match the extended ACL rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Available settings function as follows: * ALLOW - The Citrix ADC processes the packet. * BRIDGE - The Citrix ADC bridges the packet to the destination without processing it. * DENY - The Citrix ADC drops the packet. Possible values = BRIDGE, DENY, ALLOW
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcip	<Boolean>	Read-write	IP address or range of IP addresses to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			match against the source IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipval	<String>	Read-write	IP address or range of IP addresses to match against the source IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example:10.102.29.30-10.102.29.189.
srcipdataset	<String>	Read-write	Policy dataset which can have multiple IP ranges bound to it.
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an incoming IPv4

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packet. In the command line interface, separate the range with a hyphen. For example: 40-90.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Port number or range of port numbers to match against the source port number of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Maximum length = 65535
srcportdataset	<String>	Read-write	Policy dataset which can have multiple port ranges bound to it.
destip	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an incoming IPv4 packet. In the command line

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipval	<String>	Read-write	IP address or range of IP addresses to match against the destination IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
destipdataset	<String>	Read-write	Policy dataset which can have multiple IP ranges bound to it.
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an incoming IPv4 packet. In the command line

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Port number or range of port numbers to match against the destination port number of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols. Maximum length = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
destportdataset	<String>	Read-write	Policy dataset which can have multiple port ranges bound to it.
ttl	<Integer>	Read-write	Number of seconds, in multiples of four, after which the extended ACL rule expires. If you do not want the extended ACL rule to expire, do not specify a TTL value. Minimum value = 1 Maximum value = 2147483647
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an incoming IPv4 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
protocol	<String>	Read-write	Protocol to match against the protocol of an incoming IPv4 packet. Possible values = ICMP, IGMP, TCP, EGP, IGP, ARGUS, UDP, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, ICMPV6, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-Protocol, CFTP, Any-Local-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IGNORE, Mobility-Header, UDPLite
protocolnumber	<Integer>	Read-write	Protocol to match against the protocol of an incoming IPv4 packet. Minimum value = 1 Maximum value = 255
vlan	<Integer>	Read-write	ID of the VLAN. The Citrix ADC applies the ACL rule only to the incoming packets of the specified VLAN. If you do not specify a VLAN ID, the appliance applies the ACL rule to the incoming packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Integer>	Read-write	ID of the VXLAN. The Citrix ADC applies the ACL rule only to the incoming packets of the specified VXLAN. If you do not specify a VXLAN ID, the appliance applies the ACL rule to the incoming packets on all VXLANs.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC applies the ACL rule only to the incoming packets from the specified interface. If you do not specify any value, the appliance applies the ACL rule to the incoming packets of all interfaces.
established	<Boolean>	Read-write	Allow only incoming TCP packets that have the ACK or RST bit set, if the action set for the ACL rule is ALLOW and these packets match the other conditions in the ACL rule.
icmptype	<Integer>	Read-write	ICMP Message type to match against the message type of an incoming ICMP packet. For example, to block DESTINATION UNREACHABLE messages, you must specify 3 as the ICMP type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: This parameter can be specified only for the ICMP protocol. Minimum value = 0 Maximum value = 65536
icmpcode	<Integer>	Read-write	Code of a particular ICMP message type to match against the ICMP code of an incoming ICMP packet. For example, to block DESTINATION HOST UNREACHABLE messages, specify 3 as the ICMP type and 1 as the ICMP code. If you set this parameter, you must set the ICMP Type parameter. Minimum value = 0 Maximum value = 65536
priority	<Integer>	Read-write	Priority for the extended ACL rule that determines the order in which it is evaluated relative to the other extended ACL rules. If you do

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			not specify priorities while creating extended ACL rules, the ACL rules are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 100000
state	<String>	Read-write	Enable or disable the extended ACL rule. After you apply the extended ACL rules, the Citrix ADC compares incoming packets against the enabled extended ACL rules. Default value: ENABLED Possible values = ENABLED, DISABLED
logstate	<String>	Read-write	Enable or disable logging of events related to the extended ACL rule. The log messages are stored in the configured syslog or auditlog server. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
ratelimit	<Integer>	Read-write	Maximum number of log messages to be generated per second. If you set this parameter, you must enable the Log State parameter. Default value: 100 Minimum value = 1 Maximum value = 10000
type	<String>	Read-write	Type of the acl ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster . Default value: CLASSIC Possible values = CLASSIC, DFD

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dfdhash	<String>	Read-write	Specifies the type hashmethod to be applied, to steer the packet to the FP of the packet. Possible values = SIP-SPORT-DIP-DPORT, SIP, DIP, SIP-DIP, SIP-SPORT, DIP-DPORT
nodeid	<Integer>	Read-write	Specifies the NodeId to steer the packet to the provided FP. Minimum value = 0 Maximum value = 31
stateful	<String>	Read-write	If stateful option is enabled, transparent sessions are created for the traffic hitting this ACL and not hitting any other features like LB, INAT etc. . Default value: NO Possible values = YES, NO
newname	<String>	Read-write	New name for the extended ACL rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
hits	<Integer>	Read-only	The hits of this ACL.
kernelstate	<String>	Read-only	The commit status of the ACL. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED, SFAPPLIED61, SFNOTAPPLIED61
aclassociate	<String[]>	Read-only	ACL linked. Possible values = NAT, FORWARDINGSESSION, NAT64, LSN
aclchildcount	<Integer>	Read-only	Number of childs for this ACL.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- RENAME
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl **HTTP Method:** POST

```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsacl":{

<b>"aclname":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **args=aclname: <String_value> ,type: <String_value>**

Use this query-parameter to get nsacl resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsacl resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **view=summary**

Use this query-parameter to get the summary output of nsacl resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsacl resources in chunks.

nsacl6

Configuration for ACL6 entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
acl6name	<String>	Read-write	Name for the ACL6 rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
acl6action	<String>	Read-write	Action to perform on the incoming IPv6 packets that match the ACL6 rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Available settings function as follows: * ALLOW - The Citrix ADC processes the packet. * BRIDGE - The Citrix ADC bridges the packet to the destination without processing it. * DENY - The Citrix ADC drops the packet. Possible values = BRIDGE, DENY, ALLOW
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcipv6	<Boolean>	Read-write	IP address or range of IP addresses to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			match against the source IP address of an incoming IPv6 packet. In the command line interface, separate the range with a hyphen.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipv6val	<String>	Read-write	Source IPv6 address (range).
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an incoming IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Source port (range). Maximum length = 65535
destipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an incoming IPv6 packet. In the command line interface, separate the range with a hyphen.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipv6val	<String>	Read-write	Destination IPv6 address (range).
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an incoming IPv6 packet. In the command line interface, separate the range with a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Destination port (range). Maximum length = 65535
ttl	<Integer>	Read-write	Time to expire this ACL6 (in seconds). Minimum value = 1 Maximum value = 2147483647
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an incoming IPv6 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address, srcMacMask value "000000111111". . Default value: "000000000000"
protocol	<String>	Read-write	Protocol, identified by protocol name, to match against the protocol of an incoming IPv6 packet. Possible values = ICMPV6, TCP, UDP, ICMP, IGMP, EGP, IGP, ARGUS, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SWIPE, NARP, MOBILE, TLSP, SKIP, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-IGNORE, Mobility-Header, UDPLite
protocolnumber	<Integer>	Read-write	Protocol, identified by protocol number, to match against the protocol of an incoming IPv6 packet. Minimum value = 1 Maximum value = 255
vlan	<Integer>	Read-write	ID of the VLAN. The Citrix ADC applies the ACL6 rule only to the incoming packets on the specified VLAN. If you do not specify a VLAN ID, the appliance applies the ACL6 rule to the incoming packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Integer>	Read-write	ID of the VXLAN. The Citrix ADC applies the ACL6 rule only to the incoming packets on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the specified VXLAN. If you do not specify a VXLAN ID, the appliance applies the ACL6 rule to the incoming packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC applies the ACL6 rule only to the incoming packets from the specified interface. If you do not specify any value, the appliance applies the ACL6 rule to the incoming packets from all interfaces.
established	<Boolean>	Read-write	Allow only incoming TCP packets that have the ACK or RST bit set if the action set for the ACL6 rule is ALLOW and these packets match the other conditions in the ACL6 rule.
icmptype	<Integer>	Read-write	ICMP Message type to match against the message type of an incoming IPv6 ICMP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packet. For example, to block DESTINATION UNREACHABLE messages, you must specify 3 as the ICMP type. Note: This parameter can be specified only for the ICMP protocol. Minimum value = 0 Maximum value = 65536
icmpcode	<Integer>	Read-write	Code of a particular ICMP message type to match against the ICMP code of an incoming IPv6 ICMP packet. For example, to block DESTINATION HOST UNREACHABLE messages, specify 3 as the ICMP type and 1 as the ICMP code. If you set this parameter, you must set the ICMP Type parameter. Minimum value = 0 Maximum value = 65536

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-write	Priority for the ACL6 rule, which determines the order in which it is evaluated relative to the other ACL6 rules. If you do not specify priorities while creating ACL6 rules, the ACL6 rules are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 81920
state	<String>	Read-write	State of the ACL6. Default value: ENABLED Possible values = ENABLED, DISABLED
type	<String>	Read-write	Type of the acl6 ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			steering of the packet in cluster . Default value: CLASSIC Possible values = CLASSIC, DFD
dfdhash	<String>	Read-write	Specifies the type of hashmethod to be applied, to steer the packet to the FP of the packet. Possible values = SIP-SPORT-DIP-DPORT, SIP, DIP, SIP-DIP, SIP-SPORT, DIP-DPORT
dfdprefix	<Integer>	Read-write	hashprefix to be applied to SIP/DIP to generate rsshash FP.eg 128 => hash calculated on the complete IP. Default value: 128 Minimum value = 1 Maximum value = 128
nodeid	<Integer>	Read-write	Specifies the NodeId to steer the packet to the provided FP. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 31
stateful	<String>	Read-write	If stateful option is enabled, transparent sessions are created for the traffic hitting this ACL6 and not hitting any other features like LB, INAT etc. . Default value: NO Possible values = YES, NO
logstate	<String>	Read-write	Enable or disable logging of events related to the ACL6 rule. The log messages are stored in the configured syslog or auditlog server. Default value: DISABLED Possible values = ENABLED, DISABLED
ratelimit	<Integer>	Read-write	Maximum number of log messages to be generated per second. If you set this parameter, you must enable the Log State parameter. Default value: 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 10000
aclaction	<String>	Read-write	Action associated with the ACL6. Possible values = BRIDGE, DENY, ALLOW
newname	<String>	Read-write	New name for the ACL6 rule. Must begin with an ASCII alphabetic or underscore \(_\) character, and must contain only ASCII alphanumeric, underscore, hash \(#\), period \(.\), space, colon \(:\), at \(@\), equals \(=\), and hyphen \(-\) characters. Minimum length = 1
kernelstate	<String>	Read-only	Commit status of the ACL6. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hits	<Integer>	Read-only	Number of hits of this ACL6.
aclassociate	<String[]>	Read-only	ACL6 linked. Possible values = NAT, FORWARDINGSESSION, NAT64, LSN
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- RENAME
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl6 **HTTP Method:** POST

```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsacl6":{

<b>"acl6name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl6 **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **args=acl6name: <String_value> ,type: <String_value>**

Use this query-parameter to get nsacl6 resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsacl6 resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **view=summary**

Use this query-parameter to get the summary output of nsacl6 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsacl6 resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nsacls

Configuration for ACL entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the acl ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster . Default value: CLASSIC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = CLASSIC, DFD

Operations

(click to see Properties)

- RENUMBER
- CLEAR
- APPLY

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

RENUMBER

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacls? **action=renumber HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsacls":{

"type":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacls? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsacls":{

"type":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

APPLY

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacls? **action=apply HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsacls":{

"type":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nsacls6

Configuration for ACL6 entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the acl ,default will be CLASSIC. Available options as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster . Default value: CLASSIC Possible values = CLASSIC, DFD

Operations

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsappflowcollector":{

<b>"name":<String_value>,

</b><b>"ipaddress":<String_value>,

</b>"port":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsappflowcollector resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **view=summary**

Use this query-parameter to get the summary output of nsappflowcollector resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsappflowcollector resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsappflowcollector": [ {

"name":<String_value>,

"ipaddress":<String_value>,

"port":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector/ name_value<String>
Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nsappflowcollector resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsappflowcollector": [ {

"name":<String_value>,

"ipaddress":<String_value>,

"port":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsappflowcollector": [ { "__count": "#no"} ] }
```

nsappflowparam

Configuration for appflowParam resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
templaterefresh	<Integer>	Read-write	IPFIX template refresh interval (in seconds). Default value: 600 Minimum value = 60 Maximum value = 3600
udppmtu	<Integer>	Read-write	MTU to be used for IPFIX UDP packets. Default value: 1472 Minimum value = 128 Maximum value = 1472

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpurl	<String>	Read-write	Enable AppFlow HTTP URL logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpcookie	<String>	Read-write	Enable AppFlow HTTP cookie logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpreferer	<String>	Read-write	Enable AppFlow HTTP referer logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpmethod	<String>	Read-write	Enable AppFlow HTTP method logging. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httphost	<String>	Read-write	Enable AppFlow HTTP host logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpuseragent	<String>	Read-write	Enable AppFlow HTTP user-agent logging. Default value: DISABLED Possible values = ENABLED, DISABLED
clienttrafficonly	<String>	Read-write	Control whether AppFlow records should be generated only for client-side traffic. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.

nsassignment

Configuration for assignment resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the assignment. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			at (@), equals (=), colon (:), and underscore characters. Can be changed after the assignment is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my assignment" or my assignment).
variable	<String>	Read-write	Left hand side of the assigment, of the form $variable-name (for a singleton variabled) or $variable-name[key-expression], where key-expression is an expression that evaluates to a text string and provides the key to select a map entry.
set	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			assigned to the left hand variable.
Add	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and added to the left hand variable.
sub	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and subtracted from the left hand variable.
append	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and appended to the left hand variable.
clear	<Boolean>	Read-write	Clear the variable value. Deallocates a text value, and for a map, the text key.
comment	<String>	Read-write	Comment. Can be used to preserve information about this rewrite action.
newname	<String>	Read-write	New name for the assignment. Must begin with a letter, number, or the underscore character (_), and must contain only

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my assignment" or my assignment). Minimum length = 1
hits	<Integer>	Read-only	The number of times the action has been taken.
undefhits	<Integer>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Integer>	Read-only	The number of references to the action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

nscapacity

Configuration for capacity resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bandwidth	<Integer>	Read-write	System bandwidth limit.
platform	<String>	Read-write	appliance platform type. Possible values = VS10, VE10, VP10, VS25, VE25, VP25, VS50, VE50, VP50, VS200, VE200, VP200, VS1000, VE1000, VP1000, VS3000, VE3000, VP3000, VS5000, VE5000, VP5000, VS8000, VE8000, VP8000, VS10000, VE10000, VP10000, VS15000, VE15000, VP15000, VS25000, VE25000, VP25000, VS40000, VE40000, VP40000, VS100000,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VE100000, VP100000, CP1000
vcpu	<Boolean>	Read-write	licensed using vcpu pool.
edition	<String>	Read-write	Product edition. Possible values = Standard, Enterprise, Platinum
unit	<String>	Read-write	Bandwidth unit. Possible values = Gbps, Mbps
username	<String>	Read-write	Username to authenticate with ADM Agent for LAS licensing. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1 Maximum length = 127
password	<String>	Read-write	Password to use when authenticating with ADM Agent for LAS licensing. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ignoreexpiry	<Boolean>	Read-write	Value to mention if days to expire data needs to be fetched or not. Default value: 0
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
actualbandwidth	<Integer>	Read-only	Bandwith in MBPS.
vcpucount	<Integer>	Read-only	number of vCPUs licensed. Minimum value = 1 Maximum value = 20
maxvcpucount	<Integer>	Read-only	number of max vCPUs. Minimum value = 1 Maximum value = 20
maxbandwidth	<Integer>	Read-only	Maximum Bandwidth.
minbandwidth	<Integer>	Read-only	Minimum Bandwidth.
instancecount	<Integer>	Read-only	VPX will consume one instance and MPX will consume zero instance.
daystoexpiration	<Integer>	Read-only	Days to expire.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4294967294
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nscapacity **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nscapacity":{

"bandwidth":<Integer_value>,

"platform":<String_value>,

"vcpu":<Boolean_value>,

"edition":<String_value>,

"unit":<String_value>,

"username":<String_value>,

"password":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nscapacity? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nscapacity":{

"bandwidth":true,

"platform":true,

"vcpu":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nscapacity **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nscapacity? **args=ignoreexpiry: <Boolean_value> ,nodeid: <Integer_value>**

Use this query-parameter to get nscapacity resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nscapacity": [ {

ignoreexpiry:<Boolean_value>,nodeid:<Integer_value>"actualbandwidth":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

nscentralmanagementserver

Configuration for centralmanagementserver resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the central management server. Must be either CLOUD or ONPREM depending on whether the server is on the cloud or on premise. Possible values = CLOUD, ONPREM
username	<String>	Read-write	Username for access to central management server. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ns

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			centralmgmtserver" or "my ns centralmgmtserver") . Minimum length = 1 Maximum length = 127
password	<String>	Read-write	Password for access to central management server. Required for any user account. Minimum length = 1 Maximum length = 127
activationcode	<String>	Read-write	Activation code is used to register to ADM service. Minimum length = 1 Maximum length = 127
ipaddress	<String>	Read-write	Ip Address of central management server. Minimum length = 1
servername	<String>	Read-write	Fully qualified domain name of the central management server or service-url to locate ADM service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
validatecert	<String>	Read-write	validate the server certificate for secure SSL connections. Default value: YES Possible values = YES, NO
deviceprofilename	<String>	Read-write	Device profile is created on ADM and contains the user name and password of the instance(s). Minimum length = 1 Maximum length = 255
adcusername	<String>	Read-write	ADC username used to create device profile on ADM. Minimum length = 1 Maximum length = 127
adcpassword	<String>	Read-write	ADC password used to create device profile on ADM. Minimum length = 1 Maximum length = 127
instanceid	<String>	Read-only	Instance ID of the customer provided by Trust.
customerid	<String>	Read-only	Customer ID of the citrix cloud customer.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
admserviceenvironment	<String>	Read-only	ADM service environment (PRODUCTION/STAGING/DEV). Possible values = PRODUCTION, STAGING, DEV
admserviceconnectionstatus	<String>	Read-only	Built-in agent's (mastools) connection status to ADM service. Possible values = CONNECTED, DISCONNECTED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

nsconfig

Configuration for system config resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
force	<Boolean>	Read-write	Configurations will be cleared without prompting for confirmation.
level	<String>	Read-write	Types of configurations to be cleared. * basic: Clears all configurations except the following: - NSIP, default route (gateway), static routes, MIPs, and SNIPs - Network settings (DG, VLAN, RHI and DNS settings) - Cluster settings - HA node definitions - Feature and mode settings - nsroot password * extended: Clears the same configurations as the 'basic' option. In addition, it clears

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the feature and mode settings. * full: Clears all configurations except NSIP, default route, and interface settings. Note: When you clear the configurations through the cluster IP address, by specifying the level as 'full', the cluster is deleted and all cluster nodes become standalone appliances. The 'basic' and 'extended' levels are propagated to the cluster nodes. Possible values = basic, extended, full
rbaconfig	<String>	Read-write	RBA configurations and TACACS policies bound to system global will not be cleared if RBA is set to NO.This option is applicable only for BASIC level of clear configuration.Default is YES, which will

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			clear rba configurations. Default value: YES Possible values = YES, NO
ipaddress	<String>	Read-write	IP address of the Citrix ADC. Commonly referred to as NSIP address. This parameter is mandatory to bring up the appliance. Minimum length = 1
netmask	<String>	Read-write	Netmask corresponding to the IP address. This parameter is mandatory to bring up the appliance.
nsvlan	<Integer>	Read-write	VLAN (NSVLAN) for the subnet on which the IP address resides. Minimum value = 2 Maximum value = 4094
ifnum	<String[]>	Read-write	Interfaces of the appliances that must be bound to the NSVLAN. Minimum length = 1
tagged	<String>	Read-write	Specifies that the interfaces will be added as 802.1q

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			tagged interfaces. Packets sent on these interface on this VLAN will have an additional 4-byte 802.1q tag which identifies the VLAN. To use 802.1q tagging, the switch connected to the appliance's interfaces must also be configured for tagging. Default value: YES Possible values = YES, NO
httpport	<Integer[]>	Read-write	The HTTP ports on the Web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1
maxconn	<Integer>	Read-write	The maximum number of connections that will be made from the system to the web server(s) attached to it. The value entered here is applied

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			globally to all attached servers. Minimum value = 0 Maximum value = 4294967294
maxreq	<Integer>	Read-write	The maximum number of requests that the system can pass on a particular connection between the system and a server attached to it. Setting this value to 0 allows an unlimited number of requests to be passed. Minimum value = 0 Maximum value = 65535
cip	<String>	Read-write	The option to control (enable or disable) the insertion of the actual client IP address into the HTTP header request passed from the client to one, some, or all servers attached to the system. The passed address can then be accessed through a minor

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			modification to the server. l If cipHeader is specified, it will be used as the client IP header. l If it is not specified, then the value that has been set by the set ns config CLI command will be used as the client IP header. Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	The text that will be used as the client IP header. Minimum length = 1
cookieversion	<String>	Read-write	The version of the cookie inserted by system. Possible values = 0, 1
securecookie	<String>	Read-write	enable/disable secure flag for persistence cookie. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
pmtumin	<Integer>	Read-write	The minimum Path MTU. Default value: 576 Minimum value = 168 Maximum value = 1500
pmtutimeout	<Integer>	Read-write	The timeout value in minutes. Default value: 10 Minimum value = 1 Maximum value = 1440
ftpportrange	<String>	Read-write	Port range configured for FTP services. Minimum length = 1024 Maximum length = 64000
crportrange	<String>	Read-write	Port range for cache redirection services. Minimum length = 1 Maximum length = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timezone	<String>	Read-write	Name of the timezone. Default value: CoordinatedUniversalTime Minimum length = 1 Maximum length = 64
grantquotamaxclient	<Integer>	Read-write	The percentage of shared quota to be granted at a time for maxClient. Default value: 10 Minimum value = 0 Maximum value = 100
exclusivequotamaxclient	<Integer>	Read-write	The percentage of maxClient to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
grantquotaspillover	<Integer>	Read-write	The percentage of shared quota to be granted at a time for spillover. Default value: 10 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 100
exclusivequotaspillover	<Integer>	Read-write	The percentage of spillover threshold to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
securemanagementtraffic	<String>	Read-write	This enabled secure management traffic handling. Default value: DISABLED Possible values = ENABLED, DISABLED
securemanagementtd	<Integer>	Read-write	This positive integer identifies Management traffic domain. If not specified, defaults to 4094. Minimum value = 0 Maximum value = 4094
all	<Boolean>	Read-write	Use this option to do saveconfig for all partitions.
config1	<String>	Read-write	Location of the configurations.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
config2	<String>	Read-write	Location of the configurations.
outtype	<String>	Read-write	Format to display the difference in configurations. Possible values = cli, xml
template	<Boolean>	Read-write	File that contains the commands to be compared.
ignoredevicespecific	<Boolean>	Read-write	Suppress device specific differences.
weakpassword	<Boolean>	Read-write	Option to list all weak passwords (not adhering to strong password requirements). Takes config file as input, if no input specified, running configuration is considered. Command => query ns config -weakpassword / query ns config -weakpassword / nsconfig/ns.conf.
changedpassword	<Boolean>	Read-write	Option to list all passwords changed which would not work when downgraded to older releases. Takes config file as input, if no input specified, running configuration

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is considered. Command => query ns config -changedpassword / query ns config -changedpassword / nsconfig/ns.conf.
config	<String>	Read-write	configuration File to be used to find weak passwords, if not specified, running config is taken as input.
configfile	<String>	Read-write	Full path of config file to be converted to nitro.
responsefile	<String>	Read-write	Full path of file to store the nitro graph. If not specified, nitro graph is returned as part of the API response.
Async	<Boolean>	Read-write	Using this option will run the operation in async mode and return the job id. The job ID can be used later to track the conversion progress via show ns job <id> Command. This option is mostly useful for API to avoid timeouts for large input configuration.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
message	<String>	Read-only	.
mappedip	<String>	Read-only	Mapped IP Address of the System. Minimum length = 1
range	<Integer>	Read-only	The range of Mapped IP addresses to be configured. Minimum value = 1
svmcmd	<Integer>	Read-only	Identifies the source of command. When SVM fires the nitro command, it will set the value of SVMCMD to be 1 and in other cases it will be 0. Default value: 0
systemtype	<String>	Read-only	The type of the System. Possible Values: Standalone, HA, Cluster. Possible values = Stand-alone, HA, Cluster
primaryip	<String>	Read-only	HA Master Node IP address.
primaryip6	<String>	Read-only	.
flags	<Integer>	Read-only	The flags for this entry.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lastconfigchangedtime	<String>	Read-only	Time when the configuration was last modified.
lastconfigsavetime	<String>	Read-only	Time when the configuration was last saved through savensconfig.
currentsytemtime	<String>	Read-only	current system time in date format.
systemtime	<Integer>	Read-only	current system time.
configchanged	<Boolean>	Read-only	returns True if configuration has changed since last saved config.
_nextgenapiresource	<String>	Read-only	.
response	<String>	Read-only	.
id	<Integer>	Read-only	Job Id for CLI to Nitro graph request.

Operations

(click to see Properties)

- CLEAR
- UPDATE
- UNSET
- SAVE
- GET (ALL)
- DIFF
- CONVERT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsconfig? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsconfig":{

"force":<Boolean_value>,

<b>"level":<String_value>,

</b>"rbaconfig":<String_value>
```

```
}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsconfig **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsconfig":{

"ipaddress":<String_value>,

"netmask":<String_value>,

"nsvlan":<Integer_value>,

"ifnum":<String[]_value>,

"tagged":<String_value>,

			MONITORS, SSLVPN UDP, SINCUDP, RIP, UDP CLNT, SASP, RPCCLNTS, ROUTE, AUDIT, STA HTTP, STA SSL, DNS RESOLVE, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, ICA, RADIUS, RADIUSListener, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, QUIC, TFTP_DATA, USER_TCP, USER_SSL_TCP, MONGO, MONGO_TLS, MQTT, MQTT_TLS, QUIC_BRIDGE, HTTP_QUIC, CT_TCP, CT_UDP, DOT, ADNS_DOT, ADNS_DOH, KAFKA_BROKER, KAFKA_PRODUCER

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linkidletime	<Integer>	Read-only	Time since last activity was detected on link connection.
linkstate	<String>	Read-only	TCP/IP current state of link connection. Possible values = CLOSED, LISTEN, SYN_SENT, SYN_RECEIVED, ESTABLISHED, CLOSE_WAIT, FIN_WAIT_1, CLOSING, LAST_ACK, FIN_WAIT_2, TIME_WAIT, NA
entityname	<String>	Read-only	Citrix ADC entity name for the connection.
linkentityname	<String>	Read-only	Citrix ADC entity name for link connection.
connid	<Integer>	Read-only	Unique transaction number for the connection.
linkconnid	<Integer>	Read-only	Unique transaction number for the peer connection.
connproperties	<String[]>	Read-only	flags used to store connection properties like client, server etc.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = LINK, HASLINK, CLIENT, SERVER, NNM, MPTCP, SUBFLOW
optionflags	<String[]>	Read-only	flags used to store TCP options like Sack, WS. Possible values = sack, timstmp, ws
nswsvalue	<Integer>	Read-only	Citrix ADC window scaling value.
peerwsvalue	<Integer>	Read-only	peer window scaling value.
mss	<Integer>	Read-only	Client side MSS for the connection - used in server SYN.
retxretrycnt	<Integer>	Read-only	Retransmission retry count for the connection.
rcvwnd	<Integer>	Read-only	Received Advertised Window for the connection.
advwnd	<Integer>	Read-only	Sent advertised window for the connection.
sndcwnd	<Integer>	Read-only	sent congestion window for the connection.
iss	<Integer>	Read-only	Initial send sequence number for the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
irs	<Integer>	Read-only	Initial receive sequence number for the connection.
rcvnxt	<Integer>	Read-only	next expecting seq number for the connection.
maxack	<Integer>	Read-only	current running max ack sent for the connection.
sndnxt	<Integer>	Read-only	next bytes seq number for the connection.
sndunack	<Integer>	Read-only	Most recently received ACK for the connection.
httpendseq	<Integer>	Read-only	HTTP parsing tracking seq number for the connection.
httpstate	<String>	Read-only	HTTP Protocol state for the connection. Possible values = INITIALIZED, CONTENT_LENGTH, CHUNKED, WAIT_FINAL_ACK, UNKNOWN, DONE, WAIT_FIN
trcount	<Integer>	Read-only	Max reuests allowed per connection.
priority	<String>	Read-only	priority of the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = SC Priority, Priority queue1, priority queue2, priority queue3, DoS Priority, Surge Priority
httpreqver	<String>	Read-only	current HTTP request version on the connection. Possible values = HTTP_1_0, HTTP_1_1, HTTP_0_9, RTSP_1_0, SIP_2_0, VPN_ICA_SOCKS, VPN_ICA_CGP, HTTP_2_0, HTTP_2_0_DIREC T
httprequest	<String>	Read-only	current HTTP request type on the connection. Possible values = OPTIONS, GET, HEAD, POST, PUT, DELETE, TRACE, TRACK, CONNECT, RPCCONNECT
httprspcode	<Integer>	Read-only	current response type on the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rttsmoothed	<Integer>	Read-only	smoothed RTT value of the connection.
rttvariance	<Integer>	Read-only	RTT variance for the connection.
outoforderpkts	<Integer>	Read-only	held packets on the connection.
linkoptionflag	<String[]>	Read-only	Link connection's TCP option flag for Sack and WS. Possible values = sack, timstmp, ws
linknswsvalue	<Integer>	Read-only	Link connection-s Citrix ADC window scaling value.
linkpeerwsvalue	<Integer>	Read-only	Link connection-s peer Citrix ADC window scaling value.
targetnodeidnnm	<Integer>	Read-only	NNM connection target node ID.
sourcenodeidnnm	<Integer>	Read-only	NNM connection source node ID.
channelidnnm	<Integer>	Read-only	NNM connection channel ID.
msgversionnnm	<Integer>	Read-only	nnm message version.
td	<Integer>	Read-only	Traffic Domain Id.
maxrcvbuf	<Integer>	Read-only	Maximum receive window that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			application advertizes to peer.
linkmaxrcvbuf	<Integer>	Read-only	Maximum receive window that application advertizes to peer in linked connection.
rxqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC receive buffer. This includes bytes being processed / policy related data / stored in application buffer.
linkrxqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC receive buffer for linked connection. This includes bytes being processed / policy related data / stored in application buffer.
maxsndbuf	<Integer>	Read-only	Maximum send window that application can process and send.
linkmaxsndbuf	<Integer>	Read-only	Maximum send window that application can process and send in linked connection.
txqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC send buffer. This includes both inflight

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and queued bytes in Citrix ADC.
linktxqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC send buffer for linked connection. This includes both inflight and queued bytes in Citrix ADC.
flavor	<String>	Read-only	TCP congestion control algorithm. Possible values = Default, Westwood, BIC, CUBIC, Nile, BBR
linkflavor	<String>	Read-only	TCP congestion control algorithm for a linked connection. Possible values = Default, Westwood, BIC, CUBIC, Nile, BBR
bwestimate	<Integer>	Read-only	TCP Bandwidth Estimate.
linkbwestimate	<Integer>	Read-only	TCP Bandwidth Estimate for a linked connection.
rttmin	<Integer>	Read-only	Minimum Round Trip Time for the connection.
linkrttmin	<Integer>	Read-only	Minimum Round Trip Time for linked connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-only	Name of TCP profile attached to the connection. Minimum length = 1 Maximum length = 127
linkname	<String>	Read-only	Name of TCP profile attached to the connection. Minimum length = 1 Maximum length = 127
tcpmode	<String>	Read-only	TCP Optimization modes TRANSPARENT / ENDPOINT. Possible values = TRANSPARENT, ENDPOINT
linktcpmode	<String>	Read-only	TCP Optimization modes TRANSPARENT / ENDPOINT for linked connection. Possible values = TRANSPARENT, ENDPOINT
realtimertt	<Integer>	Read-only	Real Time / Instantaneous round trip time.
linkrealtimertt	<Integer>	Read-only	Real Time / Instantaneous round

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			trip time for linked connection.
sndbuf	<Integer>	Read-only	send buffer size.
linksndbuf	<Integer>	Read-only	Send buffer size for linked connection.
nsbtcpwaitq	<Integer>	Read-only	Number of packets in TCP wait queue.
linknsbtcpwaitq	<Integer>	Read-only	Number of packets in wait queue for linked connection.
nsbretxq	<Integer>	Read-only	Number of packets in retransmission queue.
linknsbretxq	<Integer>	Read-only	Number of packets in retransmission queue for linked connection.
sackblocks	<Integer>	Read-only	Number of sack blocks attached to the connection.
linksackblocks	<Integer>	Read-only	Number of sack blocks attached in linked connection.
congstate	<String>	Read-only	TCP congestion state. Possible values = open, recovery, loss, reneg, partial_ACK, retx_lost

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linkcongstate	<String>	Read-only	TCP congestion state for a linked connection. Possible values = open, recovery, loss, reneg, partial_ACK, retx_lost
sndrecoverle	<Integer>	Read-only	Sequence Number denoting end of fast recovery.
linksndrecoverle	<Integer>	Read-only	Sequence Number denoting end of fast recovery for linked connection.
creditsinbytes	<Integer>	Read-only	Connections current credits in Bytes/ms.
linkcredits	<Integer>	Read-only	Link connections current credits in Bytes/ms.
rateinbytes	<Integer>	Read-only	Connections current rate in Bytes/ms.
linkrateinbytes	<Integer>	Read-only	Link connections current rate in Bytes/ms.
rateschedulerqueue	<Integer>	Read-only	Bytes that are queued in the rate scheduler for this connection.
linkrateschedulerqueue	<Integer>	Read-only	Bytes that are queued in the rate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			scheduler for link connection.
burstratecontrol	<String>	Read-only	TCP Burst Rate Control DISABLED/ FIXED/DYNAMIC. Possible values = DISABLED, FIXED, DYNAMIC
linkburstratecontrol	<String>	Read-only	TCP Burst Rate Control DISABLED/ FIXED/DYNAMIC. Possible values = DISABLED, FIXED, DYNAMIC
cqabifavg	<Integer>	Read-only	Average bytes in flight over maxburst.
cqathruputavg	<Integer>	Read-only	Average instantaneous throughput over maxburst.
cqarcvwndavg	<Integer>	Read-only	Average receive window over maxburst.
cqaiai1mspct	<Integer>	Read-only	Percentage of inter arriaval samples for 1ms over maxburst.
cqaiai2mspct	<Integer>	Read-only	Percentage of inter arriaval samples for 2ms over maxburst.
cqasamples	<Integer>	Read-only	Number of ACK samples over maxburst.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cqaiaisamples	<Integer>	Read-only	Number of samples considered for calculating inter arrival interval over maxburst.
cqanetclass	<String>	Read-only	Network type name. Maximum length = 49
cqaccl	<Integer>	Read-only	Connection congestion level. Minimum value = 0 Maximum value = 100
cqacsq	<Integer>	Read-only	Connectiontion signal quality level. Minimum value = 0 Maximum value = 100
cqaiaiavg	<Integer>	Read-only	Average inter arriaval interval over maxburst.
cqaisiavg	<Integer>	Read-only	Average inter send interval over maxburst.
cqarcvwndmin	<Integer>	Read-only	Minimum receive window over maxburst.
cqaretxcorr	<Integer>	Read-only	Number of retransmission due to noise over maxburst.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cqaretxcong	<Integer>	Read-only	Number of retransmission due to congestion over maxburst.
cqaretxpackets	<Integer>	Read-only	Number of retransmission over maxburst.
cqaloaddelayavg	<Integer>	Read-only	Average load delay over maxburst.
cqanoisedelayavg	<Integer>	Read-only	Average noise delay over maxburst.
cqarttmax	<Integer>	Read-only	Maximum RTT sample over maxburst in ms.
cqarttmin	<Integer>	Read-only	Minimum RTT sample over maxburst in ms.
cqarttavg	<Integer>	Read-only	Minimum RTT sample over maxburst in ms.
adaptivetcpprofname	<String>	Read-only	Name of the Adaptive-TCP profile currently assigned to the connection. Minimum length = 1 Maximum length = 127
outoforderblocks	<Integer>	Read-only	held packets on the connection.
outoforderflushedcount	<Integer>	Read-only	held packets on the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
outoforderbytes	<Integer>	Read-only	held packets on the connection.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **args=filterexpression: <String_value> ,link: <Boolean_value> ,filtername: <Boolean_value> ,detail: <String _value> ,listen: <Boolean_value> ,nodeid: <Integer_value>**

Use this query-parameter to get nsconnectiontable resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsconnectiontable resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **view=summary**

Use this query-parameter to get the summary output of nsconnectiontable resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsconnectiontable resources in chunks.

HTTP Method: GET

Request Headers:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
saveroute	<String>	Read-write	DHCP acquired routes are saved on the Citrix ADC. Default value: OFF Possible values = ON, OFF
subnetselection	<String>	Read-write	Subnet Selection option (RFC 3011) to request IP from a specific subnet.
ipaddress	<String>	Read-only	DHCP acquired IP.
netmask	<String>	Read-only	DHCP acquired Netmask.
hostrtgw	<String>	Read-only	DHCP acquired Gateway.
running	<Boolean>	Read-only	DHCP mode.
_nextgenapiresource	<String>	Read-only	.

Operations

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsdhcpparams **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsdhcpparams":{

"dhcpclient":<String_value>,

"saveroute":<String_value>,

"subnetselection":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsdhcpparams? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsdhcpparams":{

"dhcpclient":true,

"saveroute":true,

"subnetselection":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsdhcpparams **HTTP Method:** GET

Request Headers:

}]}
```

nsdiameter

Configuration for Diameter Parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
identity	<String>	Read-write	DiameterIdentity to be used by NS. DiameterIdentity is used to identify a Diameter node uniquely. Before setting up diameter

