Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authorizationpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"activepolicy":<Double_value>,

"expressiontype":<String_value>,

"hits":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "authorizationpolicy": [ { "__count": "#no"} ] }
```

authorizationpolicylabel

Configuration for authorization policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the new authorization policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the authorization policy is created. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my authorization policy label" or 'authorization policy label').
newname	<String>	Read-write	The new name of the auth policy label. Minimum length = 1
numpol	<Double>	Read-only	Number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
policyname	<String>	Read-only	Name of the authorization policy to bind to the policy label.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labeltype	<String>	Read-only	Type of invocation. Available settings function as follows: * reqvserver - Send the request to the specified request virtual server. * resvserver - Send the response to the specified response virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, resvserver, policylabel
invoke_labelname	<String>	Read-only	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
flowtype	<Double>	Read-only	Flowtype of the bound authorization policy.
description	<String>	Read-only	Description of the policylabel.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicylabel

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authorizationpolicylabel":{

<b>"labelname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicylabel/labelname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicylabel?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"authorizationpolicylabel":{

<b>"labelname":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicylabel

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicylabel?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicylabel?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of authorizationpolicylabel resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicylabel?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicylabel?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authorizationpolicylabel resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

```

authorizationpolicylabel_authorizationpolicy_binding

Binding object showing the authorizationpolicy that can be bound to authorizationpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
policyname	<String>	Read-write	Name of the authorization policy to bind to the policy label.
labelname	<String>	Read-write	Name of the authorization policy label to which to bind the policy.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			label, and then either forward the request or response to the specified virtual server or evaluate the specified policy label.
invoke_labelname	<String>	Read-write	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is set to Policy Label.
labeltype	<String>	Read-write	Type of invocation. Available settings function as follows: * reqvserver - Send the request to the specified request virtual server. * resvserver - Send the response to the specified response virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy_aaauser_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"authorizationpolicy_aaauser_binding": [ { "__count": "#no"} ] }
```

authorizationpolicy_authorizationpolicylabel_binding

Binding object showing the authorizationpolicylabel that can be bound to authorizationpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the authorization policy. Minimum length = 1
priority	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy_authorizationpolicylabel_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy_authorizationpolicylabel_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of authorizationpolicy_authorizationpolicylabel_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/authorizationpolicy_authorizationpolicylabel_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the authorizationpolicy_authorizationpolicylabel_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

Autoscale

Autoscale

AutoScale configuration.

NAME	DESCRIPTION
autoscaleaction	Configuration for autoscale action
autoscalepolicy	Configuration for Autoscale policy
autoscalepolicy_binding	Binding object showing the resources that can be bound to autoscalepolicy
autoscalepolicy_nstimer_binding	Binding object showing the nstimer that can be bound to autoscalepolicy
autoscaleprofile	Configuration for autoscale profile

autoscaleaction

Configuration for autoscale action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	ActionScale action name. Minimum length = 1
type	<String>	Read-write	The type of action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = SCALE_UP, SCALE_DOWN
profilename	<String>	Read-write	AutoScale profile name. Minimum length = 1
parameters	<String>	Read-write	Parameters to use in the action. Minimum length = 1
vmdestroygraceperiod	<Double>	Read-write	Time in minutes a VM is kept in inactive state before destroying. Default value: 10
quiettime	<Double>	Read-write	Time in seconds no other policy is evaluated or action is taken. Default value: 300
vserver	<String>	Read-write	Name of the vserver on which autoscale action has to be taken.
__count	<Double>	Read-only	count parameter

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"autoscalepolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>,

</b>"comment":<String_value>,

"logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"autoscalepolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>,

"comment":<String_value>,

"logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"autoscalepolicy":{
```

```
<b>"name":<String_value>,

</b>"rule":true,

"action":true,

"comment":true,

"logaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"autoscalepolicy":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of autoscalepolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the autoscalepolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "autoscalepolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"comment":<String_value>,

"logaction":<String_value>,

"hits":<Double_value>,

"undefhits":<Double_value>,

"priority":<Double_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "autoscalepolicy": [ { "__count": "#no"} ] }
```

autoscalepolicy_binding

Binding object which returns the resources bound to autoscalepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the autoscale policy. Minimum length = 1
autoscalepolicy_nstimer_binding	<autoscalepolicy_nstimer_binding[]>	Read-only	nstimer that can be bound to autoscalepolicy.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "autoscalepolicy_binding": [ {

"name":<String_value>,

"autoscalepolicy_nstimer_binding":<autoscalepolicy_nstimer_binding[]_value
>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/autoscalepolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "autoscalepolicy_binding": [ {

"name":<String_value>,

"autoscalepolicy_nstimer_binding":<autoscalepolicy_nstimer_binding[]_value
>

}]}
```

autoscalepolicy_nstimer_binding

Binding object showing the nstimer that can be bound to autoscalepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	The name of the autoscale policy. Minimum length = 1
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which will get evaluated if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

RESTART

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

restart

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbsmonitors?**action=restart**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dbsmonitors":{

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

extendedmemoryparam

Configuration for Parameter for extended memory used by LSN and Subscriber Store resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
memlimit	<Double>	Read-write	Amount of Citrix ADC memory to reserve for the memory used by LSN and Subscriber Session Store feature, in multiples of 2MB. Note: If you later reduce the value of this parameter, the amount of active memory is not reduced. Changing the configured memory limit can only increase the amount of active memory.
memlimitactive	<Double>	Read-only	The active memory limit for extendedmemory on the system. Active memory limit could be different from configured memory limit. This could happen when memory limit could not be increased due to unavailability, or could not be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			decreased as it is already in use. This active memory limit configures the current memory limit for LSN and Subscriber Session Store.
maxmemlimit	<Double>	Read-only	The maximum value of memory limit for extendedmemory on the system. Actual available memory may be less. This is maximum memory that can be utilized by LSN and Subscriber Session Store modules.
minrequiredmemory	<Double>	Read-only	The minimum memory requirement for extendedmemory. This is minimum memory required for LSN and Subscriber Session Store Modules.

Operations

location

Configuration for location resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipfrom	<String>	Read-write	First IP address in the range, in dotted decimal notation. Minimum length = 1
ipto	<String>	Read-write	Last IP address in the range, in dotted decimal notation.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
preferredlocation	<String>	Read-write	String of qualifiers, in dotted notation, describing the geographical location of the IP address range. Each qualifier is more specific than the one that precedes it, as in continent.country.region.city.isp.organization. For example, "NA.US.CA.San Jose.ATT.citrix". Note: A qualifier that includes a dot (.) or space ( ) must be enclosed in double quotation marks. Minimum length = 1
longitude	<Integer>	Read-write	Numerical value, in degrees, specifying the longitude of the geographical location of the IP address-range. Note: Longitude and latitude parameters are used for selecting a service with the static proximity GSLB method. If they are not specified, selection is based

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			on the qualifiers specified for the location. Minimum value = -180 Maximum value = 180
latitude	<Integer>	Read-write	Numerical value, in degrees, specifying the latitude of the geographical location of the IP address-range. Note: Longitude and latitude parameters are used for selecting a service with the static proximity GSLB method. If they are not specified, selection is based on the qualifiers specified for the location. Minimum value = -90 Maximum value = 90
q1label	<String>	Read-only	Least specific location qualifier.
q2label	<String>	Read-only	Location qualifier 2.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
q3label	<String>	Read-only	Location qualifier 3.
q4label	<String>	Read-only	Location qualifier 4.
q5label	<String>	Read-only	Location qualifier 5.
q6label	<String>	Read-only	Most specific location qualifier.
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/location

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"location":{

<b>"ipfrom":<String_value>,

</b><b>"ipto":<String_value>,

</b><b>"preferredlocation":<String_value>,

</b>"longitude":<Integer_value>,

"latitude":<Integer_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/location/ipfrom_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/location

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/location?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/location?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of location resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/location?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/location?**pagesize=#no;pageno=#no**

Use this query-parameter to get the location resources in chunks.

locationparameter

Configuration for location parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
context	<String>	Read-write	Context for describing locations. In geographic context, qualifier labels are assigned by default in the following sequence: Continent.Country.Region.City.ISP.Organization. In custom context, the qualifiers labels can have any meaning that you designate. Possible values = geographic, custom
q1label	<String>	Read-write	Label specifying the meaning of the first qualifier. Can be specified for custom context only. Minimum length = 1
q2label	<String>	Read-write	Label specifying the meaning of the second qualifier. Can be specified for custom context only. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
q3label	<String>	Read-write	Label specifying the meaning of the third qualifier. Can be specified for custom context only. Minimum length = 1
q4label	<String>	Read-write	Label specifying the meaning of the fourth qualifier. Can be specified for custom context only. Minimum length = 1
q5label	<String>	Read-write	Label specifying the meaning of the fifth qualifier. Can be specified for custom context only. Minimum length = 1
q6label	<String>	Read-write	Label specifying the meaning of the sixth qualifier. Can be specified for custom context only. Minimum length = 1
Locationfile	<String>	Read-only	Currently loaded location database file.
format	<String>	Read-only	Location file format. Possible values = netscaler, ip-country, ip-country-isp, ip-country-region-city, ip-country-region-city-isp, geoip-country,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			geoip-region, geoip-city, geoip-country-org, geoip-country-isp, geoip-city-isp-org
custom	<Double>	Read-only	Number of configured custom locations.
Static	<Double>	Read-only	Number of configured locations in the database file (static locations).
lines	<Double>	Read-only	Number of lines in the databse files.
errors	<Double>	Read-only	Number of errros encountered while reading the database file.
warnings	<Double>	Read-only	Number of warnings encountered while reading the database file.
entries	<Double>	Read-only	Number of successfully added entries.
locationfile6	<String>	Read-only	Currently loaded location database file.
format6	<String>	Read-only	Location file format. Possible values = netscaler6, geoip-country6

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
custom6	<Double>	Read-only	Number of configured custom locations.
static6	<Double>	Read-only	Number of configured locations in the database file (static locations).
lines6	<Double>	Read-only	Number of lines in the databse files.
errors6	<Double>	Read-only	Number of errros encountered while reading the database file.
warnings6	<Double>	Read-only	Number of warnings encountered while reading the database file.
entries6	<Double>	Read-only	Number of successfully added entries.
flags	<Double>	Read-only	Information needed for display. This argument passes information from the kernel to the user space.
status	<Double>	Read-only	This argument displays when the status (success or failure) of database loading.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
databasemode	<String>	Read-only	This argument displays the database mode. Possible values = File, Internal, Not applicable
flushing	<String>	Read-only	This argument displays the state of flushing. Possible values = In progress, Idle
loading	<String>	Read-only	This argument displays the state of loading. Possible values = In progress, Idle
matchwildcardtoany	<String>	Read-only	Indicates whether wildcard qualifiers should match any other qualifier including non-wildcard. Option to fallback after default behavior changes to not match. Default value: NO Possible values = YES, NO

Operations

nstrace

Configuration for nstrace operations resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nf	<Double>	Read-write	Number of files to be generated in cycle. Default value: 24 Minimum value = 1 Maximum value = 100
time	<Double>	Read-write	Time per file (sec). Default value: 3600 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
size	<Double>	Read-write	Size of the captured data. Set 0 for full packet trace. Default value: 164 Minimum value = 0 Maximum value = 1514
mode	<String[]>	Read-write	Capturing mode for trace. Mode can be any of the following values or combination of these values: RX Received packets before NIC pipelining (Filter does not work when RX capturing mode is ON) NEW_RX Received packets after NIC pipelining TX Transmitted packets TXB Packets buffered for transmission IPV6 Translated IPv6 packets C2C Capture C2C message

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NS_FR_TX TX/TXB packets are not captured in flow receiver. MPTCP MPTCP master flow Default mode: NEW_RX TXB . Default value: DEFAULT_MODE Possible values = TX, TXB, RX, IPV6, NEW_RX, C2C, NS_FR_TX, APPFW, MPTCP, PolicyBased
pernic	<String>	Read-write	Use separate trace files for each interface. Works only with cap format. Default value: DISABLED Possible values = ENABLED, DISABLED
filename	<String>	Read-write	Name of the trace file.
fileid	<String>	Read-write	ID for the trace file name for uniqueness. Should be used only with -name option.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
filter	<String>	Read-write	Filter expression for nstrace. Maximum length of filter is 255 and it can be of following format: <expression> [<relop> <expression>] <relop> = (;; | ||) <expression> =: CONNECTION.<qualifier>.<qualifier-method>.(<qualifier-value>) <qualifier> = SRCIP <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv4 address. example = CONNECTION.SRCIP.EQ(127.0.0.1) <qualifier> = DSTIP <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv4 address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example = CONNECTION.DSTIP.EQ(127.0.0.1) <qualifier> = IP <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv4 address. example = CONNECTION.IP.EQ(127.0.0.1) <qualifier> = SRCIPv6 <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv6 address. example = CONNECTION.SRCIPv6.EQ(2001:db8:0:0:1::1) <qualifier> = DSTIPv6 <qualifier-method> = [EQ | NE]

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier-value> = A valid IPv6 address. example = CONNECTION.DSTIPv6.EQ(2001:db8:0:0:1::1) <qualifier> = IPv6 <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv6 address. example = CONNECTION.IPv6.EQ(2001:db8:0:0:1::1) <qualifier> = SRCPORT <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid port number. example = CONNECTION.SRCPORT.EQ(80)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier> = DSTPORT <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid port number. example = CONNECTION.DSTPORT.EQ(80) <qualifier> = PORT <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid port number. example = CONNECTION.PORT.EQ(80) <qualifier> = VLANID <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN]

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier-value> = A valid VLAN ID. example = CONNECTION.VLANID.EQ(0) <qualifier> = CONNID <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid PCB dev number. example = CONNECTION.CONNID.EQ(0) <qualifier> = PPEID <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid core ID. example = CONNECTION.PPEID.EQ(0)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier> = SVCNAME <qualifier-method> = [EQ | NE | CONTAINS | STARTSWITH | ENDSWITH] <qualifier-value> = A valid text string. example = CONNECTION.SVCNAME.EQ("name") <qualifier> = LB_VSERVER.NAME <qualifier-method> = [EQ | NE | CONTAINS | STARTSWITH | ENDSWITH] <qualifier-value> = LB vserver name. example = CONNECTION.LB_VSERVER.NAME.EQ("name")

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier> = CS_VSERVER.NAME <qualifier-method> = [EQ | NE | CONTAINS | STARTSWITH | ENDSWITH] <qualifier-value> = CS vserver name. example = CONNECTION.CS_VSERVER.NAME.EQ("name") <qualifier> = INTF <qualifier-method> = [EQ | NE] <qualifier-value> = A valid interface id in the form of x/y. example = CONNECTION.INTF.EQ("x/y") <qualifier> = SERVICE_TYPE <qualifier-method> = [EQ | NE]

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier-value> = (SVC_HTTP | FTP | TCP | UDP | SSL | SSL_BRIDGE | SSL_TCP | NNTP | RPCSVR | RPCSVRS | RPCCLNT | SVC_DNS | ADNS | SNMP | RTSP | DHCPRA | ANY| MONITOR | MONITOR_UDP | MONITOR_PING | SIP_UDP | SVC_MYSQL | SVC_MSSQL | FIX | SSL_FIX | PKTSTEER | SVC_AAA | SERVICE_UNKNOWN) example = CONNECTION.SERVICE_TYPE.EQ(ANY) <qualifier> = TRAFFIC_DOMAIN_ID

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid traffic domain ID. example = CONNECTION.TRAFFIC_DOMAIN_ID.EQ(0) eg: start nstrace -filter "CONNECTION.SRCIP.EQ(127.0.0.1) || (CONNECTION.SVCNAME.NE("s1") ;; CONNECTION.SRCPORT.EQ(80))" The filter expression should be given in double quotes. common use cases: Trace capturing full sized traffic from/to ip 10.102.44.111, excluding loopback traffic start nstrace -size 0 -filter "CONNECTION.IP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NE(127.0.0.1) ;; CONNECTION.IP.EQ(10.102.44.111)" Trace capturing all traffic to (terminating at) port 80 or 443 start nstrace -size 0 -filter "CONNECTION.DSTPORT.EQ(443) || CONNECTION.DSTPORT.EQ(80)" Trace capturing all backend traffic specific to service service1 along with corresponding client side traffic start nstrace -size 0 -filter "CONNECTION.SVCNAME.EQ("service1")" -link ENABLED Trace capturing all traffic through Citrix ADC interface 1/1 start nstrace -filter "CONNECTION.INTF.EQ("1/1")"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Trace capturing all traffic specific through vlan 2 start nstrace -filter "CONNECTION.VLANID.EQ(2)" Trace capturing all frontend (client side) traffic specific to lb vserver vserver1 along with corresponding server side traffic start nstrace -size 0 -filter "CONNECTION.LB_VSERVER.NAME.EQ("vserver1")" -link ENABLED .
link	<String>	Read-write	Includes filtered connection's peer traffic. Default value: DISABLED Possible values = ENABLED, DISABLED
nodes	<Double[]>	Read-write	Nodes on which tracing is started. Minimum value = 0 Maximum value = 32

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
filesize	<Double>	Read-write	File size, in MB, treshold for rollover. If free disk space is less than 2GB at the time of rollover, trace will stop . Default value: 1024 Minimum value = 0 Maximum value = 10240
traceformat	<String>	Read-write	Format in which trace will be generated . Default value: 0 Possible values = NSCAP, PCAP
merge	<String>	Read-write	Specify how traces across PE's are merged . Default value: 0 Possible values = ONSTOP, ONTHEFLY, NOMERGE
doruntimecleanup	<String>	Read-write	Enable or disable runtime temp file cleanup.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
tracebuffers	<Double>	Read-write	Number of 16KB trace buffers. Default value: 5000 Minimum value = 1000
skiprpc	<String>	Read-write	skip RPC packets. Default value: DISABLED Possible values = ENABLED, DISABLED
skiplocalssh	<String>	Read-write	skip local SSH packets. Default value: DISABLED Possible values = ENABLED, DISABLED
capsslkeys	<String>	Read-write	Capture SSL Master keys. Master keys will not be captured on FIPS machine. Warning: The captured keys can be used to decrypt information that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			may be confidential. The captured key files have to be stored in a secure environment. Default value: DISABLED Possible values = ENABLED, DISABLED
capdroppkt	<String>	Read-write	Captures Dropped Packets if set to ENABLED. Default value: DISABLED Possible values = ENABLED, DISABLED
inmemorytrace	<String>	Read-write	Logs packets in appliance's memory and dumps the trace file on stopping the nstrace operation. Default value: DISABLED Possible values = ENABLED, DISABLED
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 31
state	<String>	Read-only	Current running state of trace. Default value: 0 Possible values = RUNNING, STOPPED
scope	<String>	Read-only	Scope of started trace, local or cluster level. Default value: 0 Possible values = CLUSTER, LOCAL
tracelocation	<String>	Read-only	Directory where current trace files are saved.

Operations

(click to see Properties)

GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstrace

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstrace?**args=nodeid:<Double_value>**

Use this query-parameter to get nstrace resources based on additional properties.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

radiusnode

Configuration for RADIUS Node resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeprefix	<String>	Read-write	IP address/IP prefix of radius node in CIDR format.
radkey	<String>	Read-write	The key shared between the RADIUS server and clients. Required for Citrix ADC to communicate with the RADIUS nodes.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| UPDATE| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/radiusnode

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"radiusnode":{
```

```
<b>"nodeprefix":<String_value>,

</b><b>"radkey":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/radiusnode

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"radiusnode":{

<b>"nodeprefix":<String_value>,

</b>"radkey":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/radiusnode/nodeprefix_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/radiusnode

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/radiusnode?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/radiusnode?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of radiusnode resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/radiusnode?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/radiusnode?**pagesize=#no;pageno=#no**

Use this query-parameter to get the radiusnode resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

server

Configuration for server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the server. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the name is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
ipaddress	<String>	Read-write	IPv4 or IPv6 address of the server. If you create an IP address based server, you can specify the name of the server, instead of its IP address, when creating a service. Note: If you do not create a server entry, the server IP address that you enter when you create a service becomes the name of the server.
domain	<String>	Read-write	Domain name of the server. For a domain based configuration, you must create the server first. Minimum length = 1
translationip	<String>	Read-write	IP address used to transform the server's DNS-resolved IP address.
translationmask	<String>	Read-write	The netmask of the translation ip.
domainresolveretry	<Integer>	Read-write	Time, in seconds, for which the Citrix ADC must wait, after DNS resolution fails, before sending the next DNS query to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resolve the domain name. Default value: 5 Minimum value = 5 Maximum value = 20939
state	<String>	Read-write	Initial state of the server. Default value: ENABLED Possible values = ENABLED, DISABLED
ipv6address	<String>	Read-write	Support IPv6 addressing mode. If you configure a server with the IPv6 addressing mode, you cannot use the server in the IPv4 addressing mode. Default value: NO Possible values = YES, NO
comment	<String>	Read-write	Any information about the server.
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
querytype	<String>	Read-write	Specify the type of DNS resolution to be done on the configured domain to get the backend services. Valid query types are A, AAAA and SRV with A being the default querytype. The type of DNS resolution done on the domains in SRV records is inherited from ipv6 argument. Default value: A Possible values = A, AAAA, SRV
domainresolvenow	<Boolean>	Read-write	Immediately send a DNS query to resolve the server's domain name.
delay	<Double>	Read-write	Time, in seconds, after which all the services configured on the server are disabled.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
graceful	<String>	Read-write	Shut down gracefully, without accepting any new connections, and disabling each service when all of its connections are closed. Default value: NO Possible values = YES, NO
Internal	<Boolean>	Read-write	Display names of the servers that have been created for internal use.
newname	<String>	Read-write	New name for the server. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
tickssincelaststatechange	<Double>	Read-only	Time in 10 millisecond ticks

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			since the last state change.
autoscale	<String>	Read-only	Auto scale option for a servicegroup. Default value: DISABLED Possible values = DISABLED, DNS, POLICY, CLOUD
usip	<String>	Read-only	Use the client's IP address as the source IP address when initiating a connection to the server. When creating a service, if you do not set this parameter, the service inherits the global Use Source IP setting (available in the enable ns mode and disable ns mode CLI commands, or in the System > Settings > Configure modes > Configure Modes dialog box). However, you can override this setting after you create the service. Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cka	<String>	Read-only	Enable client keep-alive for the service group. Possible values = YES, NO
tcpb	<String>	Read-only	Enable TCP buffering for the service group. Possible values = YES, NO
cmp	<String>	Read-only	Enable compression for the specified service. Possible values = YES, NO
cacheable	<String>	Read-only	Use the transparent cache redirection virtual server to forward the request to the cache server. Default value: NO Possible values = YES, NO
sc	<String>	Read-only	State of the SureConnect feature for the service group. Default value: OFF Possible values = ON, OFF
sp	<String>	Read-only	Enable surge protection for the service group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: OFF Possible values = ON, OFF
__count	<Double>	Read-only	count parameter

Operations