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configuration, Citrix ADC (as a Diameter node) MUST be assigned a unique DiameterIdentity. example => set ns diameter -identity netscaler.com Now whenever Citrix ADC needs to use identity in diameter messages. It will use 'netscaler.com' as Origin-Host AVP as defined in RFC3588 . Minimum length = 1
realm	<String>	Read-write	Diameter Realm to be used by NS. example => set ns diameter -realm com Now whenever Citrix ADC system needs to use realm in diameter messages. It will use 'com' as Origin-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Realm AVP as defined in RFC3588 . Minimum length = 1
servercloseproposagation	<String>	Read-write	when a Server connection goes down, whether to close the corresponding client connection if there were requests pending on the server. Default value: NO Possible values = YES, NO
ownernode	<Integer>	Read-write	ID of the cluster node for which the diameter id is set, can be configured only through CLIP. Default value: -1 Minimum value = 0 Maximum value = 31
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```
{ "nsdiameter": [ { "__count": "#no"} ] }
```

nsencryptionkey

Configuration for encryption key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Key name. This follows the same syntax rules as other expression entity names: It must begin with an alpha character (A-Z or a-z) or an underscore (_). The rest of the characters must be alpha, numeric (0-9) or underscores. It cannot be re or xp (reserved for regular and XPath expressions). It cannot be an expression reserved word (e.g. SYS or HTTP). It cannot be used for an existing expression object (HTTP callout, patset, dataset,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			stringmap, or named expression). Minimum length = 1
method	<String>	Read-write	Cipher method to be used to encrypt and decrypt content. NONE - no encryption or decryption is performed The output of ENCRYPT() and DECRYPT() is the same as the input. RC4 - the RC4 stream cipher with a 128 bit (16 byte) key; RC4 is now considered insecure and should only be used if required by existing applciations. DES[-<mode>] - the Data Encryption Standard (DES) block cipher with a 64-bit (8 byte) key, with 56 data bits and 8 parity bits. DES is considered less secure than DES3 or AES so it should only be used

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			if required by an existing applicastion. The optional mode is described below; DES without a mode is equivalent to DES-CBC. DES3[-<mode>] - the Triple Data Encryption Standard (DES) block cipher with a 192-bit (24 byte) key. The optional mode is described below; DES3 without a mode is equivalent to DES3-CBC. AES<keysize>[-<mode>] - the Advanced Encryption Standard block cipher, available with 128 bit (16 byte), 192 bit (24 byte), and 256 bit (32 byte) keys. The optional mode is described below; AES<keysize> without a mode is equivalent to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			AES<keysize>-CBC. For a block cipher, the <mode> specifies how multiple blocks of plaintext are encrypted and how the Initialization Vector (IV) is used. Choices are CBC (Cipher Block Chaining) - Each block of plaintext is XORed with the previous ciphertext block, or IV for the first block, before being encrypted. Padding is required if the plaintext is not a multiple of the cipher block size. CFB (Cipher Feedback) - The previous ciphertext block, or the IV for the first block, is encrypted and the output is XORed with the current plaintext block to create the current ciphertext block.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The 128-bit version of CFB is provided. Padding is not required. OFB (Output Feedback) - A keystream is generated by applying the cipher successfully to the IV and XORing the keystream blocks with the plaintext. Padding is not required. ECB (Electronic Codebook) - Each block of plaintext is independently encrypted. An IV is not used. Padding is required. This mode is considered less secure than the other modes because the same plaintext always produces the same encrypted text and should only be used if required by an existing application. Possible values = NONE, RC4, DES3,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			AES128, AES192, AES256, DES, DES-CBC, DES-CFB, DES-OFB, DES-ECB, DES3-CBC, DES3-CFB, DES3-OFB, DES3-ECB, AES128-CBC, AES128-CFB, AES128-OFB, AES128-ECB, AES192-CBC, AES192-CFB, AES192-OFB, AES192-ECB, AES256-CBC, AES256-CFB, AES256-OFB, AES256-ECB
keyvalue	<String>	Read-write	The hex-encoded key value. The length is determined by the cipher method: RC4 - 16 bytes DES - 8 bytes (all modes) DES3 - 24 bytes (all modes) AES128 - 16 bytes (all modes)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			AES192 - 24 bytes (all modes) AES256 - 32 bytes (all modes) Note that the keyValue will be encrypted when it it is saved. There is a special key value AUTO which generates a new random key for the specified method. This kind of key is intended for use cases where the NetScaler both encrypts and decrypts the same data, such an HTTP header.
padding	<String>	Read-write	Enables or disables the padding of plaintext to meet the block size requirements of block ciphers: ON - For encryption, PKCS5/7 padding is used, which appends n bytes of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value n on the end of the plaintext to bring it to the cipher block lnegth. If the plaintext length is alraady a multiple of the block length, an additional block with bytes of value block_length will be added. For decryption, ISO 10126 padding is accepted, which expects the last byte of the block to be the number of added pad bytes. Note that this accepts PKCS5/7 padding, as well as ANSI_X923 padding. Padding ON is the default for the ECB and CBD modes. OFF - No padding. An Undef error will occur with the ECB or CBC modes if the plaintext length is not a multitple of the cipher block size. This can be used with the CFB and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OFB modes, and with the ECB and CBC modes if the plaintext will always be an integral number of blocks, or if custom padding is implemented using a policy extension function. Padding OFf is the default for CFB and OFB modes. Default value: DEFAULT Possible values = OFF, ON
iv	<String>	Read-write	The initalization voector (IV) for a block cipher, one block of data used to initialize the encryption. The best practice is to not specify an IV, in which case a new random IV will be generated for each encryption. The format must be iv_data or keyid_iv_data to include the generated IV in the encrypted data. The IV should only be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified if it cannot be included in the encrypted data. The IV length is the cipher block size: RC4 - not used (error if IV is specified) DES - 8 bytes (all modes) DES3 - 8 bytes (all modes) AES128 - 16 bytes (all modes) AES192 - 16 bytes (all modes) AES256 - 16 bytes (all modes).
comment	<String>	Read-write	Comments associated with this encryption key.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

nsencryptionparams

Configuration for default encryption parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
method	<String>	Read-write	Cipher method (and key length) to be used to encrypt and decrypt content. The default value is AES256. Possible values = NONE, RC4, DES3, AES128, AES192, AES256, DES, DES-CBC, DES-CFB, DES-OFB, DES-ECB, DES3-CBC, DES3-CFB, DES3-OFB, DES3-ECB, AES128-CBC,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			AES128-CFB, AES128-OFB, AES128-ECB, AES192-CBC, AES192-CFB, AES192-OFB, AES192-ECB, AES256-CBC, AES256-CFB, AES256-OFB, AES256-ECB
keyvalue	<String>	Read-write	The base64-encoded key generation number, method, and key value. Note: * Do not include this argument if you are changing the encryption method. * To generate a new key value for the current encryption method, specify an empty string \(""\) as the value of this parameter. The parameter is passed implicitly, with its automatically generated value, to the Citrix ADC packet engines

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			even when it is not included in the command. Passing the parameter to the packet engines enables the appliance to save the key value to the configuration file and to propagate the key value to the secondary appliance in a high availability setup.
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsevents

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **args=eventno: <Integer_value>**

Use this query-parameter to get nsevents resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsevents resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **view=summary**

Use this query-parameter to get the summary output of nsevents resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsevents resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsevents": [ {

eventno:<Integer_value>"time":<Integer_value>,

"eventcode":<Integer_value>,

"devid":<Integer_value>,

"devname":<String_value>,

"text":<String_value>,

"data0":<Integer_value>,

"data1":<Integer_value>,

"data2":<Integer_value>,
```

```
"data3":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsevents": [ { "__count": "#no"} ] }
```

nsextension

Configuration for Extension resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
src	<String>	Read-write	Local path to and name of, or URL (protocol, host, path, and file name) for, the file in which to store the imported extension. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access, and the issuer certificate of the HTTPS server is not present in the specific path on NetScaler to authenticate the HTTPS server. Minimum length = 1 Maximum length = 2047
name	<String>	Read-write	Name to assign to the extension object on the Citrix ADC. Minimum length = 1 Maximum length = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Any comments to preserve information about the extension object. Maximum length = 128
overwrite	<Boolean>	Read-write	Overwrites the existing file.
trace	<String>	Read-write	Enables tracing to the NS log file of extension execution: off - turns off tracing (equivalent to unset ns extension <extension-name> -trace) calls - traces extension function calls with arguments and function returns with the first return value lines - traces the above plus line numbers for executed extension lines all - traces the above plus local variables changed by executed extension lines

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note that the DEBUG log level must be enabled to see extension tracing. This can be done by set audit syslogParams -loglevel ALL or -loglevel DEBUG. Default value: off Possible values = off, calls, lines, all
tracefunctions	<String>	Read-write	Comma-separated list of extension functions to trace. By default, all extension functions are traced. Maximum length = 256
tracevariables	<String>	Read-write	Comma-separated list of variables (in traced extension functions) to trace. By default, all variables are traced. Maximum length = 256
detail	<String>	Read-write	Show detail for extension function. Possible values = brief, all

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-only	. Possible values = WSDL, CustomSettings, XMLSchema, XMLErrorPage, htmlpage, CustomResp, Extension, JSONErrorPage, ProtoFile, Signatures, Module
functionhits	<Integer>	Read-only	Number of time function evaluates successfully.
functionundefhits	<Integer>	Read-only	Number of times error occured in evaluating extension function.
functionhaltcount	<Integer>	Read-only	Number of time function evaluation is halted.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension? **action=Import HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsextension":{

<b>"src":<String_value>,

</b><b>"name":<String_value>,

</b>"comment":<String_value>,

"overwrite":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsextension":{

<b>"name":<String_value>,

</b>"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CHANGE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension? **action=update HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsextension":{

<b>"name":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsextension":{

<b>"name":<String_value>,

</b>"trace":<String_value>,

"tracefunctions":<String_value>,

"tracevariables":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsextension":{

<b>"name":<String_value>,
```

```
</b>"trace":true,

"tracefunctions":true,

"tracevariables":true,

"comment":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nsextension? **args=name: <String_value> ,detail: <String_value>**

Use this query-parameter to get nsextension resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/nsextension? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nsextension? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsextension resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nsextension? **view=summary**

Use this query-parameter to get the summary output of nsextension resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nsextension? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsextension resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsextension": [ { "__count": "#no"} ] }
```

nsextension_binding

Binding object which returns the resources bound to nsextension.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the extension object. Minimum length = 1 Maximum length = 31
nsextension_extensionfunction_binding	<nsextension_extensionfunction_binding[]>	Read-only	extensionfunction that can be bound to nsextension.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsextension_binding": [ {

"name":<String_value>,

"nsextension_extensionfunction_binding":<nsextension_extensionfunction_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/nsextension_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsextension_binding": [ {

"name":<String_value>,

"nsextension_extensionfunction_binding":<nsextension_extensionfunction_binding[]_value>

}]}
```

nsextension_extensionfunction_binding

Binding object showing the extensionfunction that can be bound to nsextension.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the extension object.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 31
extensionfunctionargcount	<Integer>	Read-only	Number of parameters in the extension function.
extensionfuncdescription	<String>	Read-only	Any description to preserve information about the extension function. Maximum length = 1023
extensionfunctionallparamscount	<Integer>	Read-only	Number of parameters (including promotions) that the function can accept.
extensionfunctionargtype	<String[]>	Read-only	List of extension function's arguments types.
extensionfunctionclasstype	<String>	Read-only	Extension function class type. Minimum length = 1 Maximum length = 31
extensionfunctionreturntype	<String>	Read-only	Extension function return type. Minimum length = 1 Maximum length = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
extensionfunctionallparams	<String[]>	Read-only	List of parameters (including promotions) that the function can accept.
extensionfunctionlinenumber	<Integer>	Read-only	Line number of the function in file.
extensionfunctionclassescount	<Integer>	Read-only	Number of classes the function is present in.
activeextensionfunction	<Integer>	Read-only	Extension function is in use or not.
extensionfunctionclasses	<String[]>	Read-only	List of classes (including inherited) that the function is present in.
extensionfunctionname	<String>	Read-only	Name of extension function given in the extension. Minimum length = 1 Maximum length = 31
__count	<Double>	Read-only	count parameter

nshardware

Configuration for hardware resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hwdescription	<String>	Read-write	Hardware and it's ports detail.
sysid	<Integer>	Read-write	System id.
manufactureday	<Integer>	Read-write	Manufacturing day.
manufacturemonth	<Integer>	Read-write	Manufacturing month.
manufactureyear	<Integer>	Read-write	Manufacturing year.
cpufrequncy	<Integer>	Read-write	CPU Frequency.
hostid	<Integer>	Read-write	host id.
host	<String>	Read-write	host id.
serialno	<String>	Read-write	Serial no.
encodedserialno	<String>	Read-write	Encoded serial no.
netscaleruuid	<String>	Read-write	Citrix ADC UUID.
bmcrevision	<String>	Read-write	BMC Firmware Revision.
_nextgenapiresource	<String>	Read-write	.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nshardware

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nshardware": [ {

"hwdescription":<String_value>,

"sysid":<Integer_value>,

"manufactureday":<Integer_value>,

"manufacturemonth":<Integer_value>,

"serialno":<String_value>,

"encodedserialno":<String_value>,

"netscaleruuid":<String_value>,

"bmcrevision":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

nshmackey

Configuration for HMAC key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Key name. This follows the same syntax rules as other expression entity names: It must begin with an alpha character (A-Z or a-z) or an underscore (_). The rest of the characters must be alpha, numeric (0-9) or underscores. It cannot be re or xp (reserved for regular and XPath expressions). It cannot be an expression reserved word (e.g. SYS or HTTP). It cannot be used for an existing expression object (HTTP callout, patset, dataset,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			stringmap, or named expression). Minimum length = 1
digest	<String>	Read-write	Digest (hash) function to be used in the HMAC computation. Possible values = MD2, MD4, MD5, SHA1, SHA224, SHA256, SHA384, SHA512
keyvalue	<String>	Read-write	The hex-encoded key to be used in the HMAC computation. The key can be any length (up to a Citrix ADC-imposed maximum of 255 bytes). If the length is less than the digest block size, it will be zero padded up to the block size. If it is greater than the block size, it will be hashed using the digest function to the block size. The block size for each digest is: MD2 - 16 bytes MD4 - 16 bytes MD5 - 16 bytes

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SHA1 - 20 bytes SHA224 - 28 bytes SHA256 - 32 bytes SHA384 - 48 bytes SHA512 - 64 bytes Note that the key will be encrypted when it it is saved There is a special key value AUTO which generates a new random key for the specified digest. This kind of key is intended for use cases where the NetScaler both generates and verifies an HMAC on the same data.
comment	<String>	Read-write	Comments associated with this encryption key.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

nshttpparam

Configuration for HTTP parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dropinvalreqs	<String>	Read-write	Drop invalid HTTP requests or responses. Default value: OFF Possible values = ON, OFF
markhttp09inval	<String>	Read-write	Mark HTTP/0.9 requests as invalid. Default value: OFF Possible values = ON, OFF
markconnreqinval	<String>	Read-write	Mark CONNECT requests as invalid. Default value: OFF Possible values = ON, OFF
insnssrvrhdr	<String>	Read-write	Enable or disable Citrix ADC server header insertion for Citrix ADC generated HTTP responses. Default value: OFF Possible values = ON, OFF
nssrvrhdr	<String>	Read-write	The server header value to be inserted. If no explicit header is specified then NSBUILD.RELEASE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is used as default server header. Minimum length = 1
logerrresp	<String>	Read-write	Server header value to be inserted. Default value: ON Possible values = ON, OFF
conmultiplex	<String>	Read-write	Reuse server connections for requests from more than one client connections. Default value: ENABLED Possible values = ENABLED, DISABLED
maxreusepool	<Integer>	Read-write	Maximum limit on the number of connections, from the Citrix ADC to a particular server that are kept in the reuse pool. This setting is helpful for optimal memory utilization and for reducing the idle connections to the server just after the peak time. Default value: 0 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 360000
http2serverside	<String>	Read-write	Enable/Disable HTTP/2 on server side. Default value: OFF Possible values = ON, OFF
ignoreconnectcodingscheme	<String>	Read-write	Ignore Coding scheme in CONNECT request. Default value: DISABLED Possible values = ENABLED, DISABLED
builtin	<String[]>	Read-only	Flag to determine if the http param is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.

nshttpprofile

Configuration for HTTP profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for an HTTP profile. Must begin with a letter, number, or the underscore \(_\) character. Other characters allowed, after the first character, are the hyphen \(-\), period \(.\), hash \(#\), space \(\), at \(@\), colon \(:\), and equal \(=\) characters. The name of a HTTP profile cannot be changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks \(for example, "my http profile" or 'my http profile'\). Minimum length = 1 Maximum length = 127
dropinvalreqs	<String>	Read-write	Drop invalid HTTP requests or responses. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
markhttp09inval	<String>	Read-write	Mark HTTP/0.9 requests as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
markconnreqinval	<String>	Read-write	Mark CONNECT requests as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
marktracereqinval	<String>	Read-write	Mark TRACE requests as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
markrfc7230noncompliantinval	<String>	Read-write	Mark RFC7230 non-compliant transaction as invalid. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
markhttpheaderextrawserror	<String>	Read-write	Mark Http header with extra white space as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
cmponpush	<String>	Read-write	Start data compression on receiving a TCP packet with PUSH flag set. Default value: DISABLED Possible values = ENABLED, DISABLED
conmultiplex	<String>	Read-write	Reuse server connections for requests from more than one client connections. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxreusepool	<Integer>	Read-write	Maximum limit on the number of connections, from the Citrix ADC to a particular server that are kept in the reuse pool. This setting is helpful for optimal memory utilization and for reducing the idle connections to the server just after the peak time. Zero implies no limit on reuse pool size. If non-zero value is given, it has to be greater than or equal to the number of running Packet Engines. Default value: 0 Minimum value = 0 Maximum value = 360000
dropextracrlf	<String>	Read-write	Drop any extra 'CR' and 'LF' characters present after the header. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
incomphdrdelay	<Integer>	Read-write	Maximum time to wait, in milliseconds, between incomplete header packets. If the header packets take longer to arrive at Citrix ADC, the connection is silently dropped. Default value: 7000 Minimum value = 1 Maximum value = 360000
websocket	<String>	Read-write	HTTP connection to be upgraded to a web socket connection. Once upgraded, Citrix ADC does not process Layer 7 traffic on this connection. Default value: DISABLED Possible values = ENABLED, DISABLED
rtsptunnel	<String>	Read-write	Allow RTSP tunnel in HTTP. Once application/x-rtsp-tunnelled is seen in Accept or Content-Type header, Citrix ADC does not process Layer 7

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			traffic on this connection. Default value: DISABLED Possible values = ENABLED, DISABLED
reqtimeout	<Integer>	Read-write	Time, in seconds, within which the HTTP request must complete. If the request does not complete within this time, the specified request timeout action is executed. Zero disables the timeout. Default value: 0 Minimum value = 0 Maximum value = 86400
adpttimeout	<String>	Read-write	Adapts the configured request timeout based on flow conditions. The timeout is increased or decreased internally and applied on the flow. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
reqtimeoutaction	<String>	Read-write	Action to take when the HTTP request does not complete within the specified request timeout duration. You can configure the following actions: * RESET - Send RST (reset) to client when timeout occurs. * DROP - Drop silently when timeout occurs. * Custom responder action - Name of the responder action to trigger when timeout occurs, used to send custom message.
dropextradata	<String>	Read-write	Drop any extra data when server sends more data than the specified content-length. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
weblog	<String>	Read-write	Enable or disable web logging. Default value: ENABLED Possible values = ENABLED, DISABLED
clientiphdrexpr	<String>	Read-write	Name of the header that contains the real client IP address.
maxreq	<Integer>	Read-write	Maximum number of requests allowed on a single connection. Zero implies no limit on the number of requests. Default value: 0 Minimum value = 0 Maximum value = 65534
persistentetag	<String>	Read-write	Generate the persistent Citrix ADC specific ETag for the HTTP response with ETag header. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
http2	<String>	Read-write	Choose whether to enable support for HTTP/2. Default value: DISABLED Possible values = ENABLED, DISABLED
http2direct	<String>	Read-write	Choose whether to enable support for Direct HTTP/2. Default value: DISABLED Possible values = ENABLED, DISABLED
http2strictcipher	<String>	Read-write	Choose whether to enable strict HTTP/2 cipher selection. Default value: ENABLED Possible values = ENABLED, DISABLED
http2altsvcframe	<String>	Read-write	Choose whether to enable support for sending HTTP/2 ALTSVC frames. When enabled, the ADC sends HTTP/2

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ALTSVC frames to HTTP/2 clients, instead of the Alt-Svc response header field. Not applicable to servers. Default value: DISABLED Possible values = ENABLED, DISABLED
altsvc	<String>	Read-write	Choose whether to enable support for Alternative Services. Default value: DISABLED Possible values = ENABLED, DISABLED
altsvcvalue	<String>	Read-write	Configure a custom Alternative Services header value that should be inserted in the response to advertise a HTTP/SSL/HTTP_QUIC vserver.
reusepooltimeout	<Integer>	Read-write	Idle timeout (in seconds) for server connections in re-use pool. Connections in the re-use pool are flushed, if they

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			remain idle for the configured timeout. Default value: 0 Minimum value = 0 Maximum value = 31536000
maxheaderlen	<Integer>	Read-write	Number of bytes to be queued to look for complete header before returning error. If complete header is not obtained after queuing these many bytes, request will be marked as invalid and no L7 processing will be done for that TCP connection. Default value: 24820 Minimum value = 2048 Maximum value = 122880
maxheaderfieldlen	<Integer>	Read-write	Number of bytes allowed for header field for HTTP header. If number of bytes exceeds beyond configured value, then request will be marked invalid.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 24820 Minimum value = 2048 Maximum value = 122880
minreusepool	<Integer>	Read-write	Minimum limit on the number of connections, from the Citrix ADC to a particular server that are kept in the reuse pool. This setting is helpful for optimal memory utilization and for reducing the idle connections to the server just after the peak time. Zero implies no limit on reuse pool size. Default value: 0 Minimum value = 0 Maximum value = 360000
http2maxheaderlistsize	<Integer>	Read-write	Maximum size of header list that the Citrix ADC is prepared to accept, in bytes. NOTE: The actual plain text header size that the Citrix ADC accepts is limited by maxHeaderLen.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Please change maxHeaderLen parameter as well when modifying http2MaxHeaderList Size. Default value: 24576 Minimum value = 8192 Maximum value = 131071
http2maxframesize	<Integer>	Read-write	Maximum size of the frame payload that the Citrix ADC is willing to receive, in bytes. Default value: 16384 Minimum value = 16384 Maximum value = 32768
http2maxconcurrents treams	<Integer>	Read-write	Maximum number of concurrent streams that is allowed per connection. Default value: 100 Minimum value = 0 Maximum value = 1000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
http2initialconnwindowsize	<Integer>	Read-write	Initial window size for connection level flow control, in bytes. Default value: 65535 Minimum value = 65535 Maximum value = 67108864
http2initialwindowsize	<Integer>	Read-write	Initial window size for stream level flow control, in bytes. Default value: 65535 Minimum value = 8192 Maximum value = 20971520
http2headertablesize	<Integer>	Read-write	Maximum size of the header compression table used to decode header blocks, in bytes. Default value: 4096 Minimum value = 0 Maximum value = 131072
http2minseverconn	<Integer>	Read-write	Minimum number of HTTP2 connections established to backend server, on receiving HTTP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requests from client before multiplexing the streams into the available HTTP/2 connections. Default value: 20 Minimum value = 1 Maximum value = 360000
http2maxpingframespermin	<Integer>	Read-write	Maximum number of PING frames allowed in HTTP2 connection per minute. Default value: 60 Minimum value = 1 Maximum value = 360000
http2maxsettingsframespermin	<Integer>	Read-write	Maximum number of SETTINGS frames allowed in HTTP2 connection per minute. Default value: 15 Minimum value = 1 Maximum value = 360000
http2maxresetframespermin	<Integer>	Read-write	Maximum number of outgoing RST_STREAM frames allowed in HTTP/2 connection per minute.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 90 Minimum value = 1 Maximum value = 360000
http2maxemptyframespermin	<Integer>	Read-write	Maximum number of empty frames allowed in HTTP2 connection per minute. Default value: 60 Minimum value = 1 Maximum value = 360000
http2maxrxresetframespermin	<Integer>	Read-write	Maximum number of incoming RST_STREAM frames allowed in HTTP/2 connection per minute. Default value: 0 Minimum value = 0 Maximum value = 360000
http2smallwndtimeout	<Integer>	Read-write	Timeout in seconds for HTTP/2 small window stalled streams. Connection is silently closed if a stream remains stalled with zero or small window for this

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			duration. 0 disables the check. Default value: 0 Minimum value = 0 Maximum value = 18000
grpcholdlimit	<Integer>	Read-write	Maximum size in bytes allowed to buffer gRPC packets till trailer is received. Default value: 131072 Minimum value = 0 Maximum value = 33554432
grpcholdtimeout	<Integer>	Read-write	Maximum time in milliseconds allowed to buffer gRPC packets till trailer is received. The value should be in multiples of 100. Default value: 1000 Minimum value = 0 Maximum value = 180000
grpclengthdelimitation	<String>	Read-write	Set to DISABLED for gRPC without a length delimitation. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
apdexcltresptimethreshold	<Integer>	Read-write	This option sets the satisfactory threshold (T) for client response time in milliseconds to be used for APDEX calculations. This means a transaction responding in less than this threshold is considered satisfactory. Transaction responding between T and 4*T is considered tolerable. Any transaction responding in more than 4*T time is considered frustrating. Citrix ADC maintains stats for such tolerable and frustrating transcations. And client response time related apdex counters are only updated on a vserver which receives clients traffic. Default value: 500 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 3600000
http3	<String>	Read-write	Choose whether to enable support for HTTP/3. Default value: DISABLED Possible values = ENABLED, DISABLED
http3maxheaderfieldsectionsize	<Integer>	Read-write	Maximum size of the HTTP/3 header field section, in bytes. Default value: 24576 Minimum value = 8192 Maximum value = 131072
http3maxheadertablesize	<Integer>	Read-write	Maximum size of the HTTP/3 QPACK dynamic header table, in bytes. Default value: 4096 Minimum value = 0 Maximum value = 131072
http3maxheaderblockedstreams	<Integer>	Read-write	Maximum number of HTTP/3 streams that can be blocked while

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			HTTP/3 headers are being decoded. Default value: 100 Minimum value = 1 Maximum value = 500
http3webtransport	<String>	Read-write	Choose whether to enable support for WebTransport over HTTP/3. Default value: DISABLED Possible values = ENABLED, DISABLED
http3minseverconn	<Integer>	Read-write	Minimum number of HTTP/3 connections established to backend server, on receiving HTTP requests from client before multiplexing the streams into the available HTTP/3 connections. Default value: 20 Minimum value = 1 Maximum value = 360000
httppipelinebuffsize	<Integer>	Read-write	Application pipeline request buffering size, in bytes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 131072 Minimum value = 131072 Maximum value = 20971520
allowonlywordcharactersandhyphen	<String>	Read-write	When enabled allows only the word characters [A-Za-z0-9_] and hyphen [-] in the request/response header names and the connection will be reset for the other characters. When disabled allows any visible (printing) characters (%21-%7E) except delimiters (double quotes and "(),/:;<=>?@[]{}"). Default value: DISABLED Possible values = ENABLED, DISABLED
hostheadervalidation	<String>	Read-write	Validates the length of the Host header and its syntax. Also includes validation of the port number if specified.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
maxduplicateheaderfields	<Integer>	Read-write	Maximum number of allowed occurrences of header fields that share the same field name. This threshold is enforced only for well-known header field names recognized by NetScaler. If the value is set to 0, then it will be similar to previous behavior, Where we store only 15 duplicate headers and rest are parsed and send to the server. Default value: 0 Minimum value = 0 Maximum value = 15
passprotocolupgrade	<String>	Read-write	Pass protocol upgrade request to the server. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
http2extendedconnect	<String>	Read-write	Choose whether to enable HTTP/2 Extended CONNECT mechanism. Default value: ENABLED Possible values = ENABLED, DISABLED
normalizeurl	<String>	Read-write	Enable or disable RFC 3986 normalization of incoming URL before validation or consumption. Default value: DISABLED Possible values = ENABLED, DISABLED
normalizeurltoorigin	<String>	Read-write	Enable or disable RFC 3986 URL normalization for request sent to the origin server. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
refcnt	<Integer>	Read-only	Number of entities using this profile.
builtin	<String[]>	Read-only	Flag to determine if http profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
apdexsvrresptimethreshold	<Integer>	Read-only	This option sets the satisfactory threshold (T) for server response time in milliseconds to be used for APDEX calculations. This means a transaction responding in less than this threshold is considered satisfactory. Transaction responding between T and 4*T is considered tolerable. Any transaction responding in more than 4*T time is considered frustrating. Citrix ADC maintains stats for such tolerable and frustrating transcations. Server Response time related apdex counters are only

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			updated on backend services or a backend vserver which is not accepting client traffic. Default value: 400 Minimum value = 1 Maximum value = 3600000
dropinvalreqswarning	<String>	Read-only	Display warning if Drop invalid reqs is disabled in the profile. Default value: 0 Possible values = Secure deployment guide : This http profile is insecure. To keep it secure enable - Drop invalid HTTP requests
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD

- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nshttpprofile **HTTP Method:** POST

nsicapprofile

Configuration for ICAP profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for an ICAP profile. Must begin with a letter, number, or the underscore \(_\) character. Other characters allowed, after the first character, are the hyphen \(-\), period \(.\), hash \(#\), space \(\), at \(@\), colon \(:\), and equal \(=\) characters. The name of a ICAP profile cannot be changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks \(for example, "my icap profile" or 'my icap profile'\). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
preview	<String>	Read-write	Enable or Disable preview header with ICAP request. This feature allows an ICAP server to see the beginning of a transaction, then decide if it wants to opt-out of the transaction early instead of receiving the remainder of the request message. Default value: DISABLED Possible values = ENABLED, DISABLED
previewlength	<Integer>	Read-write	Value of Preview Header field. Citrix ADC uses the minimum of this set value and the preview size received on OPTIONS response. Default value: 4096 Minimum value = 0 Maximum value = 4294967294
uri	<String>	Read-write	URI representing icap service. It is a mandatory argument

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			while creating an icapprofile. Minimum length = 1
hostheader	<String>	Read-write	ICAP Host Header. Minimum length = 1
useragent	<String>	Read-write	ICAP User Agent Header String. Minimum length = 1
mode	<String>	Read-write	ICAP Mode of operation. It is a mandatory argument while creating an icapprofile. Possible values = REQMOD, RESPMOD
queryparams	<String>	Read-write	Query parameters to be included with ICAP request URI. Entered values should be in arg=value format. For more than one parameters, add ; separated values. e.g.: arg1=val1;arg2=val2. Minimum length = 1
connectionkeepalive	<String>	Read-write	If enabled, Citrix ADC keeps the ICAP connection alive after a transaction to reuse it to send next ICAP request.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
allow204	<String>	Read-write	Enable or Disable sending Allow: 204 header in ICAP request. Default value: ENABLED Possible values = ENABLED, DISABLED
inserticapheaders	<String>	Read-write	Insert custom ICAP headers in the ICAP request to send to ICAP server. The headers can be static or can be dynamically constructed using PI Policy Expression. For example, to send static user agent and Client's IP address, the expression can be specified as "User-Agent: NS-ICAP-Client/ V1.0\r\nX-Client-IP: "+CLIENT.IP.SRC+"\r \n". The Citrix ADC does not check the validity of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified header name-value. You must manually validate the specified header syntax. Minimum length = 1
inserthttprequest	<String>	Read-write	Exact HTTP request, in the form of an expression, which the Citrix ADC encapsulates and sends to the ICAP server. If you set this parameter, the ICAP request is sent using only this header. This can be used when the HTTP header is not available to send or ICAP server only needs part of the incoming HTTP request. The request expression is constrained by the feature for which it is used. The Citrix ADC does not check the validity of this request. You must manually validate the request. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqtimeout	<Integer>	Read-write	Time, in seconds, within which the remote server should respond to the ICAP-request. If the Netscaler does not receive full response with this time, the specified request timeout action is performed. Zero value disables this timeout functionality. Default value: 0 Minimum value = 0 Maximum value = 86400
reqtimeoutaction	<String>	Read-write	Name of the action to perform if the Vserver/Server representing the remote service does not respond with any response within the timeout value configured. The Supported actions are * BYPASS - This Ignores the remote server response and sends the request/response to Client/Server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If the ICAP response with Encapsulated headers is not received within the request-timeout value configured, this Ignores the remote ICAP server response and sends the Full request/ response to Server/ Client. * RESET - Reset the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user. Default value: RESET Possible values = BYPASS, DROP, RESET

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
logaction	<String>	Read-write	Name of the audit message action which would be evaluated on receiving the ICAP response to emit the logs.
inspecthttp2	<String>	Read-write	Enable or Disable ICAP inspection for HTTP/2 traffic. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsicapprofile **HTTP Method:** POST

nsip

Configuration for ip resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IPv4 address to create on the Citrix ADC. Cannot be changed after the IP address is created. Minimum length = 1
netmask	<String>	Read-write	Subnet mask associated with the IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the IP address to create on the Citrix ADC. Cannot be changed after the IP address is created. The following are the different types of Citrix ADC owned IP addresses: * A Subnet IP (SNIP) address is used by the Citrix ADC to communicate with the servers. The Citrix ADC also uses the subnet IP address when generating its own packets, such as packets related to dynamic routing protocols, or to send monitor probes to check the health of the servers. * A Virtual IP (VIP) address is the IP address associated with a virtual server. It is the IP address to which clients connect. An appliance managing

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a wide range of traffic may have many VIPs configured. Some of the attributes of the VIP address are customized to meet the requirements of the virtual server. * A GSLB site IP (GSLBIP) address is associated with a GSLB site. It is not mandatory to specify a GSLBIP address when you initially configure the Citrix ADC. A GSLBIP address is used only when you create a GSLB site. * A Cluster IP (CLIP) address is the management address of the cluster. All cluster configurations must be performed by accessing the cluster through this IP address. Default value: SNIP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = SNIP, VIP, NSIP, HostIP, GSLBsiteIP, CLIP
arp	<String>	Read-write	Respond to ARP requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
icmp	<String>	Read-write	Respond to ICMP requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
vserver	<String>	Read-write	Use this option to set (enable or disable) the virtual server attribute for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
telnet	<String>	Read-write	Allow Telnet access to this IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
ftp	<String>	Read-write	Allow File Transfer Protocol (FTP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
gui	<String>	Read-write	Allow graphical user interface (GUI) access to this IP address. Default value: ENABLED Possible values = ENABLED, SECUREONLY, DISABLED
ssh	<String>	Read-write	Allow secure shell (SSH) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
snmp	<String>	Read-write	Allow Simple Network Management Protocol (SNMP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
mgmtaccess	<String>	Read-write	Allow access to management applications on this IP address. Default value: DISABLED Possible values = ENABLED, DISABLED
restrictaccess	<String>	Read-write	Block access to nonmanagement applications on this IP. This option is applicable for MIPs, SNIPs, and NSIP, and is disabled by default. Nonmanagement applications can run on the underlying Citrix ADC Free BSD operating system. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dynamicrouting	<String>	Read-write	Allow dynamic routing on this IP address. Specific to Subnet IP (SNIP) address. Default value: DISABLED Possible values = ENABLED, DISABLED
decrementttl	<String>	Read-write	Decrement TTL by 1 when ENABLED.This setting is applicable only for UDP traffic. Default value: DISABLED Possible values = ENABLED, DISABLED
ospf	<String>	Read-write	Use this option to enable or disable OSPF on this IP address for the entity. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bgp	<String>	Read-write	Use this option to enable or disable BGP on this IP address for the entity. Default value: DISABLED Possible values = ENABLED, DISABLED
rip	<String>	Read-write	Use this option to enable or disable RIP on this IP address for the entity. Default value: DISABLED Possible values = ENABLED, DISABLED
hostroute	<String>	Read-write	Option to push the VIP to ZebOS routing table for Kernel route redistribution through dynamic routing protocols. Possible values = ENABLED, DISABLED
advertiseondefaultpartition	<String>	Read-write	Advertise VIPs from Shared VLAN on Default Partition.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
networkroute	<String>	Read-write	Option to push the SNIP subnet to ZebOS routing table for Kernel route redistribution through dynamic routing protocol. Possible values = ENABLED, DISABLED
tag	<Integer>	Read-write	Tag value for the network/host route associated with this IP. Default value: 0
hostrtgw	<String>	Read-write	IP address of the gateway of the route for this VIP address. Default value: -1
metric	<Integer>	Read-write	Integer value to add to or subtract from the cost of the route advertised for the VIP address. Minimum value = -16777215
vserverrhilevel	<String>	Read-write	Advertise the route for the Virtual IP (VIP) address on the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			basis of the state of the virtual servers associated with that VIP. * NONE - Advertise the route for the VIP address, regardless of the state of the virtual servers associated with the address. * ONE VSERVER - Advertise the route for the VIP address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - Advertise the route for the VIP address if all of the associated virtual servers are in UP state. * VSVR_CNTRLD - Advertise the route for the VIP address according to the RHIstate (RHI STATE) parameter setting on all the associated virtual servers of the VIP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address along with their states. When Vserver RHI Level (RHI) parameter is set to VSVR_CNTRLD, the following are different RHI behaviors for the VIP address on the basis of RHIstate (RHI STATE) settings on the virtual servers associated with the VIP address: * If you set RHI STATE to PASSIVE on all virtual servers, the Citrix ADC always advertises the route for the VIP address. * If you set RHI STATE to ACTIVE on all virtual servers, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			servers is in UP state. *If you set RHI STATE to ACTIVE on some and PASSIVE on others, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers, whose RHI STATE set to ACTIVE, is in UP state. Default value: ONE_VSERVER Possible values = ONE_VSERVER, ALL_VSERVERS, NONE, VSVR_CNTRLD
ospflsatype	<String>	Read-write	Type of LSAs to be used by the OSPF protocol, running on the Citrix ADC, for advertising the route for this VIP address. Default value: TYPE5 Possible values = TYPE1, TYPE5