```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"server":{

<b>"name":<String_value>,

</b>"ipaddress":<String_value>,

"domainresolveretry":<Integer_value>,

"translationip":<String_value>,

"translationmask":<String_value>,
```

```
"domainresolvenow":<Boolean_value>,

"comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"server":{

<b>"name":<String_value>,

</b>"comment":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

enable

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server?**action=enable**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"server":{

<b>"name":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

disable

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server?**action=disable**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"server":{

<b>"name":<String_value>,
```

```
</b>"delay":<Double_value>,

"graceful":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"server":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server?**args=name:<String_value>,Internal:<Boolean_value>**

Use this query-parameter to get server resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of server resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server?**pagesize=#no;pageno=#no**

Use this query-parameter to get the server resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "server": [ { "__count": "#no"} ] }
```

server_binding

Binding object which returns the resources bound to server.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the server for which to display parameters. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
server_gslbservicegroup_binding	<server_gslbservicegroup_binding[]>	Read-only	gslbservicegroup that can be bound to server.
server_service_binding	<server_service_binding[]>	Read-only	service that can be bound to server.
server_gslbservice_binding	<server_gslbservice_binding[]>	Read-only	gslbservice that can be bound to server.
server_servicegroup_binding	<server_servicegroup_binding[]>	Read-only	servicegroup that can be bound to server.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "server_binding": [ {

"name":<String_value>,

"server_gslbservicegroup_binding":<server_gslbservicegroup_binding[]_value
>,

"server_servicegroup_binding":<server_servicegroup_binding[]_value>,

"server_service_binding":<server_service_binding[]_value>,

"server_gslbservice_binding":<server_gslbservice_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "server_binding": [ {

"name":<String_value>,

"server_gslbservicegroup_binding":<server_gslbservicegroup_binding[]_value
>,

"server_servicegroup_binding":<server_servicegroup_binding[]_value>,

"server_service_binding":<server_service_binding[]_value>,

"server_gslbservice_binding":<server_gslbservice_binding[]_value>
```

```
}]}
```

server_gslbservice_binding

Binding object showing the gslbservice that can be bound to server.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the server for which to display parameters. Minimum length = 1
servicename	<String>	Read-write	The services attatched to the server.
serviceipstr	<String>	Read-only	This field has been intorduced to show the dbs services ip.
svctype	<String>	Read-only	The type of bound service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			MYSQL, MSSQL, ORACLE, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
svrstate	<String>	Read-only	The state of the bound service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
port	<Integer>	Read-only	The port number to be used for the bound service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serviceipaddress	<String>	Read-only	The IP address of the bound service.
__count	<Double>	Read-only	count parameter

server_gslbservicegroup_binding

Binding object showing the gslbservicegroup that can be bound to server.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the server for which to display parameters. Minimum length = 1
servicegroupname	<String>	Read-write	servicegroups bind to this server.
svrtimeout	<Double>	Read-only	Time, in seconds, after which to terminate an idle server connection. Minimum value = 0 Maximum value = 31536000
serviceipstr	<String>	Read-only	This field has been intorduced to show the dbs services ip.
cip	<String>	Read-only	Before forwarding a request to the service, insert an HTTP header with the client's IPv4 or IPv6 address as its value. Used if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server needs the client's IP address for security, accounting, or other purposes, and setting the Use Source IP parameter is not a viable option. Possible values = ENABLED, DISABLED
dup_port	<Integer>	Read-only	port of the service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
customserverid	<String>	Read-only	A positive integer to identify the service. Used when the persistency type is set to Custom Server ID. Default value: "None"
boundtd	<Double>	Read-only	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4094
downstateflush	<String>	Read-only	Perform delayed clean-up of connections to all services in the service group. Default value: ENABLED Possible values = ENABLED, DISABLED
svctype	<String>	Read-only	The type of bound service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, ORACLE, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
svrstate	<String>	Read-only	The state of the bound service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
appflowlog	<String>	Read-only	Enable logging of AppFlow information for the specified service group. Default value: ENABLED Possible values = ENABLED, DISABLED
cipheader	<String>	Read-only	Name of the HTTP header whose value must be set to the IP address of the client. Used with the Client IP parameter. If client

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IP insertion is enabled, and the client IP header is not specified, the value of Client IP Header parameter or the value set by the set ns config command is used as client's IP header name. Minimum length = 1
maxclient	<Double>	Read-only	Maximum number of simultaneous open connections for the service group. Minimum value = 0 Maximum value = 4294967294
clttimeout	<Double>	Read-only	Time, in seconds, after which to terminate an idle client connection. Minimum value = 0 Maximum value = 31536000
port	<Integer>	Read-only	The port number to be used for the bound service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dup_svctype	<String>	Read-only	service type of the service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, ORACLE, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
monthreshold	<Double>	Read-only	Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 65535
maxreq	<Double>	Read-only	Maximum number of requests that can be sent on a persistent connection to the service group. Note: Connection requests beyond this value are rejected. Minimum value = 0 Maximum value = 65535
serviceipaddress	<String>	Read-only	The IP address of the bound service.
maxbandwidth	<Double>	Read-only	Maximum bandwidth, in Kbps, allocated for all the services in the service group. Minimum value = 0 Maximum value = 4294967287
svrcfgflags	<Double>	Read-only	service flags to denote its a db enabled.
__count	<Double>	Read-only	count parameter

Response Payload:

```
{"server_gslbservicegroup_binding": [ { "__count": "#no"} ] }
```

server_servicegroup_binding

Binding object showing the servicegroup that can be bound to server.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the server for which to display parameters. Minimum length = 1
servicegroupname	<String>	Read-write	servicegroups bind to this server.
sp	<String>	Read-only	Enable surge protection for the service group. Default value: OFF Possible values = ON, OFF
sc	<String>	Read-only	State of the SureConnect feature for the service group. Default value: OFF Possible values = ON, OFF
servicegroupentname2	<String>	Read-only	Used for show server of SRV type to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			indicate target FQDNs.
svcitmpriority	<Double>	Read-only	Indicates the Priority of the SRV target FQDN.
svrtimeout	<Double>	Read-only	Time, in seconds, after which to terminate an idle server connection. Minimum value = 0 Maximum value = 31536000
serviceipstr	<String>	Read-only	This field has been intorduced to show the dbs services ip.
tcpb	<String>	Read-only	Enable TCP buffering for the service group. Possible values = YES, NO
cip	<String>	Read-only	Before forwarding a request to the service, insert an HTTP header with the client's IPv4 or IPv6 address as its value. Used if the server needs the client's IP address for security, accounting, or other purposes, and setting the Use Source IP parameter is not a viable option.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dup_port	<Integer>	Read-only	port of the service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
svcitmboundsvcs	<Double>	Read-only	Indicates the total number of bound IPs for the SRV target FQDN.
customserverid	<String>	Read-only	A positive integer to identify the service. Used when the persistency type is set to Custom Server ID. Default value: "None"
weight	<Double>	Read-only	Indicates the weight of bound IPs.
boundtd	<Double>	Read-only	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4094
downstateflush	<String>	Read-only	Perform delayed clean-up of connections to all services in the service group. Default value: ENABLED Possible values = ENABLED, DISABLED
svctype	<String>	Read-only	The type of bound service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, ORACLE, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
cka	<String>	Read-only	Enable client keep-alive for the service group. Possible values = YES, NO
svrstate	<String>	Read-only	The state of the bound service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
appflowlog	<String>	Read-only	Enable logging of AppFlow information for the specified service group. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipheader	<String>	Read-only	Name of the HTTP header whose value must be set to the IP address of the client. Used with the Client IP parameter. If client IP insertion is enabled, and the client IP header is not specified, the value of Client IP Header parameter or the value set by the set ns config command is used as client's IP header name. Minimum length = 1
maxclient	<Double>	Read-only	Maximum number of simultaneous open connections for the service group. Minimum value = 0 Maximum value = 4294967294
clttimeout	<Double>	Read-only	Time, in seconds, after which to terminate an idle client connection. Minimum value = 0 Maximum value = 31536000
port	<Integer>	Read-only	The port number to be used for the bound service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
dup_svctype	<String>	Read-only	service type of the service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, ORACLE, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cmp	<String>	Read-only	Enable compression for the specified service. Possible values = YES, NO
monthreshold	<Double>	Read-only	Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN. Minimum value = 0 Maximum value = 65535
maxreq	<Double>	Read-only	Maximum number of requests that can be sent on a persistent connection to the service group. Note: Connection requests beyond this value are rejected. Minimum value = 0 Maximum value = 65535
serviceipaddress	<String>	Read-only	The IP address of the bound service.
svcitmactsvcs	<Double>	Read-only	Indicates the total number of active IPs for SRV target FQDN.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
usip	<String>	Read-only	Use the client's IP address as the source IP address when initiating a connection to the server. When creating a service, if you do not set this parameter, the service inherits the global Use Source IP setting (available in the enable ns mode and disable ns mode CLI commands, or in the System > Settings > Configure modes > Configure Modes dialog box). However, you can override this setting after you create the service. Possible values = YES, NO
cacheable	<String>	Read-only	Use the transparent cache redirection virtual server to forward the request to the cache server. Default value: NO Possible values = YES, NO
maxbandwidth	<Double>	Read-only	Maximum bandwidth, in Kbps, allocated for all the services in the service group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4294967287
svrcfgflags	<Double>	Read-only	service flags to denote its a db enabled.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server_servicegroup_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server_servicegroup_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of server_servicegroup_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server_servicegroup_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the server_servicegroup_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

server_service_binding

Binding object showing the service that can be bound to server.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the server for which to display parameters. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	The services attatched to the server.
serviceipstr	<String>	Read-only	This field has been intorduced to show the dbs services ip.
svctype	<String>	Read-only	The type of bound service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, ORACLE, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svrstate	<String>	Read-only	The state of the bound service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
port	<Integer>	Read-only	The port number to be used for the bound service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
serviceipaddress	<String>	Read-only	The IP address of the bound service.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server_service_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server_service_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of server_service_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/server_service_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the server_service_binding resources in chunks.

HTTP Method:GET

service

Configuration for service resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the service. Must begin with an ASCII alphabetic or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the service has been created. Minimum length = 1
ip	<String>	Read-write	IP to assign to the service. Minimum length = 1
servername	<String>	Read-write	Name of the server that hosts the service. Minimum length = 1
servicetype	<String>	Read-write	Protocol in which data is exchanged with the service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			MYSQL, MSSQL, ORACLE, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
port	<Integer>	Read-write	Port number of the service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
cleartextport	<Integer>	Read-write	Port to which clear text data must be sent after the appliance decrypts incoming SSL traffic. Applicable to transparent SSL services. Minimum value = 1
cachetype	<String>	Read-write	Cache type supported by the cache server. Possible values = TRANSPARENT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			REVERSE, FORWARD
maxclient	<Double>	Read-write	Maximum number of simultaneous open connections to the service. Minimum value = 0 Maximum value = 4294967294
healthmonitor	<String>	Read-write	Monitor the health of this service. Available settings function as follows: YES - Send probes to check the health of the service. NO - Do not send probes to check the health of the service. With the NO option, the appliance shows the service as UP at all times. Default value: YES Possible values = YES, NO
maxreq	<Double>	Read-write	Maximum number of requests that can be sent on a persistent connection to the service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: Connection requests beyond this value are rejected. Minimum value = 0 Maximum value = 65535
cacheable	<String>	Read-write	Use the transparent cache redirection virtual server to forward requests to the cache server. Note: Do not specify this parameter if you set the Cache Type parameter. Default value: NO Possible values = YES, NO
cip	<String>	Read-write	Before forwarding a request to the service, insert an HTTP header with the client's IPv4 or IPv6 address as its value. Used if the server needs the client's IP address for security, accounting, or other purposes, and setting the Use Source IP parameter is not a viable option.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	Name for the HTTP header whose value must be set to the IP address of the client. Used with the Client IP parameter. If you set the Client IP parameter, and you do not specify a name for the header, the appliance uses the header name specified for the global Client IP Header parameter (the cipHeader parameter in the set ns param CLI command or the Client IP Header parameter in the Configure HTTP Parameters dialog box at System > Settings > Change HTTP parameters). If the global Client IP Header parameter is not specified, the appliance inserts a header with the name "client-ip.". Minimum length = 1
usip	<String>	Read-write	Use the client's IP address as the source IP address

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			when initiating a connection to the server. When creating a service, if you do not set this parameter, the service inherits the global Use Source IP setting (available in the enable ns mode and disable ns mode CLI commands, or in the System > Settings > Configure modes > Configure Modes dialog box). However, you can override this setting after you create the service. Possible values = YES, NO
pathmonitor	<String>	Read-write	Path monitoring for clustering. Possible values = YES, NO
pathmonitorindv	<String>	Read-write	Individual Path monitoring decisions. Possible values = YES, NO
useproxyport	<String>	Read-write	Use the proxy port as the source port when initiating connections with the server. With the NO setting, the client-side connection port

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is used as the source port for the server-side connection. Note: This parameter is available only when the Use Source IP (USIP) parameter is set to YES. Possible values = YES, NO
sc	<String>	Read-write	State of SureConnect for the service. Default value: OFF Possible values = ON, OFF
sp	<String>	Read-write	Enable surge protection for the service. Possible values = ON, OFF
rtspsessionidremap	<String>	Read-write	Enable RTSP session ID mapping for the service. Default value: OFF Possible values = ON, OFF
clttimeout	<Double>	Read-write	Time, in seconds, after which to terminate an idle client connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 31536000
svrtimeout	<Double>	Read-write	Time, in seconds, after which to terminate an idle server connection. Minimum value = 0 Maximum value = 31536000
customserverid	<String>	Read-write	Unique identifier for the service. Used when the persistency type for the virtual server is set to Custom Server ID. Default value: "None"
serverid	<Double>	Read-write	The identifier for the service. This is used when the persistency type is set to Custom Server ID.
cka	<String>	Read-write	Enable client keep-alive for the service. Possible values = YES, NO
tcpb	<String>	Read-write	Enable TCP buffering for the service. Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cmp	<String>	Read-write	Enable compression for the service. Possible values = YES, NO
maxbandwidth	<Double>	Read-write	Maximum bandwidth, in Kbps, allocated to the service. Minimum value = 0 Maximum value = 4294967287
accessdown	<String>	Read-write	Use Layer 2 mode to bridge the packets sent to this service if it is marked as DOWN. If the service is DOWN, and this parameter is disabled, the packets are dropped. Default value: NO Possible values = YES, NO
monthreshold	<Double>	Read-write	Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN. Minimum value = 0 Maximum value = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Initial state of the service. Default value: ENABLED Possible values = ENABLED, DISABLED
downstateflush	<String>	Read-write	Flush all active transactions associated with a service whose state transitions from UP to DOWN. Do not enable this option for applications that must complete their transactions. Default value: ENABLED Possible values = ENABLED, DISABLED
tcpprofilename	<String>	Read-write	Name of the TCP profile that contains TCP configuration settings for the service. Minimum length = 1 Maximum length = 127
httpprofilename	<String>	Read-write	Name of the HTTP profile that contains HTTP configuration

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			settings for the service. Minimum length = 1 Maximum length = 127
contentinspectionprofilename	<String>	Read-write	Name of the ContentInspection profile that contains IPS/IDS communication related setting for the service. Minimum length = 1 Maximum length = 127
hashid	<Double>	Read-write	A numerical identifier that can be used by hash based load balancing methods. Must be unique for each service. Minimum value = 1
comment	<String>	Read-write	Any information about the service.
appflowlog	<String>	Read-write	Enable logging of AppFlow information. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
netprofile	<String>	Read-write	Network profile to use for the service. Minimum length = 1 Maximum length = 127
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
processlocal	<String>	Read-write	By turning on this option packets destined to a service in a cluster will not under go any steering. Turn this option for single packet request response mode or when the upstream device is performing a proper RSS for connection based distribution. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dnsprofilename	<String>	Read-write	Name of the DNS profile to be associated with the service. DNS profile properties will applied to the transactions processed by a service. This parameter is valid only for ADNS and ADNS-TCP services. Minimum length = 1 Maximum length = 127
monconnectionclose	<String>	Read-write	Close monitoring connections by sending the service a connection termination message with the specified bit set. Default value: NONE Possible values = RESET, FIN
ipaddress	<String>	Read-write	The new IP address of the service.
weight	<Double>	Read-write	Weight to assign to the monitor-service binding. When a monitor is UP, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			weight assigned to its binding with the service determines how much the monitor contributes toward keeping the health of the service above the value configured for the Monitor Threshold parameter. Minimum value = 1 Maximum value = 100
monitor_name_svc	<String>	Read-write	Name of the monitor bound to the specified service. Minimum length = 1
riseapbrstatsmsgcode	<Integer>	Read-write	The code indicating the rise apbr status.
delay	<Double>	Read-write	Time, in seconds, allocated to the Citrix ADC for a graceful shutdown of the service. During this period, new requests are sent to the service only for clients who already have persistent sessions on the appliance. Requests from new clients are load balanced among other available services. After the delay time

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expires, no requests are sent to the service, and the service is marked as unavailable (OUT OF SERVICE).
graceful	<String>	Read-write	Shut down gracefully, not accepting any new connections, and disabling the service when all of its connections are closed. Default value: NO Possible values = YES, NO
all	<Boolean>	Read-write	Display both user-configured and dynamically learned services.
Internal	<Boolean>	Read-write	Display only dynamically learned services.
newname	<String>	Read-write	New name for the service. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. Minimum length = 1
numofconnections	<Integer>	Read-only	This will tell the number of client side connections are still open.
policyname	<String>	Read-only	The name of the policyname for which this service is bound.
serviceconftype	<Boolean>	Read-only	The configuration type of the service.
serviceconftype2	<String>	Read-only	The configuration type of the service (Internal/Dynamic/ Configured). Possible values = Configured, Dynamic, Internal
value	<String>	Read-only	SSL status. Possible values = Certkey not bound, SSL feature disabled
gslb	<String>	Read-only	The GSLB option for the corresponding virtual server. Possible values = REMOTE, LOCAL
dup_state	<String>	Read-only	Added this field for getting state value from table.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
publicip	<String>	Read-only	public ip.
publicport	<Integer>	Read-only	public port. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
svrstate	<String>	Read-only	The state of the service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
monitor_state	<String>	Read-only	The running state of the monitor on this service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
lastresponse	<String>	Read-only	The string form of monstatcode.
responsetime	<Double>	Read-only	Response time of this monitor.
riseapbrstatsmsgcode2	<Integer>	Read-only	The code indicating other rise stats.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
statechangetimemsec	<Double>	Read-only	Time at which last state change happened. Milliseconds part.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tickssincelaststatechange	<Double>	Read-only	Time in 10 millisecond ticks since the last state change.
stateupdatereason	<Double>	Read-only	Checks state update reason on the secondary node.
clmonowner	<Double>	Read-only	Tells the mon owner of the service. Minimum value = 0 Maximum value = 32
clmonview	<Double>	Read-only	Tells the view id of the monitoring owner.
serviceipstr	<String>	Read-only	This field has been intorduced to show the dbs services ip.
oracleserverversion	<String>	Read-only	Oracle server version. Default value: 10G Possible values = 10G, 11G
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service?**args=name:<String_value>,all:<Boolean_value>,Internal:<Boolean_value>**

Use this query-parameter to get service resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of service resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service?**pagesize=#no;pageno=#no**

Use this query-parameter to get the service resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

servicegroup

Configuration for service group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the service group. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the name is created. Minimum length = 1
servicetype	<String>	Read-write	Protocol used to exchange data with the service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, ORACLE, RADIUS,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
cachetype	<String>	Read-write	Cache type supported by the cache server. Possible values = TRANSPARENT, REVERSE, FORWARD
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
maxclient	<Double>	Read-write	Maximum number of simultaneous open

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connections for the service group. Minimum value = 0 Maximum value = 4294967294
maxreq	<Double>	Read-write	Maximum number of requests that can be sent on a persistent connection to the service group. Note: Connection requests beyond this value are rejected. Minimum value = 0 Maximum value = 65535
cacheable	<String>	Read-write	Use the transparent cache redirection virtual server to forward the request to the cache server. Note: Do not set this parameter if you set the Cache Type. Default value: NO Possible values = YES, NO
cip	<String>	Read-write	Insert the Client IP header in requests

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			forwarded to the service. Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	Name of the HTTP header whose value must be set to the IP address of the client. Used with the Client IP parameter. If client IP insertion is enabled, and the client IP header is not specified, the value of Client IP Header parameter or the value set by the set ns config command is used as client's IP header name. Minimum length = 1
usip	<String>	Read-write	Use client's IP address as the source IP address when initiating connection to the server. With the NO setting, which is the default, a mapped IP (MIP) address or subnet IP (SNIP) address is used as the source IP address to initiate server side connections.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
pathmonitor	<String>	Read-write	Path monitoring for clustering. Possible values = YES, NO
pathmonitorindv	<String>	Read-write	Individual Path monitoring decisions. Possible values = YES, NO
useproxyport	<String>	Read-write	Use the proxy port as the source port when initiating connections with the server. With the NO setting, the client-side connection port is used as the source port for the server-side connection. Note: This parameter is available only when the Use Source IP (USIP) parameter is set to YES. Possible values = YES, NO
healthmonitor	<String>	Read-write	Monitor the health of this service. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			YES - Send probes to check the health of the service. NO - Do not send probes to check the health of the service. With the NO option, the appliance shows the service as UP at all times. Default value: YES Possible values = YES, NO
sc	<String>	Read-write	State of the SureConnect feature for the service group. Default value: OFF Possible values = ON, OFF
sp	<String>	Read-write	Enable surge protection for the service group. Default value: OFF Possible values = ON, OFF
rtspsessionidremap	<String>	Read-write	Enable RTSP session ID mapping for the service group. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
clttimeout	<Double>	Read-write	Time, in seconds, after which to terminate an idle client connection. Minimum value = 0 Maximum value = 31536000
svrtimeout	<Double>	Read-write	Time, in seconds, after which to terminate an idle server connection. Minimum value = 0 Maximum value = 31536000
cka	<String>	Read-write	Enable client keep-alive for the service group. Possible values = YES, NO
tcpb	<String>	Read-write	Enable TCP buffering for the service group. Possible values = YES, NO
cmp	<String>	Read-write	Enable compression for the specified service. Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxbandwidth	<Double>	Read-write	Maximum bandwidth, in Kbps, allocated for all the services in the service group. Minimum value = 0 Maximum value = 4294967287
monthreshold	<Double>	Read-write	Minimum sum of weights of the monitors that are bound to this service. Used to determine whether to mark a service as UP or DOWN. Minimum value = 0 Maximum value = 65535
state	<String>	Read-write	Initial state of the service group. Default value: ENABLED Possible values = ENABLED, DISABLED
downstateflush	<String>	Read-write	Flush all active transactions associated with all the services in the service group whose state transitions from UP to DOWN. Do not enable this option for applications that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must complete their transactions. Default value: ENABLED Possible values = ENABLED, DISABLED
tcpprofilename	<String>	Read-write	Name of the TCP profile that contains TCP configuration settings for the service group. Minimum length = 1 Maximum length = 127
httpprofilename	<String>	Read-write	Name of the HTTP profile that contains HTTP configuration settings for the service group. Minimum length = 1 Maximum length = 127
comment	<String>	Read-write	Any information about the service group.
appflowlog	<String>	Read-write	Enable logging of AppFlow information for the specified service group. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
netprofile	<String>	Read-write	Network profile for the service group. Minimum length = 1 Maximum length = 127
autoscale	<String>	Read-write	Auto scale option for a servicegroup. Default value: DISABLED Possible values = DISABLED, DNS, POLICY, CLOUD
memberport	<Integer>	Read-write	member port.
autodisablegraceful	<String>	Read-write	Indicates graceful shutdown of the service. System will wait for all outstanding connections to this service to be closed before disabling the service. Default value: NO Possible values = YES, NO
autodisabledelay	<Double>	Read-write	The time allowed (in seconds) for a graceful shutdown. During this period, new connections or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requests will continue to be sent to this service for clients who already have a persistent session on the system. Connections or requests from fresh or new clients who do not yet have a persistence sessions on the system will not be sent to the service. Instead, they will be load balanced among other available services. After the delay time expires, no new requests or connections will be sent to the service.
monconnectionclose	<String>	Read-write	Close monitoring connections by sending the service a connection termination message with the specified bit set. Default value: NONE Possible values = RESET, FIN
servername	<String>	Read-write	Name of the server to which to bind the service group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
port	<Integer>	Read-write	Server port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
weight	<Double>	Read-write	Weight to assign to the servers in the service group. Specifies the capacity of the servers relative to the other servers in the load balancing configuration. The higher the weight, the higher the percentage of requests sent to the service. Minimum value = 1 Maximum value = 100
customserverid	<String>	Read-write	The identifier for this IP:Port pair. Used when the persistency type is set to Custom Server ID. Default value: "None"
serverid	<Double>	Read-write	The identifier for the service. This is used when the persistency

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			type is set to Custom Server ID.
hashid	<Double>	Read-write	The hash identifier for the service. This must be unique for each service. This parameter is used by hash based load balancing methods. Minimum value = 1
nameserver	<String>	Read-write	Specify the nameserver to which the query for bound domain needs to be sent. If not specified, use the global nameserver.
dbsttl	<Double>	Read-write	Specify the TTL for DNS record for domain based service.The default value of ttl is 0 which indicates to use the TTL received in DNS response for monitors. Default value: 0
monitor_name_svc	<String>	Read-write	Name of the monitor bound to the service group. Used to assign a weight to the monitor. Minimum length = 1
dup_weight	<Double>	Read-write	weight of the monitor that is bound to servicegroup.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1
riseapbrstatsmsgcode	<Integer>	Read-write	The code indicating the rise apbr status.
delay	<Double>	Read-write	Time, in seconds, allocated for a shutdown of the services in the service group. During this period, new requests are sent to the service only for clients who already have persistent sessions on the appliance. Requests from new clients are load balanced among other available services. After the delay time expires, no requests are sent to the service, and the service is marked as unavailable (OUT OF SERVICE).
graceful	<String>	Read-write	Wait for all existing connections to the service to terminate before shutting down the service. Default value: NO Possible values = YES, NO
includemembers	<Boolean>	Read-write	Display the members of the listed service

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			groups in addition to their settings. Can be specified when no service group name is provided in the command. In that case, the details displayed for each service group are identical to the details displayed when a service group name is provided, except that bound monitors are not displayed.
newname	<String>	Read-write	New name for the service group. Minimum length = 1
numofconnections	<Integer>	Read-only	This will tell the number of client side connections are still open.
serviceconftype	<Boolean>	Read-only	The configuration type of the service group.
value	<String>	Read-only	SSL Status. Possible values = Certkey not bound, SSL feature disabled
svrstate	<String>	Read-only	The state of the service. Possible values = UP, DOWN,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
ip	<String>	Read-only	IP Address.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
statechangetimemsec	<Double>	Read-only	Time when last state change occurred. Milliseconds part.
stateupdatereason	<Double>	Read-only	Checks state update reason on the secondary node.
clmonowner	<Double>	Read-only	Tells the mon owner of the service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clmonview	<Double>	Read-only	Tells the view id of the monitoring owner.
groupcount	<Double>	Read-only	Servicegroup Count.
riseapbrstatsmsgcode2	<Integer>	Read-only	The code indicating other rise stats.
serviceipstr	<String>	Read-only	This field has been intorduced to show the dbs services ip.
servicegroupeffectivestate	<String>	Read-only	Indicates the effective servicegroup state based on the state of the bound service items.If all services are UP the effective state is UP, if all are DOWN its DOWN,if all are OFS its OFS.If atleast one serviceis UP and rest are either DOWN or OFS, the effective state is PARTIAL-UP.If atleast one bound service is DOWN and rest are OFS the effective state is PARTIAL DOWN. Possible values = UP, DOWN, OUT OF SERVICE, PARTIAL-UP, PARTIAL-DOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodefaultbindings	<String>	Read-only	to determine if the configuration is from stylebooks. Default value: NO Possible values = YES, NO
svcitmactsvcs	<Double>	Read-only	This gives the total active service items for an FQDN for SRV type server binding.
svcitmboundsvcs	<Double>	Read-only	This gives the total bound items for an FQDN for SRV type server binding.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

```

servicegroupbindings

Configuration for servicegroupbind resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The name of the service. Minimum length = 1
ipaddress	<String>	Read-only	The IP address of the vserver.
port	<Integer>	Read-only	The port of the vserver. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
state	<String>	Read-only	The state of the service group. Possible values = ENABLED, DISABLED
svrstate	<String>	Read-only	The state of the vserver. Possible values = UP, DOWN, UNKNOWN, BUSY,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
vservername	<String>	Read-only	The name of the vserver.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/servicegroupbindings

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/servicegroupbindings?**args=servicegroupname:<String_value>,**

Use this query-parameter to get servicegroupbindings resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/servicegroupbindings?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/servicegroupbindings?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of servicegroupbindings resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/servicegroupbindings?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/servicegroupbindings?**pagesize=#no;pageno=#no**

Use this query-parameter to get the servicegroupbindings resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "servicegroupbindings": [ { "__count": "#no"} ] }
```

servicegroup_binding

Binding object which returns the resources bound to servicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the service group. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroup_servicegroupentitymonbindings_binding	<servicegroup_servicegroupentitymonbindings_binding[]>	Read-only	servicegroupentitymonbindings that can be bound to servicegroup.
servicegroup_lbmonitor_binding	<servicegroup_lbmonitor_binding[]>	Read-only	lbmonitor that can be bound to servicegroup.
servicegroup_servicegroupmember_binding	<servicegroup_servicegroupmember_binding[]>	Read-only	servicegroupmember that can be bound to servicegroup.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/servicegroup_binding/servicegroupname_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "servicegroup_binding": [ {

"servicegroupname":<String_value>,

"servicegroup_lbmonitor_binding":<servicegroup_lbmonitor_binding[]_value>,

"servicegroup_servicegroupmember_binding":<servicegroup_servicegroupmember
_binding[]_value>,

"servicegroup_servicegroupentitymonbindings_binding":<servicegroup_service
groupentitymonbindings_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/servicegroup_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/servicegroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "servicegroup_binding": [ {

"servicegroupname":<String_value>,

"servicegroup_lbmonitor_binding":<servicegroup_lbmonitor_binding[]_value>,

"servicegroup_servicegroupmember_binding":<servicegroup_servicegroupmember
_binding[]_value>,

"servicegroup_servicegroupentitymonbindings_binding":<servicegroup_service
groupentitymonbindings_binding[]_value>

}]}
```

servicegroup_lbmonitor_binding

Binding object showing the lbmonitor that can be bound to servicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the service group. Minimum length = 1
port	<Integer>	Read-write	Port number of the service. Each service must have a unique port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
nameserver	<String>	Read-write	Specify the nameserver to which the query for bound domain needs to be sent. If not specified, use the global nameserver.
state	<String>	Read-write	Initial state of the service after binding. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
hashid	<Double>	Read-write	Unique numerical identifier used by hash based load balancing methods to identify a service. Minimum value = 1
serverid	<Double>	Read-write	The identifier for the service. This is used when the persistency type is set to Custom Server ID.
customserverid	<String>	Read-write	Unique service identifier. Used when the persistency type for the virtual server is set to Custom Server ID. Default value: "None"
weight	<Double>	Read-write	Weight to assign to the servers in the service group. Specifies the capacity of the servers relative to the other servers in the load balancing configuration. The higher the weight, the higher the percentage of requests sent to the service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 100
monitor_name	<String>	Read-write	Monitor name.
dbsttl	<Double>	Read-write	Specify the TTL for DNS record for domain based service.The default value of ttl is 0 which indicates to use the TTL received in DNS response for monitors. Default value: 0
passive	<Boolean>	Read-write	Indicates if load monitor is passive. A passive load monitor does not remove service from LB decision when threshold is breached.
monstate	<String>	Read-write	Monitor state. Possible values = ENABLED, DISABLED
monweight	<Double>	Read-only	weight of the monitor that is bound to servicegroup.
__count	<Double>	Read-only	count parameter

servicegroup_servicegroupmember_binding

Binding object showing the servicegroupmember that can be bound to servicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the service group. Minimum length = 1
ip	<String>	Read-write	IP Address.
port	<Integer>	Read-write	Server port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
nameserver	<String>	Read-write	Specify the nameserver to which the query for bound domain needs to be sent. If not specified, use the global nameserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Initial state of the service group. Default value: ENABLED Possible values = ENABLED, DISABLED
hashid	<Double>	Read-write	The hash identifier for the service. This must be unique for each service. This parameter is used by hash based load balancing methods. Minimum value = 1
serverid	<Double>	Read-write	The identifier for the service. This is used when the persistency type is set to Custom Server ID.
servername	<String>	Read-write	Name of the server to which to bind the service group. Minimum length = 1
customserverid	<String>	Read-write	The identifier for this IP:Port pair. Used when the persistency type is set to Custom Server ID. Default value: "None"
weight	<Double>	Read-write	Weight to assign to the servers in the service group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Specifies the capacity of the servers relative to the other servers in the load balancing configuration. The higher the weight, the higher the percentage of requests sent to the service. Minimum value = 1 Maximum value = 100
dbsttl	<Double>	Read-write	Specify the TTL for DNS record for domain based service.The default value of ttl is 0 which indicates to use the TTL received in DNS response for monitors. Default value: 0
svcitmpriority	<Double>	Read-only	This gives the priority of the FQDN service items for SRV server binding.
delay	<Double>	Read-only	Time, in seconds, allocated for a shutdown of the services in the service group. During this period, new requests are sent to the service only for clients who

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			already have persistent sessions on the appliance. Requests from new clients are load balanced among other available services. After the delay time expires, no requests are sent to the service, and the service is marked as unavailable (OUT OF SERVICE).
statechangetimesec	<String>	Read-only	Time when last state change occurred. Seconds part.
svrstate	<String>	Read-only	The state of the service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
tickssincelaststatechange	<Double>	Read-only	Time in 10 millisecond ticks since the last state change.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
graceful	<String>	Read-only	Wait for all existing connections to the service to terminate before shutting down the service. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

{"servicegroup_servicegroupmember_binding": [ { "__count": "#no"} ] }
```

service_binding

Binding object which returns the resources bound to service.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the service for which to display configuration details. Minimum length = 1
service_lbmonitor_binding	<service_lbmonitor_binding[]>	Read-only	lbmonitor that can be bound to service.
service_dospolicy_binding	<service_dospolicy_binding[]>	Read-only	dospolicy that can be bound to service.
service_scpolicy_binding	<service_scpolicy_binding[]>	Read-only	scpolicy that can be bound to service.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "service_binding": [ {

"name":<String_value>,

"service_scpolicy_binding":<service_scpolicy_binding[]_value>,

"service_lbmonitor_binding":<service_lbmonitor_binding[]_value>,

"service_dospolicy_binding":<service_dospolicy_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/service_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

service_lbmonitor_binding

Binding object showing the lbmonitor that can be bound to service.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
weight	<Double>	Read-write	Weight to assign to the monitor-service binding. When a monitor is UP, the weight assigned to its binding with the service determines how much the monitor contributes toward keeping the health of the service above the value configured for the Monitor Threshold parameter. Minimum value = 1 Maximum value = 100
name	<String>	Read-write	Name of the service to which to bind a policy or monitor. Minimum length = 1
passive	<Boolean>	Read-write	Indicates if load monitor is passive. A

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			passive load monitor does not remove service from LB decision when threshold is breached.
monitor_name	<String>	Read-write	The monitor Names.
monstate	<String>	Read-write	The configured state (enable/disable) of the monitor on this server. Possible values = ENABLED, DISABLED
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
dup_weight	<Double>	Read-only	The weight of the monitor.
responsetime	<Double>	Read-only	Response time of this monitor.
totalfailedprobes	<Double>	Read-only	The total number of failed probs.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
lastresponse	<String>	Read-only	The string form of monstatcode.
failedprobes	<Double>	Read-only	Number of the current failed monitoring probes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
totalprobes	<Double>	Read-only	The total number of probs sent.
monitor_state	<String>	Read-only	The running state of the monitor on this service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
dup_state	<String>	Read-only	Added this field for getting state value from table. Possible values = ENABLED, DISABLED
monitortotalprobes	<Double>	Read-only	Total number of probes sent to monitor this service.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monitortotalfailedprobes	<Double>	Read-only	Total number of failed probes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitorcurrentfailedprobes	<Double>	Read-only	Total number of currently failed probes.
__count	<Double>	Read-only	count parameter

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/svcbindings

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/svcbindings?
args=servicename:<String_value>,

Use this query-parameter to get svcbindings resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/svcbindings?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/svcbindings?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of svcbindings resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/svcbindings?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/svcbindings?**pagesize=#no;pageno=#no**

Use this query-parameter to get the svcbindings resources in chunks.

vserver

Configuration for virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the virtual server to be removed. Minimum length = 1
backupvserver	<String>	Read-write	The name of the backup virtual server for this virtual server. Minimum length = 1
redirecturl	<String>	Read-write	The URL where traffic is redirected if the virtual server in the system becomes unavailable. Minimum length = 1
cacheable	<String>	Read-write	Use this option to specify whether a virtual server (used for load balancing or content switching) routes requests to the cache redirection virtual server before sending it to the configured servers.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
clttimeout	<Double>	Read-write	The timeout value in seconds for idle client connection. Minimum value = 0 Maximum value = 31536000
somethod	<String>	Read-write	The spillover factor. The system will use this value to determine if it should send traffic to the backupvserver when the main virtual server reaches the spillover threshold. Possible values = CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, NONE
sopersistence	<String>	Read-write	The state of the spillover persistence. Default value: DISABLED Possible values = ENABLED, DISABLED
sopersistencetimeout	<Double>	Read-write	The spillover persistence entry timeout.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 2 Minimum value = 2 Maximum value = 1440
sothreshold	<Double>	Read-write	The spillver threshold value. Minimum value = 1 Maximum value = 4294967294
pushvserver	<String>	Read-write	The lb vserver of type PUSH/ SSL_PUSH to which server pushes the updates received on the client facing non-push lb vserver. Minimum length = 1

```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

BFD

Bfd

Bidirectional Forwarding Detection

NAME	DESCRIPTION
bfdsession	Configuration for BFD configuration

bfdsession

Configuration for BFD configuration resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
localip	<String>	Read-write	IPV4 or IPV6 Address of Local Node.
remoteip	<String>	Read-write	IPV4 or IPV6 Address of Remote Node.
state	<String>	Read-only	Current state of the BFD session. Possible values = ADMIN DOWN, DOWN, INIT, UP
localport	<Double>	Read-only	Source Port used by Local node to send Control packets for the BFD session.
remoteport	<Double>	Read-only	Source Port used by Remote node to send Control packets for the BFD session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
minimumtransmitinterval	<Double>	Read-only	Minimum trasmit interval, in milliseconds, the local node would like to use when transmitting BFD Control packets.
negotiatedminimumtransmitinterval	<Double>	Read-only	Negotiated Minimum Transmit Interval. This is the interval at which the local node will be sending out BFD control packets.
minimumreceiveinterval	<Double>	Read-only	Minimum receive interval, in milliseconds, between received BFD Control packets that the local node is capable of supporting.
negotiatedminimumreceiveinterval	<Double>	Read-only	Negotiated Minimum Receive Interval. This is the interval at which the local node will be expecting BFD control packets.
multiplier	<Double>	Read-only	Detection Multiplier. The negotiated transmit interval multiplied by Detection multiplier provides the Detection Time for the remote node for the BFD session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
remotemultiplier	<Double>	Read-only	Your Multiplier. The negotiated receive interval multiplied by Your Multiplier provides the Detection Time for the local node for the BFD session.
vlan	<Double>	Read-only	VLAN ID on which the BDS session is configured.
localdiagnotic	<Double>	Read-only	Diagnostic Code specifying the local system's reason for the last change in session state.
localdiscriminator	<Double>	Read-only	A unique discriminator value generated by the local node for the session.
remotediscriminator	<Double>	Read-only	A unique discriminator value as received from the remote node for the session.
passive	<Boolean>	Read-only	Flag indicating that the session is passive.
multihop	<Boolean>	Read-only	Flag indicating if the session is multihop.
admindown	<Boolean>	Read-only	Flag indicating if admin down is being sent.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
originalownerpe	<Double>	Read-only	Original Owner PE of the BFD session.
currentownerpe	<Double>	Read-only	Current Owner PE of the BFD session.
ownernode	<Double>	Read-only	The owner node in a Cluster for this BFD session. Owner node can vary from 0 to 31. If ownernode is not specified then the session is treated as Striped session. Default value: 255
__count	<Double>	Read-only	count parameter

CA

Ca

Content Accelerator Configuration. The Content Accelerator feature is used to cache static and dynamic web application data.

NAME	DESCRIPTION
caaction	Configuration for ca action
caglobal_binding	Binding object showing the resources that can be bound to caglobal
caglobal_capolicy_binding	Binding object showing the capolicy that can be bound to caglobal
capolicy	Configuration for contentaccelerator policy
capolicy_binding	Binding object showing the resources that can be bound to capolicy
capolicy_caglobal_binding	Binding object showing the caglobal that can be bound to capolicy
capolicy_csvserver_binding	Binding object showing the csvserver that can be bound to capolicy
capolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to capolicy

caaction

Configuration for ca action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the content accelerator action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.
accumressize	<Double>	Read-write	Size of the data, in KB, that the server must respond with. The Citrix ADC uses this data to compute a hash which is then used to lookup within the T2100 appliance.
lbvserver	<String>	Read-write	Name of the load balancing virtual server that has the T2100 appliances as services.
comment	<String>	Read-write	Information about the content accelerator action.
type	<String>	Read-write	Specifies whether the Citrix ADC must lookup for the response on the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			T2100 appliance or serve the response directly from the server. Possible values = nolookup, lookup, noop
newname	<String>	Read-write	New name for the content accelerator action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the content accelerator policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my content accelerator action" or 'my content accelerator action'). Minimum length = 1
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default content accelerator action.
hits	<Double>	Read-only	The number of times the action has been taken.
__count	<Double>	Read-only	count parameter

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/caglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/caglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "caglobal_binding": [ {

"caglobal_capolicy_binding":<caglobal_capolicy_binding[]_value>

}]}
```

caglobal_capolicy_binding

Binding object showing the capolicy that can be bound to caglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the content accelerator policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the content accelerator policy.
gotopriorityexpression	<String>	Read-write	.
type	<String>	Read-write	. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT
flowtype	<Double>	Read-only	flowtype of the bound content accelerator policy.
numpol	<Double>	Read-only	Number of polices bound to label.
__count	<Double>	Read-only	count parameter