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ospfarea	<Integer>	Read-write	ID of the area in which the type1 link-state advertisements (LSAs) are to be advertised for this virtual IP (VIP) address by the OSPF protocol running on the Citrix ADC. When this parameter is not set, the VIP is advertised on all areas. Default value: -1 Minimum value = 0 Maximum value = 4294967294LU
state	<String>	Read-write	Enable or disable the IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
vrid	<Integer>	Read-write	A positive integer that uniquely identifies a VMAC address for binding to this VIP address. This binding is used to set up Citrix ADCs in an active-active configuration using VRRP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 255
icmpresponse	<String>	Read-write	Respond to ICMP requests for a Virtual IP (VIP) address on the basis of the states of the virtual servers associated with that VIP. Available settings function as follows: * NONE - The Citrix ADC responds to any ICMP request for the VIP address, irrespective of the states of the virtual servers associated with the address. * ONE VSERVER - The Citrix ADC responds to any ICMP request for the VIP address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - The Citrix ADC responds to any ICMP request for the VIP address if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			all of the associated virtual servers are in UP state. * VSVR_CNTRLD - The behavior depends on the ICMP VSERVER RESPONSE setting on all the associated virtual servers. The following settings can be made for the ICMP VSERVER RESPONSE parameter on a virtual server: * If you set ICMP VSERVER RESPONSE to PASSIVE on all virtual servers, Citrix ADC always responds. * If you set ICMP VSERVER RESPONSE to ACTIVE on all virtual servers, Citrix ADC responds

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			if even one virtual server is UP. * When you set ICMP VSERVER RESPONSE to ACTIVE on some and PASSIVE on others, Citrix ADC responds if even one virtual server set to ACTIVE is UP. Default value: 5 Possible values = NONE, ONE_VSERVER, ALL_VSERVERS, VSVR_CNTRLD
ownernode	<Integer>	Read-write	The owner node in a Cluster for this IP address. Owner node can vary from 0 to 31. If ownernode is not specified then the IP is treated as Striped IP. Default value: 255
arpresponse	<String>	Read-write	Respond to ARP requests for a Virtual IP (VIP) address on the basis of the states of the virtual servers associated with that VIP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Available settings function as follows: * NONE - The Citrix ADC responds to any ARP request for the VIP address, irrespective of the states of the virtual servers associated with the address. * ONE VSERVER - The Citrix ADC responds to any ARP request for the VIP address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - The Citrix ADC responds to any ARP request for the VIP address if all of the associated virtual servers are in UP state. Default value: 5 Possible values = NONE, ONE_VSERVER, ALL_VSERVERS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ownerdownresponse	<String>	Read-write	in cluster system, if the owner node is down, whether should it respond to icmp/arp. Default value: YES Possible values = YES, NO
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. TD id 4095 is used reserved for LSN use . Minimum value = 0 Maximum value = 4095
arpowner	<Integer>	Read-write	The arp owner in a Cluster for this IP address. It can vary from 0 to 31. Default value: 255
mptcpadvertise	<String>	Read-write	If enabled, this IP will be advertised by Citrix ADC to MPTCP enabled

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			clients as part of ADD_ADDR option. Default value: NO Possible values = YES, NO
flags	<Integer>	Read-only	The flags for this entry.
hostrtgwact	<String>	Read-only	Actual Gateway used for advertising host route.
ospfareaval	<Integer>	Read-only	The area ID of the area in which OSPF Type1 LSAs are advertised.
viprtadv2bsd	<Boolean>	Read-only	Whether this route is advertised to FreeBSD.
vipvsercount	<Integer>	Read-only	Number of vservers bound to this VIP.
vipvserdowncount	<Integer>	Read-only	Number of vservers bound to this VIP, which are down.
vipvsrvrrhiactivecoun t	<Integer>	Read-only	Number of vservers that have RHI state ACTIVE.
vipvsrvrrhiactiveupco unt	<Integer>	Read-only	Number of vservers that have RHI state ACTIVE, which are UP.
freeports	<Integer>	Read-only	Number of free Ports available on this IP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
iptype	<String[]>	Read-only	. Possible values = SNIP, VIP, NSIP, HostIP, GSLBsiteIP, CLIP
operationalarpowner	<Integer>	Read-only	Run time operational Arp Owner.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

get (all)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsip **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nsip? **args=ipaddress: <String_value> ,td: <Integer_value> ,type: <String_value>**

Use this query-parameter to get nsip resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/nsip? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nsip? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsip resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nsip? **view=summary**

Use this query-parameter to get the summary output of nsip resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nsip? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsip resources in chunks.

nsip6

Configuration for ip6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipv6address	<String>	Read-write	IPv6 address to create on the Citrix ADC. Minimum length = 1
scope	<String>	Read-write	Scope of the IPv6 address to be created. Cannot be changed after the IP address is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: global Possible values = global, link-local
type	<String>	Read-write	Type of IP address to be created on the Citrix ADC. Cannot be changed after the IP address is created. Default value: SNIP Possible values = NSIP, VIP, SNIP, GSLBsiteIP, ADNSsvcIP, RADIUSListenersvcIP, CLIP
vlan	<Integer>	Read-write	The VLAN number. Default value: 0 Minimum value = 0 Maximum value = 4094
nd	<String>	Read-write	Respond to Neighbor Discovery (ND) requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
icmp	<String>	Read-write	Respond to ICMP requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
vserver	<String>	Read-write	Enable or disable the state of all the virtual servers associated with this VIP6 address. Default value: ENABLED Possible values = ENABLED, DISABLED
telnet	<String>	Read-write	Allow Telnet access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
ftp	<String>	Read-write	Allow File Transfer Protocol (FTP) access to this IP address. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
gui	<String>	Read-write	Allow graphical user interface (GUI) access to this IP address. Default value: ENABLED Possible values = ENABLED, SECUREONLY, DISABLED
ssh	<String>	Read-write	Allow secure Shell (SSH) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
snmp	<String>	Read-write	Allow Simple Network Management Protocol (SNMP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mgmtaccess	<String>	Read-write	Allow access to management applications on this IP address. Default value: DISABLED Possible values = ENABLED, DISABLED
restrictaccess	<String>	Read-write	Block access to nonmanagement applications on this IP address. This option is applicable forMIP6s, SNIP6s, and NSIP6s, and is disabled by default. Nonmanagement applications can run on the underlying Citrix ADC Free BSD operating system. Default value: DISABLED Possible values = ENABLED, DISABLED
dynamicrouting	<String>	Read-write	Allow dynamic routing on this IP address. Specific to Subnet IPv6 (SNIP6) address. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
decrementhoplimit	<String>	Read-write	Decrement Hop Limit by 1 when ENABLED.This setting is applicable only for UDP traffic. Default value: DISABLED Possible values = ENABLED, DISABLED
hostroute	<String>	Read-write	Option to push the VIP6 to ZebOS routing table for Kernel route redistribution through dynamic routing protocols. Possible values = ENABLED, DISABLED
advertiseondefaultpartition	<String>	Read-write	Advertise VIPs from Shared VLAN on Default Partition. Default value: DISABLED Possible values = ENABLED, DISABLED
networkroute	<String>	Read-write	Option to push the SNIP6 subnet to ZebOS routing table

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for Kernel route redistribution through dynamic routing protocol. Possible values = ENABLED, DISABLED
tag	<Integer>	Read-write	Tag value for the network/host route associated with this IP. Default value: 0
ip6hostrtgw	<String>	Read-write	IPv6 address of the gateway for the route. If Gateway is not set, VIP uses :: as the gateway. Default value: 0
metric	<Integer>	Read-write	Integer value to add to or subtract from the cost of the route advertised for the VIP6 address. Minimum value = -16777215
vserverrhilevel	<String>	Read-write	Advertise or do not advertise the route for the Virtual IP (VIP6) address on the basis of the state of the virtual servers associated with that VIP6. * NONE - Advertise the route for the VIP6 address,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			irrespective of the state of the virtual servers associated with the address. * ONE VSERVER - Advertise the route for the VIP6 address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - Advertise the route for the VIP6 address if all of the associated virtual servers are in UP state. * VSVR_CNTRLD. Advertise the route for the VIP address according to the RHIstate (RHI STATE) parameter setting on all the associated virtual servers of the VIP address along with their states. When Vserver RHI Level (RHI) parameter is set to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VSVR_CNTRLD, the following are different RHI behaviors for the VIP address on the basis of RHIstate (RHI STATE) settings on the virtual servers associated with the VIP address: * If you set RHI STATE to PASSIVE on all virtual servers, the Citrix ADC always advertises the route for the VIP address. * If you set RHI STATE to ACTIVE on all virtual servers, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers is in UP state. *If you set RHI STATE to ACTIVE on some and PASSIVE on others, the Citrix ADC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			advertises the route for the VIP address if at least one of the associated virtual servers, whose RHI STATE set to ACTIVE, is in UP state. Default value: ONE_VSERVER Possible values = ONE_VSERVER, ALL_VSERVERS, NONE, VSVR_CNTRLD
ospf6lsatype	<String>	Read-write	Type of LSAs to be used by the IPv6 OSPF protocol, running on the Citrix ADC, for advertising the route for the VIP6 address. Default value: EXTERNAL Possible values = INTRA_AREA, EXTERNAL
ospfarea	<Integer>	Read-write	ID of the area in which the Intra-Area-Prefix LSAs are to be advertised for the VIP6 address by the IPv6 OSPF protocol running on the Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADC. When ospfArea is not set, VIP6 is advertised on all areas. Default value: -1 Minimum value = 0 Maximum value = 4294967294LU
state	<String>	Read-write	Enable or disable the IP address. Default value: ENABLED Possible values = DISABLED, ENABLED
map	<String>	Read-write	Mapped IPV4 address for the IPV6 address.
vrid6	<Integer>	Read-write	A positive integer that uniquely identifies a VMAC address for binding to this VIP address. This binding is used to set up Citrix ADCs in an active-active configuration using VRRP. Minimum value = 1 Maximum value = 255
ownernode	<Integer>	Read-write	ID of the cluster node for which you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are adding the IP address. Must be used if you want the IP address to be active only on the specific node. Can be configured only through the cluster IP address. Cannot be changed after the IP address is created. Default value: 255
ownerdownresponse	<String>	Read-write	in cluster system, if the owner node is down, whether should it respond to icmp/arp. Default value: YES Possible values = YES, NO
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ndowner	<Integer>	Read-write	NdOwner in Cluster for VIPS and Striped SNIPS. Default value: 255
mptcpadvertise	<String>	Read-write	If enabled, this IP will be advertised by Citrix ADC to MPTCP enabled clients as part of ADD_ADDR option. Default value: NO Possible values = YES, NO
icmpresponse	<String>	Read-write	Respond to ICMPv6 requests for a Virtual IP (VIP) address on the basis of the states of the virtual servers associated with that VIP. Default value: 5 Possible values = NONE, ONE_VSERVER, ALL_VSERVERS, VSVR_CNTRLD
iptype	<String[]>	Read-only	The type of the IPv6 address. Possible values = NSIP, VIP, SNIP, GSLBsiteIP, ADNSsvcIP, RADIUSListenersvcIP, CLIP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
curstate	<String>	Read-only	Current state of this IP. Default value: ENABLED Possible values = DISABLED, ENABLED
viprtadv2bsd	<Boolean>	Read-only	Whether this route is advertised to FreeBSD.
vipvsercount	<Integer>	Read-only	Number of vservers bound to this VIP.
vipvserdowncount	<Integer>	Read-only	Number of vservers bound to this VIP, which are down.
systemtype	<String>	Read-only	The type of the System. Possible Values: Standalone, HA, Cluster. Used for display purpose. Possible values = Stand-alone, HA, Cluster
operationalndowner	<Integer>	Read-only	Operational ND6 Owner.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD

- DELETE
- UPDATE
- UNSET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

nsjob

Configuration for job resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-write	Running job id.
name	<String>	Read-write	Running job Name.
status	<String>	Read-only	Running job status. Possible values = InProgress, Success, Failed, TimedOut
progress	<String>	Read-only	Running job progress details.
timeelapsed	<Integer>	Read-only	Number of seconds since the job started. Minimum value = 0 Maximum value = 31536000
errorcode	<Integer>	Read-only	Errcode for a particular job.
message	<String>	Read-only	Error message corresponding to the errorcode.
response	<String>	Read-only	Response of the JOB Process.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsjob **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nsjob? **args=id: <Integer_value> ,name: <String_value>**

Use this query-parameter to get nsjob resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/nsjob? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nsjob? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsjob resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nsjob? **view=summary**

Use this query-parameter to get the summary output of nsjob resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nsjob? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsjob resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslicenseactivationdata **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nslicenseactivationdata? **args=usehostname: <Boolean_value>**

Use this query-parameter to get nslicenseactivationdata resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslicenseactivationdata": [ {

usehostname:<Boolean_value>"filename":<String_value>,

"_nextgenapiresource":<String_value>
```

```
}]}
```

nslicenseparameters

Configuration for licenseparameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
alert1gracetimeout	<Integer>	Read-write	If ADC remains in grace for the configured hours then first grace alert will be raised. Default value: 6 Minimum value = 0 Maximum value = 24
alert2gracetimeout	<Integer>	Read-write	If ADC remains in grace for the configured hours then major grace alert will be raised. Default value: 240 Minimum value = 24 Maximum value = 720
licenseexpiryalerttime	<Integer>	Read-write	If ADC license contract expiry date is nearer then GUI/ SNMP license expiry alert will be raised.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 30 Minimum value = 1 Maximum value = 365
heartbeatinterval	<Integer>	Read-write	Heartbeat between ADC and Licenseserver is configurable and applicable in case of pooled licensing. Default value: 280 Minimum value = 30 Maximum value = 280
inventoryrefreshinterval	<Integer>	Read-write	Inventory refresh interval between ADC and Licenseserver is configurable and applicable in case of pooled licensing. Default value: 360 Minimum value = 45 Maximum value = 1440
_nextgenapiresource	<String>	Read-only	.

nslicenseserver

Configuration for licenseserver resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
licenseserverip	<String>	Read-write	IP address of the License server. Minimum length = 1
servername	<String>	Read-write	Fully qualified domain name of the License server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
port	<Integer>	Read-write	License server port.
forceupdateip	<Boolean>	Read-write	If this flag is used while adding the licenseserver, existing config will be overwritten. Use this flag only if you are sure that the new licenseserver has the required capacity.
licensemode	<String>	Read-write	This paramter indicates type of license customer interested while configuring add/set licenseserver. Possible values = Pooled, VCPU, CICO, SelfManagedPool, SelfManagedvCPU, LAS
username	<String>	Read-write	Username to authenticate with ADM Agent for LAS licensing. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
password	<String>	Read-write	Password to use when authenticating with ADM Agent for LAS licensing. Minimum length = 1
deviceprofilename	<String>	Read-write	Device profile is created on ADM and contains the user name and password of the instance(s). ADM will use this info to add the NS for registration. Minimum length = 1 Maximum length = 255
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
status	<Integer>	Read-only	Status of license server.
grace	<Integer>	Read-only	Grace status of server.
gptimeleft	<Integer>	Read-only	Grace time left.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-only	License Server type CLA/ADM. Possible values = ADM, CLA
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

vpx100000pavailable	<Integer>	Read-only	VPX100000P Available.
licensemode	<String>	Read-only	This paramter indicates type of license customer interested while configuring add/set licenseserver. Possible values = Pooled, VCPU, CICO, SelfManagedPool, SelfManagedvCPU, LAS
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserverpool **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserverpool? **args=getalllicenses: <Boolean_value>**

Use this query-parameter to get nslicenseserverpool resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

nslimitidentifier

Configuration for limit Identifier resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name for a rate limit identifier. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Reserved words must not be used.
threshold	<Integer>	Read-write	Maximum number of requests that are allowed in the given timeslice when requests (mode is set as REQUEST_RATE) are tracked per timeslice. When connections (mode is set as CONNECTION) are tracked, it is the total number of connections that would be let through. Maximum number of tokens that are allowed in the given timeslice when Tokens (mode is set to TOKEN_RATE) are tracked per timeslice.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 1 Minimum value = 1
timeslice	<Integer>	Read-write	Time interval, in milliseconds, specified in multiples of 10, during which requests/tokens are tracked to check if they cross the threshold. This argument is needed only when the mode is set to REQUEST_RATE or TOKEN_RATE. Default value: 1000 Minimum value = 10
mode	<String>	Read-write	Defines the type of traffic to be tracked. * REQUEST_RATE - Tracks requests/ timeslice. * CONNECTION - Tracks active transactions. * TOKEN_RATE - Tracks total input+output tokens/minute for LLM chat completions, Timeslice is fixed at 60000 ms, Useful on applications

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			serving LLM services. Examples 1. To permit 20 requests in 10 ms and 2 traps in 10 ms: add limitidentifier limit_req -mode request_rate -limitType smooth -timeslice 1000 -Threshold 2000 -trapsInTimeSlice 200 2. To permit 50 requests in 10 ms: set limitidentifier limit_req -mode request_rate -timeslice 1000 -Threshold 5000 -limitType smooth 3. To permit 1 request in 40 ms: set limitidentifier limit_req -mode request_rate -timeslice 2000 -Threshold 50 -limitType smooth

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			4. To permit 1 request in 200 ms and 1 trap in 130 ms: set limitidentifier limit_req -mode request_rate -timeslice 1000 -Threshold 5 -limitType smooth -trapsInTimeSlice 8 5. To permit 5000 requests in 1000 ms and 200 traps in 1000 ms and 20 appflow alerts in 1000ms: set limitidentifier limit_req -mode request_rate -timeslice 1000 -Threshold 5000 -limitType BURSTY -trapsInTimeSlice 200 -alertsInTimeSlice 20 6. To permit 100000 tokens in 60000 ms and 100 appflow alerts in 60000ms:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			set limitidentifier limit_tokens -mode token_rate -timeSlice 60000 -Threshold 100000 -limittype BURSTY -alertsInTimeSlice 100. Default value: REQUEST_RATE Possible values = CONNECTION, REQUEST_RATE, TOKEN_RATE, NONE
limittype	<String>	Read-write	Smooth or bursty request type. * SMOOTH - When you want the permitted number of requests in a given interval of time to be spread evenly across the timeslice * BURSTY - When you want the permitted number of requests to exhaust the quota anytime within the timeslice. This argument is needed only when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the mode is set to REQUEST_RATE. Mode TOKEN_RATE only supports BURSTY type. Default value: BURSTY Possible values = BURSTY, SMOOTH
selectorname	<String>	Read-write	Name of the rate limit selector. If this argument is NULL, rate limiting will be applied on all traffic received by the virtual server or the Citrix ADC (depending on whether the limit identifier is bound to a virtual server or globally) without any filtering. Minimum length = 1
maxbandwidth	<Integer>	Read-write	Maximum bandwidth permitted, in kbps. Minimum value = 0 Maximum value = 4294967287
trapsintimeslice	<Integer>	Read-write	Number of traps to be sent in the timeslice configured. A value of 0 indicates

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that traps are disabled. Minimum value = 0 Maximum value = 65535
alertsintimeslice	<Integer>	Read-write	Number of appflow alerts to be sent in the timeslice configured. A value of 0 indicates that alerts are disabled. A value of 65535 indicates no limit on number of appflow alerts. Default value: 65535 Minimum value = 0 Maximum value = 65535
timealign	<String>	Read-write	Value MINUTE will align the time windows for a configured timeslice to Minute boundary. TimeSlice values should be integrals of 60000ms when value MINUTE is choosen. Default : NONE, timeslice alignments will happen with next 10ms.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NONE Possible values = NONE, MINUTE
ngname	<String>	Read-only	Nodegroup name to which this identifier belongs to.
hits	<Integer>	Read-only	The number of times this identifier was evaluated.
drop	<Integer>	Read-only	The number of times action was taken.
rule	<String[]>	Read-only	Rule.
time	<Integer>	Read-only	Time interval considered for rate limiting.
total	<Integer>	Read-only	Maximum number of requests permitted in the computed timeslice.
trapscomputedintimeslice	<Integer>	Read-only	The number of traps that would be sent in the timeslice configured. .
computedtraptimeslice	<Integer>	Read-only	The time interval computed for sending traps.
alertscomputedintimeslice	<Integer>	Read-only	The number of appflow alerts that would be sent in the timeslice configured.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
computedalerttimeslice	<Integer>	Read-only	The time interval computed for sending appflow alerts.
referencecount	<Integer>	Read-only	Total number of transactions pointing to this entry.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslimitidentifier_binding": [ {

"limitidentifier":<String_value>,

"nslimitidentifier_nslimitsessions_binding":<nslimitidentifier_nslimitsessions_binding[]_value>

}]}
```

nslimitidentifier_nslimitsessions_binding

Binding object showing the nslimitsessions that can be bound to nslimitidentifier.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name of the rate limit identifier about which to display information. If a name is not provided, information about all rate limit identifiers is shown.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_nslimitsessions_binding/limitidentifier_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_nslimitsessions_binding/limitidentifier_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of nslimitidentifier_nslimitsessions_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_nslimitsessions_binding/ limitidentifier_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nslimitidentifier_nslimitsessions_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nslimitidentifier_nslimitsessions_binding": [ {

"limitidentifier":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_nslimitsessions_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_nslimitsessions_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nslimitidentifier_nslimitsessions_binding": [ {

"limitidentifier":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_nslimitsessions_binding/ limitidentifier_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"nslimitidentifier_nslimitsessions_binding": [ { "__count": "#no"} ] }
```

nslimitselector

Configuration for limit selector resource.

Properties

(click to see Operations)

nslimitsessions

Configuration for limit sessions resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name of the rate limit identifier for which to display the sessions. Minimum length = 1
detail	<Boolean>	Read-write	Show the individual hash values.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeout	<Integer>	Read-only	The time remaining on the session before a flush can be attempted. If active transactions are present the session will not be flushed.
hits	<Integer>	Read-only	The number of times this entry was hit.
drop	<Integer>	Read-only	The number of times action was taken.
number	<Integer[]>	Read-only	The hash of the matched selectlets.
name	<String>	Read-only	The string formed by gathering selectlet values.
unit	<Integer>	Read-only	Total computed hash of the matched selectlets.
flags	<Integer>	Read-only	Used internally to identify ip addresses.
referencecount	<Integer>	Read-only	Total number of transactions pointing to this entry. Its the sum total of the connection and bandwidth references.
maxbandwidth	<Integer>	Read-only	The current bandwidth.
selectoripv61	<String>	Read-only	First IPV6 address gathered.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
selectoripv62	<String>	Read-only	Second IPV6 address gathered.
flag	<Integer>	Read-only	Used internally to identify ipv6 addresses.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

STOP

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsmigration? **action=stop HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsmigration":{

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

COMPLETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsmigration? **action=complete HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsmigration":{

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsmigration **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nsmigration? **args=dumpsession: <String_value>**

Use this query-parameter to get nsmigration resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/nsmigration? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nsmigration? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsmigration resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nsmigration? **view=summary**

Use this query-parameter to get the summary output of nsmigration resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nsmigration? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsmigration resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsmigration": [ {

usip	<Boolean>	Read-only	Use Source IP.
cka	<Boolean>	Read-only	Client Keep-alive.
tcpb	<Boolean>	Read-only	TCP Buffering.
mbf	<Boolean>	Read-only	MAC-based forwarding.
edge	<Boolean>	Read-only	Edge configuration.
usnip	<Boolean>	Read-only	Use Subnet IP.
l3	<Boolean>	Read-only	Layer 3 mode (ip forwarding).
pmtud	<Boolean>	Read-only	Path MTU Discovery.
mediaclassification	<Boolean>	Read-only	mediaclassification.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sradv	<Boolean>	Read-only	Static Route Advertisement.
dradv	<Boolean>	Read-only	Direct Route Advertisement.
iradv	<Boolean>	Read-only	Intranet Route Advertisement.
sradv6	<Boolean>	Read-only	Ipv6 Static Route Advertisement.
dradv6	<Boolean>	Read-only	Ipv6 Direct Route Advertisement.
bridgebpdus	<Boolean>	Read-only	BPDU Bridging Mode.
single_ip	<Boolean>	Read-only	Single IP mode.
ulfd	<Boolean>	Read-only	Unified Logging Framework Mode for adding/removing ULF services.
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- ENABLE
- DISABLE
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsmode? **action=enable HTTP Method:** POST

nsparam

Configuration for Citrix ADC parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpport	<Integer[]>	Read-write	HTTP ports on the web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1 Maximum value = 65535
maxconn	<Integer>	Read-write	Maximum number of connections that will be made from the appliance to the web server(s) attached to it. The value entered here is applied globally to all attached servers.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 4294967294
maxreq	<Integer>	Read-write	Maximum number of requests that the system can pass on a particular connection between the appliance and a server attached to it. Setting this value to 0 allows an unlimited number of requests to be passed. This value is overridden by the maximum number of requests configured on the individual service. Minimum value = 0 Maximum value = 65535
cip	<String>	Read-write	Enable or disable the insertion of the actual client IP address into the HTTP header request passed from the client to one, some, or all servers attached to the system. The passed address can then be accessed through a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			minor modification to the server. * If the CIP header is specified, it will be used as the client IP header. * If the CIP header is not specified, the value that has been set will be used as the client IP header. Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	Text that will be used as the client IP address header. Minimum length = 1
cookieversion	<String>	Read-write	Version of the cookie inserted by the system. Possible values = 0, 1
securecookie	<String>	Read-write	Enable or disable secure flag for persistence cookie. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pmtumin	<Integer>	Read-write	Minimum path MTU value that Citrix ADC will process in the ICMP fragmentation needed message. If the ICMP message contains a value less than this value, then this value is used instead. Default value: 576 Minimum value = 168 Maximum value = 1500
pmtutimeout	<Integer>	Read-write	Interval, in minutes, for flushing the PMTU entries. Default value: 10 Minimum value = 1 Maximum value = 1440
ftpportrange	<String>	Read-write	Minimum and maximum port (port range) that FTP services are allowed to use. Minimum length = 1024 Maximum length = 64000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crportrange	<String>	Read-write	Port range for cache redirection services. Minimum length = 1 Maximum length = 65535
timezone	<String>	Read-write	Time zone for the Citrix ADC. Name of the time zone should be specified as argument. Default value: CoordinatedUniversalTime Minimum length = 1 Maximum length = 63
grantquotamaxclient	<Integer>	Read-write	Percentage of shared pool value granted to PE once PE exhausts the local exclusive quota. Where shared pool is the remaining maxclient quota after distribution of exclusive quota to PEs. Example: In a 2 PE NetScaler system if configured maxclient is 100 and exclusive quota is 80 percent then each PE will get 40

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			as local exclusive quota and 20 will be in shared pool. If configured grantQuota is 20 percent, then after exhausting its local exclusive quota PE borrows from shared pool in chunks of 4 i.e. 20 percent of 20. Default value: 10 Minimum value = 0 Maximum value = 100
exclusivequotamaxclient	<Integer>	Read-write	Percentage of maxClient threshold to be divided equally among PEs. Default value: 80 Minimum value = 0 Maximum value = 100
grantquotaspillover	<Integer>	Read-write	Percentage of shared pool value granted to PE once PE exhausts the local exclusive quota. Where shared pool is the remaining spillover quota after distribution of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			exclusive quota to PEs. Example: In a 2 PE NetScaler system if configured spillover is 100 and exclusive quota is 80 percent then each PE will get 40 as local exclusive quota and 20 will be in shared pool. If configured grantQuota is 20 percent, then after exhausting its local exclusive quota PE borrows from shared pool in chunks of 4 i.e. 20 percent of 20. Default value: 10 Minimum value = 0 Maximum value = 100
exclusivequotaspillover	<Integer>	Read-write	Percentage of spillover threshold to be divided equally among PEs. Default value: 80 Minimum value = 0 Maximum value = 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
useproxyport	<String>	Read-write	Enable/Disable use_proxy_port setting. Default value: ENABLED Possible values = ENABLED, DISABLED
internaluserlogin	<String>	Read-write	Enables/disables the internal user from logging in to the appliance. Before disabling internal user login, you must have key-based authentication set up on the appliance. The file name for the key pair must be "ns_comm_key". Default value: ENABLED Possible values = ENABLED, DISABLED
aftpallowrandomsourceport	<String>	Read-write	Allow the FTP server to come from a random source port for active FTP data connections. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
icaports	<Integer[]>	Read-write	The ICA ports on the Web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1
tcpcip	<String>	Read-write	Enable or disable the insertion of the client TCP/IP header in TCP payload passed from the client to one, some, or all servers attached to the system. The passed address can then be accessed through a minor modification to the server. Default value: DISABLED Possible values = ENABLED, DISABLED
servicepathingressvlan	<Integer>	Read-write	VLAN on which the subscriber traffic arrives on the appliance.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1
secureicaports	<Integer[]>	Read-write	The Secure ICA ports on the Web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1
mgmthttpport	<Integer>	Read-write	This allow the configuration of management HTTP port. Default value: 80 Minimum value = 1 Maximum value = 65534
mgmthttpsport	<Integer>	Read-write	This allows the configuration of management HTTPS port. Default value: 443 Minimum value = 1 Maximum value = 65534
proxyprotocol	<String>	Read-write	Disable/Enable v1 or v2 proxy protocol

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			header for client info insertion. Default value: DISABLED Possible values = ENABLED, DISABLED
advancedanalyticsstats	<String>	Read-write	Disable/Enable advanace analytics stats. Default value: DISABLED Possible values = ENABLED, DISABLED
ipttl	<Integer>	Read-write	Set the IP Time to Live (TTL) and Hop Limit value for all outgoing packets from Citrix ADC. Default value: 255 Minimum value = 1 Maximum value = 255
autoscaleoption	<Integer>	Read-only	64 bits are provided for communication between ADM and ADC in cloud deployments. Currently LSB 3 bits are used.0x01=>AWS,0x

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			02=>Azure,0x04=>GCP. Default value: 0
_nextgenapiresource	<String>	Read-only	.

nspartition

Configuration for admin partition resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of the Partition. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. Minimum length = 1
maxbandwidth	<Integer>	Read-write	Maximum bandwidth, in Kbps, that the partition can consume. A zero value indicates the bandwidth is unrestricted on the partition and it can consume up to the system limits. Default value: 10240
minbandwidth	<Integer>	Read-write	Minimum bandwidth, in Kbps, that the partition can consume. A zero value indicates the bandwidth is unrestricted on the partition and it can consume up to the system limits. Default value: 10240
maxconn	<Integer>	Read-write	Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on number of open connections. Default value: 1024

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxmemlimit	<Integer>	Read-write	Maximum memory, in megabytes, allocated to the partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits. Default value: 10 Minimum value = 0 Maximum value = 1048576
partitionmac	<String>	Read-write	Special MAC address for the partition which is used for communication over shared vlans in this partition. If not specified, the MAC address is auto-generated.
force	<Boolean>	Read-write	Switches to new admin partition without prompt for saving configuration. Configuration will not be saved.
save	<Boolean>	Read-write	Switches to new admin partition without prompt for saving configuration. Configuration will be saved.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionid	<Integer>	Read-only	Partition Id. Minimum value = 1 Maximum value = 511
partitiontype	<String>	Read-only	Type of the Partition. Possible values = Default Partition, Current Partition
pmacinternal	<Boolean>	Read-only	Partition MAC is generated internally.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- SWITCH
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspartition":{

<b>"partitionname":<String_value>,

</b>"maxbandwidth":<Integer_value>,

"minbandwidth":<Integer_value>,

"maxconn":<Integer_value>,

"maxmemlimit":<Integer_value>,

"partitionmac":<String_value>
```

```
}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition/ partitionname_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspartition":{

<b>"partitionname":<String_value>,

</b>"maxbandwidth":<Integer_value>,

"minbandwidth":<Integer_value>,

"maxconn":<Integer_value>,

"maxmemlimit":<Integer_value>,
```

```
"partitionmac":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspartition":{

<b>"partitionname":<String_value>,

</b>"maxbandwidth":true,

"minbandwidth":true,

"maxconn":true,

"maxmemlimit":true,

"partitionmac":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

SWITCH

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **action=Switch HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspartition":{

<b>"partitionname":<String_value>,

</b>"force":<Boolean_value>,

"save":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nspartition resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **view=summary**

Use this query-parameter to get the summary output of nspartition resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nspartition resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartition": [ {

"partitionname":<String_value>,

"partitionid":<Integer_value>,

"partitiontype":<String_value>,

"maxbandwidth":<Integer_value>,

"minbandwidth":<Integer_value>,

"maxconn":<Integer_value>,

"maxmemlimit":<Integer_value>,
```

```
"partitionmac":<String_value>,

"pmacinternal":<Boolean_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition/ partitionname_value<String>
Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/nspartition/ partitionname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/nspartition/ partitionname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nspartition resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nspartition": [ {

"partitionname":<String_value>,

"partitionid":<Integer_value>,

"partitiontype":<String_value>,

"maxbandwidth":<Integer_value>,

"minbandwidth":<Integer_value>,

"maxmemlimit":<Integer_value>,

"partitionmac":<String_value>,

"pmacinternal":<Boolean_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartition": [ { "__count": "#no"} ] }
```

nspartition_binding

Binding object which returns the resources bound to nspartition.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of partition for which to display parameters. Minimum length = 1
nspartition_vlan_binding	<nspartition_vlan_binding[]>	Read-only	vlan that can be bound to nspartition.
nspartition_bridgegroup_binding	<nspartition_bridgegroup_binding[]>	Read-only	bridgegroup that can be bound to nspartition.
nspartition_vxlan_binding	<nspartition_vxlan_binding[]>	Read-only	vxlan that can be bound to nspartition.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_binding/ partitionname_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartition_binding": [ {

"partitionname":<String_value>,
```

```
"nspartition_bridgegroup_binding":<nspartition_bridgegroup_binding[]_value
>,

"nspartition_vlan_binding":<nspartition_vlan_binding[]_value>,

"nspartition_vxlan_binding":<nspartition_vxlan_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/nspartition_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartition_binding": [ {

"partitionname":<String_value>,

"nspartition_bridgegroup_binding":<nspartition_bridgegroup_binding[]_value
>,
```

```
"nspartition_vlan_binding":<nspartition_vlan_binding[]_value>,

"nspartition_vxlan_binding":<nspartition_vxlan_binding[]_value>

}]}
```

nspartition_bridgegroup_binding

Binding object showing the bridgegroup that can be bound to nspartition.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of the Partition. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
bridgegroup	<Integer>	Read-write	Identifier of the bridge group that is assigned to this partition. Minimum value = 1 Maximum value = 1000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-write	count parameter

Operations

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nspartition_vxlan_binding": [ {

"vxlan":<Integer_value>,
```

```
"partitionname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding/ partitionname_value<String> ? **count=yes HTTP Method:** GET

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"nspartition_vxlan_binding": [ { "__count": "#no"} ] }
```

nspartitionmac

Configuration for partition MACs resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionmac	<String>	Read-write	A configured virtual MAC address that can be used by a partition for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			communication over shared VLANs.
partitionname	<String>	Read-write	Name of the partition to which the MAC has been assigned. Minimum length = 1
_nextgenapiresource	<String>	Read-write	.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nspartitionmac resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac? **view=summary**

Use this query-parameter to get the summary output of nspartitionmac resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nspartitionmac resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Response Payload:

```
{ "nspartitionmac": [ { "__count": "#no"} ] }
```

nspbr

Configuration for Policy Based Routing(PBR) entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the PBR. Must begin with an ASCII alphabetic or underscore \(_\) character, and must contain only ASCII alphanumeric, underscore, hash \(#\), period \(.\), space, colon \(:\), at \(@\), equals \(=\), and hyphen \(-\) characters. Cannot be changed after the PBR is created. Minimum length = 1
action	<String>	Read-write	Action to perform on the outgoing IPv4 packets that match the PBR. Available settings function as follows: * ALLOW - The Citrix ADC sends the packet to the designated next-hop router. * DENY - The Citrix ADC applies the routing table for normal destination-based routing. Possible values = ALLOW, DENY

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcip	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipval	<String>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv4

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
srcipdataset	<String>	Read-write	Policy dataset which can have multiple IP ranges bound to it.
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Port number or range of port numbers to match