Operations

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/caglobal_capolicy_binding

```

capolicy

Configuration for contentaccelerator policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the content accelerator policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the policy is created.
rule	<String>	Read-write	Expression that determines which requests or responses match the content accelerator policy. When specifying the rule in the CLI, the description must be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclosed within double quotes.
action	<String>	Read-write	Name of content accelerator action to be executed when the rule is evaluated to true.
undefaction	<String>	Read-write	.
comment	<String>	Read-write	Information about the content accelerator policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the content accelerator policy. Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of Undef hits.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default content accelerator policy.
__count	<Double>	Read-only	count parameter

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/capolicy_csvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "capolicy_csvserver_binding": [ {
```

```
"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"activepolicy":<Integer_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/capolicy_csvserver_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"capolicy_csvserver_binding": [ { "__count": "#no"} ] }
```

capolicy_lbvserver_binding

Binding object showing the lbvserver that can be bound to capolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the content accelerator policy to be displayed.
boundto	<String>	Read-write	Location where policy is bound.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/capolicy_lbvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/capolicy_lbvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of capolicy_lbvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/capolicy_lbvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the capolicy_lbvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "capolicy_lbvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"activepolicy":<Integer_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/capolicy_lbvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/capolicy_lbvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"capolicy_lbvserver_binding": [ { "__count": "#no"} ] }
```

Cache Redirection

Cache Redirection

Cache redirection configuration. The cache redirection feature can transparently redirect cacheable HTTP requests to a cache and send non-cacheable or dynamic HTTP requests to the origin server. A cache stores or caches frequently requested web content and serves such web content to a client on behalf of the origin servers, alleviating the load on the origin server farm.

NAME	DESCRIPTION
craction	Configuration for cache redirection action
crpolicy	Configuration for cache redirection policy
crpolicy_binding	Binding object showing the resources that can be bound to crpolicy
crpolicy_crvserver_binding	Binding object showing the crvserver that can be bound to crpolicy
crvserver	Configuration for CR virtual server
crvserver_appflowpolicy_binding	Binding object showing the appflowpolicy that can be bound to crvserver

NAME	DESCRIPTION
crvserver_appfwpolicy_binding	Binding object showing the appfwpolicy that can be bound to crvserver
crvserver_appqoepolicy_binding	Binding object showing the appqoepolicy that can be bound to crvserver
crvserver_binding	Binding object showing the resources that can be bound to crvserver
crvserver_cachepolicy_binding	Binding object showing the cachepolicy that can be bound to crvserver
crvserver_cmppolicy_binding	Binding object showing the cmppolicy that can be bound to crvserver
crvserver_crpolicy_binding	Binding object showing the crpolicy that can be bound to crvserver
crvserver_cspolicy_binding	Binding object showing the cspolicy that can be bound to crvserver
crvserver_feopolicy_binding	Binding object showing the feopolicy that can be bound to crvserver
crvserver_filterpolicy_binding	Binding object showing the filterpolicy that can be bound to crvserver
crvserver_icapolicy_binding	Binding object showing the icapolicy that can be bound to crvserver
crvserver_lbvserver_binding	Binding object showing the lbvserver that can be bound to crvserver
crvserver_policymap_binding	Binding object showing the policymap that can be bound to crvserver
crvserver_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to crvserver
crvserver_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to crvserver

NAME	DESCRIPTION
crvserver_spilloverpolicy_binding	Binding object showing the spilloverpolicy that can be bound to crvserver

craction

Configuration for cache redirection action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the action for which to display detailed information. Minimum length = 1
crtype	<String>	Read-only	Type to decide where to redirect the requests if the cache redirection policy is hit. The valid options are as follows: *CACHE - Directs all the requests to the cache if cache redirection policy is hit. *ORIGIN - Directs all requests to the origin server if the cache redirection policy is hit.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = origin, cache
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default cr action.
hits	<Double>	Read-only	The number of times the action has been taken.
referencecount	<String>	Read-only	The number of references to the action.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
comment	<String>	Read-only	Comment. Any type of information about this responder action.
__count	<Double>	Read-only	count parameter

crpolicy

Configuration for cache redirection policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name for the cache redirection policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression, or name of a named expression, against which traffic is evaluated.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Name of the built-in cache redirection action: CACHE/ ORIGIN.
logaction	<String>	Read-write	The log action associated with the cache redirection policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	The new name of the content switching policy. Minimum length = 1
domain	<String>	Read-only	Domain name.
vstype	<Double>	Read-only	Virtual server type.
hits	<Double>	Read-only	Total number of hits.
bindhits	<Double>	Read-only	Total number of hits.
priority	<Double>	Read-only	priority of bound policy.
activepolicy	<Boolean>	Read-only	Indicates whether policy is bound or not.
cspolicytype	<String>	Read-only	Indicates whether policy is PI or not. (used only during display). Possible values = Classic Policy, Advanced Policy
labelname	<String>	Read-only	Name of the label invoked.
labeltype	<String>	Read-only	The invocation type. Possible values = reqvserver, resvserver, policylabel
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default cr policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crpolicy_crvserver_binding/policyname_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crpolicy_crvserver_binding/policyname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of crpolicy_crvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crpolicy_crvserver_binding/policyname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the crpolicy_crvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "crpolicy_crvserver_binding": [ {
```

```
"policyname":<String_value>,

"domain":<String_value>,

"priority":<Double_value>,

"labelname":<String_value>,

"pihits":<Double_value>,

"hits":<Double_value>,

"gotopriorityexpression":<String_value>,

"pipolicyhits":<Double_value>,

"labeltype":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crpolicy_crvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crpolicy_crvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "crpolicy_crvserver_binding": [ {

"pipolicyhits":<Double_value>,

"labeltype":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crpolicy_crvserver_binding/policyname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"crpolicy_crvserver_binding": [ { "__count": "#no"} ] }
```

crvserver

Configuration for CR virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the cache redirection virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the cache redirection

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			virtual server is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my server" or 'my server'). Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
servicetype	<String>	Read-write	Protocol (type of service) handled by the virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = HTTP, SSL, NNTP, HDX
ipv46	<String>	Read-write	IPv4 or IPv6 address of the cache redirection virtual server. Usually a public IP address. Clients send connection requests to this IP address. Note: For a transparent cache redirection virtual server, use an asterisk (*) to specify a wildcard virtual server address.
port	<Integer>	Read-write	Port number of the virtual server. Default value: 80 Minimum value = 1 Maximum value = 65534
ipset	<String>	Read-write	The list of IPv4/IPv6 addresses bound to ipset would form a part of listening service on the current cr vserver. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
range	<Double>	Read-write	Number of consecutive IP addresses, starting with the address specified by the IPAddress parameter, to include in a range of addresses assigned to this virtual server. Default value: 1 Minimum value = 1 Maximum value = 254
cachetype	<String>	Read-write	Mode of operation for the cache redirection virtual server. Available settings function as follows: * TRANSPARENT - Intercept all traffic flowing to the appliance and apply cache redirection policies to determine whether content should be served from the cache or from the origin server. * FORWARD - Resolve the hostname of the incoming request,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by using a DNS server, and forward requests for non-cacheable content to the resolved origin servers. Cacheable requests are sent to the configured cache servers. * REVERSE - Configure reverse proxy caches for specific origin servers. Incoming traffic directed to the reverse proxy can either be served from a cache server or be sent to the origin server with or without modification to the URL. The default value for cache type is TRANSPARENT if service is HTTP or SSL whereas the default cache type is FORWARD if the service is HDX. Possible values = TRANSPARENT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			REVERSE, FORWARD
redirect	<String>	Read-write	Type of cache server to which to redirect HTTP requests. Available settings function as follows: * CACHE - Direct all requests to the cache. * POLICY - Apply the cache redirection policy to determine whether the request should be directed to the cache or to the origin. * ORIGIN - Direct all requests to the origin server. Default value: POLICY Possible values = CACHE, POLICY, ORIGIN
onpolicymatch	<String>	Read-write	Redirect requests that match the policy to either the cache or the origin server, as specified.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: For this option to work, you must set the cache redirection type to POLICY. Default value: ORIGIN Possible values = CACHE, ORIGIN
redirecturl	<String>	Read-write	URL of the server to which to redirect traffic if the cache redirection virtual server configured on the Citrix ADC becomes unavailable. Minimum length = 1 Maximum length = 128
clttimeout	<Double>	Read-write	Time-out value, in seconds, after which to terminate an idle client connection. Minimum value = 0 Maximum value = 31536000
precedence	<String>	Read-write	Type of policy (URL or RULE) that takes precedence on the cache redirection virtual server. Applies only to cache redirection virtual

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			servers that have both URL and RULE based policies. If you specify URL, URL based policies are applied first, in the following order: 1. Domain and exact URL 2. Domain, prefix and suffix 3. Domain and suffix 4. Domain and prefix 5. Domain only 6. Exact URL 7. Prefix and suffix 8. Suffix only 9. Prefix only 10. Default If you specify RULE, the rule based policies are applied before URL based policies are applied. Default value: RULE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = RULE, URL
arp	<String>	Read-write	Use ARP to determine the destination MAC address. Possible values = ON, OFF
ghost	<String>	Read-write	. Possible values = ON, OFF
map	<String>	Read-write	Obsolete. Possible values = ON, OFF
format	<String>	Read-write	. Possible values = ON, OFF
via	<String>	Read-write	Insert a via header in each HTTP request. In the case of a cache miss, the request is redirected from the cache server to the origin server. This header indicates whether the request is being sent from a cache server. Default value: ON Possible values = ON, OFF
cachevserver	<String>	Read-write	Name of the default cache virtual server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to which to redirect requests (the default target of the cache redirection virtual server). Minimum length = 1
dnsvservername	<String>	Read-write	Name of the DNS virtual server that resolves domain names arriving at the forward proxy virtual server. Note: This parameter applies only to forward proxy virtual servers, not reverse or transparent. Minimum length = 1
destinationvserver	<String>	Read-write	Destination virtual server for a transparent or forward proxy cache redirection virtual server. Minimum length = 1
domain	<String>	Read-write	Default domain for reverse proxies. Domains are configured to direct an incoming request from a specified source domain to a specified target domain. There can be several

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configured pairs of source and target domains. You can select one pair to be the default. If the host header or URL of an incoming request does not include a source domain, this option sends the request to the specified target domain. Minimum length = 1
sopersistencetimeout	<Double>	Read-write	Time-out, in minutes, for spillover persistence. Minimum value = 2 Maximum value = 24
sothreshold	<Double>	Read-write	For CONNECTION (or) DYNAMICCONNECTION spillover, the number of connections above which the virtual server enters spillover mode. For BANDWIDTH spillover, the amount of incoming and outgoing traffic (in Kbps) before spillover. For HEALTH spillover, the percentage of active services (by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			weight) below which spillover occurs. Minimum value = 1
reuse	<String>	Read-write	Reuse TCP connections to the origin server across client connections. Do not set this parameter unless the Service Type parameter is set to HTTP. If you set this parameter to OFF, the possible settings of the Redirect parameter function as follows: * CACHE - TCP connections to the cache servers are not reused. * ORIGIN - TCP connections to the origin servers are not reused. * POLICY - TCP connections to the origin servers are not reused. If you set the Reuse parameter to ON, connections to origin servers and connections to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cache servers are reused. Default value: ON Possible values = ON, OFF
state	<String>	Read-write	Initial state of the cache redirection virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
downstateflush	<String>	Read-write	Perform delayed cleanup of connections to this virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
backupvserver	<String>	Read-write	Name of the backup virtual server to which traffic is forwarded if the active server becomes unavailable. Minimum length = 1
disableprimaryondown	<String>	Read-write	Continue sending traffic to a backup virtual server even

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			after the primary virtual server comes UP from the DOWN state. Default value: DISABLED Possible values = ENABLED, DISABLED
l2conn	<String>	Read-write	Use L2 parameters, such as MAC, VLAN, and channel to identify a connection. Possible values = ON, OFF
backendssl	<String>	Read-write	Decides whether the backend connection made by Citrix ADC to the origin server will be HTTP or SSL. Applicable only for SSL type CR Forward proxy vserver. Default value: DISABLED Possible values = ENABLED, DISABLED
listenpolicy	<String>	Read-write	String specifying the listen policy for the cache redirection virtual server. Can be either an in-line expression or the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name of a named expression. Default value: "NONE"
listenpriority	<Double>	Read-write	Priority of the listen policy specified by the Listen Policy parameter. The lower the number, higher the priority. Default value: 101 Minimum value = 0 Maximum value = 100
tcpprofilename	<String>	Read-write	Name of the profile containing TCP configuration information for the cache redirection virtual server. Minimum length = 1 Maximum length = 127
httpprofilename	<String>	Read-write	Name of the profile containing HTTP configuration information for cache redirection virtual server. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Comments associated with this virtual server. Maximum length = 256
srcipexpr	<String>	Read-write	Expression used to extract the source IP addresses from the requests originating from the cache. Can be either an in-line expression or the name of a named expression. Minimum length = 1 Maximum length = 1500
originusip	<String>	Read-write	Use the client's IP address as the source IP address in requests sent to the origin server. Note: You can enable this parameter to implement fully transparent CR deployment. Possible values = ON, OFF
useportrange	<String>	Read-write	Use a port number from the port range (set by using the set ns param command, or in the Create

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Virtual Server (Cache Redirection) dialog box) as the source port in the requests sent to the origin server. Default value: OFF Possible values = ON, OFF
appflowlog	<String>	Read-write	Enable logging of AppFlow information. Default value: ENABLED Possible values = ENABLED, DISABLED
netprofile	<String>	Read-write	Name of the network profile containing network configurations for the cache redirection virtual server. Minimum length = 1 Maximum length = 127
icmpvsrresponse	<String>	Read-write	Criterion for responding to PING requests sent to this virtual server. If ACTIVE, respond only if the virtual server is available. If PASSIVE, respond even if the virtual

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server is not available. Default value: PASSIVE Possible values = PASSIVE, ACTIVE
rhistate	<String>	Read-write	A host route is injected according to the setting on the virtual servers * If set to PASSIVE on all the virtual servers that share the IP address, the appliance always injects the hostroute. * If set to ACTIVE on all the virtual servers that share the IP address, the appliance injects even if one virtual server is UP. * If set to ACTIVE on some virtual servers and PASSIVE on the others, the appliance, injects even if one virtual server set to ACTIVE is UP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: PASSIVE Possible values = PASSIVE, ACTIVE
useoriginipportforcache	<String>	Read-write	Use origin ip/port while forwarding request to the cache. Change the destination IP, destination port of the request came to CR vserver to Origin IP and Origin Port and forward it to Cache. Default value: NO Possible values = YES, NO
newname	<String>	Read-write	New name for the cache redirection virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. If the name includes one or more spaces, enclose the name in double or single

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotation marks (for example, "my name" or 'my name'). Minimum length = 1
ip	<String>	Read-only	.
value	<String>	Read-only	The ssl card status for the transparent ssl cr vserver. Possible values = Certkey not bound, SSL feature disabled
ngname	<String>	Read-only	Nodegroup devno to which this crvserver belongs to.
type	<String>	Read-only	Virtual server type. Possible values = CONTENT, ADDRESS
curstate	<String>	Read-only	The state of the cr vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
status	<Integer>	Read-only	Status.
sc	<String>	Read-only	The state of SureConnect the specified virtual server. Possible values = ON, OFF
authentication	<String>	Read-only	Authentication. Possible values = ON, OFF
homepage	<String>	Read-only	Home page.
rule	<String>	Read-only	Rule.
policyname	<String>	Read-only	Policies bound to this vserver.
pipolicyhits	<Double>	Read-only	Number of hits.
servicename	<String>	Read-only	Service name.
weight	<Double>	Read-only	Weight for this service.
targetvserver	<String>	Read-only	The CSW target server names.
priority	<Double>	Read-only	The priority for the policy.
somethod	<String>	Read-only	The spillover factor. When the main virtual server reaches this spillover threshold, it will give further traffic to the backupvserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, NONE
sopersistence	<String>	Read-only	The state of spillover persistence. Possible values = ENABLED, DISABLED
lbvserver	<String>	Read-only	The Default target server name. Minimum length = 1
bindpoint	<String>	Read-only	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, ICA_REQUEST
invoke	<Boolean>	Read-only	Invoke flag.
labeltype	<String>	Read-only	The invocation type. Possible values = reqvserver, resvserver, policylabel
labelname	<String>	Read-only	Name of the label invoked.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which will get evaluated if the current policy rule evaluates to TRUE.
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of crvserver resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver?**pagesize=#no;pageno=#no**

Use this query-parameter to get the crvserver resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

crvserver_appflowpolicy_binding

Binding object showing the appflowpolicy that can be bound to crvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority for the policy.
bindpoint	<String>	Read-write	For a rewrite policy, the bind point to which to bind the policy. Note: This parameter applies only to rewrite policies, because content switching policies are evaluated only at request time. Possible values = REQUEST, RESPONSE, ICA_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label invoked.
name	<String>	Read-write	Name of the cache redirection virtual server to which to bind the cache redirection policy. Minimum length = 1
targetvserver	<String>	Read-write	Name of the virtual server to which content is forwarded. Applicable only if the policy is a map policy and the cache redirection virtual

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server is of type REVERSE. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag.
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/crvserver_appflowpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"crvserver_appflowpolicy_binding":{

<b>"name":<String_value>,

</b>"policyname":<String_value>,

"targetvserver":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,
```

```
"bindpoint":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver_appflowpolicy_binding/name_value<String>

Query-parameters:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"crvserver_appqoepolicy_binding": [ { "__count": "#no"} ] }
```

crvserver_binding

Binding object which returns the resources bound to crvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of a cache redirection virtual server about which to display detailed information. Minimum length = 1
crvserver_spilloverpolicy_binding	<crvserver_spilloverpolicy_binding[]>	Read-only	spilloverpolicy that can be bound to crvserver.
crvserver_filterpolicy_binding	<crvserver_filterpolicy_binding[]>	Read-only	filterpolicy that can be bound to crvserver.
crvserver_icapolicy_binding	<crvserver_icapolicy_binding[]>	Read-only	icapolicy that can be bound to crvserver.
crvserver_cmppolicy_binding	<crvserver_cmppolicy_binding[]>	Read-only	cmppolicy that can be bound to crvserver.
crvserver_lbvserver_binding	<crvserver_lbvserver_binding[]>	Read-only	lbvserver that can be bound to crvserver.
crvserver_appflowpolicy_binding	<crvserver_appflowpolicy_binding[]>	Read-only	appflowpolicy that can be bound to crvserver.
crvserver_responderpolicy_binding	<crvserver_responderpolicy_binding[]>	Read-only	responderpolicy that can be bound to crvserver.
crvserver_policymap_binding	<crvserver_policymap_binding[]>	Read-only	policymap that can be bound to crvserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crvserver_feopolicy_binding	<crvserver_feopolicy_binding[]>	Read-only	feopolicy that can be bound to crvserver.
crvserver_cachepolicy_binding	<crvserver_cachepolicy_binding[]>	Read-only	cachepolicy that can be bound to crvserver.
crvserver_rewritepolicy_binding	<crvserver_rewritepolicy_binding[]>	Read-only	rewritepolicy that can be bound to crvserver.
crvserver_cspolicy_binding	<crvserver_cspolicy_binding[]>	Read-only	cspolicy that can be bound to crvserver.
crvserver_appqoepolicy_binding	<crvserver_appqoepolicy_binding[]>	Read-only	appqoepolicy that can be bound to crvserver.
crvserver_appfwpolicy_binding	<crvserver_appfwpolicy_binding[]>	Read-only	appfwpolicy that can be bound to crvserver.
crvserver_crpolicy_binding	<crvserver_crpolicy_binding[]>	Read-only	crpolicy that can be bound to crvserver.

Operations

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "crvserver_binding": [ {

"name":<String_value>,
```

```
"crvserver_spilloverpolicy_binding":<crvserver_spilloverpolicy_binding[]_value>,

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver_crpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "crvserver_crpolicy_binding": [ {

"priority":<Double_value>,

"bindpoint":<String_value>,

"policyname":<String_value>,

"labelname":<String_value>,

"name":<String_value>,

"targetvserver":<String_value>,

"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,
```

```
"labeltype":<String_value>,

"hits":<Double_value>,

"pipolicyhits":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver_crpolicy_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"crvserver_crpolicy_binding": [ { "__count": "#no"} ] }
```

crvserver_cspolicy_binding

Binding object showing the cspolicy that can be bound to crvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority for the policy.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, ICA_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label invoked.
name	<String>	Read-write	Name of the cache redirection virtual server to which to bind the cache redirection policy. Minimum length = 1
targetvserver	<String>	Read-write	The CSW target server names.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag.
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resvserver, policylabel
hits	<Double>	Read-only	Number of hits.
pipolicyhits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/crvserver_cspolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
"crvserver_cspolicy_binding":{
<b>"name":<String_value>,
</b>"policyname":<String_value>,
"targetvserver":<String_value>,
"priority":<Double_value>,
"gotopriorityexpression":<String_value>,
"bindpoint":<String_value>,
"invoke":<Boolean_value>,
"labeltype":<String_value>,
"labelname":<String_value>
}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/crvserver_cspolicy_binding/name_value<String>

Query-parameters:

crvserver_filterpolicy_binding

Binding object showing the filterpolicy that can be bound to crvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority for the policy.
bindpoint	<String>	Read-write	For a rewrite policy, the bind point to which to bind the policy. Note: This parameter applies only to rewrite policies, because content switching policies are evaluated only at request time.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = REQUEST, RESPONSE, ICA_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label to be invoked.
name	<String>	Read-write	Name of the cache redirection virtual server to which to bind the cache redirection policy. Minimum length = 1
targetvserver	<String>	Read-write	Name of the virtual server to which content is forwarded. Applicable only if the policy is a map policy and the cache redirection virtual server is of type REVERSE. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), b ut does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number incr ements by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke a policy label if this policy's rule evaluates to TRUE (valid only for default-syntax

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policies such as application firewall, transform, integrated cache, rewrite, responder, and content switching).
labeltype	<String>	Read-write	Type of label to be invoked. Possible values = reqvserver, resvserver, policylabel
inherited	<String>	Read-only	On State describes that policy bound is inherited from global binding. Possible values = ON, OFF
__count	<Double>	Read-only	count parameter

crvserver_lbvserver_binding

Binding object showing the lbvserver that can be bound to crvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the cache redirection virtual server to which to bind the cache redirection policy. Minimum length = 1
lbvserver	<String>	Read-write	The Default target server name. Minimum length = 1
hits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/crvserver_lbvserver_binding

```

crvserver_policymap_binding

Binding object showing the policymap that can be bound to crvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	An unsigned integer that determines the priority of the policy relative to other policies bound to this cache redirection virtual server. The lower the value, higher the priority. Note: This option is available only when binding content switching, filtering, and compression policies to a cache redirection virtual server.
bindpoint	<String>	Read-write	For a rewrite policy, the bind point to which to bind the policy. Note: This parameter applies only to rewrite policies, because content switching

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policies are evaluated only at request time. Possible values = REQUEST, RESPONSE, ICA_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label to be invoked.
name	<String>	Read-write	Name of the cache redirection virtual server to which to bind the cache redirection policy. Minimum length = 1
targetvserver	<String>	Read-write	The CSW target server names.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), b ut does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number incr ements by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke a policy label if this policy's rule evaluates to TRUE (valid only for default-syntax policies such as application firewall, transform, integrated cache, rewrite,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			responder, and content switching).
labeltype	<String>	Read-write	Type of label to be invoked. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/crvserver_rewritepolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

```

crvserver_spilloverpolicy_binding

Binding object showing the spilloverpolicy that can be bound to crvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority for the policy.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, ICA_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label to be invoked.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the cache redirection virtual server to which to bind the cache redirection policy. Minimum length = 1
targetvserver	<String>	Read-write	Name of the virtual server to which content is forwarded. Applicable only if the policy is a map policy and the cache redirection virtual server is of type REVERSE. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke a policy label if this policy's rule evaluates to TRUE (valid only for default-syntax policies such as application firewall, transform, integrated cache, rewrite, responder, and content switching).
labeltype	<String>	Read-write	Type of label to be invoked.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

NAME	DESCRIPTION
contentinspectionprofile	Configuration for ContentInspection profile

contentinspectionaction

Configuration for Content Inspection action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the remote service action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.
type	<String>	Read-write	Type of operation this action is going to perform. following actions are available to configure: * ICAP - forward the incoming request or response to an ICAP server for modification.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* INLINEINSPECTION - forward the incoming or outgoing packets to IPS server for Intrusion Prevention. * MIRROR - Forwards cloned packets for Intrusion Detection. * NOINSPECTION - This does not forward incoming and outgoing packets to the Inspection device. * NSTRACE - capture current and further incoming packets on this transaction. Possible values = ICAP, INLINEINSPECTION, MIRROR, NOINSPECTION
servername	<String>	Read-write	Name of the LB vserver or service. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
serverip	<String>	Read-write	IP address of remoteService. Minimum length = 1
serverport	<Double>	Read-write	Port of remoteService. Default value: 1344 Minimum value = 1 Maximum value = 65535
icapprofilename	<String>	Read-write	Name of the ICAP profile to be attached to the contentInspection action. Minimum length = 1 Maximum length = 127
ifserverdown	<String>	Read-write	Name of the action to perform if the Vserver representing the remote service is not UP. This is not supported for NOINSPECTION Type. There are also some built-in actions which can be used. These are: * RESET - Reset the client connection by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user. Default value: CONTINUE Possible values = CONTINUE, DROP, RESET
reqtimeout	<Double>	Read-write	Time, in seconds, within which the remote service request must complete. This is not supported for NOINSPECTION action type. If the request does not complete within this time, the specified request timeout action is executed. Zero disables the timeout. Default value: 0 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 86400
reqtimeoutaction	<String>	Read-write	Name of the action to perform if the Vserver representing the remote service does not respond. This is not supported for NOINSPECTION action type. There are also some built-in actions which can be used. These are: * RESET - Reset the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user. Default value: BYPASS Possible values = BYPASS, DROP, RESET

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hits	<Double>	Read-only	The number of times the action has been taken.
referencecount	<Double>	Read-only	The number of references to the action.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
builtin	<String[]>	Read-only	Flag to determine whether contentinspection action is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
__count	<Double>	Read-only	count parameter

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "contentinspectionglobal_binding": [ {

"contentinspectionglobal_contentinspectionpolicy_binding":<contentinspectionglobal_contentinspectionpolicy_binding[]_value>

}]}
```

contentinspectionglobal_contentinspectionpolicy_binding

Binding object showing the contentinspectionpolicy that can be bound to contentinspectionglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the contentInspection policy.
type	<String>	Read-write	The bindpoint to which to policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT
labeltype	<String>	Read-write	Type of invocation. Available settings function as follows: * reqvserver - Forward the request to the specified request virtual server. * resvserver - Forward the response to the specified response virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, resvserver, policylabel
labelname	<String>	Read-write	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which to forward the request of response.
invoke	<Boolean>	Read-write	Terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
flowtype	<Double>	Read-only	flowtype of the bound contentInspection policy.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/contentinspectionglobal_contentinspectionpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"contentinspectionglobal_contentinspectionpolicy_binding":{

<b>"policyname":<String_value>,

</b><b>"priority":<Double_value>,

</b>"gotopriorityexpression":<String_value>,
```

```
"type":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/contentinspectionglobal_contentinspectionpolicy_binding

Query-parameters:

contentinspectionpolicy

Configuration for ContentInspection policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the contentInspection policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			characters. Can be changed after the contentInspection policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my contentInspection policy" or 'my contentInspection policy').
rule	<String>	Read-write	Expression that the policy uses to determine whether to execute the specified action.
action	<String>	Read-write	Name of the contentInspection action to perform if the request matches this contentInspection policy. There are also some built-in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			actions which can be used. These are: * NOINSPECTION - Send the request from the client to the server or response from the server to the client without sending it to Inspection device for Content Inspection. * RESET - Resets the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the above built-in actions can be used.
comment	<String>	Read-write	Any type of information about this contentInspection policy.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
newname	<String>	Read-write	New name for the contentInspection policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contentInspection policy" or 'my contentInspection policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of policy UNDEF hits.
__count	<Double>	Read-only	count parameter

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/contentinspectionpolicy_contentinspectionpolicylabel_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/contentinspectionpolicy_contentinspectionpolicylabel_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of contentinspectionpolicy_contentinspectionpolicylabel_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/contentinspectionpolicy_contentinspectionpolicylabel_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the contentinspectionpolicy_contentinspectionpolicylabel_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

"deployment":<String_value>,

"connectorresidence":<String_value>

}]}
```

cloudautoscalegroup

Configuration for Cloud autoscalegroup resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
azcount	<Integer>	Read-only	Number of Availibility Zone this Autoscale Group is in.
aznames	<String[]>	Read-only	Availibility Zones this Autoscale Group is in.
graceful	<String>	Read-only	Autoscale down policy Set for this Autoscale group. Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cloudautoscalegroup

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cloudautoscalegroup?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cloudautoscalegroup?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of cloudautoscalegroup resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cloudautoscalegroup?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cloudautoscalegroup?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cloudautoscalegroup resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cloudautoscalegroup": [ {

"name":<String_value>,

"azcount":<Integer_value>,

```

cloudprofile

Configuration for cloud profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Cloud profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
type	<String>	Read-write	Type of cloud profile that you want to create, stats or Vserver. Possible values = autoscale, stats
vservername	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicetype	<String>	Read-write	Protocol used by the service (also called the service type). Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, DNS, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, RTSP, PUSH, SSL_PUSH, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, SMPP, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, PROXY, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
ipaddress	<String>	Read-write	IPv4 or IPv6 address to assign to the virtual server.
port	<Integer>	Read-write	Port number for the virtual server. Range 1 - 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* in CLI is represented as 65535 in NITRO API
servicegroupname	<String>	Read-write	servicegroups bind to this server.
boundservicegroups vctype	<String>	Read-write	The type of bound service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, ORACLE, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vsvrbindsvcport	<Integer>	Read-write	The port number to be used for the bound service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
graceful	<String>	Read-write	Indicates graceful shutdown of the service. System will wait for all outstanding connections to this service to be closed before disabling the service. Default value: NO Possible values = YES, NO
delay	<Double>	Read-write	Time, in seconds, after which all the services configured on the server are disabled.
__count	<Double>	Read-only	count parameter

JOIN

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

join

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cluster?**action=join**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cluster":{

<b>"clip":<String_value>,

</b><b>"password":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

clusterfiles

Configuration for files resource.

SYNC

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

sync

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterfiles?**action=sync**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"clusterfiles":{

"mode":<String[]_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

clusterinstance

Configuration for cluster instance resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clid	<Double>	Read-write	Unique number that identifies the cluster. Minimum value = 1 Maximum value = 16
deadinterval	<Double>	Read-write	Amount of time, in seconds, after which nodes that do not respond to the heartbeats are assumed to be down.If the value is less than 3 sec, set the helloInterval parameter to 200 msec. Default value: 3 Minimum value = 1 Maximum value = 60
hellointerval	<Double>	Read-write	Interval, in milliseconds, at which heartbeats are sent to each cluster node to check the health status.Set the value to 200 msec, if the deadInterval parameter is less than 3 sec. Default value: 200

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 200 Maximum value = 1000
preemption	<String>	Read-write	Preempt a cluster node that is configured as a SPARE if an ACTIVE node becomes available. Default value: DISABLED Possible values = ENABLED, DISABLED
quorumtype	<String>	Read-write	Quorum Configuration Choices - "Majority" (recommended) requires majority of nodes to be online for the cluster to be UP. "None" relaxes this requirement. Default value: MAJORITY Possible values = MAJORITY, NONE
inc	<String>	Read-write	This option is required if the cluster nodes reside on different networks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
processlocal	<String>	Read-write	By turning on this option packets destined to a service in a cluster will not under go any steering. Default value: DISABLED Possible values = ENABLED, DISABLED
retainconnectionsoncluster	<String>	Read-write	This option enables you to retain existing connections on a node joining a Cluster system or when a node is being configured for passive timeout. By default, this option is disabled. Default value: NO Possible values = YES, NO
nodegroup	<String>	Read-write	The node group in a Cluster system used for transition from L2 to L3.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
adminstate	<String>	Read-only	Cluster Admin State. Default value: DISABLED Possible values = ENABLED, DISABLED
propstate	<String>	Read-only	Enable/Disable the execution of commands on the cluster. This will not impact the execution of commands on individual cluster nodes by using the NSIP. Default value: ENABLED Possible values = ENABLED, DISABLED
validmtu	<Double>	Read-only	Correct MTU value that has to be set on backplane.
heterogeneousflag	<String>	Read-only	This field diplay if heterogeneous is detected in the cluster system. Default value: NO Possible values = YES, NO
operationalstate	<String>	Read-only	Cluster Operational State.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
status	<String>	Read-only	Cluster Operational State. Possible values = DOWN, UP, PARTIAL-UP, UNKNOWN
rsskeymismatch	<Boolean>	Read-only	This argument is used to determine if there is a RSS key mismatch at cluster instance level.
penummismatch	<Boolean>	Read-only	This argument is used to determine if there is a PE number mismatch at cluster instance level.
nodegroupstatewarning	<Boolean>	Read-only	This argumnt is used to determind whether all the cluster nodes are bound to nodegroup with state set.
licensemismatch	<Boolean>	Read-only	This argument is used to determine if there is a License mismatch at cluster instance level.
jumbonotsupported	<Boolean>	Read-only	This argument is used to determine if Jumbo framework is not supported at

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cluster instance level.
clusternoheartbeatonnode	<Boolean>	Read-only	HB is not seen on the backplane interface of member node.
clusternolinksetmbf	<Boolean>	Read-only	MBF is enabled but linkset is not configured .
clusternospottedip	<Boolean>	Read-only	There is no spotted SNIP or MIP.
nodepenummismatch	<Boolean>	Read-only	This argument is used to determine if there is a PE missmatch at cluster node level.
operationalpropstate	<String>	Read-only	Cluster Operational Propagation State. Default value: ENABLED Possible values = UNKNOWN, ENABLED, DISABLED, AUTO DISABLED
__count	<Double>	Read-only	count parameter

Request Payload:

```
{"clusterinstance":{

<b>"clid":<Double_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

disable

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance?**action=disable**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"clusterinstance":{

<b>"clid":<Double_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of clusterinstance resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance?**pagesize=#no;pageno=#no**

Use this query-parameter to get the clusterinstance resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

```

clusterinstance_binding

Binding object which returns the resources bound to clusterinstance.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clid	<Double>	Read-write	Unique number that identifies the cluster. Minimum value = 1 Maximum value = 16
clusterinstance_clusternode_binding	<clusterinstance_clusternode_binding[]>	Read-only	clusternode that can be bound to clusterinstance.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance_binding/clid_value<Double>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "clusterinstance_binding": [ {
```

```
"clid":<Double_value>,

"clusterinstance_clusternode_binding":<clusterinstance_clusternode_binding
[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "clusterinstance_binding": [ {

"clid":<Double_value>,

"clusterinstance_clusternode_binding":<clusterinstance_clusternode_binding
[]_value>
```

```
}]}
```

clusterinstance_clusternode_binding

Binding object showing the clusternode that can be bound to clusterinstance.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Double>	Read-write	The unique number that identiies a cluster. Minimum value = 0 Maximum value = 31
clid	<Double>	Read-write	Unique number that identifies the cluster. Minimum value = 1 Maximum value = 16
state	<String>	Read-only	Active, Spare or Passive. An active node serves traffic. A spare node serves as a backup for active nodes. A passive node does not serve traffic. This may be useful during temporary maintenance activity where it is desirable that the node takes part in the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			consensus protocol, but not serve traffic. Default value: PASSIVE Possible values = ACTIVE, SPARE, PASSIVE
nodersskeymismatch	<Boolean>	Read-only	This argument is used to determine if there is a RSS key mismatch at cluster node level.
nodelicensemismatch	<Boolean>	Read-only	This argument is used to determine if there is a License mismatch at cluster node level.
effectivestate	<String>	Read-only	Node effective health state. Possible values = UP, NOT UP, UNKNOWN, INIT
islocalnode	<Boolean>	Read-only	This argument is used to determine whether it is local node.
isconfigurationcoordinator	<Boolean>	Read-only	This argument is used to determine whether the node is configuration coordinator (CCO).
nodejumbonotsupported	<Boolean>	Read-only	This argument is used to determine if Jumbo framework

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			not supported at cluster node level.
health	<String>	Read-only	Node Health state. Possible values = UNKNOWN, INIT, DOWN, UP, Some enabled and HAMON interfaces of the node are down, All interfaces of the node are down or disabled, SSL card(s) of the node have failed, Route Monitor(s) of the node have failed, Service state is being synchronized with the cluster, The backplane interface is either not set or it is down or is disabled, The CLAG member(s) of the node are down, Persistence sessions are being synchronized with the cluster, The Syn Cookie is being synchronized with the cluster, Unknown Health, AAA keys are being

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			sychronized with the cluster, Cluster health is not up due to config sync is in progress
clusterhealth	<String>	Read-only	Node clusterd state. Possible values = UP, Configurations of the node are lagging behind the cluster by more than 256 commands, The config sync operation has exceeded the time limit of 60 seconds, The config sync operation (full sync) is in progress, The node is not in sync with the cluster configurations as sync is disabled on this node, The execution of a configuration command has failed on this node, UNKNOWN
masterstate	<String>	Read-only	Master state. Possible values = INACTIVE, ACTIVE, UNKNOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-only	The IP Address of the node.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance_clusternode_binding/clid_value<Double>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance_clusternode_binding/clid_value<Double>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of clusterinstance_clusternode_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusterinstance_clusternode_binding/clid_value<Double>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the clusterinstance_clusternode_binding resources in chunks.

clusternode

Configuration for cluster node resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	Citrix ADC IP (NSIP) address of the appliance to add to the cluster. Must be an IPv4 address. Minimum length = 1
state	<String>	Read-write	Admin state of the cluster node. The available settings function as follows: ACTIVE - The node serves traffic. SPARE - The node does not serve traffic unless an ACTIVE node goes down. PASSIVE - The node does not serve traffic, unless you change its state. PASSIVE state is useful during temporary maintenance activities in which you want the node to take part in the consensus protocol but not to serve traffic. Default value: PASSIVE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ACTIVE, SPARE, PASSIVE
backplane	<String>	Read-write	Interface through which the node communicates with the other nodes in the cluster. Must be specified in the three-tuple form n/c/u, where n represents the node ID and c/u refers to the interface on the appliance. Minimum length = 1
priority	<Double>	Read-write	Preference for selecting a node as the configuration coordinator. The node with the lowest priority value is selected as the configuration coordinator. When the current configuration coordinator goes down, the node with the next lowest priority is made the new configuration coordinator. When the original node comes back up, it will preempt the new configuration

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			coordinator and take over as the configuration coordinator. Note: When priority is not configured for any of the nodes or if multiple nodes have the same priority, the cluster elects one of the nodes as the configuration coordinator. Default value: 31 Minimum value = 0 Maximum value = 31
nodegroup	<String>	Read-write	The default node group in a Cluster system. Default value: DEFAULT_NG Minimum length = 1
delay	<Double>	Read-write	Applicable for Passive node and node becomes passive after this timeout (in minutes). Default value: 0 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 1440
tunnelmode	<String>	Read-write	To set the tunnel mode. Default value: NONE Possible values = NONE, GRE, UDP
clearnodegroupconfig	<String>	Read-write	Option to remove nodegroup config. Default value: YES Possible values = YES, NO
clusterhealth	<String>	Read-only	Node clusterd state. Possible values = UP, Configurations of the node are lagging behind the cluster by more than 256 commands, The config sync operation has exceeded the time limit of 60 seconds, The config sync operation (full sync) is in progress, The node is not in sync with the cluster configurations as sync is disabled on this node, The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			execution of a configuration command has failed on this node, UNKNOWN
effectivestate	<String>	Read-only	Node effective health state. Possible values = UP, NOT UP, UNKNOWN, INIT
operationalsyncstate	<String>	Read-only	Node Operational Reconciliation state. Default value: ENABLED Possible values = ENABLED, SUCCESS, IN PROGRESS, FAILED, INCREMENTAL SYNC DISABLED, DISABLED, UNKNOWN
masterstate	<String>	Read-only	Node Master state. Possible values = INACTIVE, ACTIVE, UNKNOWN
health	<String>	Read-only	Node Health state. Possible values = UNKNOWN, INIT, DOWN, UP, Some enabled and HAMON interfaces

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of the node are down, All interfaces of the node are down or disabled, SSL card(s) of the node have failed, Route Monitor(s) of the node have failed, Service state is being synchronized with the cluster, The backplane interface is either not set or it is down or is disabled, The CLAG member(s) of the node are down, Persistence sessions are being synchronized with the cluster, The Syn Cookie is being synchronized with the cluster, Unknown Health, AAA keys are being sychronized with the cluster, Cluster health is not up due to config sync is in progress
syncstate	<String>	Read-only	Enable/Disable the synchronization of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cluster configurations on the node. Default value: ENABLED Possible values = ENABLED, DISABLED
isconfigurationcoordinator	<Boolean>	Read-only	This argument is used to determine whether the node is configuration coordinator (CCO).
islocalnode	<Boolean>	Read-only	This argument is used to determine whether it is local node.
nodersskeymismatch	<Boolean>	Read-only	This argument is used to determine if there is a RSS key mismatch at cluster node level.
nodelicensemismatch	<Boolean>	Read-only	This argument is used to determine if there is a License mismatch at cluster node level.
nodejumbonotsupported	<Boolean>	Read-only	This argument is used to determine if Jumbo framework not supported at cluster node level.
nodelist	<Double[]>	Read-only	Nodelist for displaying Heartbeat

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			not seen interfaces on a cluster node.
ifaceslist	<String[]>	Read-only	Interface list corresponding to nodelist for Heartbeat not seen interfaces on a cluster node.
enabledifaces	<String>	Read-only	Enabled Interfaces on a cluster node.
disabledifaces	<String>	Read-only	Disabled Interfaces on a cluster node.
partialfailifaces	<String>	Read-only	Partial Failure Interfaces on a cluster node.
hamonifaces	<String>	Read-only	Hamon Interfaces on a cluster node.
name	<String>	Read-only	Name of the state specific nodegroup. Minimum length = 1
cfgflags	<Double>	Read-only	Flag indicates whether the node is bound to cluster nodegroup.
routemonitor	<String>	Read-only	The IP address (IPv4 or IPv6).
netmask	<String>	Read-only	The netmask.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| UPDATE| UNSET| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternode

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"clusternode":{

<b>"nodeid":<Double_value>,

</b><b>"ipaddress":<String_value>,

clusternodegroup

Configuration for Node group object type resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the nodegroup. The name uniquely identifies the nodegroup on the cluster. Minimum length = 1
strict	<String>	Read-write	Specifies whether cluster nodes, that are not part of the nodegroup, will be used as backup for the nodegroup. * Enabled - When one of the nodes goes down, no other cluster node is picked up to replace

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			it. When the node comes up, it will continue being part of the nodegroup. * Disabled - When one of the nodes goes down, a non-nodegroup cluster node is picked up and acts as part of the nodegroup. When the original node of the nodegroup comes up, the backup node will be replaced. Default value: NO Possible values = YES, NO
sticky	<String>	Read-write	Only one node can be bound to nodegroup with this option enabled. It specifies whether to prempt the traffic for the entities bound to nodegroup when owner node goes down and rejoins the cluster. * Enabled - When owner node goes down, backup node will become the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			owner node and takes the traffic for the entities bound to the nodegroup. When bound node rejoins the cluster, traffic for the entities bound to nodegroup will not be steered back to this bound node. Current owner will have the ownership till it goes down. * Disabled - When one of the nodes goes down, a non-nodegroup cluster node is picked up and acts as part of the nodegroup. When the original node of the nodegroup comes up, the backup node will be replaced. Default value: NO Possible values = YES, NO
state	<String>	Read-write	State of the nodegroup. All the nodes binding to this nodegroup must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			have the same state. ACTIVE/SPARE/ PASSIVE. Possible values = ACTIVE, SPARE, PASSIVE
priority	<Double>	Read-write	Priority of Nodegroup. This priority is used for all the nodes bound to the nodegroup for Nodegroup selection. Minimum value = 0 Maximum value = 31
currentnodemask	<Double>	Read-only	Bitmap of current nodes in this nodegroup.
backupnodemask	<Double>	Read-only	Bitmap of backup nodes in this nodegroup.
boundedentitiescntfrompe	<Double>	Read-only	Count of bounded entities to this nodegroup accoding to PE.
activelist	<Double[]>	Read-only	Active node list of this nodegroup.
backuplist	<Double[]>	Read-only	Backup node list of this nodegroup.
__count	<Double>	Read-only	count parameter

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_authenticationvserver_binding?**args=;count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "clusternodegroup_authenticationvserver_binding": [ { "__count":
"#no"} ] }
```

clusternodegroup_binding

Binding object which returns the resources bound to clusternodegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the nodegroup to be displayed. If a name is not provided, information about all nodegroups is displayed. Minimum length = 1
clusternodegroup_csvserver_binding	<clusternodegroup_csvserver_binding[]>	Read-only	csvserver that can be bound to clusternodegroup.
clusternodegroup_gslbsite_binding	<clusternodegroup_gslbsite_binding[]>	Read-only	gslbsite that can be bound to clusternodegroup.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clusternodegroup_nslimitidentifier_binding	<clusternodegroup_nslimitidentifier_binding[]>	Read-only	nslimitidentifier that can be bound to clusternodegroup.
clusternodegroup_clusternode_binding	<clusternodegroup_clusternode_binding[]>	Read-only	clusternode that can be bound to clusternodegroup.
clusternodegroup_lbvserver_binding	<clusternodegroup_lbvserver_binding[]>	Read-only	lbvserver that can be bound to clusternodegroup.
clusternodegroup_vpnvserver_binding	<clusternodegroup_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to clusternodegroup.
clusternodegroup_service_binding	<clusternodegroup_service_binding[]>	Read-only	service that can be bound to clusternodegroup.
clusternodegroup_streamidentifier_binding	<clusternodegroup_streamidentifier_binding[]>	Read-only	streamidentifier that can be bound to clusternodegroup.
clusternodegroup_gslbvserver_binding	<clusternodegroup_gslbvserver_binding[]>	Read-only	gslbvserver that can be bound to clusternodegroup.
clusternodegroup_authenticationvserver_binding	<clusternodegroup_authenticationvserver_binding[]>	Read-only	authenticationvserver that can be bound to clusternodegroup.
clusternodegroup_crvserver_binding	<clusternodegroup_crvserver_binding[]>	Read-only	crvserver that can be bound to clusternodegroup.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_gslbsite_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "clusternodegroup_gslbsite_binding": [ {

"gslbsite":<String_value>,

"name":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_gslbsite_binding?**args=;count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "clusternodegroup_gslbsite_binding": [ { "__count": "#no"} ] }
```

clusternodegroup_gslbvserver_binding

Binding object showing the gslbvserver that can be bound to clusternodegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserver	<String>	Read-write	vserver that need to be bound to this nodegroup.
name	<String>	Read-write	Name of the nodegroup. The name uniquely identifies the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			nodegroup on the cluster. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/clusternodegroup_gslbvserver_binding

```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_streamidentifier_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_streamidentifier_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "clusternodegroup_streamidentifier_binding": [ {
```

```
"name":<String_value>,

"identifiername":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_streamidentifier_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"clusternodegroup_streamidentifier_binding": [ { "__count": "#no"} ] }
```

clusternodegroup_vpnvserver_binding

Binding object showing the vpnvserver that can be bound to clusternodegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserver	<String>	Read-write	vserver that need to be bound to this nodegroup.
name	<String>	Read-write	Name of the nodegroup. The name uniquely identifies the nodegroup on the cluster. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/clusternodegroup_vpnvserver_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"clusternodegroup_vpnvserver_binding":{

<b>"name":<String_value>,

</b>"vserver":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_vpnvserver_binding

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_vpnvserver_binding?**args=name:<String_value>,vserver:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_vpnvserver_binding

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_vpnvserver_binding?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of clusternodegroup_vpnvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clusternodegroup_vpnvserver_binding?**pagesize=#no;pageno=#no**

Use this query-parameter to get the clusternodegroup_vpnvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Content-Type:application/json

Response Payload:

```
{ "clusternodegroup_vpnvserver_binding": [ { "__count": "#no"} ] }
```

clusternode_binding

Binding object which returns the resources bound to clusternode.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Double>	Read-write	ID of the cluster node for which to display information. If an ID is not provided, information about all nodes is shown. Default value: 255 Minimum value = 0 Maximum value = 31
clusternode_routemonitor_binding	<clusternode_routemonitor_binding[]>	Read-only	routemonitor that can be bound to clusternode.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Force

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/clustersync?**action=Force**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"clustersync":{

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

Compression

Compression

Compression configuration. The system's feature for compressing HTTP responses to compression-aware browsers.