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			against the source port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols. Maximum length = 65535
srcportdataset	<String>	Read-write	Policy dataset which can have multiple port ranges bound to it.
destip	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipval	<String>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
destipdataset	<String>	Read-write	Policy dataset which can have multiple IP ranges bound to it.
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Port number or range of port numbers to match against the destination port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols. Maximum length = 65535
destportdataset	<String>	Read-write	Policy dataset which can have multiple port ranges bound to it.
nexthop	<Boolean>	Read-write	IP address of the next hop router or the name of the link

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			load balancing virtual server to which to send matching packets if action is set to ALLOW. If you specify a link load balancing (LLB) virtual server, which can provide a backup if a next hop link fails, first make sure that the next hops bound to the LLB virtual server are actually next hops that are directly connected to the Citrix ADC. Otherwise, the Citrix ADC throws an error when you attempt to create the PBR. The next hop can be null to represent null routes.
nexthopval	<String>	Read-write	The Next Hop IP address or gateway name.
iptunnel	<Boolean>	Read-write	The Tunnel name.
iptunnelname	<String>	Read-write	The iptunnel name where packets need to be forwarded upon.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vxlanvlanmap	<String>	Read-write	The vlan to vxlan mapping to be applied for incoming packets over this pbr tunnel.
targettd	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain to which you want to send packet to. Minimum value = 0 Maximum value = 4094
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an outgoing IPv4 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"
protocol	<String>	Read-write	Protocol, identified by protocol name, to match against the protocol of an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			outgoing IPv4 packet. Possible values = ICMP, IGMP, TCP, EGP, IGP, ARGUS, UDP, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, ICMPV6, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-Protocol, CFTP, Any-Local-Network, SAT-EXPAK,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-IGNORE, Mobility-Header, UDPLite

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
protocolnumber	<Integer>	Read-write	Protocol, identified by protocol number, to match against the protocol of an outgoing IPv4 packet. Minimum value = 1 Maximum value = 255
vlan	<Integer>	Read-write	ID of the VLAN. The Citrix ADC compares the PBR only to the outgoing packets on the specified VLAN. If you do not specify any interface ID, the appliance compares the PBR to the outgoing packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Integer>	Read-write	ID of the VXLAN. The Citrix ADC compares the PBR only to the outgoing packets on the specified VXLAN. If you do not specify any interface ID, the appliance compares the PBR to the outgoing packets on all VXLANs.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC compares the PBR only to the outgoing packets on the specified interface. If you do not specify any value, the appliance compares the PBR to the outgoing packets on all interfaces.
priority	<Integer>	Read-write	Priority of the PBR, which determines the order in which it is evaluated relative to the other PBRs. If you do not specify priorities while creating PBRs, the PBRs are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 81920
msr	<String>	Read-write	Monitor the route specified byte Next Hop parameter. This parameter is not applicable if you specify a link load balancing (LLB)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			virtual server name with the Next Hop parameter. Default value: DISABLED Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	The name of the monitor.(Can be only of type ping or ARP). Minimum length = 1
state	<String>	Read-write	Enable or disable the PBR. After you apply the PBRs, the Citrix ADC compares outgoing packets to the enabled PBRs. Default value: ENABLED Possible values = ENABLED, DISABLED
ownergroup	<String>	Read-write	The owner node group in a Cluster for this pbr rule. If ownernode is not specified then the pbr rule is treated as Striped pbr rule. Default value: DEFAULT_NG Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
detail	<Boolean>	Read-write	To get a detailed view.
hits	<Integer>	Read-only	The hits of this PBR.
kernelstate	<String>	Read-only	The commit status of the PBR. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED, SFAPPLIED61, SFNOTAPPLIED61
curstate	<Integer>	Read-only	If this route is UP/DOWN.
totalprobes	<Integer>	Read-only	The total number of probes sent.
totalfailedprobes	<Integer>	Read-only	The total number of failed probes.
failedprobes	<Integer>	Read-only	Number of the current failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
data	<Boolean>	Read-only	Internal data of this route.
pbrchildcount	<Integer>	Read-only	Number of childs for this PBR, in case of dataset this will be number of ips bound to that dataset.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbr? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspbr": [ { "__count": "#no"} ] }
```

nspbr6

Configuration for PBR6 entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the PBR6. Must begin with an ASCII alphabetic or underscore \(_\) character, and must contain only ASCII alphanumeric, underscore, hash \(#\), period \(.\), space, colon \(:\), at \(@\), equals \(=\), and hyphen \(-\) characters. Cannot be changed after the PBR6 is created. Minimum length = 1
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
action	<String>	Read-write	Action to perform on the outgoing IPv6 packets that match the PBR6. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ALLOW - The Citrix ADC sends the packet to the designated next-hop router. * DENY - The Citrix ADC applies the routing table for normal destination-based routing. Possible values = ALLOW, DENY
srcipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipv6val	<String>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv6 packet. In the command line interface, separate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the range with a hyphen.
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Source port (range). Maximum length = 65535
destipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = =, !=, EQ, NEQ
destipv6val	<String>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
destportval	<String>	Read-write	Destination port (range). Maximum length = 65535
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an outgoing IPv6 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"
protocol	<String>	Read-write	Protocol, identified by protocol name, to match against the protocol of an outgoing IPv6 packet. Possible values = ICMPV6, TCP, UDP, ICMP, IGMP, EGP, IGP, ARGUS, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-IGNORE, Mobility-Header, UDPLite
protocolnumber	<Integer>	Read-write	Protocol, identified by protocol number, to match against the protocol of an outgoing IPv6 packet. Minimum value = 1 Maximum value = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Integer>	Read-write	ID of the VLAN. The Citrix ADC compares the PBR6 only to the outgoing packets on the specified VLAN. If you do not specify an interface ID, the appliance compares the PBR6 to the outgoing packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Integer>	Read-write	ID of the VXLAN. The Citrix ADC compares the PBR6 only to the outgoing packets on the specified VXLAN. If you do not specify an interface ID, the appliance compares the PBR6 to the outgoing packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC compares the PBR6 only to the outgoing packets on the specified interface. If you do not specify a value, the appliance

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			compares the PBR6 to the outgoing packets on all interfaces.
priority	<Integer>	Read-write	Priority of the PBR6, which determines the order in which it is evaluated relative to the other PBR6s. If you do not specify priorities while creating PBR6s, the PBR6s are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 81920
state	<String>	Read-write	Enable or disable the PBR6. After you apply the PBR6s, the Citrix ADC compares outgoing packets to the enabled PBR6s. Default value: ENABLED Possible values = ENABLED, DISABLED
msr	<String>	Read-write	Monitor the route specified by the Next Hop parameter. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	The name of the monitor.(Can be only of type ping or ARP). Minimum length = 1
nexthop	<Boolean>	Read-write	IP address of the next hop router to which to send matching packets if action is set to ALLOW. This next hop should be directly reachable from the appliance.
nexthopval	<String>	Read-write	The Next Hop IPv6 address.
iptunnel	<String>	Read-write	The iptunnel name where packets need to be forwarded upon.
vxlanvlanmap	<String>	Read-write	The vlan to vxlan mapping to be applied for incoming packets over this pbr tunnel.
nexthopvlan	<Integer>	Read-write	VLAN number to be used for link local nexthop . Minimum value = 1 Maximum value = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ownergroup	<String>	Read-write	The owner node group in a Cluster for this pbr rule. If owner node group is not specified then the pbr rule is treated as Striped pbr rule. Default value: DEFAULT_NG Minimum length = 1
detail	<Boolean>	Read-write	To get a detailed view.
kernelstate	<String>	Read-only	Commit status of the PBR6. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED
hits	<Integer>	Read-only	Number of hits of this PBR6.
curstate	<Integer>	Read-only	If this route is UP/DOWN.
totalprobes	<Integer>	Read-only	The total number of probes sent.
totalfailedprobes	<Integer>	Read-only	The total number of failed probes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
failedprobes	<Integer>	Read-only	Number of the current failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
data	<Boolean>	Read-only	Internal data of this route.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

APPLY

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbrs? **action=apply**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspbrs":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nsratecontrol

Configuration for rate control resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tcpthreshold	<Integer>	Read-write	Number of SYNs permitted per 10 milliseconds.
udpthreshold	<Integer>	Read-write	Number of UDP packets permitted per 10 milliseconds.
icmpthreshold	<Integer>	Read-write	Number of ICMP packets permitted per 10 milliseconds. Default value: 100
tcprstthreshold	<Integer>	Read-write	The number of TCP RST packets permitted per 10 milli

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			second. zero means rate control is disabled and 0xffffffff means every thing is rate controlled. Default value: 100
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsratecontrol **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsratecontrol":{

"tcpthreshold":<Integer_value>,

"udpthreshold":<Integer_value>,

"icmpthreshold":<Integer_value>,

"tcprstthreshold":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsratecontrol? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsratecontrol":{

"tcpthreshold":true,

"udpthreshold":true,

"icmpthreshold":true,

"tcprstthreshold":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsratecontrol **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsratecontrol": [ {

"tcpthreshold":<Integer_value>,

"udpthreshold":<Integer_value>,
```

```
"icmpthreshold":<Integer_value>,

"tcprstthreshold":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

nsrollbackcmd

Configuration for Generate rollback commands resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
filename	<String>	Read-write	File that contains the commands for which the rollback commands must be generated. Specify the full path of the file name.
outtype	<String>	Read-write	Format in which the rollback commands must be generated. Possible values = cli, xml
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsrollbackcmd **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/nsrollbackcmd? **args=filename: <String_value> ,outtype: <String_value>**

Use this query-parameter to get nsrollbackcmd resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsrollbackcmd": [ {

filename:<String_value>,outtype:<String_value>"_nextgenapiresource":<Strin
g_value>

}]}
```

nsrpcnode

Configuration for rpc node resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the node. This has to be in the same subnet as the NSIP address. Minimum length = 1
password	<String>	Read-write	Password to be used in authentication with the peer system node. Minimum length = 1
srcip	<String>	Read-write	Source IP address to be used to communicate with the peer system node. The default

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value is 0, which means that the appliance uses the NSIP address as the source IP address.
secure	<String>	Read-write	State of the channel when talking to the node. Default value: YES Possible values = YES, NO
validatecert	<String>	Read-write	validate the server certificate for secure SSL connections. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsservicepath resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath? **view=summary**

Use this query-parameter to get the summary output of nsservicepath resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsservicepath resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicepath": [ {

"servicepathname":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath/ servicepathname_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath/ servicepathname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath/ servicepathname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nsservicepath resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsservicepath": [ {

"servicepathname":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicepath": [ { "__count": "#no"} ] }
```

nsservicepath_binding

Binding object which returns the resources bound to nsservicepath.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicepathname	<String>	Read-write	Name for the Service path. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
nsservicepath_nsservicefunction_binding	<nsservicepath_nsservicefunction_binding []>	Read-only	nsservicefunction that can be bound to nsservicepath.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_binding/servicepathname_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicepath_binding": [ {

"servicepathname":<String_value>,

"nsservicepath_nsservicefunction_binding":<nsservicepath_nsservicefunction
_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicepath_binding": [ {

"servicepathname":<String_value>,

"nsservicepath_nsservicefunction_binding":<nsservicepath_nsservicefunction
_binding[]_value>

}]}
```

nsservicepath_nsservicefunction_binding

Binding object showing the nsservicefunction that can be bound to nsservicepath.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
index	<Integer>	Read-write	The serviceindex of each servicefunction in path. Minimum value = 1
servicefunction	<String>	Read-write	List of service functions constituting the chain. Minimum length = 1
servicepathname	<String>	Read-write	Name for the Service path. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/nsservicepath_nsservicefunction_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"nsservicepath_nsservicefunction_binding":{

<b>"servicepathname":<String_value>,

</b><b>"servicefunction":<String_value>,

</b><b>"index":<Integer_value></b>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding/ servicepathname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/ config/nsservicepath_nsservicefunction_binding/ servicepathname_value<String> ? **args= servicefunction:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding/ servicepathname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/ config/nsservicepath_nsservicefunction_binding/ servicepathname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of nsservicepath_nsservicefunction_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ nsservicepath_nsservicefunction_binding/ servicepathname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsservicepath_nsservicefunction_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsservicepath_nsservicefunction_binding": [ {

"index":<Integer_value>,

"servicefunction":<String_value>,

"servicepathname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsservicepath_nsservicefunction_binding": [ {

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"nsservicepath_nsservicefunction_binding": [ { "__count": "#no"} ] }
```

nssimpleacl

Configuration for simple ACL resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclname	<String>	Read-write	Name for the simple ACL rule. Must begin

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the simple ACL rule is created. Minimum length = 1
aclaction	<String>	Read-write	Drop incoming IPv4 packets that match the simple ACL rule. Possible values = DENY
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcip	<String>	Read-write	IP address to match against the source IP address of an incoming IPv4 packet.
destport	<Integer>	Read-write	Port number to match against the destination port number of an incoming IPv4 packet. DestPort is mandatory while setting Protocol. Omitting the port number and protocol creates an all-ports and all protocols simple ACL rule, which matches any port and any protocol. In that case, you cannot create another simple ACL rule specifying a specific port and the same source IPv4 address. Minimum value = 1 Maximum value = 65535
protocol	<String>	Read-write	Protocol to match against the protocol

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of an incoming IPv4 packet. You must set this parameter if you have set the Destination Port parameter. Possible values = TCP, UDP
ttl	<Integer>	Read-write	Number of seconds, in multiples of four, after which the simple ACL rule expires. If you do not want the simple ACL rule to expire, do not specify a TTL value. Minimum value = 4 Maximum value = 2147483647
estsessions	<Boolean>	Read-write	.
hits	<Integer>	Read-only	Number of hits for this ACL rule.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6/ aclname_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6/ aclname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6/ aclname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nssimpleacl6 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nssimpleacl6": [ {

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssimpleacl6": [ { "__count": "#no"} ] }
```

nssourceroutecachetable

Configuration for Source IP Mac Cache Table. resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sourceip	<String>	Read-write	Source ip of the connection.
sourcemac	<String>	Read-write	source MAC address of an incoming IPv6 packet.
vlan	<Integer>	Read-write	ID of the VLAN.
Interface	<String>	Read-write	ID of an interface.
_nextgenapiresource	<String>	Read-write	.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- FLUSH

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **action=flush**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nssourceroutecachetable":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nssourceroutecachetable resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **view=summary**

Use this query-parameter to get the summary output of nssourceroutecachetable resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nssourceroutecachetable resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssourceroutecachetable": [ {

"sourceip":<String_value>,

"sourcemac":<String_value>,

"vlan":<Integer_value>,

"Interface":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssourceroutecachetable": [ { "__count": "#no"} ] }
```

nsspparams

Configuration for Surge Protection parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
basethreshold	<Integer>	Read-write	Maximum number of server connections that can be opened before surge protection is activated. Default value: 200 Minimum value = 0 Maximum value = 32767
throttle	<String>	Read-write	Rate at which the system opens connections to the server. Default value: Normal Possible values = Aggressive, Normal, Relaxed
table0	<Integer[]>	Read-only	Table.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
builtin	<String[]>	Read-only	Flag to determine if sp param is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsspparams **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsspparams":{

"basethreshold":<Integer_value>,

"throttle":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsspparams? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsspparams":{

"basethreshold":true,

"throttle":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsspparams **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsspparams": [ {

"basethreshold":<Integer_value>,
```

```
"throttle":<String_value>,

"table0":<Integer[]_value>,

"builtin":<String[]_value>,

"feature":<String_value>,

}]}
```

nsstats

Configuration for stats resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cleanuplevel	<String>	Read-write	The level of stats to be cleared. 'global' option will clear global counters only, 'all' option will clear all device counters also along with global counters. For both the cases only 'ever incrementing counters' i.e. total counters will be cleared. Possible values = global, all

Operations

(click to see Properties)

- CLEAR

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsstats? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsstats":{

<b>"cleanuplevel":<String_value>
```

```
</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nssurgeq

Configuration for surge queue resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of a virtual server, service or service group for which the SurgeQ must be flushed.
servername	<String>	Read-write	Name of a service group member. This argument is needed when you want to flush the SurgeQ of a service group.
port	<Integer>	Read-write	port on which server is bound to the entity(Servicegroup). Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

Operations

(click to see Properties)

- FLUSH

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssurgeq? **action=flush HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nssurgeq":{

"name":<String_value>,

"servername":<String_value>,

"port":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nstcpbufparam

Configuration for tcp buffer parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
size	<Integer>	Read-write	TCP buffering size per connection, in kilobytes. Default value: 64 Minimum value = 4 Maximum value = 20480
memlimit	<Integer>	Read-write	Maximum memory, in megabytes, that can be used for buffering. Default value: 64

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
builtin	<String[]>	Read-only	Flag to determine if TCP buffering is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

nstcpparam

Configuration for tcp parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ws	<String>	Read-write	Enable or disable window scaling. Default value: ENABLED Possible values = ENABLED, DISABLED
wsval	<Integer>	Read-write	Factor used to calculate the new window size. This argument is needed only when the window scaling is enabled. Default value: 8 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 14
sack	<String>	Read-write	Enable or disable Selective ACKnowledgement (SACK). Default value: ENABLED Possible values = ENABLED, DISABLED
learnvsvrmss	<String>	Read-write	Enable or disable maximum segment size (MSS) learning for virtual servers. Default value: DISABLED Possible values = ENABLED, DISABLED
maxburst	<Integer>	Read-write	Maximum number of TCP segments allowed in a burst. Default value: 6 Minimum value = 1 Maximum value = 255
initialcwnd	<Integer>	Read-write	Initial maximum upper limit on the number of TCP packets that can be outstanding on the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			TCP link to the server. Default value: 10 Minimum value = 1 Maximum value = 44
recvbuffsize	<Integer>	Read-write	TCP Receive buffer size. Default value: 8190 Minimum value = 8190 Maximum value = 20971520
delayedack	<Integer>	Read-write	Timeout for TCP delayed ACK, in milliseconds. Default value: 100 Minimum value = 10 Maximum value = 300
downstaterst	<String>	Read-write	Flag to switch on RST on down services. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nagle	<String>	Read-write	Enable or disable the Nagle algorithm on TCP connections. Default value: DISABLED Possible values = ENABLED, DISABLED
limitedpersist	<String>	Read-write	Limit the number of persist (zero window) probes. Default value: ENABLED Possible values = ENABLED, DISABLED
oooqsize	<Integer>	Read-write	Maximum size of out-of-order packets queue. A value of 0 means no limit. Default value: 300 Minimum value = 0 Maximum value = 65535
ackonpush	<String>	Read-write	Send immediate positive acknowledgement (ACK) on receipt of TCP packets with PUSH flag. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
maxpktpermss	<Integer>	Read-write	Maximum number of TCP packets allowed per maximum segment size (MSS). Minimum value = 0 Maximum value = 1460
pktperretx	<Integer>	Read-write	Maximum limit on the number of packets that should be retransmitted on receiving a partial ACK. Default value: 1 Minimum value = 1 Maximum value = 100
minrto	<Integer>	Read-write	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole number if divided by 10). Default value: 1000 Minimum value = 10

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 64000
slowstartincr	<Integer>	Read-write	Multiplier that determines the rate at which slow start increases the size of the TCP transmission window after each acknowledgement of successful transmission. Default value: 2 Minimum value = 1 Maximum value = 100
maxdynserverprobes	<Integer>	Read-write	Maximum number of probes that Citrix ADC can send out in 10 milliseconds, to dynamically learn a service. Citrix ADC probes for the existence of the origin in case of wildcard virtual server or services. Default value: 7 Minimum value = 1 Maximum value = 65535
synholdfastgiveup	<Integer>	Read-write	Maximum threshold. After crossing this threshold number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			outstanding probes for origin, the Citrix ADC reduces the number of connection retries for probe connections. Default value: 1024 Minimum value = 256 Maximum value = 65535
maxsynholdperprobe	<Integer>	Read-write	Limit the number of client connections (SYN) waiting for status of single probe. Any new SYN packets will be dropped. Default value: 128 Minimum value = 1 Maximum value = 255
maxsynhold	<Integer>	Read-write	Limit the number of client connections (SYN) waiting for status of probe system wide. Any new SYN packets will be dropped. Default value: 16384 Minimum value = 256

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65535
msslearninterval	<Integer>	Read-write	Duration, in seconds, to sample the Maximum Segment Size (MSS) of the services. The Citrix ADC determines the best MSS to set for the virtual server based on this sampling. The argument to enable maximum segment size (MSS) for virtual servers must be enabled. Default value: 180 Minimum value = 1 Maximum value = 1048576
msslearndelay	<Integer>	Read-write	Frequency, in seconds, at which the virtual servers learn the Maximum segment size (MSS) from the services. The argument to enable maximum segment size (MSS) for virtual servers must be enabled. Default value: 3600 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 1048576
maxtimewaitconn	<Integer>	Read-write	Maximum number of connections to hold in the TCP TIME_WAIT state on a packet engine. New connections entering TIME_WAIT state are proactively cleaned up. Default value: 7000 Minimum value = 1
kaprobeupdatelastactivity	<String>	Read-write	Update last activity for KA probes. Default value: ENABLED Possible values = ENABLED, DISABLED
maxsynackretx	<Integer>	Read-write	When 'syncookie' is disabled in the TCP profile that is bound to the virtual server or service, and the number of TCP SYN+ACK retransmission by Citrix ADC for that virtual server or service crosses this threshold, the Citrix ADC responds by using the TCP SYN-Cookie mechanism.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 100 Minimum value = 100 Maximum value = 1048576
synattackdetection	<String>	Read-write	Detect TCP SYN packet flood and send an SNMP trap. Default value: ENABLED Possible values = ENABLED, DISABLED
connflushifnomem	<String>	Read-write	Flush an existing connection if no memory can be obtained for new connection. HALF_CLOSED_AND_IDLE: Flush a connection that is closed by us but not by peer, or failing that, a connection that is past configured idle time. New connection fails if no such connection can be found. FIFO: If no half-closed or idle connection can be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			found, flush the oldest non-management connection, even if it is active. New connection fails if the oldest few connections are management connections. Note: If you enable this setting, you should also consider lowering the zombie timeout and half-close timeout, while setting the Citrix ADC timeout. See Also: connFlushThres argument below. Default value: NSA_CONNFLUSH_NONE Possible values = NONE , HALFCLOSED_AND_IDLE, FIFO
connflushthres	<Integer>	Read-write	Flush an existing connection (as configured through -connFlushIfNoMem

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			FIFO) if the system has more than specified number of connections, and a new connection is to be established. Note: This value may be rounded down to be a whole multiple of the number of packet engines running. Minimum value = 1
mptcpconcloseonpassivesf	<String>	Read-write	Accept DATA_FIN/ FAST_CLOSE on passive subflow. Default value: ENABLED Possible values = ENABLED, DISABLED
mptcpchecksum	<String>	Read-write	Use MPTCP DSS checksum. Default value: ENABLED Possible values = ENABLED, DISABLED
mptcpsftimeout	<Integer>	Read-write	The timeout value in seconds for idle mptcp subflows. If this timeout is not set, idle subflows are cleared after cltTimeout of vserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 31536000
mptcpsfreplacetimeout	<Integer>	Read-write	The minimum idle time value in seconds for idle mptcp subflows after which the sublow is replaced by new incoming subflow if maximum subflow limit is reached. The priority for replacement is given to those subflow without any transaction. Default value: 10 Minimum value = 0 Maximum value = 31536000
mptcpmaxsf	<Integer>	Read-write	Maximum number of subflow connections supported in established state per mptcp connection. Default value: 4 Minimum value = 2 Maximum value = 6
mptcpmaxpendingsf	<Integer>	Read-write	Maximum number of subflow connections supported in pending

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			join state per mptcp connection. Default value: 4 Minimum value = 0 Maximum value = 4
mptcppendingjointhreshold	<Integer>	Read-write	Maximum system level pending join connections allowed. Default value: 0 Minimum value = 0 Maximum value = 4294967294
mptcprtostoswitchsf	<Integer>	Read-write	Number of RTO's at subflow level, after which MPCTP should start using other subflow. Default value: 2 Minimum value = 1 Maximum value = 6
mptcpusebackupondss	<String>	Read-write	When enabled, if NS receives a DSS on a backup subflow, NS will start using that subflow to send data. And if disabled, NS will continue to transmit on current chosen subflow. In case there is some error on a subflow (like RTO's/RST etc.) then NS can choose

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a backup subflow irrespective of this tunable. Default value: ENABLED Possible values = ENABLED, DISABLED
tcpmaxretries	<Integer>	Read-write	Number of RTO's after which a connection should be freed. Default value: 7 Minimum value = 1 Maximum value = 7
mptcpimmediatesfcloseonfin	<String>	Read-write	Allow subflows to close immediately on FIN before the DATA_FIN exchange is completed at mptcp level. Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpclosemptcpsessiononlastsfclose	<String>	Read-write	Allow to send DATA FIN or FAST CLOSE on mptcp connection while sending FIN or RST on the last subflow.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpsendsfresetoption	<String>	Read-write	Allow MPTCP subflows to send TCP RST Reason (MP_TCPRST) Option while sending TCP RST. Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpfastcloseoption	<String>	Read-write	Allow to select option ACK or RESET to force the closure of an MPTCP connection abruptly. Default value: ACK Possible values = ACK, RESET
mptcpreliableaddaddr	<String>	Read-write	If enabled, Citrix ADC retransmits MPTCP ADD-ADDR option if echo response is not received within the timeout interval. The retransmission is attempted only once.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
tcpfastopencookietimeout	<Integer>	Read-write	Timeout in seconds after which a new TFO Key is computed for generating TFO Cookie. If zero, the same key is used always. If timeout is less than 120seconds, NS defaults to 120seconds timeout. Default value: 0 Minimum value = 0 Maximum value = 31536000
autosyncookietimeout	<Integer>	Read-write	Timeout for the server to function in syncookie mode after the synattack. This is valid if TCP syncookie is disabled on the profile and server acts in non syncookie mode by default. Default value: 30 Minimum value = 7

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65535
tcpfintimeout	<Integer>	Read-write	The amount of time in seconds, after which a TCP connnection in the TCP TIME-WAIT state is flushed. Default value: 40 Minimum value = 10 Maximum value = 240
compacttcpoptionnoop	<String>	Read-write	If enabled, non-negotiated TCP options are removed from the received packet while proxying it. By default, non-negotiated TCP options would be replaced by NOPs in the proxied packets. This option is not applicable for Citrix ADC generated packets. Default value: DISABLED Possible values = ENABLED, DISABLED
delinkclientserveronrst	<String>	Read-write	If enabled, Delink client and server connection, when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			there is outstanding data to be sent to the other side. Default value: DISABLED Possible values = ENABLED, DISABLED
rfc5961chlgacklimit	<Integer>	Read-write	Limits number of Challenge ACK sent per second, as recommended in RFC 5961(Improving TCP's Robustness to Blind In-Window Attacks). Default value: 0 Minimum value = 0 Maximum value = 2147483647
enhancedisngeneration	<String>	Read-write	If enabled, increase the ISN variation in SYN-ACKs sent by the NetScaler. Default value: DISABLED Possible values = ENABLED, DISABLED
sendresetreasoncode	<String>	Read-write	If enabled, NetScaler includes a debug code indicating the reason for the reset in the TCP Window

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			header field of outgoing TCP RST segments. Default value: DISABLED Possible values = ENABLED, DISABLED
builtin	<String[]>	Read-only	Flag to determine if the tcp param is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

nstcpprofile

Configuration for TCP profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for a TCP profile. Must begin with a letter, number, or the underscore \(_\) character. Other characters allowed, after the first character, are the hyphen \(-\), period \(.\), hash \(#\), space \(\), at \(@\), colon \(:\), and equal \(=\) characters. The name of a TCP profile cannot be changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			double or single quotation marks \ (for example, "my tcp profile" or 'my tcp profile'\). Minimum length = 1 Maximum length = 127
ws	<String>	Read-write	Enable or disable window scaling. Default value: ENABLED Possible values = ENABLED, DISABLED
sack	<String>	Read-write	Enable or disable Selective ACKnowledgement (SACK). Default value: ENABLED Possible values = ENABLED, DISABLED
wsval	<Integer>	Read-write	Factor used to calculate the new window size. This argument is needed only when window scaling is enabled.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: TCP_DEFAULT_WSVAL Minimum value = 0 Maximum value = 14
nagle	<String>	Read-write	Enable or disable the Nagle algorithm on TCP connections. Default value: DISABLED Possible values = ENABLED, DISABLED
ackonpush	<String>	Read-write	Send immediate positive acknowledgement (ACK) on receipt of TCP packets with PUSH flag. Default value: ENABLED Possible values = ENABLED, DISABLED
mss	<Integer>	Read-write	Maximum number of octets to allow in a TCP data segment. Default value: TCP_DEFAULT_CLIENT_MSS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 9176
maxburst	<Integer>	Read-write	Maximum number of TCP segments allowed in a burst. Default value: 6 Minimum value = 1 Maximum value = 255
initialcwnd	<Integer>	Read-write	Initial maximum upper limit on the number of TCP packets that can be outstanding on the TCP link to the server. Default value: TCP_DEFAULT_INITIALCWND Minimum value = 1 Maximum value = 44
delayedack	<Integer>	Read-write	Timeout for TCP delayed ACK, in milliseconds. Default value: 100 Minimum value = 10 Maximum value = 300

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
oooqsize	<Integer>	Read-write	Maximum size of out-of-order packets queue. A value of 0 means no limit. Default value: TCP_DEFAULT_MAX_OOO_PKTS Minimum value = 0 Maximum value = 65535
maxpktpermss	<Integer>	Read-write	Maximum number of TCP packets allowed per maximum segment size (MSS). Minimum value = 0 Maximum value = 1460
pktperretx	<Integer>	Read-write	Maximum limit on the number of packets that should be retransmitted on receiving a partial ACK. Default value: 1 Minimum value = 1 Maximum value = 512
minrto	<Integer>	Read-write	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			increments (value must yield a whole number if divided by 10). Default value: 1000 Minimum value = 10 Maximum value = 64000
slowstartincr	<Integer>	Read-write	Multiplier that determines the rate at which slow start increases the size of the TCP transmission window after each acknowledgement of successful transmission. Default value: 2 Minimum value = 1 Maximum value = 100
buffersize	<Integer>	Read-write	TCP buffering size, in bytes. Default value: TCP_DEFAULT_BUFFSIZE Minimum value = 8190 Maximum value = 20971520

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
syncookie	<String>	Read-write	Enable or disable the SYNCOOKIE mechanism for TCP handshake with clients. Disabling SYNCOOKIE prevents SYN attack protection on the Citrix ADC. Default value: ENABLED Possible values = ENABLED, DISABLED
kaprobeupdatelastactivity	<String>	Read-write	Update last activity for the connection after receiving keep-alive (KA) probes. Default value: ENABLED Possible values = ENABLED, DISABLED
flavor	<String>	Read-write	Set TCP congestion control algorithm. Default value: BIC Possible values = Default, Westwood, BIC, CUBIC, Nile, BBR
dynamicreceivebuffering	<String>	Read-write	Enable or disable dynamic receive buffering. When enabled, allows the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			receive buffer to be adjusted dynamically based on memory and network conditions. Note: The buffer size argument must be set for dynamic adjustments to take place. Default value: DISABLED Possible values = ENABLED, DISABLED
ka	<String>	Read-write	Send periodic TCP keep-alive (KA) probes to check if peer is still up. Default value: DISABLED Possible values = ENABLED, DISABLED
kaconnidletime	<Integer>	Read-write	Duration, in seconds, for the connection to be idle, before sending a keep-alive (KA) probe. Minimum value = 1 Maximum value = 4095

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
kamaxprobes	<Integer>	Read-write	Number of keep-alive (KA) probes to be sent when not acknowledged, before assuming the peer to be down. Minimum value = 1 Maximum value = 254
kaprobeinterval	<Integer>	Read-write	Time interval, in seconds, before the next keep-alive (KA) probe, if the peer does not respond. Minimum value = 1 Maximum value = 4095
sendbuffsize	<Integer>	Read-write	TCP Send Buffer Size. Default value: TCP_DEFAULT_SENDBUFFSIZE Minimum value = 8190 Maximum value = 20971520
mptcp	<String>	Read-write	Enable or disable Multipath TCP. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
establishclientconn	<String>	Read-write	Establishing Client Client connection on First data/ Final-ACK / Automatic. Default value: AUTOMATIC Possible values = AUTOMATIC, CONN_ESTABLISHED, ON_FIRST_DATA
tcpsegoffload	<String>	Read-write	Offload TCP segmentation to the NIC. If set to AUTOMATIC, TCP segmentation will be offloaded to the NIC, if the NIC supports it. Default value: AUTOMATIC Possible values = AUTOMATIC, DISABLED
rfc5961compliance	<String>	Read-write	Enable or disable RFC 5961 compliance to protect against tcp spoofing(RST/SYN/Data). When enabled, will be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			compliant with RFC 5961. Default value: DISABLED Possible values = ENABLED, DISABLED
rstwindowattenuate	<String>	Read-write	Enable or disable RST window attenuation to protect against spoofing. When enabled, will reply with corrective ACK when a sequence number is invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
rstmaxack	<String>	Read-write	Enable or disable acceptance of RST that is out of window yet echoes highest ACK sequence number. Useful only in proxy mode. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
spoofsyndrop	<String>	Read-write	Enable or disable drop of invalid SYN packets to protect against spoofing. When disabled, established connections will be reset when a SYN packet is received. Default value: ENABLED Possible values = ENABLED, DISABLED
ecn	<String>	Read-write	Enable or disable TCP Explicit Congestion Notification. Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpdropdataonpreestsf	<String>	Read-write	Enable or disable silently dropping the data on Pre-Established subflow. When enabled, DSS data packets are dropped silently instead of dropping the connection when data is received on pre established subflow.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpfastopen	<String>	Read-write	Enable or disable Multipath TCP fastopen. When enabled, DSS data packets are accepted before receiving the third ack of SYN handshake. Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpsessiontimeout	<Integer>	Read-write	MPTCP session timeout in seconds. If this value is not set, idle MPTCP sessions are flushed after vserver's client idle timeout. Default value: 0 Minimum value = 0 Maximum value = 86400
timestamp	<String>	Read-write	Enable or Disable TCP Timestamp option (RFC 1323).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
dsack	<String>	Read-write	Enable or disable DSACK. Default value: ENABLED Possible values = ENABLED, DISABLED
ackaggregation	<String>	Read-write	Enable or disable ACK Aggregation. Default value: DISABLED Possible values = ENABLED, DISABLED
frto	<String>	Read-write	Enable or disable FRTO (Forward RTO-Recovery). Default value: ENABLED Possible values = ENABLED, DISABLED
maxcwnd	<Integer>	Read-write	TCP Maximum Congestion Window. Default value: 524288

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 8190 Maximum value = 20971520
fack	<String>	Read-write	Enable or disable FACK (Forward ACK). Default value: ENABLED Possible values = ENABLED, DISABLED
tcpmode	<String>	Read-write	TCP Optimization modes TRANSPARENT / ENDPOINT. Default value: TRANSPARENT Possible values = TRANSPARENT, ENDPOINT
tcpfastopen	<String>	Read-write	Enable or disable TCP Fastopen. When enabled, NS can receive or send Data in SYN or SYN-ACK packets. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hystart	<String>	Read-write	Enable or disable CUBIC Hystart. Default value: DISABLED Possible values = ENABLED, DISABLED
dupackthresh	<Integer>	Read-write	TCP dupack threshold. Default value: 3 Minimum value = 1 Maximum value = 15
burstratecontrol	<String>	Read-write	TCP Burst Rate Control DISABLED/FIXED/DYNAMIC. FIXED requires a TCP rate to be set. Default value: DISABLED Possible values = DISABLED, FIXED, DYNAMIC
tcprate	<Integer>	Read-write	TCP connection payload send rate in Kb/s. Default value: 0 Minimum value = 0 Maximum value = 10000000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rateqmax	<Integer>	Read-write	Maximum connection queue size in bytes, when BurstRateControl is used. Default value: 0 Minimum value = 0 Maximum value = 1000000000
drophalfclosedconnontimeout	<String>	Read-write	Silently drop tcp half closed connections on idle timeout. Default value: DISABLED Possible values = ENABLED, DISABLED
dropestconnontimeout	<String>	Read-write	Silently drop tcp established connections on idle timeout. Default value: DISABLED Possible values = ENABLED, DISABLED
applyadaptivetcp	<String>	Read-write	Apply Adaptive TCP optimizations. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tcpfastopencookiesize	<Integer>	Read-write	TCP FastOpen Cookie size. This accepts only even numbers. Odd number is trimmed down to nearest even number. Default value: 8 Minimum value = 4 Maximum value = 16
taillossprobe	<String>	Read-write	TCP tail loss probe optimizations. Default value: DISABLED Possible values = ENABLED, DISABLED
clientiptcpoption	<String>	Read-write	Client IP in TCP options. Default value: DISABLED Possible values = ENABLED, DISABLED
clientiptcpoptionnumber	<Integer>	Read-write	ClientIP TCP Option number.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Minimum value = 1 Maximum value = 254
mpcapablecbit	<String>	Read-write	Set C bit in MP-CAPABLE Syn-Ack sent by Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
sendclientportintcpoption	<String>	Read-write	Send Client Port number along with Client IP in TCP-Options. ClientIpTcpOption must be ENABLED. Default value: DISABLED Possible values = ENABLED, DISABLED
slowstartthreshold	<Integer>	Read-write	TCP Slow Start Threhsold Value. Default value: 524288 Minimum value = 8190

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 20971520
refcnt	<Integer>	Read-only	Number of entities using this profile.
builtin	<String[]>	Read-only	Flag to determine if tcp profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

nstestlicense

Configuration for testlicense resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wl	<Boolean>	Read-write	Web Logging.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sp	<Boolean>	Read-write	Surge Protection.
lb	<Boolean>	Read-write	Load Balancing.
cs	<Boolean>	Read-write	Content Switching.
cr	<Boolean>	Read-write	Cache Redirect.
cmp	<Boolean>	Read-write	Compression.
delta	<Boolean>	Read-write	Delta Compression.
ssl	<Boolean>	Read-write	Secure Sockets Layer.
gslb	<Boolean>	Read-write	Global Server Load Balancing.
gslbp	<Boolean>	Read-write	GSLB Proximity.
routing	<Boolean>	Read-write	Routing.
cf	<Boolean>	Read-write	Content Filter.
contentaccelerator	<Boolean>	Read-write	transparent Integrated Caching.
ic	<Boolean>	Read-write	Integrated Caching.
sslvpn	<Boolean>	Read-write	SSL VPN.
f_sslvpn_users	<Integer>	Read-write	Number of licensed users allowed by this license.
f_ica_users	<Integer>	Read-write	Number of licensed users allowed by ICAONLY license. As long as the AG Feature is licensed,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			unlimited number of ICA connections are accepted. (In API, 0 value for this parameter means unlimited when AG license in ON).
aaa	<Boolean>	Read-write	AAA.
ospf	<Boolean>	Read-write	OSPF Routing.
rip	<Boolean>	Read-write	RIP Routing.
bgp	<Boolean>	Read-write	BGP Routing.
rewrite	<Boolean>	Read-write	Rewrite.
ipv6pt	<Boolean>	Read-write	IPv6 protocol translation.
appfw	<Boolean>	Read-write	Application Firewall.
responder	<Boolean>	Read-write	Responder.
agee	<Boolean>	Read-write	.
nsxn	<Boolean>	Read-write	.
modelid	<Integer>	Read-write	Model Number ID. Represents different numbers for two types of licenses.: * Bandwidth licenses - specifies the throughput

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bandwidth licensed for this appliance e.g. (For 20 Gbps) Model Number ID: 20000 * vCPU licenses - specifies number of vCPUs licensed for this appliance. e.g. (For 4 vCPU) Model Number ID: 4 vCPUs.
push	<Boolean>	Read-write	Citrix ADC Push.
appflow	<Boolean>	Read-write	AppFlow.
cloudbridge	<Boolean>	Read-write	CloudBridge.
cloudbridgeappliance	<Boolean>	Read-write	.
cloudextenderappliance	<Boolean>	Read-write	.
isis	<Boolean>	Read-write	ISIS Routing.
cluster	<Boolean>	Read-write	Clustering.
ch	<Boolean>	Read-write	Call Home.
appqoe	<Boolean>	Read-write	AppQoS.
appflowica	<Boolean>	Read-write	Appflow for ICA.
isstandardlic	<Boolean>	Read-write	Standard License.
isenterpriselic	<Boolean>	Read-write	Enterprise License.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
isplatinumlic	<Boolean>	Read-write	Platinum License.
issgwylic	<Boolean>	Read-write	Simple Gateway License.
isswglic	<Boolean>	Read-write	Secure Web Gateway License.
feo	<Boolean>	Read-write	Front End Optimization.
lsn	<Boolean>	Read-write	Large Scale NAT.
licensingmode	<String>	Read-write	Pooled Licensed. Default value: Local Possible values = Local, Pooled, Fips-Pooled, CICO, Fips-CICO, EXPRESS, CPU, CPU-Local, Self Managed Pool, Self Managed vCPU, LAS, LAS (Fixed Bandwidth)
daystoexpiration	<Integer>	Read-write	Days to expire. Minimum value = 0 Maximum value = 4294967294
rdpproxy	<Boolean>	Read-write	RDPPROXY.
rep	<Boolean>	Read-write	Reputation Services.
urlfiltering	<Boolean>	Read-write	URL Filtering.
videooptimization	<Boolean>	Read-write	Video Optimization.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
forwardproxy	<Boolean>	Read-write	Forward Proxy.
sslinterception	<Boolean>	Read-write	SSL Interception.
remotecontentinspection	<Boolean>	Read-write	Remote Content Inspection.
adaptivetcp	<Boolean>	Read-write	Adaptive TCP.
cqa	<Boolean>	Read-write	Connection Quality Analytics.
bot	<Boolean>	Read-write	Bot Management.
apigateway	<Boolean>	Read-write	API Gateway.
_nextgenapiresource	<String>	Read-write	.