NAME	DESCRIPTION
cmpaction	Configuration for compression action
cmpglobal_binding	Binding object showing the resources that can be bound to cmpglobal
cmpglobal_cmppolicy_binding	Binding object showing the cmppolicy that can be bound to cmpglobal
cmpparameter	Configuration for CMP parameter
cmppolicy	Configuration for compression policy
cmppolicy_binding	Binding object showing the resources that can be bound to cmppolicy
cmppolicy_cmpglobal_binding	Binding object showing the cmpglobal that can be bound to cmppolicy
cmppolicy_cmppolicylabel_binding	Binding object showing the cmppolicylabel that can be bound to cmppolicy

NAME	DESCRIPTION
cmppolicy_crvserver_binding	Binding object showing the crvserver that can be bound to cmppolicy
cmppolicy_csvserver_binding	Binding object showing the csvserver that can be bound to cmppolicy
cmppolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to cmppolicy
cmppolicylabel	Configuration for compression policy label
cmppolicylabel_binding	Binding object showing the resources that can be bound to cmppolicylabel
cmppolicylabel_cmppolicy_binding	Binding object showing the cmppolicy that can be bound to cmppolicylabel
cmppolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to cmppolicylabel

cmpaction

Configuration for compression action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the compression action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. Can be changed after the action is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp action" or 'my cmp action'). Minimum length = 1
cmptype	<String>	Read-write	Type of compression performed by this action. Available settings function as follows: * COMPRESS - Apply GZIP or DEFLATE compression to the response, depending on the request header. Prefer GZIP. * GZIP - Apply GZIP compression.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DEFLATE - Apply DEFLATE compression. * NOCOMPRESS - Do not compress the response if the request matches a policy that uses this action. Possible values = compress, gzip, deflate, nocompress
addvaryheader	<String>	Read-write	Control insertion of the Vary header in HTTP responses compressed by Citrix ADC. Intermediate caches store different versions of the response for different values of the headers present in the Vary response header. Default value: GLOBAL Possible values = GLOBAL, DISABLED, ENABLED
varyheadervalue	<String>	Read-write	The value of the HTTP Vary header for compressed responses.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
deltatype	<String>	Read-write	The type of delta action (if delta type compression action is defined). Default value: PERURL Possible values = PERURL, PERPOLICY
newname	<String>	Read-write	New name for the compression action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Choose a name that can be correlated with the function that the action performs. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp action" or 'my cmp action'). Minimum length = 1
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default policy.
__count	<Double>	Read-only	count parameter

```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmpaction

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmpaction?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmpaction?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of cmpaction resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmpaction?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmpaction?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cmpaction resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

cmpglobal_binding

Binding object which returns the resources bound to cmpglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cmpglobal_cmppolicy_binding	<cmpglobal_cmppolicy_binding[]>	Read-only	cmppolicy that can be bound to cmpglobal.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmpglobal_binding

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cmpglobal_binding": [ {

"cmpglobal_cmppolicy_binding":<cmpglobal_cmppolicy_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmpglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmpglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cmpglobal_binding": [ {

"cmpglobal_cmppolicy_binding":<cmpglobal_cmppolicy_binding[]_value>

}]}
```

cmpglobal_cmppolicy_binding

Binding object showing the cmppolicy that can be bound to cmpglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Positive integer specifying the priority of the policy. The lower the number, the higher the priority. By default, polices within a label are evaluated in the order of their priority numbers. In the configuration utility, you can click the Priority field and edit the priority level or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			drag the entry to a new position in the list. If you drag the entry to a new position, the priority level is updated automatically.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	The name of the globally bound HTTP compression policy.
labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE. Applicable only to advanced (default-syntax) policies.
state	<String>	Read-write	The current state of the policy binding. This attribute is relevant only for CLASSIC policies. Possible values = ENABLED, DISABLED
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the priority of the next

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy, within the policy label, to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher numbered priority. * END - Stop evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, it's evaluation result determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, that policy is evaluated next. * If the expression evaluates to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			priority of the current policy, the policy with the next higher priority number is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest priority number, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or a policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority. Applicable only for default-syntax policies.
type	<String>	Read-write	Bind point to which the policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT
labeltype	<String>	Read-write	Type of policy label invocation. This argument is relevant only for advanced (default-syntax) policies. Possible values = reqvserver, resvserver, policylabel
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policytype	<String>	Read-only	Policy type (Classic/ Advanced) to be bound.Used for display. Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

cmpparameter

Configuration for CMP parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cmplevel	<String>	Read-write	Specify a compression level. Available settings function as follows: * Optimal - Corresponds to a gzip GZIP level of 5-7. * Best speed - Corresponds to a gzip level of 1. * Best compression - Corresponds to a gzip level of 9. Default value: optimal Possible values = optimal, bestspeed, bestcompression
quantumsize	<Double>	Read-write	Minimum quantum of data to be filled before compression begins. Default value: 57344 Minimum value = 8

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 63488
servercmp	<String>	Read-write	Allow the server to send compressed data to the Citrix ADC. With the default setting, the Citrix ADC appliance handles all compression. Default value: ON Possible values = ON, OFF
heurexpiry	<String>	Read-write	Heuristic basefile expiry. Default value: OFF Possible values = ON, OFF
heurexpirythres	<Double>	Read-write	Threshold compression ratio for heuristic basefile expiry, multiplied by 100. For example, to set the threshold ratio to 1.25, specify 125. Default value: 100 Minimum value = 1 Maximum value = 1000
heurexpiryhistwt	<Double>	Read-write	For heuristic basefile expiry, weightage to be given to historical

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			delta compression ratio, specified as percentage. For example, to give 25% weightage to historical ratio (and therefore 75% weightage to the ratio for current delta compression transaction), specify 25. Default value: 50 Minimum value = 1 Maximum value = 100
minressize	<Double>	Read-write	Smallest response size, in bytes, to be compressed.
cmpbypasspct	<Double>	Read-write	Citrix ADC CPU threshold after which compression is not performed. Range: 0 - 100. Default value: 100 Minimum value = 0 Maximum value = 100
cmponpush	<String>	Read-write	Citrix ADC does not wait for the quantum to be filled before starting to compress data. Upon receipt of a packet with a PUSH flag, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			appliance immediately begins compression of the accumulated packets. Default value: DISABLED Possible values = ENABLED, DISABLED
policytype	<String>	Read-write	Type of policy. Available settings function as follows: * Classic - Classic policies evaluate basic characteristics of traffic and other data. Deprecated. * Advanced - Advanced policies (which have been renamed as default syntax policies) can perform the same type of evaluations as classic policies. They also enable you to analyze more data (for example, the body of an HTTP request) and to configure more operations in the policy rule (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			transforming data in the body of a request into an HTTP header). Possible values = CLASSIC, ADVANCED
addvaryheader	<String>	Read-write	Control insertion of the Vary header in HTTP responses compressed by Citrix ADC. Intermediate caches store different versions of the response for different values of the headers present in the Vary response header. Default value: DISABLED Possible values = ENABLED, DISABLED
varyheadervalue	<String>	Read-write	The value of the HTTP Vary header for compressed responses. If this argument is not specified, a default value of "Accept-Encoding" will be used. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
externalcache	<String>	Read-write	Enable insertion of Cache-Control: private response directive to indicate response message is intended for a single user and must not be cached by a shared or proxy cache. Default value: NO Possible values = YES, NO

cmppolicy

Configuration for compression policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the HTTP compression policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp policy" or 'my cmp policy'). Minimum length = 1
rule	<String>	Read-write	Expression that determines which HTTP requests or responses match the compression policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
resaction	<String>	Read-write	The built-in or user-defined compression action to apply to the response when the policy matches a request or response. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the compression policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Choose a name that reflects the function that the policy performs. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp policy" or 'my cmp policy'). Minimum length = 1
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced) .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Classic Policy, Advanced Policy
reqaction	<String>	Read-only	The compression action to be performed on requests.
hits	<Double>	Read-only	Number of hits.
txbytes	<Double>	Read-only	Number of bytes transferred.
rxbytes	<Double>	Read-only	Number of bytes received.
clientttlb	<Double>	Read-only	Total client TTLB value.
clienttransactions	<Double>	Read-only	Number of client transactions.
serverttlb	<Double>	Read-only	Total server TTLB value.
servertransactions	<Double>	Read-only	Number of server transactions.
description	<String>	Read-only	Description of the policy.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default policy.
__count	<Double>	Read-only	count parameter

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cmppolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"resaction":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cmppolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"resaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cmppolicy":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of cmppolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cmppolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

```

cmppolicylabel

Configuration for compression policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the HTTP compression policy label. Must begin with a letter, number, or the underscore character (_). Additional characters allowed, after the first character, are the hyphen (-), period (.) pound sign (#), space ( ), at sign (@), equals (=), and colon (:). The name must be unique within the list of policy labels for compression policies. Can be renamed after the policy label is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp policylabel" or 'my cmp policylabel'). Minimum length = 1
type	<String>	Read-write	Type of packets (request packets or response) against which to match the policies bound to this policy label. Possible values = REQ, RES
newname	<String>	Read-write	New name for the compression policy label. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cmp policylabel" or 'my cmp policylabel'). Minimum length = 1
numpol	<Double>	Read-only	Number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = reqvserver, resvserver, policylabel
invoke_labelname	<String>	Read-only	Name of the label to invoke if the current policy evaluates to TRUE.
flowtype	<Double>	Read-only	Flowtype of the bound compression policy.
description	<String>	Read-only	Description of the policylabel.
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicylabel

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cmppolicylabel":{

<b>"labelname":<String_value>,

</b><b>"type":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicylabel/labelname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicylabel?**action=rename**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"cmppolicylabel_policybinding_binding": [ { "__count": "#no"} ] }
```

cmppolicy_binding

Binding object which returns the resources bound to cmppolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the HTTP compression policy for which to display details. Minimum length = 1
cmppolicy_csvserver_binding	<cmppolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to cmppolicy.
cmppolicy_cmppolicylabel_binding	<cmppolicy_cmppolicylabel_binding[]>	Read-only	cmppolicylabel that can be bound to cmppolicy.
cmppolicy_lbvserver_binding	<cmppolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to cmppolicy.
cmppolicy_cmpglobal_binding	<cmppolicy_cmpglobal_binding[]>	Read-only	cmpglobal that can be bound to cmppolicy.
cmppolicy_crvserver_binding	<cmppolicy_crvserver_binding[]>	Read-only	crvserver that can be bound to cmppolicy.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cmppolicy_binding": [ {

"name":<String_value>,
```

```
"cmppolicy_crvserver_binding":<cmppolicy_crvserver_binding[]_value>,

"cmppolicy_cmpglobal_binding":<cmppolicy_cmpglobal_binding[]_value>,

"cmppolicy_csvserver_binding":<cmppolicy_csvserver_binding[]_value>,

"cmppolicy_cmppolicylabel_binding":<cmppolicy_cmppolicylabel_binding[]_val
ue>,

"cmppolicy_lbvserver_binding":<cmppolicy_lbvserver_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy_lbvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy_lbvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of cmppolicy_lbvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy_lbvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cmppolicy_lbvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cmppolicy_lbvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"labeltype":<String_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy_lbvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy_lbvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cmppolicy_lbvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"labeltype":<String_value>,
```

```
"activepolicy":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cmppolicy_lbvserver_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"cmppolicy_lbvserver_binding": [ { "__count": "#no"} ] }
```

Content Switching

Content Switching

Content Switching configuration. Content Switching feature that enables you to direct traffic to servers on the basis of content.

NAME	DESCRIPTION
csaction	Configuration for Content Switching action

NAME	DESCRIPTION
csparameter	Configuration for CS parameter
cspolicy	Configuration for content-switching policy
cspolicy_binding	Binding object showing the resources that can be bound to cspolicy
cspolicy_crvserver_binding	Binding object showing the crvserver that can be bound to cspolicy
cspolicy_cspolicylabel_binding	Binding object showing the cspolicylabel that can be bound to cspolicy
cspolicy_csvserver_binding	Binding object showing the csvserver that can be bound to cspolicy
cspolicylabel	Configuration for CS policy label
cspolicylabel_binding	Binding object showing the resources that can be bound to cspolicylabel
cspolicylabel_cspolicy_binding	Binding object showing the cspolicy that can be bound to cspolicylabel
csvserver	Configuration for CS virtual server
csvserver_appflowpolicy_binding	Binding object showing the appflowpolicy that can be bound to csvserver
csvserver_appfwpolicy_binding	Binding object showing the appfwpolicy that can be bound to csvserver
csvserver_appqoepolicy_binding	Binding object showing the appqoepolicy that can be bound to csvserver
csvserver_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to csvserver
csvserver_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to csvserver

NAME	DESCRIPTION
csvserver_authorizationpolicy_binding	Binding object showing the authorizationpolicy that can be bound to csvserver
csvserver_binding	Binding object showing the resources that can be bound to csvserver
csvserver_cachepolicy_binding	Binding object showing the cachepolicy that can be bound to csvserver
csvserver_cmppolicy_binding	Binding object showing the cmppolicy that can be bound to csvserver
csvserver_contentinspectionpolicy_binding	Binding object showing the contentinspectionpolicy that can be bound to csvserver
csvserver_cspolicy_binding	Binding object showing the cspolicy that can be bound to csvserver
csvserver_domain_binding	Binding object showing the domain that can be bound to csvserver
csvserver_feopolicy_binding	Binding object showing the feopolicy that can be bound to csvserver
csvserver_filterpolicy_binding	Binding object showing the filterpolicy that can be bound to csvserver
csvserver_gslbvserver_binding	Binding object showing the gslbvserver that can be bound to csvserver
csvserver_lbvserver_binding	Binding object showing the lbvserver that can be bound to csvserver
csvserver_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to csvserver
csvserver_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to csvserver
csvserver_spilloverpolicy_binding	Binding object showing the spilloverpolicy that can be bound to csvserver

NAME	DESCRIPTION
csvserver_tmtrafficpolicy_binding	Binding object showing the tmtrafficpolicy that can be bound to csvserver
csvserver_transformpolicy_binding	Binding object showing the transformpolicy that can be bound to csvserver
csvserver_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to csvserver

csaction

Configuration for Content Switching action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the content switching action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the content switching action is created. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action').
targetlbvserver	<String>	Read-write	Name of the load balancing virtual server to which the content is switched.
targetvserver	<String>	Read-write	Name of the VPN virtual server to which the content is switched.
targetvserverexpr	<String>	Read-write	Information about this content switching action. Maximum length = 1499
comment	<String>	Read-write	Comments associated with this cs action.
newname	<String>	Read-write	New name for the content switching action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my name" or 'my name'). Minimum length = 1
hits	<Double>	Read-only	The number of times the action has been taken.
referencecount	<Double>	Read-only	The number of references to the action.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"csaction":{

<b>"name":<String_value>,

</b>"targetlbvserver":<String_value>,

"targetvserver":<String_value>,

"targetvserverexpr":<String_value>,

"comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"csaction":{

<b>"name":<String_value>,

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"csaction":{
```

```
<b>"name":<String_value>,

</b>"comment":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"csaction":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of csaction resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csaction?**pagesize=#no;pageno=#no**

Use this query-parameter to get the csaction resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

csparameter

Configuration for CS parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
stateupdate	<String>	Read-write	Specifies whether the virtual server checks the attached load balancing server for state information. Default value: DISABLED Possible values = ENABLED, DISABLED

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csparameter

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"csparameter":{

"stateupdate":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csparameter?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"csparameter":{

"stateupdate":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csparameter

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "csparameter": [ {

"stateupdate":<String_value>

}]}
```

cspolicy

Configuration for content-switching policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name for the content switching policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after a policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
url	<String>	Read-write	URL string that is matched with the URL of a request. Can contain a wildcard character. Specify the string value in the following format: [[prefix] [*]] [.suffix]. Minimum length = 1 Maximum length = 208

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rule	<String>	Read-write	Expression, or name of a named expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
domain	<String>	Read-write	The domain name. The string value can range to 63 characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
action	<String>	Read-write	Content switching action that names the target load balancing virtual server to which the traffic is switched.
logaction	<String>	Read-write	The log action associated with the content switching policy.
newname	<String>	Read-write	The new name of the content switching policy. Minimum length = 1
vstype	<Double>	Read-only	Virtual server type.
hits	<Double>	Read-only	Total number of hits.
bindhits	<Double>	Read-only	Total number of hits.
labelname	<String>	Read-only	Name of the label invoked.
labeltype	<String>	Read-only	The invocation type. Possible values = reqvserver, resvserver, policylabel
priority	<Double>	Read-only	priority of bound policy.
activepolicy	<Boolean>	Read-only	Indicates whether policy is bound or not.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cspolicytype	<String>	Read-only	Indicates whether policy is PI or not. (used only during display). Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

cspolicylabel

Configuration for CS policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the policy label. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. The label name must be unique within the list of policy labels for content switching. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policylabel" or 'my policylabel').
cspolicylabeltype	<String>	Read-write	Protocol supported by the policy label. All policies bound to the policy label must either match the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified protocol or be a subtype of that protocol. Available settings function as follows: * HTTP - Supports policies that process HTTP traffic. Used to access unencrypted Web sites. (The default.) * SSL - Supports policies that process HTTPS/ SSL encrypted traffic. Used to access encrypted Web sites. * TCP - Supports policies that process any type of TCP traffic, including HTTP. * SSL_TCP - Supports policies that process SSL-encrypted TCP traffic, including SSL. * UDP - Supports policies that process any type of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			UDP-based traffic, including DNS. * DNS - Supports policies that process DNS traffic. * ANY - Supports all types of policies except HTTP, SSL, and TCP. * SIP_UDP - Supports policies that process UDP based Session Initiation Protocol (SIP) traffic. SIP initiates, manages, and terminates multimedia communications sessions, and has emerged as the standard for Internet telephony (VoIP). * RTSP - Supports policies that process Real Time Streaming Protocol (RTSP) traffic. RTSP provides delivery of multimedia and other streaming data, such as audio,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			video, and other types of streamed media. * RADIUS - Supports policies that process Remote Authentication Dial In User Service (RADIUS) traffic. RADIUS supports combined authentication, authorization, and auditing services for network management. * MYSQL - Supports policies that process MYSQL traffic. * MSSQL - Supports policies that process Microsoft SQL traffic. Possible values = HTTP, TCP, RTSP, SSL, SSL_TCP, UDP, DNS, SIP_UDP, SIP_TCP, ANY, RADIUS, RDP, MYSQL, MSSQL, ORACLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DIAMETER, SSL_DIAMETER, FTP, DNS_TCP, SMPP
newname	<String>	Read-write	The new name of the content switching policylabel. Minimum length = 1
numpol	<Double>	Read-only	number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
policyname	<String>	Read-only	Name of the content switching policy.
priority	<Double>	Read-only	Specifies the priority of the policy.
targetvserver	<String>	Read-only	Name of the virtual server to which to forward requests that match the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke_labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

ADD| DELETE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicylabel

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cspolicylabel":{

<b>"labelname":<String_value>,

</b><b>"cspolicylabeltype":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicylabel/labelname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicylabel?**action=rename**

HTTP Method:POST

Request Headers:

"labelname":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicy_crvserver_binding/policyname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"cspolicy_crvserver_binding": [ { "__count": "#no"} ] }
```

cspolicy_cspolicylabel_binding

Binding object showing the cspolicylabel that can be bound to cspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the content switching policy to display. If this parameter is omitted, details of all the policies are displayed. Minimum length = 1
domain	<String>	Read-write	The domain name. The string value can range to 63 characters. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-only	priority of bound policy.
hits	<Double>	Read-only	Total number of hits.
url	<String>	Read-only	URL string that is matched with the URL of a request. Can contain a wildcard character. Specify the string value in the following format: [[prefix] [*]] [.suffix]. Minimum length = 1 Maximum length = 208
labeltype	<String>	Read-only	The invocation type. Possible values = reqvserver, resvserver, policylabel
labelname	<String>	Read-only	Name of the label invoked.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicy_cspolicylabel_binding/policyname_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicy_cspolicylabel_binding/policyname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of cspolicy_cspolicylabel_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicy_cspolicylabel_binding/policyname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cspolicy_cspolicylabel_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cspolicy_cspolicylabel_binding": [ {

"policyname":<String_value>,

"domain":<String_value>,

"priority":<Double_value>,

"hits":<Double_value>,

"url":<String_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicy_cspolicylabel_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicy_cspolicylabel_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cspolicy_cspolicylabel_binding": [ {

"policyname":<String_value>,

"domain":<String_value>,

{"cspolicy_cspolicylabel_binding": [ { "__count": "#no"} ] }
```

cspolicy_csvserver_binding

Binding object showing the csvserver that can be bound to cspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the content switching policy to display. If this parameter is omitted, details of all the policies are displayed. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	The domain name. The string value can range to 63 characters. Minimum length = 1
priority	<Double>	Read-only	priority of bound policy.
hits	<Double>	Read-only	Total number of hits.
url	<String>	Read-only	URL string that is matched with the URL of a request. Can contain a wildcard character. Specify the string value in the following format: [[prefix] [*]] [.suffix]. Minimum length = 1 Maximum length = 208
pipolicyhits	<Double>	Read-only	bind hits for PI CS Policy.
labeltype	<String>	Read-only	The invocation type. Possible values = reqvserver, resvserver, policylabel
labelname	<String>	Read-only	Name of the label invoked.
pihits	<Double>	Read-only	Total number of hits.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
action	<String>	Read-only	Content switching action that names the target load balancing virtual server to which the traffic is switched.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicy_csvserver_binding/policyname_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicy_csvserver_binding/policyname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of cspolicy_csvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cspolicy_csvserver_binding/policyname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cspolicy_csvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

{"cspolicy_csvserver_binding": [ { "__count": "#no"} ] }
```

csvserver

Configuration for CS virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the content switching virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Cannot be changed after the CS virtual server is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, my server or my server). Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
servicetype	<String>	Read-write	Protocol used by the virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = HTTP, SSL, TCP, FTP, RTSP, SSL_TCP, UDP, DNS, SIP_UDP, SIP_TCP, SIP_SSL, ANY, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, DNS_TCP, ORACLE, SMPP, PROXY
ipv46	<String>	Read-write	IP address of the content switching virtual server. Minimum length = 1
targettype	<String>	Read-write	Virtual server target type. Possible values = GSLB
dnsrecordtype	<String>	Read-write	. Default value: NSGSLB_IPV4 Possible values = A, AAAA, CNAME, NAPTR
persistenceid	<Double>	Read-write	. Minimum value = 0 Maximum value = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ippattern	<String>	Read-write	IP address pattern, in dotted decimal notation, for identifying packets to be accepted by the virtual server. The IP Mask parameter specifies which part of the destination IP address is matched against the pattern. Mutually exclusive with the IP Address parameter. For example, if the IP pattern assigned to the virtual server is 198.51.100.0 and the IP mask is 255.255.240.0 (a forward mask), the first 20 bits in the destination IP addresses are matched with the first 20 bits in the pattern. The virtual server accepts requests with IP addresses that range from 198.51.96.1 to 198.51.111.254. You can also use a pattern such as 0.0.2.2 and a mask

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			such as 0.0.255.255 (a reverse mask). If a destination IP address matches more than one IP pattern, the pattern with the longest match is selected, and the associated virtual server processes the request. For example, if the virtual servers, vs1 and vs2, have the same IP pattern, 0.0.100.128, but different IP masks of 0.0.255.255 and 0.0.224.255, a destination IP address of 198.51.100.128 has the longest match with the IP pattern of vs1. If a destination IP address matches two or more virtual servers to the same extent, the request is processed by the virtual server whose port number matches the port

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number in the request.
ipmask	<String>	Read-write	IP mask, in dotted decimal notation, for the IP Pattern parameter. Can have leading or trailing non-zero octets (for example, 255.255.240.0 or 0.0.255.255). Accordingly, the mask specifies whether the first n bits or the last n bits of the destination IP address in a client request are to be matched with the corresponding bits in the IP pattern. The former is called a forward mask. The latter is called a reverse mask.
range	<Double>	Read-write	Number of consecutive IP addresses, starting with the address specified by the IP Address parameter, to include in a range of addresses assigned to this virtual server. Default value: 1 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 254
port	<Integer>	Read-write	Port number for content switching virtual server. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
ipset	<String>	Read-write	The list of IPv4/IPv6 addresses bound to ipset would form a part of listening service on the current cs vserver. Minimum length = 1
state	<String>	Read-write	Initial state of the load balancing virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
stateupdate	<String>	Read-write	Enable state updates for a specific content switching virtual server. By default, the Content Switching virtual server is always UP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			regardless of the state of the Load Balancing virtual servers bound to it. This parameter interacts with the global setting as follows: Global Level | Vserver Level | Result ENABLED ENABLED ENABLED ENABLED DISABLED ENABLED DISABLED ENABLED ENABLED DISABLED DISABLED DISABLED If you want to enable state updates for only some content switching virtual servers, be sure to disable the state update parameter.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED, UPDATEONBACKENDUPDATE
cacheable	<String>	Read-write	Use this option to specify whether a virtual server, used for load balancing or content switching, routes requests to the cache redirection virtual server before sending it to the configured servers. Default value: NO Possible values = YES, NO
redirecturl	<String>	Read-write	URL to which traffic is redirected if the virtual server becomes unavailable. The service type of the virtual server should be either HTTP or SSL. Caution: Make sure that the domain in the URL does not match the domain specified for a content switching

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy. If it does, requests are continuously redirected to the unavailable virtual server. Minimum length = 1
clttimeout	<Double>	Read-write	Idle time, in seconds, after which the client connection is terminated. The default values are: 180 seconds for HTTP/SSL-based services. 9000 seconds for other TCP-based services. 120 seconds for DNS-based services. 120 seconds for other UDP-based services. Minimum value = 0 Maximum value = 31536000
precedence	<String>	Read-write	Type of precedence to use for both RULE-based and URL-based policies on the content

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			switching virtual server. With the default (RULE) setting, incoming requests are evaluated against the rule-based content switching policies. If none of the rules match, the URL in the request is evaluated against the URL-based content switching policies. Default value: RULE Possible values = RULE, URL
casesensitive	<String>	Read-write	Consider case in URLs (for policies that use URLs instead of RULES). For example, with the ON setting, the URLs /a/1.html and /A/1.HTML are treated differently and can have different targets (set by content switching policies). With the OFF setting, /a/1.html and /A/1.HTML are switched to the same target. Default value: ON

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
somethod	<String>	Read-write	Type of spillover used to divert traffic to the backup virtual server when the primary virtual server reaches the spillover threshold. Connection spillover is based on the number of connections. Bandwidth spillover is based on the total Kbps of incoming and outgoing traffic. Possible values = CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, NONE
sopersistence	<String>	Read-write	Maintain source-IP based persistence on primary and backup virtual servers. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sopersistencetimeout	<Double>	Read-write	Time-out value, in minutes, for spillover persistence. Default value: 2 Minimum value = 2 Maximum value = 1440
sothreshold	<Double>	Read-write	Depending on the spillover method, the maximum number of connections or the maximum total bandwidth (Kbps) that a virtual server can handle before spillover occurs. Minimum value = 1 Maximum value = 4294967287
sobackupaction	<String>	Read-write	Action to be performed if spillover is to take effect, but no backup chain to spillover is usable or exists. Possible values = DROP, ACCEPT, REDIRECT
redirectportrewrite	<String>	Read-write	State of port rewrite while performing HTTP redirect. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
downstateflush	<String>	Read-write	Flush all active transactions associated with a virtual server whose state transitions from UP to DOWN. Do not enable this option for applications that must complete their transactions. Default value: ENABLED Possible values = ENABLED, DISABLED
backupvserver	<String>	Read-write	Name of the backup virtual server that you are configuring. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the backup virtual server is created. You can assign a different

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			backup virtual server or rename the existing virtual server. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks. Minimum length = 1
disableprimaryondown	<String>	Read-write	Continue forwarding the traffic to backup virtual server even after the primary server comes UP from the DOWN state. Default value: DISABLED Possible values = ENABLED, DISABLED
insertvserveripport	<String>	Read-write	Insert the virtual server's VIP address and port number in the request header. Available values function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VIPADDR - Header contains the vserver's IP address and port number without any translation. OFF - The virtual IP and port header insertion option is disabled. V6TOV4MAPPING - Header contains the mapped IPv4 address corresponding to the IPv6 address of the vserver and the port number. An IPv6 address can be mapped to a user-specified IPv4 address using the set ns ip6 command. Possible values = OFF, VIPADDR, V6TOV4MAPPING
vipheader	<String>	Read-write	Name of virtual server IP and port header, for use with the VServer IP Port Insertion parameter. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rtspnat	<String>	Read-write	Enable network address translation (NAT) for real-time streaming protocol (RTSP) connections. Default value: OFF Possible values = ON, OFF
authenticationhost	<String>	Read-write	FQDN of the authentication virtual server. The service type of the virtual server should be either HTTP or SSL. Minimum length = 3 Maximum length = 252
authentication	<String>	Read-write	Authenticate users who request a connection to the content switching virtual server. Default value: OFF Possible values = ON, OFF
listenpolicy	<String>	Read-write	String specifying the listen policy for the content switching virtual server. Can be either the name of an existing expression or an in-line expression.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: "NONE"
listenpriority	<Double>	Read-write	Integer specifying the priority of the listen policy. A higher number specifies a lower priority. If a request matches the listen policies of more than one virtual server the virtual server whose listen policy has the highest priority (the lowest priority number) accepts the request. Default value: 101 Minimum value = 0 Maximum value = 100
authn401	<String>	Read-write	Enable HTTP 401-response based authentication. Default value: OFF Possible values = ON, OFF
authnvsname	<String>	Read-write	Name of authentication virtual server that authenticates the incoming user requests to this content switching virtual server. .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 252
push	<String>	Read-write	Process traffic with the push virtual server that is bound to this content switching virtual server (specified by the Push VServer parameter). The service type of the push virtual server should be either HTTP or SSL. Default value: DISABLED Possible values = ENABLED, DISABLED
pushvserver	<String>	Read-write	Name of the load balancing virtual server, of type PUSH or SSL_PUSH, to which the server pushes updates received on the client-facing load balancing virtual server. Minimum length = 1
pushlabel	<String>	Read-write	Expression for extracting the label from the response received from server. This string can be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			either an existing rule name or an inline expression. The service type of the virtual server should be either HTTP or SSL. Default value: "none"
pushmulticlients	<String>	Read-write	Allow multiple Web 2.0 connections from the same client to connect to the virtual server and expect updates. Default value: NO Possible values = YES, NO
tcpprofilename	<String>	Read-write	Name of the TCP profile containing TCP configuration settings for the virtual server. Minimum length = 1 Maximum length = 127
httpprofilename	<String>	Read-write	Name of the HTTP profile containing HTTP configuration settings for the virtual server. The service type of the virtual server should be either HTTP or SSL.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
dbprofilename	<String>	Read-write	Name of the DB profile. Minimum length = 1 Maximum length = 127
oracleserverversion	<String>	Read-write	Oracle server version. Default value: 10G Possible values = 10G, 11G
comment	<String>	Read-write	Information about this virtual server.
mssqlserverversion	<String>	Read-write	The version of the MSSQL server. Default value: 2008R2 Possible values = 70, 2000, 2000SP1, 2005, 2008, 2008R2, 2012, 2014
l2conn	<String>	Read-write	Use L2 Parameters to identify a connection. Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mysqlprotocolversion	<Double>	Read-write	The protocol version returned by the mysql vserver. Default value: 10
mysqlserverversion	<String>	Read-write	The server version string returned by the mysql vserver. Minimum length = 1 Maximum length = 31
mysqlcharacterset	<Double>	Read-write	The character set returned by the mysql vserver. Default value: 8
mysqlservercapabilities	<Double>	Read-write	The server capabilities returned by the mysql vserver. Default value: 41613
appflowlog	<String>	Read-write	Enable logging appflow flow information. Default value: ENABLED Possible values = ENABLED, DISABLED
netprofile	<String>	Read-write	The name of the network profile. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
icmpvsrresponse	<String>	Read-write	Can be active or passive. Default value: PASSIVE Possible values = PASSIVE, ACTIVE
rhistate	<String>	Read-write	A host route is injected according to the setting on the virtual servers * If set to PASSIVE on all the virtual servers that share the IP address, the appliance always injects the hostroute. * If set to ACTIVE on all the virtual servers that share the IP address, the appliance injects even if one virtual server is UP. * If set to ACTIVE on some virtual servers and PASSIVE on the others, the appliance, injects even if one virtual server set to ACTIVE is UP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: PASSIVE Possible values = PASSIVE, ACTIVE
authnprofile	<String>	Read-write	Name of the authentication profile to be used when authentication is turned on.
dnsprofilename	<String>	Read-write	Name of the DNS profile to be associated with the VServer. DNS profile properties will applied to the transactions processed by a VServer. This parameter is valid only for DNS and DNS-TCP VServers. Minimum length = 1 Maximum length = 127
persistencetype	<String>	Read-write	Type of persistence for the virtual server. Available settings function as follows: * SOURCEIP - Connections from the same client IP address belong to the same

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			persistence session. * COOKIEINSERT - Connections that have the same HTTP Cookie, inserted by a Set-Cookie directive from a server, belong to the same persistence session. * SSLSESSION - Connections that have the same SSL Session ID belong to the same persistence session. Possible values = SOURCEIP, COOKIEINSERT, SSLSESSION, NONE
persistmask	<String>	Read-write	Persistence mask for IP based persistence types, for IPv4 virtual servers. Minimum length = 1
v6persistmasklen	<Double>	Read-write	Persistence mask for IP based persistence types, for IPv6 virtual servers.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 128 Minimum value = 1 Maximum value = 128
timeout	<Double>	Read-write	Time period for which a persistence session is in effect. Default value: 2 Minimum value = 0 Maximum value = 1440
cookiename	<String>	Read-write	Use this parameter to specify the cookie name for COOKIE peristence type. It specifies the name of cookie with a maximum of 32 characters. If not specified, cookie name is internally generated.
persistencebackup	<String>	Read-write	Backup persistence type for the virtual server. Becomes operational if the primary persistence mechanism fails. Possible values = SOURCEIP, NONE
backuppersistencetimeout	<Double>	Read-write	Time period for which backup

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			persistence is in effect. Default value: 2 Minimum value = 2 Maximum value = 1440
domainname	<String>	Read-write	Domain name for which to change the time to live (TTL) and/or backup service IP address. Minimum length = 1
ttl	<Double>	Read-write	. Minimum value = 1
backupip	<String>	Read-write	. Minimum length = 1
cookiedomain	<String>	Read-write	. Minimum length = 1
cookietimeout	<Double>	Read-write	. Minimum value = 0 Maximum value = 1440
sitedomainttl	<Double>	Read-write	. Minimum value = 1
newname	<String>	Read-write	New name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my name" or 'my name'). Minimum length = 1
ip	<String>	Read-only	The IP address of the virtual server.
value	<String>	Read-only	The ssl card status for the transparent ssl cs vserver. Possible values = Certkey not bound, SSL feature disabled
ngname	<String>	Read-only	Nodegroup devno to which this csvserver belongs to.
type	<String>	Read-only	Virtual server type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = CONTENT, ADDRESS
curstate	<String>	Read-only	The state of the cs vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
sc	<String>	Read-only	The state of SureConnect the specified virtual server. Possible values = ON, OFF
status	<Integer>	Read-only	Status.
cachetype	<String>	Read-only	Cache type. Possible values = TRANSPARENT, REVERSE, FORWARD
redirect	<String>	Read-only	Redirect URL string. Possible values = CACHE, POLICY, ORIGIN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
homepage	<String>	Read-only	Home page.
dnsvservername	<String>	Read-only	DNS vserver name.
domain	<String>	Read-only	Domain.
policyname	<String>	Read-only	Policies bound to this vserver.
servicename	<String>	Read-only	Service name.
weight	<Double>	Read-only	Weight for this service.
cachevserver	<String>	Read-only	Cache vserver name.
targetvserver	<String>	Read-only	target vserver name.
priority	<Double>	Read-only	Priority for the policy.
url	<String>	Read-only	URL string.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
bindpoint	<String>	Read-only	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke	<Boolean>	Read-only	Invoke flag.
labeltype	<String>	Read-only	The invocation type. Possible values = reqvserver, resvserver, policylabel
labelname	<String>	Read-only	Name of the label invoked.
gt2gb	<String>	Read-only	This argument has no effect. Default value: DISABLED Possible values = ENABLED, DISABLED
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
statechangetimemsec	<Double>	Read-only	Time at which last state change happened. Milliseconds part.
tickssincelaststatechange	<Double>	Read-only	Time in 10 millisecond ticks since the last state change.
ruletype	<Double>	Read-only	Rule type.
lbvserver	<String>	Read-only	Name of the default lb vserver bound. Use this param for Default binding only. For Example: bind cs

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			vserver cs1 -lbvserver lb1. Minimum length = 1
targetlbvserver	<String>	Read-only	target vserver name.
analyticsprofile	<String>	Read-only	Name of the analytics profile bound to the LB vserver.
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings. Default value: NO Possible values = YES, NO
version	<Integer>	Read-only	Cookie version.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of csvserver resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver?**pagesize=#no;pageno=#no**

Use this query-parameter to get the csvserver resources in chunks.

csvserver_appflowpolicy_binding

Binding object showing the appflowpolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority for the policy.
bindpoint	<String>	Read-write	For a rewrite policy, the bind point to which to bind the policy. Note: This parameter applies only to rewrite policies, because content switching policies are evaluated only at request time. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label invoked.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1 -policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this parameter only in case of Content Switching policy bind operations to a CS vserver. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag.
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/csvserver_appflowpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"csvserver_appflowpolicy_binding":{

<b>"name":<String_value>,

</b>"policyname":<String_value>,

"targetlbvserver":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"bindpoint":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver_appflowpolicy_binding/name_value<String>

Query-parameters:

args

csvserver_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority for the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bindpoint	<String>	Read-write	For a rewrite policy, the bind point to which to bind the policy. Note: This parameter applies only to rewrite policies, because content switching policies are evaluated only at request time. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label to be invoked.
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1 -policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this parameter only in case of Content Switching policy bind operations to a CS vserver. Minimum length = 1
invoke	<Boolean>	Read-write	Invoke a policy label if this policy's rule evaluates to TRUE (valid only for default-syntax policies such as application firewall, transform, integrated cache, rewrite, responder, and content switching).
labeltype	<String>	Read-write	Type of label to be invoked. Possible values = reqvserver, resvserver, policylabel
sc	<String>	Read-only	The state of SureConnect the specified virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
__count	<Double>	Read-only	count parameter

Response Payload:

```
{"csvserver_auditnslogpolicy_binding": [ { "__count": "#no"} ] }
```

csvserver_auditsyslogpolicy_binding

Binding object showing the auditsyslogpolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority for the policy.
bindpoint	<String>	Read-write	For a rewrite policy, the bind point to which to bind the policy. Note: This parameter applies only to rewrite policies, because content switching policies are evaluated only at request time. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label to be invoked.
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			85 does not exist in the policy label.
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1 -policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this parameter only in case of Content Switching policy bind operations to a CS vserver. Minimum length = 1
invoke	<Boolean>	Read-write	Invoke a policy label if this policy's rule evaluates to TRUE (valid only for default-syntax policies such as application firewall, transform, integrated cache, rewrite, responder, and content switching).
labeltype	<String>	Read-write	Type of label to be invoked. Possible values = reqvserver, resvserver, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sc	<String>	Read-only	The state of SureConnect the specified virtual server. Possible values = ON, OFF
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/csvserver_auditsyslogpolicy_binding

csvserver_cachepolicy_binding

Binding object showing the cachepolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority for the policy.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label invoked.
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1 -policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parameter only in case of Content Switching policy bind operations to a CS vserver. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag.
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/csvserver_cachepolicy_binding

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"csvserver_cspolicy_binding": [ { "__count": "#no"} ] }
```

csvserver_domain_binding

Binding object showing the domain that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
backupip	<String>	Read-write	. Minimum length = 1
ttl	<Double>	Read-write	. Minimum value = 1
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
domainname	<String>	Read-write	Domain name for which to change the time to live (TTL) and/or backup service IP address. Minimum length = 1
sitedomainttl	<Double>	Read-write	. Minimum value = 1
cookiedomain	<String>	Read-write	. Minimum length = 1
cookietimeout	<Double>	Read-write	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 1440
appflowlog	<String>	Read-only	Enable logging appflow flow information. Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/csvserver_domain_binding

csvserver_filterpolicy_binding

Binding object showing the filterpolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority for the policy.
bindpoint	<String>	Read-write	For a rewrite policy, the bind point to which to bind the policy. Note: This parameter applies only to rewrite

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policies, because content switching policies are evaluated only at request time. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label to be invoked.
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this parameter only in case of Content Switching policy bind operations to a CS vserver. Minimum length = 1
invoke	<Boolean>	Read-write	Invoke a policy label if this policy's rule evaluates to TRUE (valid only for default-syntax policies such as application firewall, transform, integrated cache, rewrite, responder, and content switching).
labeltype	<String>	Read-write	Type of label to be invoked. Possible values = reqvserver, resvserver, policylabel
sc	<String>	Read-only	The state of SureConnect the specified virtual server. Possible values = ON, OFF
__count	<Double>	Read-only	count parameter

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/csvserver_gslbvserver_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"csvserver_gslbvserver_binding":{

<b>"name":<String_value>,

</b>"vserver":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver_gslbvserver_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver_gslbvserver_binding/name_value<String>?**args=vserver:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver_gslbvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver_gslbvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of csvserver_gslbvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/csvserver_gslbvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the csvserver_gslbvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "csvserver_gslbvserver_binding": [ {

"vserver":<String_value>,

"name":<String_value>,

Response Payload:

```
{"csvserver_gslbvserver_binding": [ { "__count": "#no"} ] }
```

csvserver_lbvserver_binding

Binding object showing the lbvserver that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
targetvserver	<String>	Read-write	The virtual server name (created with the add lb vserver command) to which content will be switched. Minimum length = 1
lbvserver	<String>	Read-write	Name of the default lb vserver bound. Use this param for Default binding only. For Example: bind cs vserver cs1 -lbvserver lb1. Minimum length = 1
hits	<Double>	Read-only	Number of hits.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserverid	<String>	Read-only	Vserver Id of vserver.
cookieipport	<String>	Read-only	Vserver id of the lb vserver that is inserted into the set-cookie HTTP header.
__count	<Double>	Read-only	count parameter

csvserver_responderpolicy_binding

Binding object showing the responderpolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority for the policy.
bindpoint	<String>	Read-write	For a rewrite policy, the bind point to which to bind the policy. Note: This parameter applies only to rewrite policies, because content switching policies are evaluated only at request time. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label invoked.
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1 -policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this parameter only in case of Content Switching policy bind operations to a CS vserver. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke	<Boolean>	Read-write	Invoke flag.
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