Operations

(click to see Properties)

- GET (ALL)
- APPLY

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

APPLY

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstestlicense? **action=apply HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstestlicense":{

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstestlicense **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nstimeout

Configuration for timeout resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
zombie	<Integer>	Read-write	Interval, in seconds, at which the Citrix ADC zombie cleanup process must run. This process cleans up inactive TCP connections. Default value: 120 Minimum value = 1 Maximum value = 600
client	<Integer>	Read-write	Client idle timeout (in seconds). If zero, the service-type default value is taken when service is created. Default value: 0 Minimum value = 0 Maximum value = 18000
server	<Integer>	Read-write	Server idle timeout (in seconds). If zero, the service-type default value is taken when service is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 18000
httpclient	<Integer>	Read-write	Global idle timeout, in seconds, for client connections of HTTP service type. This value is over ridden by the client timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 18000
httpserver	<Integer>	Read-write	Global idle timeout, in seconds, for server connections of HTTP service type. This value is over ridden by the server timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 18000
tcpclient	<Integer>	Read-write	Global idle timeout, in seconds, for non-HTTP client connections of TCP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service type. This value is over ridden by the client timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 18000
tcpserver	<Integer>	Read-write	Global idle timeout, in seconds, for non-HTTP server connections of TCP service type. This value is over ridden by the server timeout that is configured on entities. Default value: 0 Minimum value = 0 Maximum value = 18000
anyclient	<Integer>	Read-write	Global idle timeout, in seconds, for non-TCP client connections. This value is over ridden by the client timeout that is configured on individual entities. Default value: 0 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 31536000
anyserver	<Integer>	Read-write	Global idle timeout, in seconds, for non TCP server connections. This value is over ridden by the server timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 31536000
anytcpclient	<Integer>	Read-write	Global idle timeout, in seconds, for TCP client connections. This value takes precedence over entity level timeout settings (vserver/service). This is applicable only to transport protocol TCP. Default value: 0 Minimum value = 0 Maximum value = 31536000
anytcpserver	<Integer>	Read-write	Global idle timeout, in seconds, for TCP server connections. This value takes precedence over

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			entity level timeout settings (vserver/ service). This is applicable only to transport protocol TCP. Default value: 0 Minimum value = 0 Maximum value = 31536000
halfclose	<Integer>	Read-write	Idle timeout, in seconds, for connections that are in TCP half-closed state. Default value: 10 Minimum value = 1 Maximum value = 600
nontcpzombie	<Integer>	Read-write	Interval at which the zombie clean-up process for non-TCP connections should run. Inactive IP NAT connections will be cleaned up. Default value: 60 Minimum value = 1 Maximum value = 600
reducedfintimeout	<Integer>	Read-write	Alternative idle timeout, in seconds, for closed TCP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NATPCB connections. Default value: 30 Minimum value = 1 Maximum value = 300
reducedrsttimeout	<Integer>	Read-write	Timer interval, in seconds, for abruptly terminated TCP NATPCB connections. Default value: 0 Minimum value = 0 Maximum value = 300
newconnidletimeout	<Integer>	Read-write	Timer interval, in seconds, for new TCP NATPCB connections on which no data was received. Default value: 4 Minimum value = 1 Maximum value = 120
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

```

nstimer

Configuration for Timer resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Timer name. Minimum length = 1
interval	<Integer>	Read-write	The frequency at which the policies bound to this timer are invoked. The minimum value is 20 msec. The maximum value is 20940 in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			seconds and 349 in minutes. Default value: 5 Minimum value = 1 Maximum value = 20940000
unit	<String>	Read-write	Timer interval unit. Default value: SEC Possible values = SEC, MIN
comment	<String>	Read-write	Comments associated with this timer.
newname	<String>	Read-write	The new name of the timer. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstimer":{

<b>"name":<String_value>,

</b><b>"interval":<Integer_value>,
```

```
</b>"unit":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstimer":{

<b>"name":<String_value>,

</b>"interval":<Integer_value>,

"unit":<String_value>,
```

```
"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstimer":{

<b>"name":<String_value>,

</b>"interval":true,

"unit":true,

"comment":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstimer":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nstimer resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **view=summary**

Use this query-parameter to get the summary output of nstimer resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nstimer resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstimer": [ {

"name":<String_value>,

"interval":<Integer_value>,

"unit":<String_value>,

"comment":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nstimer/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/nstimer/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nstimer resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nstimer": [ {

"name":<String_value>,

"interval":<Integer_value>,

"unit":<String_value>,

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstimer": [ { "__count": "#no"} ] }
```

nstimer_autoscalepolicy_binding

Binding object showing the autoscalepolicy that can be bound to nstimer.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
samplesize	<Integer>	Read-write	Denotes the sample size. Sample size value of 'x' means that previous '(x - 1)' policy's rule evaluation results and the current evaluation result are present with the binding. For

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, sample size of 10 means that there is a state of previous 9 policy evaluation results and also the current policy evaluation result. Default value: 3 Minimum value = 1 Maximum value = 32
policyname	<String>	Read-write	The timer policy associated with the timer.
vserver	<String>	Read-write	Name of the vserver which provides the context for the rule in timer policy. When not specified it is treated as a Global Default context.
threshold	<Integer>	Read-write	Denotes the threshold. If the rule of the policy in the binding relation evaluates 'threshold size' number of times in 'sample size' to true, then the corresponding action is taken. Its value needs to be less than or equal to the sample size value.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 3 Minimum value = 1 Maximum value = 32
name	<String>	Read-write	Timer name. Minimum length = 1
priority	<Integer>	Read-write	Specifies the priority of the timer policy.
__count	<Double>	Read-write	count parameter

```

nstrafficdomain

Configuration for Traffic Domain resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Integer>	Read-write	Integer value that uniquely identifies a traffic domain. Minimum value = 1 Maximum value = 4094
aliasname	<String>	Read-write	Name of traffic domain being added. Minimum length = 1 Maximum length = 31
vmac	<String>	Read-write	Associate the traffic domain with a VMAC address instead of with VLANs. The Citrix ADC then sends the VMAC address of the traffic domain in all responses to ARP queries for network entities in that domain. As a result, the ADC can segregate subsequent incoming traffic for this traffic domain on the basis of the destination MAC address,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			because the destination MAC address is the VMAC address of the traffic domain. After creating entities on a traffic domain, you can easily manage and monitor them by performing traffic domain level operations. Default value: DISABLED Possible values = ENABLED, DISABLED
state	<String>	Read-only	The state of TrafficDmain. Default value: ENABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstrafficdomain":{

<b>"td":<Integer_value>,

</b>"aliasname":<String_value>,

"vmac":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain/ td_value<Integer> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstrafficdomain":{

<b>"td":<Integer_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **action=enable HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstrafficdomain":{

<b>"td":<Integer_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DISABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **action=disable HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstrafficdomain":{

<b>"td":<Integer_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nstrafficdomain resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **view=summary**

Use this query-parameter to get the summary output of nstrafficdomain resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nstrafficdomain resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain": [ {

"td":<Integer_value>,

"aliasname":<String_value>,

"vmac":<String_value>,

"state":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain/ td_value<Integer> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain/ td_value<Integer> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain/ td_value<Integer> ? **view=summary**

Use this query-parameter to get the summary output of nstrafficdomain resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nstrafficdomain": [ {

"td":<Integer_value>,

"aliasname":<String_value>,

"vmac":<String_value>,

"state":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain": [ { "__count": "#no"} ] }
```

nstrafficdomain_binding

Binding object which returns the resources bound to nstrafficdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Integer>	Read-write	Integer value that uniquely identifies a traffic domain. Minimum value = 1 Maximum value = 4094
nstrafficdomain_vlan_binding	<nstrafficdomain_vlan_binding[]>	Read-only	vlan that can be bound to nstrafficdomain.
nstrafficdomain_bridgegroup_binding	<nstrafficdomain_bridgegroup_binding[]>	Read-only	bridgegroup that can be bound to nstrafficdomain.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nstrafficdomain_vxlan_binding	<nstrafficdomain_vxlan_binding[]>	Read-only	vxlan that can be bound to nstrafficdomain.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_binding/ td_value<Integer>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain_binding": [ {

"td":<Integer_value>,

"nstrafficdomain_vxlan_binding":<nstrafficdomain_vxlan_binding[]_value>,

"nstrafficdomain_bridgegroup_binding":<nstrafficdomain_bridgegroup_binding
[]_value>,

"nstrafficdomain_vlan_binding":<nstrafficdomain_vlan_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/ nstrafficdomain_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain_binding": [ {

"td":<Integer_value>,

"nstrafficdomain_vxlan_binding":<nstrafficdomain_vxlan_binding[]_value>,

"nstrafficdomain_bridgegroup_binding":<nstrafficdomain_bridgegroup_binding
[]_value>,

"nstrafficdomain_vlan_binding":<nstrafficdomain_vlan_binding[]_value>

}]}
```

nstrafficdomain_bridgegroup_binding

Binding object showing the bridgegroup that can be bound to nstrafficdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bridgegroup	<Integer>	Read-write	ID of the configured bridge to bind to this traffic domain. More

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			than one bridge group can be bound to a traffic domain, but the same bridge group cannot be a part of multiple traffic domains. Minimum value = 1 Maximum value = 1000
td	<Integer>	Read-write	Integer value that uniquely identifies a traffic domain. Minimum value = 1 Maximum value = 4094
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/nstrafficdomain_bridgegroup_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

```

nsvariable

Configuration for variable resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Variable name. This follows the same syntax rules as other expression entity names: It must begin with an alpha character (A-Z or a-z) or an underscore (_). The rest of the characters must be alpha, numeric (0-9) or underscores. It cannot be re or xp (reserved for regular and XPath expressions). It cannot be an expression reserved word (e.g. SYS or HTTP). It cannot be used for an existing expression object (HTTP callout, patset, dataset, stringmap, or named expression). Minimum length = 1
type	<String>	Read-write	Specification of the variable type; one of the following:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ulong - singleton variable with an unsigned 64-bit value. text(value-max-size) - singleton variable with a text string value. map(text(key-max-size),ulong,max-entries) - map of text string keys to unsigned 64-bit values. map(text(key-max-size),text(value-max-size),max-entries) - map of text string keys to text string values. where value-max-size is a positive integer that is the maximum number of bytes in a text string value. key-max-size is a positive integer that is the maximum number of bytes in a text string key.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			max-entries is a positive integer that is the maximum number of entries in a map variable. For a global singleton text variable, value-max-size <= 64000. For a global map with ulong values, key-max-size <= 64000. For a global map with text values, key-max-size + value-max-size <= 64000. max-entries is a positive integer that is the maximum number of entries in a map variable. This has a theoretical maximum of 2\^64-1, but in actual use will be much smaller, considering the memory available for use by the map. Example:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			map(text(10),text(20),100) specifies a map of text string keys (max size 10 bytes) to text string values (max size 20 bytes), with 100 max entries. Minimum length = 1
scope	<String>	Read-write	Scope of the variable: global - (default) one set of values visible across all Packet Engines on a standalone Citrix ADC, an HA pair, or all nodes of a cluster transaction - one value for each request-response transaction (singleton variables only; no expiration). Default value: global Possible values = global, transaction
iffull	<String>	Read-write	Action to perform if an assignment to a map exceeds its

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configured max-entries: lru - (default) reuse the least recently used entry in the map. undef - force the assignment to return an undefined (Undef) result to the policy executing the assignment. Default value: lru Possible values = undef, lru
ifvaluetoobig	<String>	Read-write	Action to perform if an value is assigned to a text variable that exceeds its configured max-size, or if a key is used that exceeds its configured max-size: truncate - (default) truncate the text string to the first max-size bytes and proceed. undef - force the assignment or expression evaluation to return

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			an undefined (Undef) result to the policy executing the assignment or expression. Default value: truncate Possible values = undef, truncate
ifnovalue	<String>	Read-write	Action to perform if on a variable reference in an expression if the variable is single-valued and uninitialized or if the variable is a map and there is no value for the specified key: init - (default) initialize the single-value variable, or create a map entry for the key and the initial value, using the -init value or its default. undef - force the expression evaluation to return an undefined (Undef) result to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy executing the expression. Default value: init Possible values = undef, init
init	<String>	Read-write	Initialization value for this variable, to which a singleton variable or map entry will be set if it is referenced before an assignment action has assigned it a value. If the singleton variable or map entry already has been assigned a value, setting this parameter will have no effect on that variable value. Default: 0 for ulong, NULL for text.
expires	<Integer>	Read-write	Value expiration in seconds. If the value is not referenced within the expiration period it will be deleted. 0 (the default) means no expiration. Minimum value = 0 Maximum value = 31622400

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Comments associated with this variable.
referencecount	<Integer>	Read-only	The number of references to the variable in expressions and assignments.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- UPDATE
- UNSET
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsvariable **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsvariable":{

<b>"name":<String_value>,

</b><b>"type":<String_value>,

</b>"scope":<String_value>,

"iffull":<String_value>,

"ifvaluetoobig":<String_value>,

"ifnovalue":<String_value>,

"init":<String_value>,

"expires":<Integer_value>,
```

```
"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsvariable **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsvariable":{

<b>"name":<String_value>,

</b>"type":<String_value>,

nsvpxparam

Configuration for "VPX" resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
masterclockcpu1	<String>	Read-write	This argument is deprecated. Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cpuyield	<String>	Read-write	This setting applicable in virtual appliances, is to affect the cpu yield(relinquishing the cpu resources) in any hypervised environment. * There are 3 options for the behavior: 1. YES - Allow the Virtual Appliance to yield its vCPUs periodically, if there is no data traffic. 2. NO - Virtual Appliance will not yield the vCPU. 3. DEFAULT - Restores the default behaviour, according to the license. * Its behavior in different scenarios: 1. As this setting is node specific only, it will not be propagated to other nodes, when executed on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Cluster(CLIP) and HA(Primary). 2. In cluster setup, use '-ownerNode' to specify ID of the cluster node. 3. This setting is a system wide implementation and not granular to vCPUs. 4. No effect on the management PE. Default value: DEFAULT Possible values = DEFAULT, YES, NO
ownernode	<Integer>	Read-write	ID of the cluster node for which you are setting the cpuyield and/or KVMVirtioMultiqueue . It can be configured only through the cluster IP address. Default value: 255 Minimum value = 0 Maximum value = 31
kvmvirtiomultiqueue	<String>	Read-write	This setting applicable on KVM VPX with virtio NICs,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is to configure multiple queues for all virtio interfaces. * There are 2 options for this behavior: 1. YES - Allows VPX to use multiple queues for each virtio interface as configured through the KVM Hypervisor. 2. NO - Each virtio interface within VPX will use a single queue for transmit and receive. * Its behavior in different scenarios: 1. As this setting is node specific only, it will not be propagated to other nodes, when executed on Cluster(CLIP) and HA(Primary). 2. In cluster setup, use '-ownerNode' to specify ID of the cluster node.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
vpxenvironment	<String>	Read-only	Shows VPX Running Environmentrunning 0 VPX ON PREM, 1 AWS, 2 OPENSTACK 3 Azure, 4 GCP CLoud . Possible values = VPX, AWSCLOUD, OPENSTACKCLOUD, AZURECLOUD, GOOGLECLOUD, ALICLOUD, IBMCLOUD
memorystatus	<String>	Read-only	Provides the information about memory status. Possible values = Sufficent, Insufficent
cloudproductcode	<String>	Read-only	Cloud Product Code Description . Maximum length = 127

- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsweblogparam **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsweblogparam":{

ntp

NTP

NTP configuration.

NAME	DESCRIPTION
ntpparam	Configuration for NTP parameter
ntpserver	Configuration for NTP server
ntpstatus	Configuration for ntp status
ntpsync	Configuration for NTP sync

ntpparam

Configuration for NTP parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authentication	<String>	Read-write	Apply NTP authentication, which enables the NTP client (Citrix ADC) to verify that the server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is in fact known and trusted. Default value: YES Possible values = YES, NO
trustedkey	<Integer[]>	Read-write	Key identifiers that are trusted for server authentication with symmetric key cryptography in the keys file. Minimum value = 1 Maximum value = 65534
autokeylogsec	<Integer>	Read-write	Autokey protocol requires the keys to be refreshed periodically. This parameter specifies the interval between regenerations of new session keys. In seconds, expressed as a power of 2. Default value: 12 Minimum value = 0 Maximum value = 32
revokelogsec	<Integer>	Read-write	Interval between re-randomizations of the autokey seeds to prevent brute-force attacks on the autokey algorithms.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 16 Minimum value = 0 Maximum value = 32
_nextgenapiresource	<String>	Read-only	.

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ntpsync? **action=enable HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ntpsync":{

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DISABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ntpsync? **action=disable HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ntpsync":{

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ntpsync **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ntpsync": [ {

"state":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

pcp

Pcp

Port Control Protocol Configuration.

NAME	DESCRIPTION
pcpmap	Configuration for server

NAME	DESCRIPTION
pcpprofile	Configuration for PCP Profile
pcpserver	Configuration for server

pcpmap

Configuration for server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nattype	<String>	Read-write	Type of sessions to be displayed. Default value: NAT44 Possible values = NAT44, DS-Lite, NAT64
pcpsrcip	<String>	Read-only	Internal IP address.
subscrip	<String>	Read-only	IPV4 src address of Client in DS-Lite.
pcpsrcport	<Integer>	Read-only	Internal Port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
pcpdstip	<String>	Read-only	Remote PEER IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pcpdstport	<Integer>	Read-only	Remote PEER Port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
pcpnatip	<String>	Read-only	External IP address.
pcpnatport	<Integer>	Read-only	External Port Number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
pcpprotocol	<String>	Read-only	Protocol of the PCP mapping. Possible values = HopOpt, icmp, igmp, ggp, ipv4, st, tcp, udp
pcpaddr	<Integer>	Read-only	Address of PCP Map entity.
pcpnounce	<Integer>	Read-only	PCP Mapping Nounce.
pcprefcnt	<Integer>	Read-only	Refcount, which indicates how many session is active.
pcplifetime	<Integer>	Read-only	Integer value that shows the requested lifetime.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/pcpmap **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **args=nattype: <String_value>**

Use this query-parameter to get pcpmap resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of pcpmap resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **view=summary**

Use this query-parameter to get the summary output of pcpmap resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **pagesize=#no;pageno=#no**

Use this query-parameter to get the pcpmap resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "pcpmap": [ {

nattype:<String_value>"pcpsrcip":<String_value>,

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "pcpmap": [ { "__count": "#no"} ] }
```

pcpprofile

Configuration for PCP Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the PCP Profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my pcpProfile" or my pcpProfile).
mapping	<String>	Read-write	This argument is for enabling/disabling

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the MAP opcode of current PCP Profile. Default value: ENABLED Possible values = ENABLED, DISABLED
peer	<String>	Read-write	This argument is for enabling/disabling the PEER opcode of current PCP Profile. Default value: ENABLED Possible values = ENABLED, DISABLED
minmaplife	<Integer>	Read-write	Integer value that identify the minimum mapping lifetime (in seconds) for a pcp profile. default(120s). Minimum value = 1 Maximum value = 2147483647
maxmaplife	<Integer>	Read-write	Integer value that identify the maximum mapping lifetime (in seconds) for a pcp profile. default(86400s = 24Hours). Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 2147483647
announcemulticount	<Integer>	Read-write	Integer value that identify the number announce message to be send. Default value: 10 Minimum value = 0 Maximum value = 65535
thirdparty	<String>	Read-write	This argument is for enabling/disabling the THIRD PARTY opcode of current PCP Profile. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

NAME	DESCRIPTION
policystringmap_binding	Binding object showing the resources that can be bound to policystringmap
policystringmap_pattern_binding	Binding object showing the pattern that can be bound to policystringmap
policytracing	
policyurlset	Configuration for URL set

policydataset

Configuration for TYPE set resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the dataset. Must not exceed 127 characters. Minimum length = 1
type	<String>	Read-write	Type of value to bind to the dataset. Possible values = ipv4, number, ipv6, ulong, double, mac
comment	<String>	Read-write	Any comments to preserve information about this dataset or a data bound to this dataset.
patsetfile	<String>	Read-write	File which contains list of patterns that needs to be bound to the dataset. A

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			patsetfile cannot be associated with multiple datasets.
dynamic	<String>	Read-write	This is used to populate internal dataset information so that the dataset can also be used dynamically in an expression. Here dynamically means the dataset name can also be derived using an expression. For example for a given dataset name "allow_test" it can be used dynamically as client.ip.src.equals_any("allow_" + http.req.url.path.get(1)). This cannot be used with default datasets. Default value: NO Possible values = YES, NO
dynamiconly	<Boolean>	Read-write	Shows only dynamic datasets when set true. Default value: 0
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policydataset":{

<b>"name":<String_value>,

</b><b>"type":<String_value>,

</b>"comment":<String_value>,

"patsetfile":<String_value>,

"dynamic":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policydataset":{

<b>"name":<String_value>,

</b>"dynamic":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policydataset":{

<b>"name":<String_value>,

</b>"dynamic":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **args=name: <String_value> ,dynamiconly: <Boolean_value>**

Use this query-parameter to get policydataset resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policydataset resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **view=summary**

Use this query-parameter to get the summary output of policydataset resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policydataset resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policydataset": [ {

name:<String_value>,dynamiconly:<Boolean_value>"type":<String_value>,

"comment":<String_value>,

"patsetfile":<String_value>,

"dynamic":<String_value>,

"builtin":<String[]_value>,

"feature":<String_value>,
```

```
"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/policydataset/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/policydataset/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of policydataset resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policydataset": [ {

name:<String_value>,dynamiconly:<Boolean_value>"type":<String_value>,
```

```
"comment":<String_value>,

"patsetfile":<String_value>,

"dynamic":<String_value>,

"builtin":<String[]_value>,

"feature":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policydataset": [ { "__count": "#no"} ] }
```

policydataset_binding

Binding object which returns the resources bound to policydataset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the dataset. Must not exceed 127 characters. Minimum length = 1
policydataset_value_binding	<policydataset_value_binding[]>	Read-only	value that can be bound to policydataset.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policydataset_binding": [ {

"name":<String_value>,

"policydataset_value_binding":<policydataset_value_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/policydataset_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policydataset_binding": [ {

"name":<String_value>,

"policydataset_value_binding":<policydataset_value_binding[]_value>

}]}
```

policydataset_value_binding

Binding object showing the value that can be bound to policydataset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
index	<Integer>	Read-write	The index of the value (ipv4, ipv6, number) associated with the set.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the dataset to which to bind the value. Minimum length = 1
value	<String>	Read-write	Value of the specified type that is associated with the dataset. For ipv4 and ipv6, value can be a subnet using the slash notation address/n, where address is the beginning of the subnet and n is the number of left-most bits set in the subnet mask, defining the end of the subnet. The start address will be masked by the subnet mask if necessary, for example for 192.128.128.0/10, the start address will be 192.128.0.0.
endrange	<String>	Read-write	The dataset entry is a range from <value> through <end_range>, inclusive. endRange cannot be used if value is an ipv4 or ipv6 subnet and endRange cannot itself be a subnet.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Any comments to preserve information about this dataset or a data bound to this dataset.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/policydataset_value_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"policydataset_value_binding":{

<b>"name":<String_value>,

</b><b>"value":<String_value>,

</b>"index":<Integer_value>,

"endrange":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset_value_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/

policydataset_value_binding/ name_value<String> ? **args= value:<String_value>, endrange: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset_value_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ policydataset_value_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of policydataset_value_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/policydataset_value_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policydataset_value_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

policyevaluation

Configuration for expr evaluation resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
expression	<String>	Read-write	Expression string. For example: http.req.body(100).contains("this").
action	<String>	Read-write	Rewrite action name. Supported rewrite action types are: -delete -delete_all -delete_http_header -insert_after -insert_after_all -insert_before -insert_before_all -insert_http_header -replace -replace_all . Minimum length = 1
type	<String>	Read-write	Indicates request or response input packet. Possible values = HTTP_REQ, HTTP_RES, TEXT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
input	<String>	Read-write	Text representation of input packet.
pitmodifiedinputdata	<String>	Read-only	Text representation of packet after evaluating expression or rewrite action.
pitboolresult	<Boolean>	Read-only	Result of the expression in bool format.
pitnumresult	<Integer>	Read-only	Result of the expression in num format.
pitdoubleresult	<Double>	Read-only	Result of the expression in double format.
pitulongresult	<Integer>	Read-only	Result of the expression in unsigned long format.
pitrefresult	<String>	Read-only	Result of the expression in string format.
pitoffsetresult	<Integer>	Read-only	Offset of the resultant sting.
pitoffsetresultlen	<Integer>	Read-only	Offset length of the resultant sting.
istruncatedrefresult	<Boolean>	Read-only	Identify whether ref result is truncated result.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pitboolevaltime	<Integer>	Read-only	Average evaluation time of bool type expression in nanoseconds.
pitnumevaltime	<Integer>	Read-only	Average evaluation time of num type expression in nanoseconds.
pitdoubleevaltime	<Integer>	Read-only	Average evaluation time of double type expression in nanoseconds.
pitulongevaltime	<Integer>	Read-only	Average evaluation time of unsigned long type expression in nanoseconds.
pitrefevaltime	<Integer>	Read-only	Average evaluation time of string type expression in nanoseconds.
pitoffsetevaltime	<Integer>	Read-only	Average evaluation time in finding offset of the resultant string in the input. Time is in nanoseconds.
pitactionevaltime	<Integer>	Read-only	Average evaluation time of rewrite action in nanoseconds.
pitoperationperformerarray	<String[]>	Read-only	Details of the operation Citrix ADC performed at various offsets during applying of rewrite action on input data.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Operation can be insertion, modfication or deletion. Possible values = INSERT, MODIFY, DELETE
pitoldoffsetarray	<Integer[]>	Read-only	Details of the offsets in the input data at which Citrix ADC either inserted or modified or deleted data during applying of rewrite action.
pitnewoffsetarray	<Integer[]>	Read-only	Details of the offsets in the output data at which Citrix ADC either inserted or modified or deleted data during applying of rewrite action.
pitoffsetlengtharray	<Integer[]>	Read-only	Details of the lengths of the data which Citrix ADC modified or deleted during applying of rewrite action.
pitoffsetnewlengtharray	<Integer[]>	Read-only	Details of the lengths of the data which Citrix ADC either inserted or modified during applying of rewrite action.
pitboolerrorresult	<String>	Read-only	Result of the bool type expression if any error occurs during evaluation.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Result will be in string format.
pitnumerrorresult	<String>	Read-only	Result of the num type expression if any error occurs during evaluation. Result will be in string format.
pitdoubleerrorresult	<String>	Read-only	Result of the double type expression if any error occurs during evaluation. Result will be in string format.
pitulongerrorresult	<String>	Read-only	Result of the unsigned long type expression if any error occurs during evaluation. Result will be in string format.
pitreferrorresult	<String>	Read-only	Result of the ref type expression if any error occurs during evaluation. Result will be in string format.
pitoffseterrorresult	<String>	Read-only	Result of the expression if any error occurs in calculating offset. Result will be in string format.
pitactionerrorresult	<String>	Read-only	Result of the action if any error occurs in evaluation. Result

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			will be in string format.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

policyexpression

Configuration for expression resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name for the expression. Not case sensitive. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Must not begin with 're' or 'xp' or be a word reserved for use as an expression qualifier prefix (such as HTTP) or enumeration value (such as ASCII). Must not be the name of an existing named expression, pattern set, dataset, stringmap, or HTTP callout. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
value	<String>	Read-write	Expression string. For example: http.req.body(100).contains("this").
comment	<String>	Read-write	Any comments associated with the expression. Displayed upon viewing the policy expression.
clientsecuritymessage	<String>	Read-write	Message to display if the expression fails. Allowed for classic end-point check expressions only. Minimum length = 1
type	<String>	Read-write	Type of expression. Can be a classic or default syntax (advanced) expression. Possible values = CLASSIC, ADVANCED
hits	<Integer>	Read-only	The total number of hits.
pihits	<Integer>	Read-only	The total number of hits.
type1	<String>	Read-only	The type of expression. This is for output only. Possible values = CLASSIC, ADVANCED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default policy expression.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policyexpression": [ { "__count": "#no"} ] }
```

policyhttpcallout

Configuration for HTTP callout resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the HTTP callout. Not case sensitive. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Must not begin with 're' or 'xp' or be a word reserved for use as an expression qualifier prefix (such as HTTP) or enumeration value (such as ASCII).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Must not be the name of an existing named expression, pattern set, dataset, stringmap, or HTTP callout. Minimum length = 1
ipaddress	<String>	Read-write	IP Address of the server (callout agent) to which the callout is sent. Can be an IPv4 or IPv6 address. Mutually exclusive with the Virtual Server parameter. Therefore, you cannot set the <IP Address, Port> and the Virtual Server in the same HTTP callout.
port	<Integer>	Read-write	Server port to which the HTTP callout agent is mapped. Mutually exclusive with the Virtual Server parameter. Therefore, you cannot set the <IP Address, Port> and the Virtual Server in the same HTTP callout. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserver	<String>	Read-write	Name of the load balancing, content switching, or cache redirection virtual server (the callout agent) to which the HTTP callout is sent. The service type of the virtual server must be HTTP. Mutually exclusive with the IP address and port parameters. Therefore, you cannot set the <IP Address, Port> and the Virtual Server in the same HTTP callout. Minimum length = 1
returntype	<String>	Read-write	Type of data that the target callout agent returns in response to the callout. Available settings function as follows: * TEXT - Treat the returned value as a text string. * NUM - Treat the returned value as a number. * BOOL - Treat the returned value as a Boolean value.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: You cannot change the return type after it is set. Possible values = BOOL, NUM, TEXT
httpmethod	<String>	Read-write	Method used in the HTTP request that this callout sends. Mutually exclusive with the full HTTP request expression. Possible values = GET, POST
hostexpr	<String>	Read-write	String expression to configure the Host header. Can contain a literal value (for example, 10.101.10.11) or a derived value (for example, http.req.header("Host")). The literal value can be an IP address or a fully qualified domain name. Mutually exclusive with the full HTTP request expression. Minimum length = 1
urlstemexpr	<String>	Read-write	String expression for generating the URL stem. Can contain a literal string (for example, "/mysite/index.html") or an expression that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			derives the value (for example, http.req.url). Mutually exclusive with the full HTTP request expression. Minimum length = 1
headers	<String[]>	Read-write	One or more headers to insert into the HTTP request. Each header is specified as "name(expr)", where expr is an expression that is evaluated at runtime to provide the value for the named header. You can configure a maximum of eight headers for an HTTP callout. Mutually exclusive with the full HTTP request expression.
parameters	<String[]>	Read-write	One or more query parameters to insert into the HTTP request URL (for a GET request) or into the request body (for a POST request). Each parameter is specified as "name(expr)", where expr is an expression that is evaluated at run time to provide the value for the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			named parameter (name=value). The parameter values are URL encoded. Mutually exclusive with the full HTTP request expression.
bodyexpr	<String>	Read-write	An advanced string expression for generating the body of the request. The expression can contain a literal string or an expression that derives the value (for example, client.ip.src). Mutually exclusive with -fullReqExpr. Minimum length = 1
fullreqexpr	<String>	Read-write	Exact HTTP request, in the form of an expression, which the Citrix ADC sends to the callout agent. If you set this parameter, you must not include HTTP method, host expression, URL stem expression, headers, or parameters. The request expression is constrained by the feature for which the callout is used.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			For example, an HTTP.RES expression cannot be used in a request-time policy bank or in a TCP content switching policy bank. The Citrix ADC does not check the validity of this request. You must manually validate the request. Minimum length = 1
scheme	<String>	Read-write	Type of scheme for the callout server. Possible values = http, https
resultexpr	<String>	Read-write	Expression that extracts the callout results from the response sent by the HTTP callout agent. Must be a response based expression, that is, it must begin with HTTP.RES. The operations in this expression must match the return type. For example, if you configure a return type of TEXT, the result expression

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must be a text based expression. If the return type is NUM, the result expression (resultExpr) must return a numeric value, as in the following example: http.res.body(10000).length. Minimum length = 1
cacheforsecs	<Integer>	Read-write	Duration, in seconds, for which the callout response is cached. The cached responses are stored in an integrated caching content group named "calloutContentGroup". If no duration is configured, the callout responses will not be cached unless normal caching configuration is used to cache them. This parameter takes precedence over any normal caching configuration that would otherwise apply to these responses. Note that the calloutContentGroup definition may not be modified or removed nor may it

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be used with other cache policies. Minimum value = 1 Maximum value = 31536000
comment	<String>	Read-write	Any comments to preserve information about this HTTP callout.
hits	<Integer>	Read-only	Total hits.
undefhits	<Integer>	Read-only	Total undefs.
svrstate	<String>	Read-only	The state of the service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
effectivestate	<String>	Read-only	The effective state of the service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
undefreason	<String>	Read-only	Reason for last undef. Possible values = Failed to add service, Vserver not found, Not a HTTP or SSL vserver, Generated callout request is invalid, Content-Length header not found in callout request, Not enough space to put Content-Length value, Config incomplete, Server is DOWN, Creating callout connection failed, No memory to generate callout request packets, No memory to create callout task, No memory to create callout async, Callout request expression undef, No callout response expression, Skipped callout response

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			eval, Callout response pixl init undef, Callout response expression undef
recursivecallout	<Integer>	Read-only	Number of recursive callouts.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

policymap

Configuration for map policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mappolicyname	<String>	Read-write	Name for the map policy. Must begin with a letter, number, or the underscore (_) character and must consist only of letters, numbers, and the hash (#), period (.), colon (:), space ( ), at (@), equals (=), hyphen (-), and underscore (_) characters. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my map" or 'my map'). Minimum length = 1
sd	<String>	Read-write	Publicly known source domain name. This is the domain name with which a client request arrives at a reverse proxy virtual server for cache redirection. If you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specify a source domain, you must specify a target domain. Minimum length = 1
su	<String>	Read-write	Source URL. Specify all or part of the source URL, in the following format: /[[prefix] [*]] [.suffix]. Minimum length = 1
td	<String>	Read-write	Target domain name sent to the server. The source domain name is replaced with this domain name. Minimum length = 1
tu	<String>	Read-write	Target URL. Specify the target URL in the following format: /[[prefix] [*]][.suffix]. Minimum length = 1
targetname	<String>	Read-only	The expression string.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)

- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/policymap/ mappolicyname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/policymap/ mappolicyname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of policymap resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policymap": [ {

"mappolicyname":<String_value>,

"sd":<String_value>,

"su":<String_value>,

"td":<String_value>,

"tu":<String_value>,

"targetname":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policymap? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policymap": [ { "__count": "#no"} ] }
```

policyparam

Configuration for policy parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeout	<Integer>	Read-write	Maximum time in milliseconds to allow for processing expressions and policies without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed. Default value: 3900 Minimum value = 1 Maximum value = 5000
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyparam **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policyparam":{

"timeout":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyparam? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policyparam":{

"timeout":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyparam **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policyparam": [ {

"timeout":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

policypatset

Configuration for PAT set resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name of the pattern set. Not case sensitive. Must begin with an ASCII letter or underscore (_) character and must contain only alphanumeric and underscore characters. Must not be the name of an existing named expression, pattern set, dataset, string map, or HTTP callout. Minimum length = 1
comment	<String>	Read-write	Any comments to preserve information about this patset or a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			pattern bound to this patset.
patsetfile	<String>	Read-write	File which contains list of patterns that needs to be bound to the patset. A patsetfile cannot be associated with multiple patsets.
dynamic	<String>	Read-write	This is used to populate internal patset information so that the patset can also be used dynamically in an expression. Here dynamically means the patset name can also be derived using an expression. For example for a given patset name "allow_test" it can be used dynamically as http.req.url.contains_any("allow_" + http.req.url.path.get(1)). This cannot be used with default patsets. Default value: NO Possible values = YES, NO
dynamiconly	<Boolean>	Read-write	Shows only dynamic patsets when set true. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Response Payload:

```
{ "policypatset": [ { "__count": "#no"} ] }
```

policypatset_binding

Binding object which returns the resources bound to policypatset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the pattern set for which to display the detailed information. If a name is not provided, a list of all pattern sets configured on the appliance is shown. Minimum length = 1
policypatset_pattern_binding	<policypatset_pattern_binding[]>	Read-only	pattern that can be bound to policypatset.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policypatset_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policypatset_binding": [ {

"name":<String_value>,

"policypatset_pattern_binding":<policypatset_pattern_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policypatset_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/policypatset_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policypatset_binding": [ {

"name":<String_value>,
```

```
"policypatset_pattern_binding":<policypatset_pattern_binding[]_value>

}]}
```

policypatset_pattern_binding

Binding object showing the pattern that can be bound to policypatset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
charset	<String>	Read-write	Character set associated with the characters in the string. Note: UTF-8 characters can be entered directly (if the UI supports it) or can be encoded as a sequence of hexadecimal bytes '\xNN'. For example, the UTF-8 character ' ' can be encoded as '\xC3\xBC'. Possible values = ASCII, UTF_8
builtin	<String[]>	Read-write	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Any comments to preserve information about this patset or a pattern bound to this patset.
String	<String>	Read-write	String of characters that constitutes a pattern. For more information about the characters that can be used, refer to the character set parameter. Note: Minimum length for pattern sets used in rewrite actions of type REPLACE_ALL, DELETE_ALL, INSERT_AFTER_ALL, and INSERT_BEFORE_ALL, is three characters.
feature	<String>	Read-write	The feature to be checked while applying this config.
name	<String>	Read-write	Name of the pattern set to which to bind the string. Minimum length = 1
index	<Integer>	Read-write	The index of the string associated with the patset.
__count	<Double>	Read-write	count parameter

```

policypatsetfile

Configuration for patset file resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
src	<String>	Read-write	URL in protocol, host, path, and file name format from where the patset file will be imported. If file is already present, then it can be imported using local keyword (import patsetfile local:filename patsetfile1) NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
name	<String>	Read-write	Name to assign to the imported patset file. Unique name of the pattern set. Not case sensitive. Must begin with an ASCII letter or underscore (_) character and must contain only alphanumeric and underscore characters. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 31
overwrite	<Boolean>	Read-write	Overwrites the existing file.
delimiter	<String>	Read-write	patset file patterns delimiter. Default value: 10
charset	<String>	Read-write	Character set associated with the characters in the string. Possible values = ASCII, UTF_8
comment	<String>	Read-write	Any comments to preserve information about this patsetfile.
imported	<Boolean>	Read-write	When set, display only shows all imported patsetfiles. Default value: 0
totalpatterns	<Integer>	Read-only	Total number of patterns in the patset file.
boundpatterns	<Integer>	Read-only	Total number of patterns bound to a patset.
patsetname	<String>	Read-only	The patset with which the patsetfile is associated.
bindstatuscode	<Integer>	Read-only	The status code of pattern bindings to patset.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bindstatus	<String>	Read-only	The status of pattern bindings to patset.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

CHANGE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policypatsetfile? **action=update HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policypatsetfile":{

<b>"name":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policypatsetfile **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/policypatsetfile? **args=name: <String_value> ,imported: <Boolean_value>**

Use this query-parameter to get policypatsetfile resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/policypatsetfile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/policypatsetfile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policypatsetfile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/policypatsetfile? **view=summary**

Use this query-parameter to get the summary output of policypatsetfile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/policypatsetfile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policypatsetfile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policypatsetfile": [ {

name:<String_value>,imported:<Boolean_value>"src":<String_value>,

"delimiter":<String_value>,

"charset":<String_value>,

"totalpatterns":<Integer_value>,

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policypatsetfile? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policypatsetfile": [ { "__count": "#no"} ] }
```

policystringmap

Configuration for string map resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name for the string map. Not case sensitive. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Must not begin with 're' or 'xp' or be a word reserved for use as an expression qualifier prefix (such as HTTP) or enumeration value (such as ASCII). Must not be the name of an existing named expression, pattern set, dataset, string map, or HTTP callout. Minimum length = 1
comment	<String>	Read-write	Comments associated with the string map or key-value pair bound to this string map.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policystringmap":{

<b>"name":<String_value>,

</b>"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policystringmap":{

<b>"name":<String_value>,

</b>"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policystringmap":{

<b>"name":<String_value>,

</b>"comment":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policystringmap resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **view=summary**

Use this query-parameter to get the summary output of policystringmap resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policystringmap resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policystringmap": [ {

"name":<String_value>,

"comment":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/policystringmap/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/policystringmap/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of policystringmap resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policystringmap": [ {

"name":<String_value>,

"comment":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policystringmap": [ { "__count": "#no"} ] }
```

policystringmap_binding

Binding object which returns the resources bound to policystringmap.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the string map to display. If a name is not provided, a list of all the configured string maps is shown. Minimum length = 1
policystringmap_pattern_binding	<policystringmap_pattern_binding[]>	Read-only	pattern that can be bound to policystringmap.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policystringmap_binding": [ {

"name":<String_value>,

"policystringmap_pattern_binding":<policystringmap_pattern_binding[]_value
>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policystringmap_binding": [ {

"name":<String_value>,

"policystringmap_pattern_binding":<policystringmap_pattern_binding[]_value
>

}]}
```

policystringmap_pattern_binding

Binding object showing the pattern that can be bound to policystringmap.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the string map to which to bind the key-value pair. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
key	<String>	Read-write	Character string constituting the key to be bound to the string map. The key is matched against the data processed by the operation that uses the string map. The default character set is ASCII. UTF-8 characters can be included if the character set is UTF-8. UTF-8 characters can be entered directly (if the UI supports it) or can be encoded as a sequence of hexadecimal bytes '\xNN'. For example, the UTF-8 character '' can be encoded as '\xC3\xBC'. Minimum length = 1
value	<String>	Read-write	Character string constituting the value associated with the key. This value is returned when processed data matches the associated key. Refer to the key parameter for details of the value character set. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Comments associated with the string map or key-value pair bound to this string map.
__count	<Double>	Read-write	count parameter

Operations

{"policystringmap_pattern_binding": [ { "__count": "#no"} ] }
```

policytracing

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
filterexpr	<String>	Read-write	Policy tracing filter expression. For example: http.req.url.startswith ("/this").
protocoltype	<String>	Read-write	protocol type for which policy records needs to be collected. Default value: HTTP Possible values = HTTP, SSL, TCP, SSL_TCP, DNS, DNS_TCP, ANY
capturesslhandshake policies	<String>	Read-write	Set it to yes if need to capture the SSL handshake policies. Default value: NO Possible values = YES, NO
transactionid	<String>	Read-write	Unique ID to identify the current transaction.
detail	<String>	Read-write	Show detailed information of the captured records. Default value: all Possible values = brief, all
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 31
packetengineid	<Integer>	Read-only	The packet engine identifier.
clientip	<String>	Read-only	The IP address of client.
destip	<String>	Read-only	The IP address of destination.
srcport	<Integer>	Read-only	Source port of the request.
destport	<Integer>	Read-only	Destination port of the request.
transactiontime	<String>	Read-only	Conveys time at which request processing started.
policytracingmodule	<String>	Read-only	Module or feature for which policy is evaluated. Possible values = SSL, DNS, DNS64, VPNTraffic, VPNSession, VPNURL, VPNApp, TMTraffic, TMSession, SAMLIdp, Authentication, Authorizaion, CacheRedirection, ContentSwitching, Bot Management,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			AppFw, ContentInspection, Responder, ContentOptimization, Video Optimization, CACHE, REWRITE, AppQoE, AppFlow, LB, Compression, TunnelTraffic, URLTRANS, CVPNRewrite
url	<String>	Read-only	Request URL.
policynames	<String[]>	Read-only	List of the policy names which are evaluated to true for this transaction.
isresponse	<Integer>	Read-only	True if the current policy is evaluated on the request side.
isundefpolicy	<Integer>	Read-only	True if the current policy is evaluated to undef.
policytracingrecordcount	<Integer>	Read-only	Current record number.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

START

URL: http:// <netscaler-ip-address> /nitro/v1/config/policytracing? **action=start HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policytracing":{

<b>"filterexpr":<String_value>,

</b>"protocoltype":<String_value>,

"capturesslhandshakepolicies":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

STOP

URL: http:// <netscaler-ip-address> /nitro/v1/config/policytracing? **action=stop HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policytracing":{

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/policytracing? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policytracing":{

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policytracing **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/policytracing? **args=transactionid: <String_value> ,detail: <String_value> ,nodeid: <Integer_value>**

Use this query-parameter to get policytracing resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/policytracing? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/policytracing? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policytracing resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/policytracing? **view=summary**

Use this query-parameter to get the summary output of policytracing resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/policytracing? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policytracing resources in chunks.

HTTP Method: GET

Request Headers:

```

policyurlset

Configuration for URL set resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name of the url set. Not case sensitive. Must begin with an ASCII letter or underscore (_) character and must contain only alphanumeric and underscore characters. Must not be the name of an existing named expression, pattern set, dataset, string map, or HTTP callout. Minimum length = 1 Maximum length = 127
comment	<String>	Read-write	Any comments to preserve information about this url set.
imported	<Boolean>	Read-write	when set, display shows all imported urlsets. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
overwrite	<Boolean>	Read-write	Overwrites the existing file. Default value: 0
delimiter	<String>	Read-write	CSV file record delimiter. Default value: 44
rowseparator	<String>	Read-write	CSV file row separator. Default value: 10
url	<String>	Read-write	URL (protocol, host, path and file name) from where the CSV (comma separated file) file will be imported or exported. Each record/line will one entry within the urlset. The first field contains the URL pattern, subsequent fields contains the metadata, if available. HTTP, HTTPS and FTP protocols are supported. NOTE: The operation fails if the destination HTTPS server requires client certificate authentication for access. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 2047
interval	<Integer>	Read-write	The interval, in seconds, rounded down to the nearest 15 minutes, at which the update of urlset occurs. Default value: 0 Minimum value = 0 Maximum value = 2592000
privateset	<Boolean>	Read-write	Prevent this urlset from being exported. Default value: 0
subdomainexactmatch	<Boolean>	Read-write	Force exact subdomain matching, ex. given an entry 'google.com' in the urlset, a request to 'news.google.com' won't match, if subdomainExactMatch is set. Default value: 0
matchedid	<Integer>	Read-write	An ID that would be sent to AppFlow to indicate which URLSet was the last one that matched the requested URL. Default value: 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 2 Maximum value = 31
canaryurl	<String>	Read-write	Add this URL to this urlset. Used for testing when contents of urlset is kept confidential. Minimum length = 1 Maximum length = 2047
patterncount	<Integer>	Read-only	Number of patterns in this urlset. Default value: 0
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT
- IMPORT
- CHANGE
- EXPORT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyurlset **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policyurlset":{

<b>"name":<String_value>,

</b>"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyurlset/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyurlset? **action=Import HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policyurlset":{

<b>"name":<String_value>,

</b>"overwrite":<Boolean_value>,

"delimiter":<String_value>,

"rowseparator":<String_value>,

<b>"url":<String_value>,
```

```
</b>"interval":<Integer_value>,

"privateset":<Boolean_value>,

"subdomainexactmatch":<Boolean_value>,

"matchedid":<Integer_value>,

"canaryurl":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CHANGE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyurlset? **action=update HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policyurlset":{

<b>"name":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

EXPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyurlset? **action=export HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policyurlset":{

<b>"name":<String_value>,

</b><b>"url":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyurlset **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/policyurlset? **args=name: <String_value> ,imported: <Boolean_value>**

Use this query-parameter to get policyurlset resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/policyurlset? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/policyurlset? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policyurlset resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/policyurlset? **view=summary**

Use this query-parameter to get the summary output of policyurlset resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/policyurlset? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policyurlset resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policyurlset": [ {

name:<String_value>,imported:<Boolean_value>"comment":<String_value>,

"patterncount":<Integer_value>,

"url":<String_value>,

"delimiter":<String_value>,

"interval":<Integer_value>,
```

```
"matchedid":<Integer_value>,

"canaryurl":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyurlset/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/policyurlset/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/policyurlset/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of policyurlset resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policyurlset": [ {

name:<String_value>,imported:<Boolean_value>"comment":<String_value>,

"patterncount":<Integer_value>,

"url":<String_value>,

"rowseparator":<String_value>,

"interval":<Integer_value>,

"matchedid":<Integer_value>,

"canaryurl":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyurlset? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policyurlset": [ { "__count": "#no"} ] }
```

protocol

Protocol

Protocol Configuration.

NAME	DESCRIPTION
protocolhttpband	Configuration for HTTP request/response band

protocolhttpband

Configuration for HTTP request/response band resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqbandsize	<Integer>	Read-write	Band size, in bytes, for HTTP request band statistics. For example, if you specify a band size of 100 bytes, statistics will be maintained and displayed for the following size ranges: 0 - 99 bytes 100 - 199 bytes 200 - 299 bytes and so on.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 100 Minimum value = 50
respbandsize	<Integer>	Read-write	Band size, in bytes, for HTTP response band statistics. For example, if you specify a band size of 100 bytes, statistics will be maintained and displayed for the following size ranges: 0 - 99 bytes 100 - 199 bytes 200 - 299 bytes and so on. Default value: 1024 Minimum value = 50
type	<String>	Read-write	Type of statistics to display. Possible values = REQUEST, RESPONSE, MQTT_JUMBO_REQ
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bandrange	<Integer>	Read-only	The range of the HTTP request/ response size, in bytes.
numberofbands	<Integer>	Read-only	The total number of http bands.
totalbandsize	<Integer[]>	Read-only	The total size of all HTTP requests/ responses in this size range.
avgbandsize	<Integer[]>	Read-only	The average size of all HTTP requests/ responses in this size range.
avgbandsizenew	<Double[]>	Read-only	The average size of all HTTP requests/ responses in this size range.
banddata	<Integer[]>	Read-only	The total size of all HTTP requests/ responses in this size range, expressed as a percentage of the total size of all HTTP requests/responses.
banddatanew	<Double[]>	Read-only	The total size of all HTTP requests/ responses in this size range, expressed as a percentage of the total size of all HTTP requests/responses.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
accesscount	<Integer[]>	Read-only	The number of HTTP requests/responses in this size range.
accessratio	<Integer[]>	Read-only	The number of HTTP requests/responses in this size range, expressed as a percentage of the total number of HTTP requests/responses.
accessrationew	<Double[]>	Read-only	The number of HTTP requests/responses in this size range, expressed as a percentage of the total number of HTTP requests/responses.
totals	<Integer[]>	Read-only	The total of totalBandSize, avgBandSize, BandData, accessCount, accessRatio respectively.
_nextgenapiresource	<String>	Read-only	.

Operations

quic

Quic

QUIC configuration.

NAME	DESCRIPTION
quicparam	Configuration for Citrix ADC QUIC parameters
quicprofile	Configuration for QUIC profile

quicparam

Configuration for Citrix ADC QUIC parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
quicsecrettimeout	<Integer>	Read-write	Rotation frequency, in seconds, for the secret used to generate address validation tokens that will be issued in QUIC Retry packets and QUIC NEW_TOKEN frames sent by the Citrix ADC. A value of 0 can be configured if secret rotation is not desired. Default value: 3600 Minimum value = 0 Maximum value = 31536000
_nextgenapiresource	<String>	Read-only	.

quicprofile

Configuration for QUIC profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the QUIC profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			colon (:), at (@),equals sign (=), and hyphen (-) characters. Cannot be changed after the profile is created. Minimum length = 1 Maximum length = 256
ackdelayexponent	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, indicating an exponent that the remote QUIC endpoint should use, to decode the ACK Delay field in QUIC ACK frames sent by the Citrix ADC. Default value: 3 Minimum value = 0 Maximum value = 20
activeconnectionidlimit	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the maximum number of QUIC connection IDs from the remote QUIC endpoint, that the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix ADC is willing to store. Default value: 3 Minimum value = 2 Maximum value = 8
activeconnectionmigration	<String>	Read-write	Specify whether the Citrix ADC should allow the remote QUIC endpoint to perform active QUIC connection migration. Default value: ENABLED Possible values = ENABLED, DISABLED
congestionctrlalgorithm	<String>	Read-write	Specify the congestion control algorithm to be used for QUIC connections. The default congestion control algorithm is CUBIC. Default value: Default Possible values = Default, NewReno, CUBIC, BBR
initialmaxdata	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			endpoint, specifying the initial value, in bytes, for the maximum amount of data that can be sent on a QUIC connection. Default value: 1048576 Minimum value = 8192 Maximum value = 67108864
initialmaxstreamdata bidilocal	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial flow control limit, in bytes, for bidirectional QUIC streams initiated by the Citrix ADC. Default value: 262144 Minimum value = 8192 Maximum value = 8388608
initialmaxstreamdata bidiremote	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial flow control

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			limit, in bytes, for bidirectional QUIC streams initiated by the remote QUIC endpoint. Default value: 262144 Minimum value = 8192 Maximum value = 8388608
initialmaxstreamdatauni	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial flow control limit, in bytes, for unidirectional streams initiated by the remote QUIC endpoint. Default value: 262144 Minimum value = 8192 Maximum value = 8388608
initialmaxstreamsbidi	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial maximum number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bidirectional streams the remote QUIC endpoint may initiate. Default value: 100 Minimum value = 1 Maximum value = 500
initialmaxstreamsuni	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the initial maximum number of unidirectional streams the remote QUIC endpoint may initiate. Default value: 10 Minimum value = 1 Maximum value = 500
maxackdelay	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the maximum amount of time, in milliseconds, by which the Citrix ADC will delay sending acknowledgments. Default value: 20

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 10 Maximum value = 2000
maxidletimeout	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the maximum idle timeout, in seconds, for a QUIC connection. A QUIC connection will be silently discarded by the Citrix ADC if it remains idle for longer than the minimum of the idle timeout values advertised by the Citrix ADC and the remote QUIC endpoint, and three times the current Probe Timeout (PTO). Default value: 180 Minimum value = 1 Maximum value = 3600
maxudpdatagramsperburst	<Integer>	Read-write	An integer value, specifying the maximum number of UDP datagrams that can be transmitted by the Citrix ADC in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a single transmission burst on a QUIC connection. Default value: 8 Minimum value = 1 Maximum value = 256
maxudppayloadsize	<Integer>	Read-write	An integer value advertised by the Citrix ADC to the remote QUIC endpoint, specifying the size of the largest UDP datagram payload, in bytes, that the Citrix ADC is willing to receive on a QUIC connection. Default value: 1472 Minimum value = 1252 Maximum value = 9188
newtokenvalidityperiod	<Integer>	Read-write	An integer value, specifying the validity period, in seconds, of address validation tokens issued through QUIC NEW_TOKEN frames sent by the Citrix ADC. Default value: 300

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 3600
retrytokenvalidityperiod	<Integer>	Read-write	An integer value, specifying the validity period, in seconds, of address validation tokens issued through QUIC Retry packets sent by the Citrix ADC. Default value: 10 Minimum value = 1 Maximum value = 120
statelessaddressvalidation	<String>	Read-write	Specify whether the Citrix ADC should perform stateless address validation for QUIC clients, by sending tokens in QUIC Retry packets during QUIC connection establishment, and by sending tokens in QUIC NEW_TOKEN frames after QUIC connection establishment. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
refcnt	<Integer>	Read-only	Number of entities using this profile.
builtin	<String[]>	Read-only	Flag to determine if the QUIC profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/quicprofile **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

rdp

Rdp

RDP configuration.

NAME	DESCRIPTION
rdpclientprofile	Configuration for RDP clientprofile
rdpconnections	Configuration for active rdp connections
rdpserverprofile	Configuration for RDP serverprofile

rdpclientprofile

Configuration for RDP clientprofile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the rdp profile. Minimum length = 1
rdpurloverride	<String>	Read-write	This setting determines whether the RDP parameters supplied in the vpn

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			url override those specified in the RDP profile. Default value: ENABLE Possible values = ENABLE, DISABLE
redirectclipboard	<String>	Read-write	This setting corresponds to the Clipboard check box on the Local Resources tab under Options in RDC. Default value: ENABLE Possible values = ENABLE, DISABLE
redirectdrives	<String>	Read-write	This setting corresponds to the selections for Drives under More on the Local Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
redirectprinters	<String>	Read-write	This setting corresponds to the selection in the Printers check box on the Local

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Resources tab under Options in RDC. Default value: ENABLE Possible values = ENABLE, DISABLE
redirectcomports	<String>	Read-write	This setting corresponds to the selections for comports under More on the Local Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
redirectpnpdevices	<String>	Read-write	This setting corresponds to the selections for pnpdevices under More on the Local Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
keyboardhook	<String>	Read-write	This setting corresponds to the selection in the Keyboard drop-down list on the Local

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Resources tab under Options in RDC. Default value: InFullScreenMode Possible values = OnLocal, OnRemote, InFullScreenMode
audiocapturemode	<String>	Read-write	This setting corresponds to the selections in the Remote audio area on the Local Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
videoplaybackmode	<String>	Read-write	This setting determines if Remote Desktop Connection (RDC) will use RDP efficient multimedia streaming for video playback. Default value: ENABLE Possible values = ENABLE, DISABLE
multimonitorsupport	<String>	Read-write	Enable/Disable Multiple Monitor Support for Remote

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Desktop Connection (RDC). Default value: ENABLE Possible values = ENABLE, DISABLE
rdpcookievalidity	<Integer>	Read-write	RDP cookie validity period. RDP cookie validity time is applicable for new connection and also for any re-connection that might happen, mostly due to network disruption or during fail-over. Default value: 60 Minimum value = 1 Maximum value = 86400
addusernameinrdpfile	<String>	Read-write	Add username in rdp file. Default value: NO Possible values = YES, NO
rdpfilename	<String>	Read-write	RDP file name to be sent to End User. Minimum length = 1
rdphost	<String>	Read-write	Fully-qualified domain name (FQDN) of the RDP Listener.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 252
rdplistener	<String>	Read-write	IP address (or) Fully-qualified domain name(FQDN) of the RDP Listener with the port in the format IP:Port (or) FQDN:Port. Maximum length = 255
rdpcustomparams	<String>	Read-write	Option for RDP custom parameters settings (if any). Custom params needs to be separated by ';'. Default value: 0 Minimum length = 1
psk	<String>	Read-write	Pre shared key value. Default value: 0
randomizerdpfilename	<String>	Read-write	Will generate unique filename everytime rdp file is downloaded by appending output of time() function in the format <rdpfileName>_<time>.rdp. This tries to avoid the pop-up for replacement of existing rdp file during each rdp connection launch,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hence providing better end-user experience. Default value: NO Possible values = YES, NO
rdplinkattribute	<String>	Read-write	Citrix Gateway allows the configuration of rdpLinkAttribute parameter which can be used to fetch a list of RDP servers(IP/FQDN) that a user can access, from an Authentication server attribute(Example: LDAP, SAML). Based on the list received, the RDP links will be generated and displayed to the user. Note: The Attribute mentioned in the rdpLinkAttribute should be fetched through corresponding authentication method.
rdpvalidateclientip	<String>	Read-write	This setting determines whether RDC launch is initiated by the valid client IP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLE Possible values = ENABLE, DISABLE
rdpurlmaxlencheck	<String>	Read-write	This setting determines whether the RDP URL max length check is enforced during RDP file generation. Default value: DISABLE Possible values = ENABLE, DISABLE
rdpurlmaxlen	<Integer>	Read-write	Indicates the permissible max length of the RDP URL. Set to 256 by default. Default value: 256 Minimum value = 32 Maximum value = 2048
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of rdpclientprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile? **view=summary**

Use this query-parameter to get the summary output of rdpclientprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the rdpclientprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Response Payload:

```
{ "rdpclientprofile": [ { "__count": "#no"} ] }
```

rdpconnections

Configuration for active rdp connections resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User name for which to display connections. Minimum length = 1
all	<Boolean>	Read-write	Terminate all active rdpconnections.
endpointip	<String>	Read-only	The client IP address.
endpointport	<Integer>	Read-only	The client port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
targetip	<String>	Read-only	The Server IP address.
targetport	<Integer>	Read-only	The server port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
peid	<Integer>	Read-only	Core id of the session owner.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- KILL

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

KILL

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **action=kill HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rdpconnections":{

"username":<String_value>,

"all":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **args=username: <String_value>**

Use this query-parameter to get rdpconnections resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of rdpconnections resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **view=summary**

Use this query-parameter to get the summary output of rdpconnections resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **pagesize=#no;pageno=#no**

Use this query-parameter to get the rdpconnections resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rdpconnections": [ {

username:<String_value>"endpointip":<String_value>,

"endpointport":<Integer_value>,

"targetip":<String_value>,

"targetport":<Integer_value>,

"peid":<Integer_value>,
```

```
"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rdpconnections": [ { "__count": "#no"} ] }
```

rdpserverprofile

Configuration for RDP serverprofile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the rdp server profile. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 32
rdpip	<String>	Read-write	IPv4 or IPv6 address of RDP listener. This terminates client RDP connections. Minimum length = 1
rdpport	<Integer>	Read-write	TCP port on which the RDP connection is established. Default value: 3389 Minimum value = 1 Maximum value = 65535
psk	<String>	Read-write	Pre shared key value.
rdpredirection	<String>	Read-write	Enable/Disable RDP redirection support. This needs to be enabled in presence of connection broker or session directory with IP cookie(msts cookie) based redirection support. Default value: DISABLE Possible values = ENABLE, DISABLE
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

responder

Responder

Responder configuration.

NAME	DESCRIPTION
responderaction	Configuration for responder action
responderglobal_binding	Binding object showing the resources that can be bound to responderglobal
responderglobal_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to responderglobal
responderhtmlpage	Configuration for Responder HTML page
responderparam	Configuration for responser parameter
responderpolicy	Configuration for responder policy
responderpolicy_binding	Binding object showing the resources that can be bound to responderpolicy
responderpolicy_crvserver_binding	Binding object showing the crvserver that can be bound to responderpolicy
responderpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to responderpolicy
responderpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to responderpolicy

NAME	DESCRIPTION
responderpolicy_responderglobal_binding	Binding object showing the responderglobal that can be bound to responderpolicy
responderpolicy_responderpolicylabel_binding	Binding object showing the responderpolicylabel that can be bound to responderpolicy
responderpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to responderpolicy
responderpolicylabel	Configuration for responder policy label
responderpolicylabel_binding	Binding object showing the resources that can be bound to responderpolicylabel
responderpolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to responderpolicylabel
responderpolicylabel_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to responderpolicylabel

responderaction

Configuration for responder action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the responder action. Must begin with a letter, number, or the underscore character

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the responder policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder action" or 'my responder action').
type	<String>	Read-write	Type of responder action. Available settings function as follows: * respondwith <target> - Respond to the request with the expression specified as the target.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* respondwithhtmlpage - Respond to the request with the uploaded HTML page object specified as the target. * redirect - Redirect the request to the URL specified as the target. * sqlresponse_ok - Send an SQL OK response. * sqlresponse_error - Send an SQL ERROR response. Possible values = noop, respondwith, redirect, respondwithhtmlpage, sqlresponse_ok, sqlresponse_error
target	<String>	Read-write	Expression specifying what to respond with. Typically a URL for redirect policies or a default-syntax expression. In addition to Citrix ADC default-syntax expressions that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			refer to information in the request, a stringbuilder expression can contain text and HTML, and simple escape codes that define new lines and paragraphs. Enclose each stringbuilder expression element (either a Citrix ADC default-syntax expression or a string) in double quotation marks. Use the plus (+) character to join the elements. Examples: 1) Respondwith expression that sends an HTTP 1.1 200 OK response: "HTTP/1.1 200 OK\r\n\r\n" 2) Redirect expression that redirects user to the specified web host and appends the request URL to the redirect.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"http://backupsite2.com" + HTTP.REQ.URL 3) Respondwith expression that sends an HTTP 1.1 404 Not Found response with the request URL included in the response: "HTTP/1.1 404 Not Found\r\n\r\n"+ "HTTP.REQ.URL.HTTP_URL_SAFE" + "does not exist on the web server." The following requirement applies only to the Citrix ADC CLI: Enclose the entire expression in single quotation marks. (Citrix ADC expression elements should be included inside the single quotation marks for the entire expression, but do not need to be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclosed in double quotation marks.).
htmlpage	<String>	Read-write	For respondwithhtmlpage policies, name of the HTML page object to use as the response. You must first import the page object. Minimum length = 1
bypasssafetycheck	<String>	Read-write	Bypass the safety check, allowing potentially unsafe expressions. An unsafe expression in a response is one that contains references to request elements that might not be present in all requests. If a response refers to a missing request element, an empty string is used instead. Default value: NO Possible values = YES, NO
comment	<String>	Read-write	Comment. Any type of information about this responder action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
responsestatuscode	<Integer>	Read-write	HTTP response status code, for example 200, 302, 404, etc. The default value for the redirect action type is 302 and for respondwithhtmlpage is 200. Minimum value = 100 Maximum value = 599
reasonphrase	<String>	Read-write	Expression specifying the reason phrase of the HTTP response. The reason phrase may be a string literal with quotes or a PI expression. For example: "Invalid URL: " + HTTP.REQ.URL. Minimum length = 1
headers	<String[]>	Read-write	One or more headers to insert into the HTTP response. Each header is specified as "name(expr)", where expr is an expression that is evaluated at runtime to provide the value for the named header. You can configure a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			maximum of eight headers for a responder action.
newname	<String>	Read-write	New name for the responder action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder action" or my responder action'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hits	<Integer>	Read-only	The number of times the action has been taken.
referencecount	<Integer>	Read-only	The number of references to the action.
undefhits	<Integer>	Read-only	The number of times the action resulted in UNDEF.
builtin	<String[]>	Read-only	Flag to determine whether responder action is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

- GET (ALL)

- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderaction **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderaction":{

<b>"name":<String_value>,

</b><b>"type":<String_value>,

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderparam? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderparam":{

"undefaction":true,

"timeout":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderparam **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderparam": [ {

"undefaction":<String_value>,

"timeout":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

responderpolicy

Configuration for responder policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the responder policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the responder policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my responder policy" or 'my responder policy').
rule	<String>	Read-write	Expression that the policy uses to determine whether to respond to the specified request.
action	<String>	Read-write	Name of the responder action to perform if the request matches this responder policy. There are also some built-in actions which can be used. These are: * NOOP - Send the request to the protected server instead of responding to it. * RESET - Reset the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DROP - Drop the request without sending a response to the user.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any type of information about this responder policy.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
appflowaction	<String>	Read-write	AppFlow action to invoke for requests that match this policy.
newname	<String>	Read-write	New name for the responder policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder policy" or 'my responder policy'). Minimum length = 1
hits	<Integer>	Read-only	Number of hits.
undefhits	<Integer>	Read-only	Number of policy UNDEF hits.
builtin	<String[]>	Read-only	Flag to determine if responder policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>,

</b>"undefaction":<String_value>,

"comment":<String_value>,

"logaction":<String_value>,

"appflowaction":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>,

"undefaction":<String_value>,

"comment":<String_value>,

"logaction":<String_value>,

"appflowaction":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderpolicy":{

<b>"name":<String_value>,

</b>"undefaction":true,

"comment":true,

"logaction":true,

"appflowaction":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderpolicy":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of responderpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy? **view=summary**

Use this query-parameter to get the summary output of responderpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the responderpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"undefaction":<String_value>,

"hits":<Integer_value>,

"undefhits":<Integer_value>,

"comment":<String_value>,

"logaction":<String_value>,

"appflowaction":<String_value>,

"builtin":<String[]_value>,

"feature":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of responderpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "responderpolicy": [ {

"name":<String_value>,

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicy": [ { "__count": "#no"} ] }
```

responderpolicy_binding

Binding object which returns the resources bound to responderpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the responder policy for which to display settings.
responderpolicy_responderglobal_binding	<responderpolicy_responderglobal_binding[]>	Read-only	responderglobal that can be bound to responderpolicy.
responderpolicy_lbvserver_binding	<responderpolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to responderpolicy.
responderpolicy_responderpolicylabel_binding	<responderpolicy_responderpolicylabel_binding[]>	Read-only	responderpolicylabel that can be bound to responderpolicy.
responderpolicy_crvserver_binding	<responderpolicy_crvserver_binding[]>	Read-only	crvserver that can be bound to responderpolicy.
responderpolicy_vpnvserver_binding	<responderpolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to responderpolicy.
responderpolicy_csvserver_binding	<responderpolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to responderpolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicy_binding": [ {

"name":<String_value>,

"responderpolicy_responderpolicylabel_binding":<responderpolicy_responderp
olicylabel_binding[]_value>,

"responderpolicy_crvserver_binding":<responderpolicy_crvserver_binding[]_v
alue>,

"responderpolicy_lbvserver_binding":<responderpolicy_lbvserver_binding[]_v
alue>,

"responderpolicy_responderglobal_binding":<responderpolicy_responderglobal
_binding[]_value>,

"responderpolicy_csvserver_binding":<responderpolicy_csvserver_binding[]_v
alue>,

"responderpolicy_vpnvserver_binding":<responderpolicy_vpnvserver_binding[]
_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicy_binding": [ {

"name":<String_value>,

Response Payload:

```
{"responderpolicy_lbvserver_binding": [ { "__count": "#no"} ] }
```

responderpolicy_responderglobal_binding

Binding object showing the responderglobal that can be bound to responderpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the responder policy for which to display settings.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
priority	<Integer>	Read-only	Specifies the priority of the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_responderglobal_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ responderpolicy_responderglobal_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of responderpolicy_responderglobal_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ responderpolicy_responderglobal_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the responderpolicy_responderglobal_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "responderpolicy_responderglobal_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_responderglobal_binding
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_responderglobal_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

responderpolicylabel

Configuration for responder policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the responder policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the responder policy label is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder policy label" or my responder policy label').
policylabeltype	<String>	Read-write	Type of responses sent by the policies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bound to this policy label. Types are: * HTTP - HTTP responses. * OTHERTCP - NON-HTTP TCP responses. * SIP_UDP - SIP responses. * RADIUS - RADIUS responses. * MYSQL - SQL responses in MySQL format. * MSSQL - SQL responses in Microsoft SQL format. * NAT - NAT response. * MQTT - Trigger policies bind with MQTT type. * MQTT_JUMBO - Trigger policies bind with MQTT Jumbo type. Default value: HTTP Possible values = HTTP, OTHERTCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SIP_UDP, SIP_TCP, MYSQL, MSSQL, NAT, DIAMETER, RADIUS, DNS, MQTT, MQTT_JUMBO, QUIC_BRIDGE, HTTP_QUIC, UDP
comment	<String>	Read-write	Any comments to preserve information about this responder policy label.
newname	<String>	Read-write	New name for the responder policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1
numpol	<Integer>	Read-only	number of polices bound to label.
hits	<Integer>	Read-only	Number of times policy label was invoked.
priority	<Integer>	Read-only	Specifies the priority of the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label to invoke. Available settings function as follows: * vserver - Invoke an unnamed policy label associated with a virtual server. * policylabel - Invoke a user-defined policy label. Possible values = vserver, policylabel
invoke_labelname	<String>	Read-only	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicylabel": [ { "__count": "#no"} ] }
```

responderpolicylabel_binding

Binding object which returns the resources bound to responderpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the responder policy label.
responderpolicylabel_policybinding_binding	<responderpolicylabel_policybinding_binding[]>	Read-only	policybinding that can be bound to responderpolicylabel.
responderpolicylabel_responderpolicy_binding	<responderpolicylabel_responderpolicy_binding[]>	Read-only	responderpolicy that can be bound to responderpolicylabel.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicylabel_binding/ labelname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicylabel_binding": [ {

"labelname":<String_value>,

"responderpolicylabel_policybinding_binding":<responderpolicylabel_policybinding_binding[]_value>,

"responderpolicylabel_responderpolicy_binding":<responderpolicylabel_responderpolicy_binding[]_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicylabel_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/responderpolicylabel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicylabel_binding": [ {

"labelname":<String_value>,

"responderpolicylabel_policybinding_binding":<responderpolicylabel_policyb
```

```
inding_binding[]_value>,

"responderpolicylabel_responderpolicy_binding":<responderpolicylabel_respo
nderpolicy_binding[]_value>

}]}
```

responderpolicylabel_policybinding_binding

Binding object showing the policybinding that can be bound to responderpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke_labelname	<String>	Read-write	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server.
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label and evaluate the specified policy label.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the responder policy.
priority	<Integer>	Read-write	Specifies the priority of the policy.
labeltype	<String>	Read-write	Type of policy label to invoke. Available settings function as follows: * vserver - Invoke an unnamed policy label associated with a virtual server. * policylabel - Invoke a user-defined policy label. Possible values = vserver, policylabel
labelname	<String>	Read-write	Name of the responder policy label to which to bind the policy.
__count	<Double>	Read-write	count parameter

Operations

```

rewrite

Rewrite

Rewrite configuration.

NAME	DESCRIPTION
rewriteaction	Configuration for rewrite action
rewriteglobal_binding	Binding object showing the resources that can be bound to rewriteglobal
rewriteglobal_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to rewriteglobal
rewriteparam	Configuration for rewrite parameter
rewritepolicy	Configuration for rewrite policy
rewritepolicy_binding	Binding object showing the resources that can be bound to rewritepolicy
rewritepolicy_csvserver_binding	Binding object showing the csvserver that can be bound to rewritepolicy
rewritepolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to rewritepolicy
rewritepolicy_rewriteglobal_binding	Binding object showing the rewriteglobal that can be bound to rewritepolicy
rewritepolicy_rewritepolicylabel_binding	Binding object showing the rewritepolicylabel that can be bound to rewritepolicy
rewritepolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to rewritepolicy
rewritepolicylabel	Configuration for rewrite policy label

NAME	DESCRIPTION
rewritepolicylabel_binding	Binding object showing the resources that can be bound to rewritepolicylabel
rewritepolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to rewritepolicylabel
rewritepolicylabel_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to rewritepolicylabel

rewriteaction

Configuration for rewrite action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the user-defined rewrite action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite action" or 'my rewrite action').
type	<String>	Read-write	Type of user-defined rewrite action. The information that you provide for, and the effect of, each type are as follows:: * REPLACE <target> <string_builder_expr>. Replaces the string with the string-builder expression. * REPLACE_ALL <target> <string_builder_expr> -search <search_expr>. In the request or response specified by <target>, replaces all

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			occurrences of the string defined by <string_builder_expr> with the string defined by <search_expr>. * REPLACE_HTTP_RES <string_builder_expr>. Replaces the complete HTTP response with the string defined by the string-builder expression. * REPLACE_SIP_RES <target> - Replaces the complete SIP response with the string specified by <target>. * INSERT_HTTP_HEADER <header_string_builder_expr> <contents_string_builder_expr>. Inserts the HTTP header specified by <header_string_buil

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			der_expr> and header contents specified by <contents_string_builder_expr>. * DELETE_HTTP_HEADER <target>. Deletes the HTTP header specified by <target>. * CORRUPT_HTTP_HEADER <target>. Replaces the header name of all occurrences of the HTTP header specified by <target> with a corrupted name, so that it will not be recognized by the receiver Example: MY_HEADER is changed to MHEY_ADER. * INSERT_BEFORE <target_expr> <string_builder_expr>. Finds the string specified in <target_expr> and inserts the string in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<string_builder_expr> before it. * INSERT_BEFORE_ALL <target> <string_builder_expr> -search <search_expr>. In the request or response specified by <target>, locates all occurrences of the string specified in <string_builder_expr> and inserts the string specified in <search_expr> before each. * INSERT_AFTER <target_expr> <string_builder_expr>. Finds the string specified in <target_expr>, and inserts the string specified in <string_builder_expr> after it. * INSERT_AFTER_ALL <target> <string_builder_expr> -search

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<search_expr>. In the request or response specified by <target>, locates all occurrences of the string specified by <string_builder_expr> and inserts the string specified by <search_expr> after each. * DELETE <target>. Finds and deletes the specified target. * DELETE_ALL <target> -search <string_builder_expr>. In the request or response specified by <target>, locates and deletes all occurrences of the string specified by <string_builder_expr>. * REPLACE_DIAMETER_HEADER_FIELD <target> <field value>. In the request or response modify the header field specified by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<target>. Use Diameter.req.flags. SET(<flag>) or Diameter.req.flags. UNSET<flag> as 'stringbuilderexpression' to set or unset flags. * REPLACE_DNS_HEADER_FIELD <target>. In the request or response modify the header field specified by <target>. * REPLACE_DNS_ANSWER_SECTION <target>. Replace the DNS answer section in the response. This is currently applicable for A and AAAA records only. Use DNS.NEW_RRSET_A ; DNS.NEW_RRSET_AAAA expressions to configure the new answer section.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* REPLACE_MQTT <target> <string_builder_expr> : Replace MQTT message fields specified in <target_expr> to the value specified in <string_builder_expr> * INSERT_MQTT <string_builder_expr> : Insert the string_builder_expr to an appropriate packet field in the MQTT message. * INSERT_AFTER_MQTT <target_expr> <string_builder_expr> : Insert a topic specified in <string_builder_expr> in the MQTT Subscribe or Unsubscribe message after the specified target_expr. * INSERT_BEFORE_MQTT <target_expr>

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<string_builder_expr> : Insert a topic specified in <string_builder_expr> in the MQTT Subscribe or Unsubscribe message before the specified target_expr. * DELETE_MQTT <target> : Deletes the specified target in the MQTT message. Possible values = noop, delete, insert_http_header, delete_http_header, corrupt_http_header, insert_before, insert_after, replace, replace_http_res, delete_all, replace_all, insert_before_all, insert_after_all, clientless_vpn_encode, clientless_vpn_encode_all, clientless_vpn_decode, clientless_vpn_deco

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			de_all, insert_sip_header, delete_sip_header, corrupt_sip_header, replace_sip_res, replace_diameter_header_field, replace_dns_header_field, replace_dns_answer_section, replace_mqtt, delete_mqtt, insert_mqtt, insert_before_mqtt, insert_after_mqtt
target	<String>	Read-write	Expression that specifies which part of the request or response to rewrite. Minimum length = 1
stringbuilderexpr	<String>	Read-write	Expression that specifies the content to insert into the request or response at the specified location, or that replaces the specified string.
search	<String>	Read-write	Search facility that is used to match multiple strings in the request or response. Used in the INSERT_BEFORE_ALL,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			INSERT_AFTER_ALL, REPLACE_ALL, and DELETE_ALL action types. The following search types are supported: * Text ("text(string)") - A literal string. Example: -search text("hello") * Regular expression ("regex(re<delimiter>regular exp<delimiter>)") - Pattern that is used to match multiple strings in the request or response. The pattern may be a PCRE-format regular expression with a delimiter that consists of any printable ASCII non-alphanumeric character except for the underscore (_) and space ( ) that is not otherwise used in the expression. Example: -search regex(re~\^hello*~) The preceding regular expression

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			can use the tilde (~) as the delimiter because that character does not appear in the regular expression itself. * XPath ("xpath(xp<delimiter>xpath expression<delimiter>)") - An XPath expression to search XML. The delimiter has the same rules as for regex. Example: -search xpath(xp%/a/b%) * JSON ("xpath_json(xp<delimiter>xpath expression<delimiter>)") - An XPath expression to search JSON. The delimiter has the same rules as for regex. Example: -search xpath_json(xp%/a/b%)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NOTE: JSON searches use the same syntax as XPath searches, but operate on JSON files instead of standard XML files. * HTML ("xpath_html(xp<delimiter>xpath expression<delimiter>)") - An XPath expression to search HTML. The delimiter has the same rules as for regex. Example: -search xpath_html(xp%/html/body%) NOTE: HTML searches use the same syntax as XPath searches, but operate on HTML files instead of standard XML files; HTML 5 rules for the file syntax are used; HTML 4 and later are supported. * Patset ("patset(patset)") - A predefined pattern

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			set. Example: -search patset("patset1"). * Datset ("dataset(dataset)") - A predefined dataset. Example: -search dataset("dataset1"). * AVP ("avp(avp number)") - AVP number that is used to match multiple AVPs in a Diameter/ Radius Message. Example: -search avp(999) Note: for all these the TARGET prefix can be used in the replacement expression to specify the text that was selected by the -search parameter, optionally adjusted by the -refineSearch parameter. Example: TARGET.BEFORE_STR(",").

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
refinesearch	<String>	Read-write	Specify additional criteria to refine the results of the search. Always starts with the "extend(m,n)" operation, where 'm' specifies number of bytes to the left of selected data and 'n' specifies number of bytes to the right of selected data to extend the selected area. You can use refineSearch only on body expressions, and for the INSERT_BEFORE_ALL, INSERT_AFTER_ALL, REPLACE_ALL, and DELETE_ALL action types. Example: -refineSearch 'EXTEND(10, 20).REGEX_SELECT(re~0x[0-9a-zA-Z]+~).
comment	<String>	Read-write	Comment. Can be used to preserve

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			information about this rewrite action.
newname	<String>	Read-write	New name for the rewrite action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite action" or 'my rewrite action'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hits	<Integer>	Read-only	The number of times the action has been taken.
undefhits	<Integer>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Integer>	Read-only	The number of references to the action.
description	<String>	Read-only	Description of the action.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default rewriteaction.
builtin	<String[]>	Read-only	Flag to determine whether rewrite action is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewriteaction":{

<b>"name":<String_value>,

</b><b>"type":<String_value>,

</b><b>"target":<String_value>,

</b>"stringbuilderexpr":<String_value>,

"search":<String_value>,

"refinesearch":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewriteaction":{

<b>"name":<String_value>,

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewriteaction": [ { "__count": "#no"} ] }
```

rewriteglobal_binding

Binding object which returns the resources bound to rewriteglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rewriteglobal_rewrite policy_binding	<rewriteglobal_rewrit epolicy_binding[]>	Read-write	rewritepolicy that can be bound to rewriteglobal.

Operations

(click to see Properties)

- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewriteglobal_binding": [ {

"rewriteglobal_rewritepolicy_binding":<rewriteglobal_rewritepolicy_binding
[]_value>

}]}
```

rewriteglobal_rewritepolicy_binding

Binding object showing the rewritepolicy that can be bound to rewriteglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server to which to forward the request of response.
priority	<Integer>	Read-write	Specifies the priority of the policy.
labeltype	<String>	Read-write	Type of invocation. Available settings function as follows: * reqvserver - Forward the request to the specified request virtual server. * resvserver - Forward the response to the specified response virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, resvserver, policylabel
policyname	<String>	Read-write	Name of the rewrite policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL, APPFW_GLOBAL, TM_GLOBAL
invoke	<Boolean>	Read-write	Terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
type	<String>	Read-write	The bindpoint to which to policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT, OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, OTHERTCP_RES_OVERRIDE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OTHERTCP_RES_DEFAULT, SIPUDP_REQ_OVERRIDE, SIPUDP_REQ_DEFAULT, SIPUDP_RES_OVERRIDE, SIPUDP_RES_DEFAULT, SIPTCP_REQ_OVERRIDE, SIPTCP_REQ_DEFAULT, SIPTCP_RES_OVERRIDE, SIPTCP_RES_DEFAULT, DIAMETER_REQ_OVERRIDE, DIAMETER_REQ_DEFAULT, DIAMETER_RES_OVERRIDE, DIAMETER_RES_DEFAULT, RADIUS_REQ_OVERRIDE, RADIUS_REQ_DEFAULT, RADIUS_RES_OVERRIDE, RADIUS_RES_DEFAULT, DNS_REQ_OVERRIDE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DNS_REQ_DEFAULT, DNS_RES_OVERRIDE, DNS_RES_DEFAULT, HTTPQUIC_REQ_OVERRIDE, HTTPQUIC_REQ_DEFAULT, HTTPQUIC_RES_OVERRIDE, HTTPQUIC_RES_DEFAULT, MQTT_REQ_OVERRIDE, MQTT_REQ_DEFAULT, MQTT_RES_OVERRIDE, MQTT_RES_DEFAULT
numpol	<Integer>	Read-only	The number of policies bound to the bindpoint.
flowtype	<Integer>	Read-only	flowtype of the bound rewrite policy.
__count	<Double>	Read-only	count parameter

rewriteparam

Configuration for rewrite parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an error condition in evaluating the expression. Available settings function as follows: * NOREWRITE - Do not modify the message. * RESET - Reset the connection and notify the user's browser, so that the user can resend the request. * DROP - Drop the message without sending a response to the user. Default value: "NOREWRITE"
timeout	<Integer>	Read-write	Maximum time in milliseconds to allow

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for processing all the policies and their selected actions without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed. Note that some rewrites may have already been performed. Default value: 3900 Minimum value = 1 Maximum value = 5000
_nextgenapiresource	<String>	Read-only	.

rewritepolicy

Configuration for rewrite policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the rewrite policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite policy" or 'my rewrite policy').
rule	<String>	Read-write	Expression against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Name of the rewrite action to perform if the request or response matches this rewrite policy. There are also some built-in actions which can be used. These are: * NOREWRITE - Send the request from the client to the server or response from the server to the client without making any changes in the message. * RESET - Resets the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the request if desired. * DROP - Drop the request without sending a response to the user.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any comments to preserve information about this rewrite policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the rewrite policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite policy" or 'my rewrite policy'). Minimum length = 1
hits	<Integer>	Read-only	Number of hits.
undefhits	<Integer>	Read-only	Number of Undef hits.
description	<String>	Read-only	Description of the policy.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default rewritepolicy.
builtin	<String[]>	Read-only	Flag to determine if rewrite policy is built-in or not. Possible values = MODIFIABLE, DELETABLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of rewritepolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewritepolicy": [ {

"name":<String_value>,
```

```
"rule":<String_value>,

"action":<String_value>,

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewritepolicy": [ { "__count": "#no"} ] }
```

rewritepolicy_binding

Binding object which returns the resources bound to rewritepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the rewrite policy.
rewritepolicy_lbvserver_binding	<rewritepolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to rewritepolicy.
rewritepolicy_rewritepolicylabel_binding	<rewritepolicy_rewritepolicylabel_binding[]>	Read-only	rewritepolicylabel that can be bound to rewritepolicy.
rewritepolicy_rewriteglobal_binding	<rewritepolicy_rewriteglobal_binding[]>	Read-only	rewriteglobal that can be bound to rewritepolicy.
rewritepolicy_csvserver_binding	<rewritepolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to rewritepolicy.
rewritepolicy_vpnvserver_binding	<rewritepolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to rewritepolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewritepolicy_binding": [ {

"name":<String_value>,

"rewritepolicy_rewritepolicylabel_binding":<rewritepolicy_rewritepolicylab
el_binding[]_value>,

"rewritepolicy_csvserver_binding":<rewritepolicy_csvserver_binding[]_value
>,

"rewritepolicy_lbvserver_binding":<rewritepolicy_lbvserver_binding[]_value
>,

"rewritepolicy_rewriteglobal_binding":<rewritepolicy_rewriteglobal_binding
[]_value>,

"rewritepolicy_vpnvserver_binding":<rewritepolicy_vpnvserver_binding[]_val
ue>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewritepolicy_binding": [ {

"name":<String_value>,

"rewritepolicy_rewritepolicylabel_binding":<rewritepolicy_rewritepolicylab
el_binding[]_value>,

"rewritepolicy_csvserver_binding":<rewritepolicy_csvserver_binding[]_value
>,

"rewritepolicy_lbvserver_binding":<rewritepolicy_lbvserver_binding[]_value
>,

"rewritepolicy_rewriteglobal_binding":<rewritepolicy_rewriteglobal_binding
[]_value>,

"rewritepolicy_vpnvserver_binding":<rewritepolicy_vpnvserver_binding[]_val
ue>

}]}
```

rewritepolicy_csvserver_binding

Binding object showing the csvserver that can be bound to rewritepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the rewrite policy.
boundto	<String>	Read-write	Location where policy is bound.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
priority	<Integer>	Read-only	Specifies the priority of the policy.
__count	<Double>	Read-only	count parameter

- GET (ALL)

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_vpnvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ rewritepolicy_vpnvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of rewritepolicy_vpnvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_vpnvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the rewritepolicy_vpnvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewritepolicy_vpnvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"activepolicy":<Integer_value>,

"labeltype":<String_value>,

"priority":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_vpnvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_vpnvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewritepolicy_vpnvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"activepolicy":<Integer_value>,

"labeltype":<String_value>,

"priority":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_vpnvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"rewritepolicy_vpnvserver_binding": [ { "__count": "#no"} ] }
```

rewritepolicylabel

Configuration for rewrite policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the rewrite policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the rewrite policy label is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite policy label" or 'my rewrite policy label').
transform	<String>	Read-write	Types of transformations allowed by the policies bound to the label. For Rewrite, the following types are supported: * http_req - HTTP requests * http_res - HTTP responses * othertcp_req - Non-HTTP TCP requests

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* othertcp_res - Non-HTTP TCP responses * url - URLs * text - Text strings * clientless_vpn_req - Citrix ADC clientless VPN requests * clientless_vpn_res - Citrix ADC clientless VPN responses * sipudp_req - SIP requests * sipudp_res - SIP responses * diameter_req - DIAMETER requests * diameter_res - DIAMETER responses * radius_req - RADIUS requests * radius_res - RADIUS responses

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* dns_req - DNS requests * dns_res - DNS responses * mqtt_req - MQTT requests * mqtt_res - MQTT responses. Possible values = http_req, http_res, othertcp_req, othertcp_res, url, text, clientless_vpn_req, clientless_vpn_res, sipudp_req, sipudp_res, siptcp_req, siptcp_res, diameter_req, diameter_res, radius_req, radius_res, dns_req, dns_res, httpquic_req, httpquic_res, mqtt_req, mqtt_res
comment	<String>	Read-write	Any comments to preserve information about this rewrite policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the rewrite policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy label" or 'my policy label'). Minimum length = 1
numpol	<Integer>	Read-only	Number of polices bound to label.
hits	<Integer>	Read-only	Number of times policy label was invoked.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of invocation. Available settings function as follows: * reqvserver - Forward the request to the specified request virtual server. * resvserver - Forward the response to the specified response virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, resvserver, policylabel
invoke_labelname	<String>	Read-only	* If labelType is policylabel, name of the policy label to invoke.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If labelType is reqvserver or resvserver, name of the virtual server to which to forward the request or response.
flowtype	<Integer>	Read-only	Flowtype of the bound rewrite policy.
description	<String>	Read-only	Description of the policylabel.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default rewritepolicylabel.
builtin	<String[]>	Read-only	Flag to determine if rewrite policy label is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewritepolicylabel":{

<b>"labelname":<String_value>,

</b><b>"transform":<String_value>,

</b>"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel/ labelname_value<String>
HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewritepolicylabel":{

<b>"labelname":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of rewritepolicylabel resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel? **view=summary**

Use this query-parameter to get the summary output of rewritepolicylabel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel? **pagesize=#no;pageno=#no**

Use this query-parameter to get the rewritepolicylabel resources in chunks.

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel_rewritepolicy_binding/ labelname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/

rewritepolicylabel_rewritepolicy_binding/ labelname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of rewritepolicylabel_rewritepolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel_rewritepolicy_binding/ labelname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the rewritepolicylabel_rewritepolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewritepolicylabel_rewritepolicy_binding": [ {

"invoke_labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"policyname":<String_value>,

"labelname":<String_value>,

"labeltype":<String_value>,
```

```
"priority":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel_rewritepolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel_rewritepolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewritepolicylabel_rewritepolicy_binding": [ {

"invoke_labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"policyname":<String_value>,
```

```
"labelname":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel_rewritepolicy_binding/ labelname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"rewritepolicylabel_rewritepolicy_binding": [ { "__count": "#no"} ] }
```

router

Router

Router configuration.

NAME	DESCRIPTION
accessList	Configuration for accessList resource
bfdInterface	Configuration for bfdInterface resource
bgpPrefix	Configuration for bgpPrefix resource
bgpRouter	Configuration for bgpRouter resource
ipRoute	Configuration for ipRoute resource
ospfDatabase	Configuration for ospfDatabase resource
ospfInterface	Configuration for ospfInterface resource
ospfNeighbor	Configuration for ospfNeighbor resource
ospfRouter	Configuration for ospfRouter resource
ospf6Database	Configuration for ospf6Database resource
ospf6Interface	Configuration for ospf6Interface resource
ospf6Neighbor	Configuration for ospf6Neighbor resource
ospf6Router	Configuration for ospf6Router resource
routeMap	Configuration for routeMap resource
routerdynamicrouting	Configuration for dynamic routing config

accessList

Configuration for accessList resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	Standard access list number in the range <0-99> or a ZebOS access-list name.
remark	<String>	Read-write	Access list entry comment.
action	<String>	Read-write	Allow or deny if traffic matches the rule. Possible values: deny, permit
address	<String>	Read-write	Address to match.
wildcard	<String>	Read-write	Wildcard bits.

Operations

(click to see Properties)

- ADD
- SET
- UNSET
- DELETE
- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/accessList **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"routerDynamicRouting" : {

"accessList" : {

"id" : <String>,

"remark" : <String>,

"rules" : {
```

```
"action" : <String>,

"address" : <String>,

"wildcard" : <String>

}

}

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

SET

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/accessList **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"routerDynamicRouting" : {

"accessList" : {

"id" : <String>,

"remark" : <String>,

"rules" : {

"action" : <String>,
```

```
"address" : <String>,

"wildcard" : <String>

}

}

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/accessList **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"routerDynamicRouting" : {

"accessList" : {

"id" : <String>,

"remark" : true,

"rules" : {

"action" : <String>,

"address" : <String>,
```

```
"wildcard" : <String>

}

}

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/accessList?args=id:<String> **HTTP Method:** DELETE

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/accessList **URL:** http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/accessList?args=id:<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/accessList **?args=id:<String>**

Use this query-parameter to get accessList resources based on additional properties.

HTTP Method: GET

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Payload:

```
{ "routerDynamicRouting": {

"accessList" : [{
```

```
"id" : <String>,

"remark" : <String>,

"rules" : [{

"action" : <String>,

"address" : <String>,

"wildcard" : <String>

}]

}]

}}
```

bfdInterface

Configuration for bfdInterface resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
interval	<Integer>	Read-write	Transmit interval for bfd packets Minimum value: 100 Maximum value: 30000
minrx	<Integer>	Read-write	Minimim receive interval for bfd packets Minimum value: 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value: 30000
multiplier	<Integer>	Read-write	Multiplier for bfd packets Minimum value: 1 Maximum value: 20
name	<String>	Read-write	Name of the interface
passive	<Boolean>	Read-write	Make bfd session passive

Operations

(click to see Properties)

Request Payload:

```
{"routerDynamicRouting" : {

"bfdInterface" : {

<b>"name" : <String></b>,

"passive" : true

}

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/bfdInterface **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/bfdInterface

Use this query-parameter to get bfdInterface resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Request Payload:

```
{"routerDynamicRouting" : {
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Payload:

```
{ "routerDynamicRouting": {

"bfdInterface" : [{

"interval" : <Integer>,

"minrx" : <Integer>,

"multiplier" : <Integer>,

"name" : <String>,

"passive" : <Boolean>

}]

}}
```

bgpPrefix

Configuration for bgpPrefix resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ASPath	<String>	Read-write	The set of ASes that must be traversed to reach the network
addressFamily	<String>	Read-write	The address family of the route. Possible values: ipv4, ipv6
attrOrigin	<String>	Read-write	The ultimate origin of the path information. Possible values: IGP, EGP, incomplete
best	<Boolean>	Read-write	Indicates if this is the best route for the prefix.
lastUpdate	<String>	Read-write	Time of last update for the prefix
localPref	<Integer>	Read-write	The originating BGP4 speaker's degree of preference for an advertised route
multiExitDisc	<Integer>	Read-write	This metric is used to discriminate between multiple exit points to an adjacent autonomous system.
nextHop	<String>	Read-write	IP gateway address
peerAddress	<String>	Read-write	The address of the peer router from which the route was learnt.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
prefix	<String>	Read-write	IP destination prefix.
prefixLen	<Integer>	Read-write	IP destination prefix length.

Operations

"prefixLen" : <Integer>
```

```
}]

}}
```

bgpRouter

Configuration for bgpRouter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
addressFamily	<String>	Read-write	Address family of the routes. Possible values: ipv4, ipv6
protocol	<String>	Read-write	The protocol from which routes need to be redistributed. Possible values: kernel, connected, static, rip, ospf, isis, intranet
routeMap	<String>	Read-write	Route map reference
localAS	<Integer>	Read-write	Autonomous system number. Minimum value: 1 Maximum value: 4294967295
ASOriginationInterval	<Integer>	Read-write	Minimum interval between sending AS-origination routing updates.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value: 1 Maximum value: 65535
address	<String>	Read-write	The ipv4 or ipv6 address of the neighboring router.
advertisementInterval	<Integer>	Read-write	Minimum interval between sending BGP routing updates. Minimum value: 0 Maximum value: 65535
activate	<Boolean>	Read-write	Enable the Address Family for the neighbor.
addressFamily	<String>	Read-write	Address family identifier Possible values: ipv4, ipv6
direction	<String>	Read-write	Apply the route-map to incoming routes or outgoing routes. Possible values: in, out
name	<String>	Read-write	Name of the route-map.
connectTimer	<Integer>	Read-write	Time interval (in seconds) for the ConnectRetry timer. Minimum value: 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value: 65535
holdTimer	<Integer>	Read-write	Holdtime for the neighbor.
holdTimerConfig	<Integer>	Read-write	Configured hold time for the neighbor. Minimum value: 0 Maximum value: 65535
keepaliveTimer	<Integer>	Read-write	Keepalive time for the neighbor.
keepaliveTimerConfig	<Integer>	Read-write	Configured keepalive time for the neighbor. Minimum value: 0 Maximum value: 65535
localAddress	<String>	Read-write	The local IP address of this entry's BGP connection.
localPort	<Integer>	Read-write	The local port of the TCP connection between the BGP peers.
md5Password	<String>	Read-write	MD5 password for the neighbor.
multihopBfd	<Boolean>	Read-write	Enable BFD for multihop session
remoteAS	<Integer>	Read-write	AS number of the neighbor.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value: 1 Maximum value: 4294967295
remotePort	<Integer>	Read-write	The remote port of the TCP connection between the BGP peers.
singlehopBfd	<Boolean>	Read-write	Enable BFD on this neighbor
state	<String>	Read-write	The neighbor connection state.
tcpMSS	<Integer>	Read-write	TCP maximum segment size Minimum value: 1 Maximum value: 65535
updateSource	<String>	Read-write	Source of routing updates.
routerId	<String>	Read-write	The router identifier for the bgp routing instance.

ipRoute

Configuration for ipRoute resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
addressFamily	<String>	Read-write	The address family of the route. Possible values: ipv4, ipv6
distance	<Integer>	Read-write	Distance value for this route Minimum value: 1 Maximum value: 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
interface	<String>	Read-write	IP gateway interface name or pseudo interface Null
isBest	<Boolean>	Read-write	Indicates is this the best route for the prefix.
metric	<Integer>	Read-write	IP destination prefix.
nextHop	<String>	Read-write	IP gateway address
prefix	<String>	Read-write	IP destination prefix.
prefixLength	<Integer>	Read-write	IP destination prefix length. Minimum value: 0 Maximum value: 128
type	<String>	Read-write	IP route protocol type

Operations

(click to see Properties)

- ADD
- DELETE
- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/ipRoute **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"routerDynamicRouting" : {

"ipRoute" : {

<b>"addressFamily" : <String></b>,

"distance" : <Integer>,

"interface" : <String>,

"nextHop" : <String>,
```

```
<b>"prefix" : <String></b>,

<b>"prefixLength" : <Integer></b>

}

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/ipRoute?args=prefixLength:<Integer>,addressFamily:<String>,nextHop:<String>,interface:<String>,prefix:<String>
HTTP Method: DELETE

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/ipRoute?args=addressFamily:<String> **URL:** http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/ipRoute?args=prefixLength:<Integer>,addressFamily:<String>,prefix:<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ipRoute **?args=prefixLength:<Integer>,addressFamily:<String>,prefix:<String>**

Use this query-parameter to get ipRoute resources based on additional properties.

HTTP Method: GET

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Payload:

```
{ "routerDynamicRouting": {

"ipRoute" : [{

"addressFamily" : <String>,

"distance" : <Integer>,

"interface" : <String>,

"isBest" : <Boolean>,

"metric" : <Integer>,

"nextHop" : <String>,

"prefix" : <String>,

"prefixLength" : <Integer>,

"type" : <String>

}]

}}
```

ospfDatabase

Configuration for ospfDatabase resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
advRouter	<String>	Read-write	The router ID of the router that originated the LSA into the Autonomous System.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
age	<Integer>	Read-write	The age of the link state advertisement in seconds.
checksum	<Integer>	Read-write	The checksum of the complete contents of the advertisement, excepting the age field
linkId	<String>	Read-write	The link state ID as an IP address.
processId	<Integer>	Read-write	OSPF process ID number
sequenceNo	<Integer>	Read-write	The sequence number of the LSA. The larger the sequence number the more recent the advertisement.
type	<String>	Read-write	The type of LSA

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/ospf6Interface **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"routerDynamicRouting" : {

"ospf6Interface" : {

"areaId" : <Integer>,
```

```
"cost" : <Integer>,

"deadInterval" : <Integer>,

"helloInterval" : <Integer>,

"instanceId" : <Integer>,

<b>"name" : <String></b>,

"networkType" : <String>,

"priority" : <Integer>,

"retransmitInterval" : <Integer>,

"tagId" : <String>,

"transmitDelay" : <Integer>

}

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

SET

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/ospf6Interface **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"routerDynamicRouting" : {

"ospf6Interface" : {

"areaId" : <Integer>,

"cost" : <Integer>,

"deadInterval" : <Integer>,

"helloInterval" : <Integer>,

"instanceId" : <Integer>,

<b>"name" : <String></b>,

"networkType" : <String>,

"priority" : <Integer>,

"retransmitInterval" : <Integer>,

"tagId" : <String>,

"transmitDelay" : <Integer>

}

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/ospf6Interface **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"routerDynamicRouting" : {

"ospf6Interface" : {

"areaId" : <Integer>,

"cost" : true,

"deadInterval" : true,

"helloInterval" : true,

"tagId" : <String>,

"transmitDelay" : <Integer>
```

```
}]

}}
```

ospf6Neighbor

Configuration for ospf6Neighbor resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
BDR	<String>	Read-write	The backup designated router for the network.
DR	<String>	Read-write	The designated router for the network.
area	<Integer>	Read-write	The area to which the neighbor belongs.
interface	<String>	Read-write	The interface of peering.
ip6address	<None>	Read-write	The IP address this neighbor is using in its IP Source Address.
options	<String>	Read-write	The options received from this neighbor.
priority	<Integer>	Read-write	The priority of this neighbor in the designated router election algorithm.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
routerId	<String>	Read-write	The IpAddress that uniquely identifies the neighboring router in the Autonomous System.
state	<String>	Read-write	The state of the relationship with this neighbor.
tagId	<String>	Read-write	OSPFv3 Tag

Operations

- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/ospf6Neighbor

URL: http:// <netscaler-ip-address> /nitro/v1/config/routerDynamicRouting/ospf6Neighbor?args=tagId:<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/ospf6Neighbor **?args=tagId:<String>**

Use this query-parameter to get ospf6Neighbor resources based on additional properties.

HTTP Method: GET

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Payload:

```
{ "routerDynamicRouting": {

"ospf6Neighbor" : [{

"BDR" : <String>,

"DR" : <String>,

"area" : <Integer>,

"interface" : <String>,

"ip6address" : <None>,
```

```
"options" : <String>,

"priority" : <Integer>,

"routerId" : <String>,

"state" : <String>,

"tagId" : <String>

}]

}}
```

ospf6Router

Configuration for ospf6Router resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
addressFamily	<String>	Read-write	IPv4 or IPv6 Address Family Possible values: ipv4, ipv6
metric	<Integer>	Read-write	The metric of redistributed routes. Minimum value: 0 Maximum value: 16777214
metricType	<Integer>	Read-write	OSPFv3 metric type for default routes - OSPFv3 External

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Type 1 metrics or Type 2 metrics. Minimum value: 1 Maximum value: 2
protocol	<String>	Read-write	The protocol from which routes need to be redistributed. Possible values: bgp, connected, isis, kernel, ospf, rip, static
routeMap	<String>	Read-write	Route map reference
tag	<String>	Read-write	Set tag for routes redistributed into OSPFv3
passiveInterface	[<String>]	Read-write	Suppress routing updates on an interface
routerId	<String>	Read-write	Router-id for the OSPFv3 process
tagId	<String>	Read-write	OSPFv3 Tag

routeMap

Configuration for routeMap resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Route map tag.
action	<String>	Read-write	Specifies if the route-map denies or permits the operations. Possible values: permit, deny
localPreference	<Integer>	Read-write	Set the BGP local preference path attribute. Minimum value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value: 4294967295
matchAsPath	<String>	Read-write	Match the BGP AS-path list.
matchCommunity	<String>	Read-write	Match BGP community list.
matchIpAddress	<String>	Read-write	Match IP address of route. IP access-list number in the range <1-99> or acces-list name.
matchIpNextHop	<String>	Read-write	Match next-hop address of route. IP access-list number in the range <1-99> or acces-list name.
matchMetric	<Integer>	Read-write	Match values from routing table. Match metric of route. Minimum value: 0 Maximum value: 4294967295
matchRouteType	<String>	Read-write	Match OSPF external routes of type 1 or type 2 metrics. Possible values: type-1, type-2
sequence	<Integer>	Read-write	Sequence to insert to/delete from existing route-map entry.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value: 1 Maximum value: 65535
setAsPath	<String>	Read-write	Set the prepend string for a BGP AS-path attribute
setCommunity	<String>	Read-write	Set the BGP community attribute.
setIpNextHop	<String>	Read-write	Set next hop address of a route.
setMetric	<Integer>	Read-write	Set metric value for destination routing protocol. Minimum value: 0 Maximum value: 4294967295
setMetricType	<String>	Read-write	Set type of metric for destination routing protocol. OSPF external type 1 metric or OSPF external type 2 metric. Possible values: type-1, type-2
weight	<Integer>	Read-write	Set BGP weight for routing table. Minimum value: 0 Maximum value: 4294967295

smpp

Smpp

All the commands associated with SMPP.

NAME	DESCRIPTION
smppparam	Configuration for SMPP configuration parameters
smppuser	Configuration for SMPP user

smppparam

Configuration for SMPP configuration parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientmode	<String>	Read-write	Mode in which the client binds to the ADC. Applicable settings function as follows: * TRANSCEIVER - Client can send and receive messages to and from the message center. * TRANSMITTERONLY - Client can only send messages. * RECEIVERONLY - Client can only receive messages. Default value: TRANSCEIVER Possible values = TRANSCEIVER, TRANSMITTERONLY, RECEIVERONLY
msgqueue	<String>	Read-write	Queue SMPP messages if a client that is capable of receiving the destination address messages is not available. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
msgqueuesize	<Integer>	Read-write	Maximum number of SMPP messages that can be queued. After the limit is reached, the Citrix ADC sends a deliver_sm_resp PDU, with an appropriate error message, to the message center. Default value: 10000
addrton	<Integer>	Read-write	Type of Number, such as an international number or a national number, used in the ESME address sent in the bind request. Default value: 0 Minimum value = 0 Maximum value = 256
addrnpi	<Integer>	Read-write	Numbering Plan Indicator, such as landline, data, or WAP client, used in the ESME address sent in the bind request. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 256
addrrange	<String>	Read-write	Set of SME addresses, sent in the bind request, serviced by the ESME. Default value: "\\d*"
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/smppparam **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"smppparam":{

"clientmode":<String_value>,

"msgqueue":<String_value>,

"msgqueuesize":<Integer_value>,

"addrton":<Integer_value>,

"addrnpi":<Integer_value>,

"addrrange":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/smppparam? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"smppparam":{

"clientmode":true,

"msgqueue":true,

"msgqueuesize":true,

"addrton":true,

"addrnpi":true,

"addrrange":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/smppparam **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "smppparam": [ {

"clientmode":<String_value>,

"msgqueue":<String_value>,

"msgqueuesize":<Integer_value>,

"addrton":<Integer_value>,

"addrnpi":<Integer_value>,

"addrrange":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

smppuser

Configuration for SMPP user resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name of the SMPP user. Must be the same as the user name specified in the SMPP server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
password	<String>	Read-write	Password for binding to the SMPP server. Must be the same as the password specified in the SMPP server. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/smppuser **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"smppuser":{

<b>"username":<String_value>,

</b>"password":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/smppuser/ username_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/smppuser **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

snmp

SNMP

SNMP(Simple Network Management Protocol) configuration.

NAME	DESCRIPTION
snmpalarm	Configuration for alarm
snmpcommunity	Configuration for community
snmpengineid	Configuration for SNMP engine id
snmpgroup	Configuration for SNMP group

NAME	DESCRIPTION
snmpmanager	Configuration for manager
snmpmib	Configuration for SNMP mib
snmpoid	Configuration for SNMP Object Identifier
snmpoption	Configuration for SNMP option
snmptrap	Configuration for snmp trap
snmptrap_binding	Binding object showing the resources that can be bound to snmptrap
snmptrap_snmpuser_binding	Binding object showing the snmpuser that can be bound to snmptrap
snmpuser	Configuration for SNMP user
snmpview	Configuration for view

snmpalarm

Configuration for alarm resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trapname	<String>	Read-write	Name of the SNMP alarm. This parameter is required for identifying the SNMP

thresholdvalue	<Integer>	Read-write	Value for the high threshold. The Citrix ADC generates an SNMP trap message when the value of the attribute associated with the alarm is greater than or equal to the specified high threshold value. Minimum value = 1
normalvalue	<Integer>	Read-write	Value for the normal threshold. A trap message is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			generated if the value of the respective attribute falls to or below this value after exceeding the high threshold. Minimum value = 1
holdtime	<Integer>	Read-write	Hold time Interval, in seconds, at which the Citrix ADC generates SNMP trap messages when the conditions specified in the SNMP alarm are met recursively for a given period of time. It is recommended to have the hold time interval period in multiple of 7 seconds as the ADC tries to validate the alarms every 7 seconds. Can only be specified for the MGMT-CPU-USAGE alarm. Minimum value = 7
time	<Integer>	Read-write	Interval, in seconds, at which the Citrix ADC generates SNMP trap messages when the conditions specified in the SNMP alarm are met.Can be specified for the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			following alarms: SYNFLOOD, HA-VERSION-MISMATCH, HA-DISK-ENCRYPTION-MISMATCH, HA-SYNC-FAILURE, HA-NO-HEARTBEATS,HA-BAD-SECONDARY-STATE, CLUSTER-NODE-HEALTH, CLUSTER-NODE-QUORUM, CLUSTER-VERSION-MISMATCH, CLUSTER-BKHB-FAILED, PORT-ALLOC-FAILED, COMPACT-FLASH-ERRORS, HARD-DISK-DRIVE-ERRORS and APPFW traps. Default trap time intervals: SYNFLOOD and APPFW traps = 1sec, PORT-ALLOC-FAILED = 3600sec(1 hour), PORT-ALLOC-EXCEED = 3600sec(1 hour), SYSLOG-CONNECTION-DROPPED = 3600sec(1 hour), Other Traps = 86400sec(1 day).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 1
state	<String>	Read-write	Current state of the SNMP alarm. The Citrix ADC generates trap messages only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them. Default value: ENABLED Possible values = ENABLED, DISABLED
severity	<String>	Read-write	Severity level assigned to trap messages generated by this alarm. The severity levels are, in increasing order of severity, Informational, Warning, Minor, Major, and Critical. This parameter is useful when you want the Citrix ADC to send trap messages to a trap listener on the basis of severity level. Trap messages with a severity level lower than the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified level (in the trap listener entry) are not sent. Default value: Unknown Possible values = Critical, Major, Minor, Warning, Informational
logging	<String>	Read-write	Logging status of the alarm. When logging is enabled, the Citrix ADC logs every trap message that is generated for this alarm. Default value: ENABLED Possible values = ENABLED, DISABLED
timeout	<Integer>	Read-only	If DB is enabled and clear config is fired, then to reset timeinterval of alarm, corresponding default time value is needed. This hidden argument holds the default time value for the corresponding alarm.
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

```

snmpcommunity

Configuration for community resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
communityname	<String>	Read-write	The SNMP community string. Can consist of 1 to 32 characters that include uppercase and lowercase letters,numbers and special characters. The following requirement applies only to the Citrix ADC CLI: If the string includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my string" or 'my string'). Minimum length = 1
permissions	<String>	Read-write	The SNMP V1 or V2 query-type privilege that you want to associate with this SNMP community. Possible values = GET, GET_NEXT, GET_BULK, SET, ALL
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpcommunity **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpcommunity":{

<b>"communityname":<String_value>,

</b><b>"permissions":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpcommunity/ communityname_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpcommunity **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/snmpcommunity? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/snmpcommunity? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of snmpcommunity resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/snmpcommunity? **view=summary**

Use this query-parameter to get the summary output of snmpcommunity resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/snmpcommunity? **pagesize=#no;pageno=#no**

Use this query-parameter to get the snmpcommunity resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "snmpcommunity": [ {

"communityname":<String_value>,

"permissions":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpcommunity/ communityname_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/ config/snmpcommunity/ communityname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/snmpcommunity/ communityname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of snmpcommunity resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "snmpcommunity": [ {

"communityname":<String_value>,

"permissions":<String_value>,

"_nextgenapiresource":<String_value>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "snmpcommunity": [ { "__count": "#no"} ] }
```

snmpengineid

Configuration for SNMP engine id resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
engineid	<String>	Read-write	A hexadecimal value of at least 10 characters, uniquely identifying the engineid. Minimum length = 10 Maximum length = 31
ownernode	<Integer>	Read-write	ID of the cluster node for which you are setting the engineid. Default value: -1 Minimum value = 0 Maximum value = 31
defaultengineid	<String>	Read-only	Unique identifier to assign to the SNMPv3 engine. Should be a hexadecimal value with a minimum length of 10 hex characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

snmpgroup

Configuration for SNMP group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SNMPv3 group. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the SNMPv3 group. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name" or 'my name'). Minimum length = 1
securitylevel	<String>	Read-write	Security level required for communication between the Citrix ADC and the SNMPv3 users who belong to the group. Specify one of the following options: noAuthNoPriv. Require neither authentication nor encryption. authNoPriv. Require authentication but no encryption. authPriv. Require authentication and encryption. Note: If you specify authentication, you must specify an encryption algorithm when you assign an SNMPv3 user to the group. If you also specify encryption, you must assign both an authentication and an encryption

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			algorithm for each group member. Possible values = noAuthNoPriv, authNoPriv, authPriv
readviewname	<String>	Read-write	Name of the configured SNMPv3 view that you want to bind to this SNMPv3 group. An SNMPv3 user bound to this group can access the subtrees that are bound to this SNMPv3 view as type INCLUDED, but cannot access the ones that are type EXCLUDED. If the Citrix ADC has multiple SNMPv3 view entries with the same name, all such entries are associated with the SNMPv3 group. Minimum length = 1
storagetype	<String>	Read-only	The storage type for this group. Possible values = volatile, nonVolatile
status	<String>	Read-only	The status of this group. Possible values = active

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

snmpmanager

Configuration for manager resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the SNMP manager. Can be an IPv4 or IPv6 address. You can instead specify an IPv4 network address or IPv6 network prefix if you want the Citrix ADC to respond to SNMP queries from any

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			device on the specified network. Alternatively, instead of an IPv4 address, you can specify a host name that has been assigned to an SNMP manager. If you do so, you must add a DNS name server that resolves the host name of the SNMP manager to its IP address. Note: The Citrix ADC does not support host names for SNMP managers that have IPv6 addresses. Minimum length = 1 Maximum length = 255
netmask	<String>	Read-write	Subnet mask associated with an IPv4 network address. If the IP address specifies the address or host name of a specific host, accept the default value of 255.255.255.255.
domainresolveretry	<Integer>	Read-write	Amount of time, in seconds, for which the Citrix ADC waits before sending

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			another DNS query to resolve the host name of the SNMP manager if the last query failed. This parameter is valid for host-name based SNMP managers only. After a query succeeds, the TTL determines the wait time. The minimum and default value is 5. Minimum value = 5 Maximum value = 20939
ip	<String>	Read-only	The resolved IP address of the hostname manager.
domain	<String>	Read-only	IP address of manager. It will be zero for hostname manager.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI: If the location includes one or more spaces, enclose it in double or single quotation marks (for example, "my location" or 'my location'). Default value: "POP (default)" Minimum length = 1
customid	<String>	Read-write	Custom identification number for the Citrix ADC. Can consist of 1 to 127 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			characters. You should choose a custom identification that helps identify the Citrix ADC appliance. The following requirement applies only to the Citrix ADC CLI: If the ID includes one or more spaces, enclose it in double or single quotation marks (for example, "my ID" or 'my ID'). Default value: "Default" Minimum length = 1
ownernode	<Integer>	Read-write	ID of the cluster node for which we are setting the mib. This is a mandatory argument to set snmp mib on CLIP. Default value: -1 Minimum value = 0 Maximum value = 31
sysdesc	<String>	Read-only	The description of the system.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sysuptime	<Integer>	Read-only	The UP time of the system in 100th of a second.
sysservices	<Integer>	Read-only	The services offered by the system.
sysoid	<String>	Read-only	The OID of the system's management system.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpmib **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpmib":{

"contact":<String_value>,

"name":<String_value>,

"location":<String_value>,

"customid":<String_value>,

"ownernode":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpmib? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

snmptrap

Configuration for snmp trap resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trapclass	<String>	Read-write	Type of trap messages that the Citrix ADC sends to the trap listener: Generic or the enterprise-specific messages defined in the MIB file. Possible values = generic, specific

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trapdestination	<String>	Read-write	IPv4 or the IPv6 address of the trap listener to which the Citrix ADC is to send SNMP trap messages. Minimum length = 1
version	<String>	Read-write	SNMP version, which determines the format of trap messages sent to the trap listener. This setting must match the setting on the trap listener. Otherwise, the listener drops the trap messages. Default value: V2 Possible values = V1, V2, V3
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 4094
destport	<Integer>	Read-write	UDP port at which the trap listener listens for trap messages. This setting must match the setting on the trap listener. Otherwise, the listener drops the trap messages. Default value: 162 Minimum value = 1 Maximum value = 65534
communityname	<String>	Read-write	Password (string) sent with the trap messages, so that the trap listener can authenticate them. Can include 1 to 32 uppercase or lowercase letters, numbers, and hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) characters. You must specify the same community string on the trap listener device. Otherwise,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the trap listener drops the trap messages. The following requirement applies only to the Citrix ADC CLI: If the string includes one or more spaces, enclose the name in double or single quotation marks (for example, "my string" or 'my string').
srcip	<String>	Read-write	IPv4 or IPv6 address that the Citrix ADC inserts as the source IP address in all SNMP trap messages that it sends to this trap listener. By default this is the appliance's NSIP or NSIP6 address, but you can specify an IPv4 MIP or SNIP/ SNIP6 address. In cluster setup, the default value is the individual node's NSIP, but it can be set to CLIP or Striped SNIP address. In non default partition, this

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parameter must be set to the SNIP/ SNIP6 address. Minimum length = 1
severity	<String>	Read-write	Severity level at or above which the Citrix ADC sends trap messages to this trap listener. The severity levels, in increasing order of severity, are Informational, Warning, Minor, Major, Critical. This parameter can be set for trap listeners of type SPECIFIC only. The default is to send all levels of trap messages. Important: Trap messages are not assigned severity levels unless you specify severity levels when configuring SNMP alarms. Default value: Unknown Possible values = Critical, Major, Minor, Warning, Informational

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
allpartitions	<String>	Read-write	Send traps of all partitions to this destination. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: args http:// <netscaler-ip-address> /nitro/v1/config/snmptrap_binding?
args=trapclass:<String_value>,trapdestination:<String_value>,version:<String_value>,td:<Integer_valu

Use this query-parameter to get snmptrap_binding resources based on additional properties.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "snmptrap_binding": [ {

"trapclass":<String_value>,

"trapdestination":<String_value>,

"version":<String_value>,

"td":<Integer_value>,

"snmptrap_snmpuser_binding":<snmptrap_snmpuser_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmptrap_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/snmptrap_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "snmptrap_binding": [ {

"trapclass":<String_value>,

"trapdestination":<String_value>,

"version":<String_value>,

"td":<Integer_value>,

"snmptrap_snmpuser_binding":<snmptrap_snmpuser_binding[]_value>

}]}
```

snmptrap_snmpuser_binding

Binding object showing the snmpuser that can be bound to snmptrap.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Integer>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
username	<String>	Read-write	Name of the SNMP user that will send the SNMPv3 traps.
trapdestination	<String>	Read-write	IPv4 or the IPv6 address of the trap listener to which the Citrix ADC is to send SNMP trap messages. Minimum length = 1
trapclass	<String>	Read-write	Type of trap messages that the Citrix ADC sends to the trap listener: Generic or the enterprise-specific

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			messages defined in the MIB file. Possible values = generic, specific
securitylevel	<String>	Read-write	Security level of the SNMPv3 trap. Default value: authNoPriv, Possible values = noAuthNoPriv, authNoPriv, authPriv
version	<String>	Read-write	SNMP version, which determines the format of trap messages sent to the trap listener. This setting must match the setting on the trap listener. Otherwise, the listener drops the trap messages. Default value: V3 Possible values = V1, V2, V3
__count	<Double>	Read-write	count parameter

Operations

- GET
- GET (ALL)
- COUNT

- ADD
- DELETE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/snmptrap_snmpuser_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"snmptrap_snmpuser_binding":{

<b>"trapclass":<String_value>,

</b><b>"trapdestination":<String_value>,

</b>"td":<Integer_value>,

"version":<String_value>,

<b>"username":<String_value>,

</b>"securitylevel":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmptrap_snmpuser_binding/ trapclass_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ snmptrap_snmpuser_binding/ trapclass_value<String> ? **args= trapdestination:<String_value>, td: <Integer_value> ,version: <String_value> , username:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmptrap_snmpuser_binding **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/snmptrap_snmpuser_binding? **args=trapdestination:<String_value>,trapclass:<String_value>,td:<Integer_value>,version:<String_valu**

Use this query-parameter to get snmptrap_snmpuser_binding resources based on additional properties.

filter http:// <netscaler-ip-address> /nitro/v1/config/snmptrap_snmpuser_binding? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of snmptrap_snmpuser_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/snmptrap_snmpuser_binding? **pagesize=#no;pageno=#no**

Use this query-parameter to get the snmptrap_snmpuser_binding resources in chunks.

snmpuser

Configuration for SNMP user resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SNMPv3 user. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my user" or 'my user'). Minimum length = 1
group	<String>	Read-write	Name of the configured SNMPv3 group to which to bind this SNMPv3 user. The access rights (bound SNMPv3 views) and security level set for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this group are assigned to this user. Minimum length = 1
authtype	<String>	Read-write	Authentication algorithm used by the Citrix ADC and the SNMPv3 user for authenticating the communication between them. You must specify the same authentication algorithm when you configure the SNMPv3 user in the SNMP manager. Possible values = MD5, SHA, SHA256, SHA512
authpasswd	<String>	Read-write	Plain-text pass phrase to be used by the authentication algorithm specified by the authType (Authentication Type) parameter. Can consist of 8 to 64 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the pass phrase includes one or more spaces, enclose it in double or single quotation marks (for example, "my phrase" or 'my phrase'). Minimum length = 8
privtype	<String>	Read-write	Encryption algorithm used by the Citrix ADC and the SNMPv3 user for encrypting the communication between them. You must specify the same encryption algorithm when you configure the SNMPv3 user in the SNMP manager. Possible values = DES, AES, AES192, AES256
privpasswd	<String>	Read-write	Encryption key to be used by the encryption algorithm specified by the privType (Encryption Type) parameter. Can consist of 8 to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			64 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI: If the key includes one or more spaces, enclose it in double or single quotation marks (for example, "my key" or 'my key'). Minimum length = 8
engineid	<String>	Read-only	The context engine ID of the user.
storagetype	<String>	Read-only	The storage type for this user. Possible values = volatile, nonVolatile
status	<String>	Read-only	The status of this user. Possible values = active

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

snmpview

Configuration for view resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SNMPv3 view. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the SNMPv3 view. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my view" or 'my view'). Minimum length = 1
subtree	<String>	Read-write	A particular branch (subtree) of the MIB tree that you want to associate with this SNMPv3 view. You must specify the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			subtree as an SNMP OID. Minimum length = 1
type	<String>	Read-write	Include or exclude the subtree, specified by the subtree parameter, in or from this view. This setting can be useful when you have included a subtree, such as A, in an SNMPv3 view and you want to exclude a specific subtree of A, such as B, from the SNMPv3 view. Possible values = included, excluded
storagetype	<String>	Read-only	The storage type for this view. Possible values = volatile, nonVolatile
status	<String>	Read-only	The status of this view. Possible values = active
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

spillover

Spillover

Spillover policies and actions.

NAME	DESCRIPTION
spilloveraction	Configuration for Spillover action
spilloverpolicy	Configuration for Spillover policy
spilloverpolicy_binding	Binding object showing the resources that can be bound to spilloverpolicy
spilloverpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to spilloverpolicy
spilloverpolicy_gslbvserver_binding	Binding object showing the gslbvserver that can be bound to spilloverpolicy
spilloverpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to spilloverpolicy

spilloveraction

Configuration for Spillover action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the spillover action.
action	<String>	Read-write	Spillover action. Currently only type SPILLOVER is supported. Possible values = SPILLOVER
newname	<String>	Read-write	New name for the spillover action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Choose a name that can be correlated with the function that the action performs. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
builtin	<String[]>	Read-only	Flag to determine whether compression is default or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

spilloverpolicy

Configuration for Spillover policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the spillover policy.
rule	<String>	Read-write	Expression to be used by the spillover policy.
action	<String>	Read-write	Action for the spillover policy. Action is created using add spillover action command.
comment	<String>	Read-write	Any comments that you might want to associate with the spillover policy.
newname	<String>	Read-write	New name for the spillover policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. Choose a name that reflects the function that the policy performs. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
hits	<Integer>	Read-only	The number of times the policy has been hit.
undefhits	<Integer>	Read-only	Number of policy UNDEF hits.
builtin	<String[]>	Read-only	Flag to determine if compression policy is builtin or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"spilloverpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>,

</b>"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"spilloverpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"spilloverpolicy":{

<b>"name":<String_value>,

</b>"comment":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

{ "spilloverpolicy": [ { "__count": "#no"} ] }
```

spilloverpolicy_binding

Binding object which returns the resources bound to spilloverpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the spillover policy.
spilloverpolicy_lbvserver_binding	<spilloverpolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to spilloverpolicy.
spilloverpolicy_gslbvserver_binding	<spilloverpolicy_gslbvserver_binding[]>	Read-only	gslbvserver that can be bound to spilloverpolicy.
spilloverpolicy_csvserver_binding	<spilloverpolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to spilloverpolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "spilloverpolicy_binding": [ {

"name":<String_value>,

"spilloverpolicy_gslbvserver_binding":<spilloverpolicy_gslbvserver_binding
[]_value>,

"spilloverpolicy_lbvserver_binding":<spilloverpolicy_lbvserver_binding[]_v
alue>,

"spilloverpolicy_csvserver_binding":<spilloverpolicy_csvserver_binding[]_v
alue>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "spilloverpolicy_binding": [ {

"name":<String_value>,

"spilloverpolicy_gslbvserver_binding":<spilloverpolicy_gslbvserver_binding

"spilloverpolicy_lbvserver_binding":<spilloverpolicy_lbvserver_binding[]_v
alue>,

"spilloverpolicy_csvserver_binding":<spilloverpolicy_csvserver_binding[]_v
alue>

}]}
```

spilloverpolicy_csvserver_binding

Binding object showing the csvserver that can be bound to spilloverpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the spillover policy.
boundto	<String>	Read-write	The name of the entity to which the policy is bound.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
priority	<Integer>	Read-only	Specifies the priority of the policy.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-only	count parameter

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_gslbvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"spilloverpolicy_gslbvserver_binding": [ { "__count": "#no"} ] }
```

spilloverpolicy_lbvserver_binding

Binding object showing the lbvserver that can be bound to spilloverpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The name of the entity to which the policy is bound.
name	<String>	Read-write	Name of the spillover policy.
priority	<Integer>	Read-only	Specifies the priority of the policy.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluated if the current policy rule evaluates to TRUE.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_lbvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ spilloverpolicy_lbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of spilloverpolicy_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_lbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the spilloverpolicy_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "spilloverpolicy_lbvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,
```

```
"priority":<Integer_value>,

"labeltype":<String_value>,

"activepolicy":<Integer_value>,

"gotopriorityexpression":<String_value>,

"labelname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_lbvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "spilloverpolicy_lbvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Integer_value>,

"labeltype":<String_value>,

"activepolicy":<Integer_value>,

"gotopriorityexpression":<String_value>,

"labelname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_lbvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"spilloverpolicy_lbvserver_binding": [ { "__count": "#no"} ] }
```

ssl

SSL

SSL Configuration

NAME	DESCRIPTION
sslaction	Configuration for SSL action
sslcacertbundle	Configuration for CA certbundle
sslcacertbundle_binding	Binding object showing the resources that can be bound to sslcacertbundle
sslcacertbundle_intermediatecacertlist_binding	Binding object showing the intermediatecacertlist that can be bound to sslcacertbundle
sslcacertgroup	Configuration for Group of CA certificate-key pairs
sslcacertgroup_binding	Binding object showing the resources that can be bound to sslcacertgroup
sslcacertgroup_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslcacertgroup
sslcert	Configuration for cerificate
sslcertbundle	Configuration for Imported Certbundle
sslcertchain	Configuration for CERT Chain
sslcertchain_binding	Binding object showing the resources that can be bound to sslcertchain
sslcertchain_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslcertchain
sslcertfile	Configuration for Imported Certfile

NAME	DESCRIPTION
sslcertificatechain	Configuration for linked certificate
sslcertkey	Configuration for certificate key
sslcertkey_binding	Binding object showing the resources that can be bound to sslcertkey
sslcertkey_crldistribution_binding	Binding object showing the crldistribution that can be bound to sslcertkey
sslcertkey_service_binding	Binding object showing the service that can be bound to sslcertkey
sslcertkey_sslocspresponder_binding	Binding object showing the sslocspresponder that can be bound to sslcertkey
sslcertkey_sslprofile_binding	Binding object showing the sslprofile that can be bound to sslcertkey
sslcertkey_sslvserver_binding	Binding object showing the sslvserver that can be bound to sslcertkey
sslcertkeybundle	Configuration for certkey bundle
sslcertkeybundle_binding	Binding object showing the resources that can be bound to sslcertkeybundle
sslcertkeybundle_intermediatecertlinks_binding	Binding object showing the intermediatecertlinks that can be bound to sslcertkeybundle
sslcertkeybundle_sslvserver_binding	Binding object showing the sslvserver that can be bound to sslcertkeybundle
sslcertlink	Configuration for linked certificate
sslcertreq	Configuration for certificate request

NAME	DESCRIPTION
sslcipher	Configuration for cipher
sslcipher_binding	Binding object showing the resources that can be bound to sslcipher
sslcipher_individualcipher_binding	Binding object showing the individualcipher that can be bound to sslcipher
sslcipher_service_binding	Binding object showing the service that can be bound to sslcipher
sslcipher_servicegroup_binding	Binding object showing the servicegroup that can be bound to sslcipher
sslcipher_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslcipher
sslcipher_sslprofile_binding	Binding object showing the sslprofile that can be bound to sslcipher
sslcipher_sslvserver_binding	Binding object showing the sslvserver that can be bound to sslcipher
sslciphersuite	Configuration for ciphersuite
sslcrl	Configuration for Certificate Revocation List
sslcrl_binding	Binding object showing the resources that can be bound to sslcrl
sslcrl_serialnumber_binding	Binding object showing the serialnumber that can be bound to sslcrl
sslcrlfile	Configuration for Imported crl files
ssldefaultprofile	
ssldhfile	Configuration for dh imported file

NAME	DESCRIPTION
ssldhparam	Configuration for dh Parameter
ssldtlsprofile	Configuration for DTLS profile
ssldynamicclientcertcache	Configuration for Dynamic Client Certificate Cache
sslecdsakey	Configuration for ecdsa key
sslechconfig	Configuration for ech config
sslfips	Configuration for fips
sslfipskey	Configuration for FIPS key
sslfipssimsource	Configuration for FIPsSIM source
sslfipssimtarget	Configuration for FIPS SIM Target
sslglobal_binding	Binding object showing the resources that can be bound to sslglobal
sslglobal_sslpolicy_binding	Binding object showing the sslpolicy that can be bound to sslglobal
sslhpkekey	Configuration for HPKE key
sslhsmkey	Configuration for HSM key
sslkeyfile	Configuration for Imported ssl key files
ssllogprofile	Configuration for SSL logging Profile
sslocspresponder	Configuration for OCSP responser
sslparameter	Configuration for SSL parameter
sslpkcs12	Configuration for pkcs12

NAME	DESCRIPTION
sslpkcs8	Configuration for pkcs8
sslpolicy	Configuration for SSL policy
sslpolicy_binding	Binding object showing the resources that can be bound to sslpolicy
sslpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to sslpolicy
sslpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to sslpolicy
sslpolicy_sslglobal_binding	Binding object showing the sslglobal that can be bound to sslpolicy
sslpolicy_sslpolicylabel_binding	Binding object showing the sslpolicylabel that can be bound to sslpolicy
sslpolicy_sslservice_binding	Binding object showing the sslservice that can be bound to sslpolicy
sslpolicy_sslvserver_binding	Binding object showing the sslvserver that can be bound to sslpolicy
sslpolicylabel	Configuration for SSL policy label
sslpolicylabel_binding	Binding object showing the resources that can be bound to sslpolicylabel
sslpolicylabel_sslpolicy_binding	Binding object showing the sslpolicy that can be bound to sslpolicylabel
sslprofile	Configuration for SSL profile
sslprofile_binding	Binding object showing the resources that can be bound to sslprofile

NAME	DESCRIPTION
sslprofile_ecccurve_binding	Binding object showing the ecccurve that can be bound to sslprofile
sslprofile_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslprofile
sslprofile_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslprofile
sslprofile_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslprofile
sslprofile_sslechconfig_binding	Binding object showing the sslechconfig that can be bound to sslprofile
sslprofile_sslvserver_binding	Binding object showing the sslvserver that can be bound to sslprofile
sslrsakey	Configuration for RSA key
sslservice	Configuration for SSL service
sslservice_binding	Binding object showing the resources that can be bound to sslservice
sslservice_ecccurve_binding	Binding object showing the ecccurve that can be bound to sslservice
sslservice_sslcacertbundle_binding	Binding object showing the sslcacertbundle that can be bound to sslservice
sslservice_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslservice
sslservice_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslservice

NAME	DESCRIPTION
sslservice_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslservice
sslservice_sslpolicy_binding	Binding object showing the sslpolicy that can be bound to sslservice
sslservicegroup	Configuration for SSL service group
sslservicegroup_binding	Binding object showing the resources that can be bound to sslservicegroup
sslservicegroup_ecccurve_binding	Binding object showing the ecccurve that can be bound to sslservicegroup
sslservicegroup_sslcacertbundle_binding	Binding object showing the sslcacertbundle that can be bound to sslservicegroup
sslservicegroup_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslservicegroup
sslservicegroup_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslservicegroup
sslservicegroup_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslservicegroup
sslvserver	Configuration for SSL virtual server
sslvserver_binding	Binding object showing the resources that can be bound to sslvserver
sslvserver_ecccurve_binding	Binding object showing the ecccurve that can be bound to sslvserver
sslvserver_hashicorp_binding	Binding object showing the hashicorp that can be bound to sslvserver

NAME	DESCRIPTION
sslvserver_sslcacertbundle_binding	Binding object showing the sslcacertbundle that can be bound to sslvserver
sslvserver_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslvserver
sslvserver_sslcertkeybundle_binding	Binding object showing the sslcertkeybundle that can be bound to sslvserver
sslvserver_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslvserver
sslvserver_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslvserver
sslvserver_sslpolicy_binding	Binding object showing the sslpolicy that can be bound to sslvserver
sslwrapkey	Configuration for WRAP key
sslzerotouchparam	Configuration for Zerotouch params

sslaction

Configuration for SSL action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SSL action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
clientauth	<String>	Read-write	Perform client certificate authentication. Possible values = DOCLIENTAUTH, NOCLIENTAUTH
clientcertverification	<String>	Read-write	Client certificate verification is mandatory or optional. Default value: Mandatory

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Mandatory, Optional
ssllogprofile	<String>	Read-write	The name of the ssllogprofile. Minimum length = 1 Maximum length = 127
clientcert	<String>	Read-write	Insert the entire client certificate into the HTTP header of the request being sent to the web server. The certificate is inserted in ASCII (PEM) format. Possible values = ENABLED, DISABLED
certheader	<String>	Read-write	Name of the header into which to insert the client certificate.
clientcertserialnumber	<String>	Read-write	Insert the entire client serial number into the HTTP header of the request being sent to the web server. Possible values = ENABLED, DISABLED
certserialheader	<String>	Read-write	Name of the header into which to insert

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the client serial number.
clientcertsubject	<String>	Read-write	Insert the client certificate subject, also known as the distinguished name (DN), into the HTTP header of the request being sent to the web server. Possible values = ENABLED, DISABLED
certsubjectheader	<String>	Read-write	Name of the header into which to insert the client certificate subject.
clientcerthash	<String>	Read-write	Insert the certificate's signature into the HTTP header of the request being sent to the web server. The signature is the value extracted directly from the X.509 certificate signature field. All X.509 certificates contain a signature field. Possible values = ENABLED, DISABLED
certhashheader	<String>	Read-write	Name of the header into which to insert the client certificate signature (hash).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientcertfingerprint	<String>	Read-write	Insert the certificate's fingerprint into the HTTP header of the request being sent to the web server. The fingerprint is derived by computing the specified hash value (SHA256, for example) of the DER-encoding of the client certificate. Possible values = ENABLED, DISABLED
certfingerprintheader	<String>	Read-write	Name of the header into which to insert the client certificate fingerprint.
certfingerprintdigest	<String>	Read-write	Digest algorithm used to compute the fingerprint of the client certificate. Possible values = SHA1, SHA224, SHA256, SHA384, SHA512
clientcertissuer	<String>	Read-write	Insert the certificate issuer details into the HTTP header of the request being sent to the web server. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certissuerheader	<String>	Read-write	Name of the header into which to insert the client certificate issuer details.
sessionid	<String>	Read-write	Insert the SSL session ID into the HTTP header of the request being sent to the web server. Every SSL connection that the client and the Citrix ADC share has a unique ID that identifies the specific connection. Possible values = ENABLED, DISABLED
sessionidheader	<String>	Read-write	Name of the header into which to insert the Session ID.
cipher	<String>	Read-write	Insert the cipher suite that the client and the Citrix ADC negotiated for the SSL session into the HTTP header of the request being sent to the web server. The appliance inserts the cipher-suite name, SSL protocol, export or non-export string, and cipher strength bit, depending on the type of browser connecting to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL virtual server or service (for example, Cipher-Suite: RC4-MD5 SSLv3 Non-Export 128-bit). Possible values = ENABLED, DISABLED
cipherheader	<String>	Read-write	Name of the header into which to insert the name of the cipher suite.
clientcertnotbefore	<String>	Read-write	Insert the date from which the certificate is valid into the HTTP header of the request being sent to the web server. Every certificate is configured with the date and time from which it is valid. Possible values = ENABLED, DISABLED
certnotbeforeheader	<String>	Read-write	Name of the header into which to insert the date and time from which the certificate is valid.
clientcertnotafter	<String>	Read-write	Insert the date of expiry of the certificate into the HTTP header of the request being sent to the web server. Every certificate is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configured with the date and time at which the certificate expires. Possible values = ENABLED, DISABLED
certnotafterheader	<String>	Read-write	Name of the header into which to insert the certificate's expiry date.
owasupport	<String>	Read-write	If the appliance is in front of an Outlook Web Access (OWA) server, insert a special header field, FRONT-END-HTTPS: ON, into the HTTP requests going to the OWA server. This header communicates to the server that the transaction is HTTPS and not HTTP. Possible values = ENABLED, DISABLED
forward	<String>	Read-write	This action takes an argument a vserver name, to this vserver one will be able to forward all the packets. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
cacertgrpname	<String>	Read-write	This action will allow to pick CA(s) from the specific CA group, to verify the client certificate. Minimum length = 1 Maximum length = 31
ocspstapling	<String>	Read-write	This option is used to enable ocspStapling parameter for the SSL connection. Possible values = ENABLED, DISABLED
ocspcertvalidation	<String>	Read-write	This option is used to check the revocation status of client/server certificate in SSL handshake using OCSP. Possible values = DISABLE, OPTIONAL, MANDATORY
ocspcache	<String>	Read-write	Enable cache of OCSP response. Caching of response received from the OCSP responder enables faster response to the client and reduces

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the load on the OCSP responder. Default value: DISABLED Possible values = ENABLED, DISABLED
inhandshakeclientauth	<String>	Read-write	This option dynamically enables client authentication for the specific SSL connection based on policy evaluation performed during ClientHello handshake message processing. It overrides the clientAuth setting configured on the SSL virtual server or the SSL frontend profile. Possible values = ENABLED, DISABLED
inhandshakeclientcertverification	<String>	Read-write	Specifies the type of client authentication and is applicable only when inHandshakeClientAuth is ENABLED. If set to MANDATORY, the appliance terminates the SSL handshake when the client fails to present

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a valid certificate. If set to OPTIONAL, the appliance requests a client certificate but continues the SSL transaction even if the certificate is missing or invalid. Default value is MANDATORY. Possible values = Mandatory, Optional
alpnhttp2	<String>	Read-write	This option is used to enable or disable the HTTP/2 application protocol based on policy evaluation performed during ClientHello handshake message processing. Possible values = ENABLED, DISABLED
hits	<Integer>	Read-only	The number of times the action has been taken.
undefhits	<Integer>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Integer>	Read-only	The number of references to the action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
description	<String>	Read-only	Description of the action.
builtin	<String[]>	Read-only	Flag to determine whether ssl action is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

```

sslcacertbundle

Configuration for CA certbundle resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cacertbundlename	<String>	Read-write	Name given to the CA certbundle. The name will be used for bind/unbind/update operations. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
bundlefile	<String>	Read-write	Name of and, optionally, path to the X509 CA certificate bundle file that is used to form cacertbundle entity. The CA certificate bundle file should be present on the appliance's hard-disk drive or solid-state drive. /nsconfig/ssl/ is the default path. The CA certificate bundle file consists of list of certificates. Minimum length = 1
servername	<String>	Read-only	Vserver/Service/ Servicegroup name to which the cacertbundle is bound.
cacertbundledigest	<String>	Read-only	Stores the digest of a CA certificate bundle file.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcacertbundle":{

<b>"cacertbundlename":<String_value>,

</b><b>"bundlefile":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle/ cacertbundlename_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcacertbundle resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle? **view=summary**

Use this query-parameter to get the summary output of sslcacertbundle resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcacertbundle resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertbundle": [ {

"cacertbundlename":<String_value>,

"bundlefile":<String_value>,

"servername":<String_value>,

"cacertbundledigest":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle/ cacertbundlename_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle/ cacertbundlename_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle/ cacertbundlename_value<String> ? **view=summary**

Use this query-parameter to get the summary output of sslcacertbundle resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcacertbundle": [ {

"cacertbundlename":<String_value>,

"bundlefile":<String_value>,

"servername":<String_value>,

"cacertbundledigest":<String_value>,
```

```
"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertbundle": [ { "__count": "#no"} ] }
```

sslcacertbundle_binding

Binding object which returns the resources bound to sslcacertbundle.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cacertbundlename	<String>	Read-write	Name given to the CA certbundle. The name will be used for bind/unbind/update

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			operations. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 127
sslcacertbundle_intermediatecacertlist_binding	<sslcacertbundle_intermediatecacertlist_binding[]>	Read-only	intermediatecacertlist that can be bound to sslcacertbundle.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle_binding/cacertbundlename_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertbundle_binding": [ {

"cacertbundlename":<String_value>,

"sslcacertbundle_intermediatecacertlist_binding":<sslcacertbundle_intermed
iatecacertlist_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertbundle_binding": [ {

"cacertbundlename":<String_value>,

"sslcacertbundle_intermediatecacertlist_binding":<sslcacertbundle_intermed
```

```
iatecacertlist_binding[]_value>

}]}
```

sslcacertbundle_intermediatecacertlist_binding

Binding object showing the intermediatecacertlist that can be bound to sslcacertbundle.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
subject	<String>	Read-write	Subject name.
cacertbundlename	<String>	Read-write	Name given to the CA certbundle. The name will be used for bind/unbind/update operations. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, "my file" or 'my file'). Minimum length = 1 Maximum length = 127
clientcertnotafter	<String>	Read-only	Not-After date.
status	<String>	Read-only	Status of the certificate. Possible values = Valid, Not yet valid, Expired
clientcertnotbefore	<String>	Read-only	Not-Before date.
issuer	<String>	Read-only	Issuer name.
daystoexpiration	<Integer>	Read-only	Days remaining for the certificate to expire.
sandns	<String>	Read-only	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). This field is for DNS names.
publickeysize	<Integer>	Read-only	Size of the public key.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sanipadd	<String>	Read-only	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). This field is for IP address.
signaturealg	<String>	Read-only	Signature algorithm.
serial	<String>	Read-only	Serial number.
publickey	<String>	Read-only	Public key algorithm.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle_intermediatecacertlist_binding/ cacertbundlename_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle_intermediatecacertlist_binding/ cacertbundlename_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcacertbundle_intermediatecacertlist_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ sslcacertbundle_intermediatecacertlist_binding/ cacertbundlename_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcacertbundle_intermediatecacertlist_binding resources in chunks.