{"csvserver_spilloverpolicy_binding": [ { "__count": "#no"} ] }
```

csvserver_tmtrafficpolicy_binding

Binding object showing the tmtrafficpolicy that can be bound to csvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority for the policy.
bindpoint	<String>	Read-write	For a rewrite policy, the bind point to which to bind the policy. Note: This parameter applies only to rewrite policies, because content switching policies are evaluated only at request time. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
policyname	<String>	Read-write	Policies bound to this vserver.
labelname	<String>	Read-write	Name of the label to be invoked.
name	<String>	Read-write	Name of the content switching virtual server to which the content switching policy applies. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			85 does not exist in the policy label.
targetlbvserver	<String>	Read-write	Name of the Load Balancing virtual server to which the content is switched, if policy rule is evaluated to be TRUE. Example: bind cs vs cs1 -policyname pol1 -priority 101 -targetLBVserver lb1 Note: Use this parameter only in case of Content Switching policy bind operations to a CS vserver. Minimum length = 1
invoke	<Boolean>	Read-write	Invoke a policy label if this policy's rule evaluates to TRUE (valid only for default-syntax policies such as application firewall, transform, integrated cache, rewrite, responder, and content switching).
labeltype	<String>	Read-write	Type of label to be invoked. Possible values = reqvserver, resvserver, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-write	count parameter

name	<String>	Read-write	Name for the database profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after the profile is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my profile" or 'my profile'). . Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
interpretquery	<String>	Read-write	If ENABLED, inspect the query and update the connection information, if required. If DISABLED, forward the query to the server. Default value: YES Possible values = YES, NO
stickiness	<String>	Read-write	If the queries are related to each other, forward to the same backend server. Default value: NO Possible values = YES, NO
kcdaccount	<String>	Read-write	Name of the KCD account that is used for Windows authentication. Minimum length = 1 Maximum length = 127
conmultiplex	<String>	Read-write	Use the same server-side connection for multiple client-side requests. Default is enabled. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
enablecachingconmuxoff	<String>	Read-write	Enable caching when connection multiplexing is OFF. Default value: DISABLED Possible values = ENABLED, DISABLED
refcnt	<Double>	Read-only	Profile Reference Count.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbdbprofile

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dbdbprofile":{

<b>"name":<String_value>,

</b>"interpretquery":<String_value>,

"stickiness":<String_value>,

"kcdaccount":<String_value>,

"conmultiplex":<String_value>,

"enablecachingconmuxoff":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbdbprofile/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbdbprofile

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dbdbprofile":{

<b>"name":<String_value>,

</b>"interpretquery":<String_value>,

"stickiness":<String_value>,
```

```
"kcdaccount":<String_value>,

"conmultiplex":<String_value>,

"enablecachingconmuxoff":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbdbprofile?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dbdbprofile":{

<b>"name":<String_value>,

</b>"interpretquery":true,

"stickiness":true,

"kcdaccount":true,

"conmultiplex":true,

"enablecachingconmuxoff":true
```

```
}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbdbprofile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbdbprofile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbdbprofile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dbdbprofile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbdbprofile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dbdbprofile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the dbdbprofile resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dbdbprofile": [ {

Domain Name Service

Domain Name Service

Domain Name Service(DNS) configuration.

NAME	DESCRIPTION
dnsaaaarec	Configuration for IPv6 address type record
dnsaction	Configuration for DNS action
dnsaction64	Configuration for dns64 action
dnsaddrec	Configuration for address type record
dnscnamerec	Configuration for CNAME record
dnsglobal_binding	Binding object showing the resources that can be bound to dnsglobal
dnsglobal_dnspolicy_binding	Binding object showing the dnspolicy that can be bound to dnsglobal
dnskey	Configuration for dns key
dnsmxrec	Configuration for MX record
dnsnameserver	Configuration for name server
dnsnaptrrec	Configuration for NAPTR record
dnsnsecrec	
dnsnsrec	Configuration for name server record
dnsparameter	Configuration for DNS parameter
dnspolicy	Configuration for DNS policy
dnspolicy64	Configuration for dns64 policy
dnspolicy64_binding	Binding object showing the resources that can be bound to dnspolicy64
dnspolicy64_lbvserver_binding	Binding object showing the lbvserver that can be bound to dnspolicy64
dnspolicy_binding	Binding object showing the resources that can be bound to dnspolicy

NAME	DESCRIPTION
dnspolicy_dnsglobal_binding	Binding object showing the dnsglobal that can be bound to dnspolicy
dnspolicy_dnspolicylabel_binding	Binding object showing the dnspolicylabel that can be bound to dnspolicy
dnspolicylabel	Configuration for dns policy label
dnspolicylabel_binding	Binding object showing the resources that can be bound to dnspolicylabel
dnspolicylabel_dnspolicy_binding	Binding object showing the dnspolicy that can be bound to dnspolicylabel
dnspolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to dnspolicylabel
dnsprofile	Configuration for DNS profile
dnsproxyrecords	Configuration for proxy record
dnsptrrec	Configuration for PTR record
dnssoarec	Configuration for SOA record
dnssrvrec	Configuration for server record
dnssubnetcache	Configuration for subnet cache
dnssuffix	Configuration for DNS suffix
dnstxtrec	Configuration for TXT record
dnsview	Configuration for DNS view
dnsview_binding	Binding object showing the resources that can be bound to dnsview
dnsview_dnspolicy_binding	Binding object showing the dnspolicy that can be bound to dnsview

NAME	DESCRIPTION
dnsview_gslbservice_binding	Binding object showing the gslbservice that can be bound to dnsview
dnszone	Configuration for DNS zone
dnszone_binding	Binding object showing the resources that can be bound to dnszone
dnszone_dnskey_binding	Binding object showing the dnskey that can be bound to dnszone
dnszone_domain_binding	Binding object showing the domain that can be bound to dnszone

dnsaaaarec

Configuration for IPv6 address type record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hostname	<String>	Read-write	Domain name. Minimum length = 1
ipv6address	<String>	Read-write	One or more IPv6 addresses to assign to the domain name. Minimum length = 1
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached records need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
vservername	<String>	Read-only	Vitual server name.
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
__count	<Double>	Read-only	count parameter

Operations

dnsaction

Configuration for DNS action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
actionname	<String>	Read-write	Name of the dns action.
actiontype	<String>	Read-write	The type of DNS action that is being configured. Possible values = ViewName, GslbPrefLoc, noop, Drop, Cache_Bypass, Rewrite_Response
ipaddress	<String[]>	Read-write	List of IP address to be returned in case of rewrite_response actiontype. They can be of IPV4 or IPV6 type. In case of set command We will remove all the IP address previously present in the action and will add new once given in set dns action command.
ttl	<Double>	Read-write	Time to live, in seconds. Default value: 3600 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 2147483647
viewname	<String>	Read-write	The view name that must be used for the given action.
preferredloclist	<String[]>	Read-write	The location list in priority order used for the given action. Minimum length = 1
dnsprofilename	<String>	Read-write	Name of the DNS profile to be associated with the transaction for which the action is chosen. Minimum length = 1 Maximum length = 127
drop	<String>	Read-only	The dns packet must be dropped. Possible values = YES, NO
cachebypass	<String>	Read-only	By pass dns cache for this. Possible values = YES, NO
__count	<Double>	Read-only	count parameter

dnsaction64

Configuration for dns64 action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
actionname	<String>	Read-write	Name of the dns64 action.
prefix	<String>	Read-write	The dns64 prefix to be used if the after evaluating the rules.
mappedrule	<String>	Read-write	The expression to select the criteria for ipv4 addresses to be used for synthesis. Only if the mappedrule is evaluated to true the corresponding ipv4 address is used for synthesis using respective prefix, otherwise the A RR is discarded.
excluderule	<String>	Read-write	The expression to select the criteria for eliminating the corresponding ipv6

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			addresses from the response.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsaction64

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnsaction64":{

<b>"actionname":<String_value>,

</b><b>"prefix":<String_value>,

</b>"mappedrule":<String_value>,

"excluderule":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsaction64/actionname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsaction64

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnsaction64":{

<b>"actionname":<String_value>,

</b>"prefix":<String_value>,

"mappedrule":<String_value>,

"excluderule":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsaction64?**action=unset**

HTTP Method:POST

Request Headers:

dnsaddrec

Configuration for address type record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hostname	<String>	Read-write	Domain name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
ipaddress	<String>	Read-write	One or more IPv4 addresses to assign to the domain name. Minimum length = 1
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached address records need to be removed.
type	<String>	Read-write	The address record type. The type can take 3 values: ADNS - If this is specified, all of the authoritative address records will be displayed. PROXY - If this is specified, all of the proxy address records will be displayed. ALL - If this is specified, all of the address records will be displayed. Possible values = ALL, ADNS, PROXY

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
vservername	<String>	Read-only	Vitual server name.
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
__count	<Double>	Read-only	count parameter

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnscnamerec": [ { "__count": "#no"} ] }
```

dnsglobal_binding

Binding object which returns the resources bound to dnsglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dnsglobal_dnspolicy_binding	<dnsglobal_dnspolicy_binding[]>	Read-only	dnspolicy that can be bound to dnsglobal.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsglobal_binding

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnsglobal_binding": [ {

"dnsglobal_dnspolicy_binding":<dnsglobal_dnspolicy_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnsglobal_binding": [ {

"dnsglobal_dnspolicy_binding":<dnsglobal_dnspolicy_binding[]_value>
```

```
}]}
```

dnsglobal_dnspolicy_binding

Binding object showing the dnspolicy that can be bound to dnsglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy with which it is bound. Maximum allowed priority should be less than 65535.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the dns policy.
labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			85 does not exist in the policy label. Minimum length = 1
invoke	<Boolean>	Read-write	Invoke flag.
type	<String>	Read-write	Type of global bind point for which to show bound policies. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = policylabel
flowtype	<Double>	Read-only	flowtype of the bound rewrite policy.
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

```

dnskey

Configuration for dns key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyname	<String>	Read-write	Name of the public-private key pair to publish in the zone. Minimum length = 1
publickey	<String>	Read-write	File name of the public key.
privatekey	<String>	Read-write	File name of the private key.
expires	<Double>	Read-write	Time period for which to consider the key valid, after the key is used to sign a zone. Default value: 120 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 32767
units1	<String>	Read-write	Units for the expiry period. Default value: DAYS Possible values = MINUTES, HOURS, DAYS
notificationperiod	<Double>	Read-write	Time at which to generate notification of key expiration, specified as number of days, hours, or minutes before expiry. Must be less than the expiry period. The notification is an SNMP trap sent to an SNMP manager. To enable the appliance to send the trap, enable the DNSKEY-EXPIRY SNMP alarm. Default value: 7 Minimum value = 1 Maximum value = 32767
units2	<String>	Read-write	Units for the notification period.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DAYS Possible values = MINUTES, HOURS, DAYS
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the DNSKEY resource record created in the zone. TTL is the time for which the record must be cached by the DNS proxies. If the TTL is not specified, either the DNS zone's minimum TTL or the default value of 3600 is used. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
password	<String>	Read-write	Passphrase for reading the encrypted public/ private DNS keys. Minimum length = 1
zonename	<String>	Read-write	Name of the zone for which to create a key. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keytype	<String>	Read-write	Type of key to create. Default value: NS_DNSKEY_ZSK Possible values = KSK, KeySigningKey, ZSK, ZoneSigningKey
algorithm	<String>	Read-write	Algorithm to generate for zone signing. Default value: NS_DNSKEYALGO_RSASHA1 Possible values = RSASHA1
keysize	<Double>	Read-write	Size of the key, in bits. Default value: 512
filenameprefix	<String>	Read-write	Common prefix for the names of the generated public and private key files and the Delegation Signer (DS) resource record. During key generation, the .key, .private, and .ds suffixes are appended automatically to the file name prefix to produce the names of the public key, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			private key, and the DS record, respectively.
src	<String>	Read-write	URL (protocol, host, path, and file name) from where the DNS key file will be imported. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. This is a mandatory argument. Minimum length = 1 Maximum length = 2047
__count	<Double>	Read-only	count parameter

dnsmxrec

Configuration for MX record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name for which to add the MX record. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mx	<String>	Read-write	Host name of the mail exchange server. Minimum length = 1
pref	<Double>	Read-write	Priority number to assign to the mail exchange server. A domain name can have multiple mail servers, with a priority number assigned to each server. The lower the priority number, the higher the mail server's priority. When other mail servers have to deliver mail to the specified domain, they begin with the mail server with the lowest priority number, and use other configured mail servers, in priority order, as backups. Minimum value = 0 Maximum value = 65535
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached MX record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Default value: ADNS Possible values = ALL, ADNS, PROXY
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Record type. Possible values = ALL, ADNS, PROXY
__count	<Double>	Read-only	count parameter

Operations

```

dnsnameserver

Configuration for name server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ip	<String>	Read-write	IP address of an external name server or, if the Local parameter is set, IP address of a local DNS server (LDNS). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dnsvservername	<String>	Read-write	Name of a DNS virtual server. Overrides any IP address-based name servers configured on the Citrix ADC. Minimum length = 1
local	<Boolean>	Read-write	Mark the IP address as one that belongs to a local recursive DNS server on the Citrix ADC. The appliance recursively resolves queries received on an IP address that is marked as being local. For recursive resolution to work, the global DNS parameter, Recursion, must also be set. If no name server is marked as being local, the appliance functions as a stub resolver and load balances the name servers.
state	<String>	Read-write	Administrative state of the name server. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
type	<String>	Read-write	Protocol used by the name server. UDP_TCP is not valid if the name server is a DNS virtual server configured on the appliance. Default value: UDP Possible values = UDP, TCP, UDP_TCP
dnsprofilename	<String>	Read-write	Name of the DNS profile to be associated with the name server. Minimum length = 1
servicename	<String>	Read-only	The name of the dns vserver.
port	<Integer>	Read-only	Port of the service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
nameserverstate	<String>	Read-only	State of the server. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
clmonowner	<Double>	Read-only	Tells the mon owner of the service.
clmonview	<Double>	Read-only	Tells the view id by which state of the service is updated.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| UPDATE| UNSET| DELETE| ENABLE| DISABLE| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnameserver

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnsnameserver":{

"ip":<String_value>,

"dnsvservername":<String_value>,

"local":<Boolean_value>,

"state":<String_value>,

"type":<String_value>,

"dnsprofilename":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnameserver

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnsnameserver":{

<b>"ip":<String_value>,

</b>"dnsprofilename":<String_value>,

"type":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnameserver?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnsnameserver":{

<b>"ip":<String_value>,

</b>"dnsprofilename":true,

"type":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnameserver/ip_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

enable

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnameserver?**action=enable**

```

dnsnaptrrec

Configuration for NAPTR record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Name of the domain for the NAPTR record. Minimum length = 1
order	<Double>	Read-write	An integer specifying the order in which the NAPTR records MUST be processed in order to accurately represent the ordered list of Rules.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The ordering is from lowest to highest. Minimum value = 0 Maximum value = 65535
preference	<Double>	Read-write	An integer specifying the preference of this NAPTR among NAPTR records having same order. lower the number, higher the preference. Minimum value = 0 Maximum value = 65535
flags	<String>	Read-write	flags for this NAPTR. Maximum length = 255
services	<String>	Read-write	Service Parameters applicable to this delegation path. Maximum length = 255
regexp	<String>	Read-write	The regular expression, that specifies the substitution expression for this NAPTR. Maximum length = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
replacement	<String>	Read-write	The replacement domain name for this NAPTR. Maximum length = 255
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 3600 Minimum value = 0 Maximum value = 2147483647
recordid	<Double>	Read-write	Unique, internally generated record ID. View the details of the naptr record to obtain its record ID. Records can be removed by either specifying the domain name and record id OR by specifying domain name and all other naptr record attributes as was supplied during the add command. Minimum value = 1 Maximum value = 65535
ecssubnet	<String>	Read-write	Subnet for which the cached NAPTR record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Default value: ADNS Possible values = ALL, ADNS, PROXY
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
vservername	<String>	Read-only	Virtual server name.
__count	<Double>	Read-only	count parameter

dnsnsecrec

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hostname	<String>	Read-write	Name of the domain. Minimum length = 1
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nextnsec	<String>	Read-only	Next nsec record in the chain.
nextrecs	<String[]>	Read-only	An array of record types associated with the nsec record. Possible values = A, NS, CNAME, SOA, MX, AAAA, SRV, RRSIG, NSEC, DNSKEY, PTR, TXT, NAPTR

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ttl	<Double>	Read-only	Time to Live (TTL), in seconds, for the record.
ecssubnet	<String>	Read-only	Subnet for which this particular record is cached. Subnet caching will occur for responses with EDNS Client Subnet (ECS) option. Applies to resource records obtained through proxy configurations only.
__count	<Double>	Read-only	count parameter

"ecssubnet":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsecrec?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnsnsecrec": [ { "__count": "#no"} ] }
```

dnsnsrec

Configuration for name server record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name. Minimum length = 1
nameserver	<String>	Read-write	Host name of the name server to add to the domain.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached name server record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Record type. Possible values = ALL, ADNS, PROXY

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnsnsrec":{

<b>"domain":<String_value>,

</b><b>"nameserver":<String_value>,

</b>"ttl":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec/domain_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec?**args=domain:<String_value>,type:<String_value>,nodeid:<Double_value>**

Use this query-parameter to get dnsnsrec resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dnsnsrec resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec?**pagesize=#no;pageno=#no**

Use this query-parameter to get the dnsnsrec resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnsnsrec": [ {

domain:<String_value>,type:<String_value>,nodeid:<Double_value>"nameserver
":<String_value>,

"ecssubnet":<String_value>,

"ttl":<Double_value>,

"authtype":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec/domain_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec/domain_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec/domain_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsnsrec?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnsnsrec": [ { "__count": "#no"} ] }
```

dnsparameter

Configuration for DNS parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
retries	<Double>	Read-write	Maximum number of retry attempts when no response is received for a query sent to a name server. Applies to end resolver and forwarder configurations. Default value: 5 Minimum value = 1 Maximum value = 5
minttl	<Double>	Read-write	Minimum permissible time to live (TTL) for all records cached in the DNS cache by DNS proxy, end

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resolver, and forwarder configurations. If the TTL of a record that is to be cached is lower than the value configured for minTTL, the TTL of the record is set to the value of minTTL before caching. When you modify this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed. Minimum value = 0 Maximum value = 604800
maxttl	<Double>	Read-write	Maximum time to live (TTL) for all records cached in the DNS cache by DNS proxy, end resolver, and forwarder configurations. If the TTL of a record that is to be cached is higher than the value configured for maxTTL, the TTL of the record is set to the value of maxTTL before caching. When you modify

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed. Default value: 604800 Minimum value = 1 Maximum value = 604800
cacherecords	<String>	Read-write	Cache resource records in the DNS cache. Applies to resource records obtained through proxy configurations only. End resolver and forwarder configurations always cache records in the DNS cache, and you cannot disable this behavior. When you disable record caching, the appliance stops caching server responses. However, cached records are not flushed. The appliance does not serve requests from the cache until

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			record caching is enabled again. Default value: YES Possible values = YES, NO
namelookuppriority	<String>	Read-write	Type of lookup (DNS or WINS) to attempt first. If the first-priority lookup fails, the second-priority lookup is attempted. Used only by the SSL VPN feature. Default value: WINS Possible values = WINS, DNS
recursion	<String>	Read-write	Function as an end resolver and recursively resolve queries for domains that are not hosted on the Citrix ADC. Also resolve queries recursively when the external name servers configured on the appliance (for a forwarder configuration) are unavailable. When external name servers are unavailable, the appliance queries a root server and resolves the request recursively, as it

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			does for an end resolver configuration. Default value: DISABLED Possible values = ENABLED, DISABLED
resolutionorder	<String>	Read-write	Type of DNS queries (A, AAAA, or both) to generate during the routine functioning of certain Citrix ADC features, such as SSL VPN, cache redirection, and the integrated cache. The queries are sent to the external name servers that are configured for the forwarder function. If you specify both query types, you can also specify the order. Available settings function as follows: * OnlyAQuery. Send queries for IPv4 address records (A records) only. * OnlyAAAAQuery. Send queries for IPv6 address records (AAAA records) instead of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			queries for IPv4 address records (A records). * AThenAAAAQuery. Send a query for an A record, and then send a query for an AAAA record if the query for the A record results in a NODATA response from the name server. * AAAAThenAQuery. Send a query for an AAAA record, and then send a query for an A record if the query for the AAAA record results in a NODATA response from the name server. Default value: OnlyAQuery Possible values = OnlyAQuery, OnlyAAAAQuery, AThenAAAAQuery, AAAAThenAQuery

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dnssec	<String>	Read-write	Enable or disable the Domain Name System Security Extensions (DNSSEC) feature on the appliance. Note: Even when the DNSSEC feature is enabled, forwarder configurations (used by internal Citrix ADC features such as SSL VPN and Cache Redirection for name resolution) do not support the DNSSEC OK (DO) bit in the EDNS0 OPT header. Default value: ENABLED Possible values = ENABLED, DISABLED
maxpipeline	<Double>	Read-write	Maximum number of concurrent DNS requests to allow on a single client connection, which is identified by the <clientip:port>-<vserver ip:port> tuple. A value of 0 (zero) applies no limit to the number of concurrent DNS requests allowed on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a single client connection.
dnsrootreferral	<String>	Read-write	Send a root referral if a client queries a domain name that is unrelated to the domains configured/ cached on the Citrix ADC. If the setting is disabled, the appliance sends a blank response instead of a root referral. Applicable to domains for which the appliance is authoritative. Disable the parameter when the appliance is under attack from a client that is sending a flood of queries for unrelated domains. Default value: DISABLED Possible values = ENABLED, DISABLED
dns64timeout	<Double>	Read-write	While doing DNS64 resolution, this parameter specifies the time to wait before sending an A query if no response is received from backend DNS server for AAAA query.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 10000
ecsmaxsubnets	<Double>	Read-write	Maximum number of subnets that can be cached corresponding to a single domain. Subnet caching will occur for responses with EDNS Client Subnet (ECS) option. Caching of such responses can be disabled using DNS profile settings. A value of zero indicates that the number of subnets cached is limited only by existing memory constraints. The default value is zero. Default value: 0 Minimum value = 0 Maximum value = 1280
maxnegcachettl	<Double>	Read-write	Maximum time to live (TTL) for all negative records (NXDONAIN and NODATA) cached in the DNS cache by DNS proxy, end resolver, and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			forwarder configurations. If the TTL of a record that is to be cached is higher than the value configured for maxnegcacheTTL, the TTL of the record is set to the value of maxnegcacheTTL before caching. When you modify this setting, the new value is applied only to those records that are cached after the modification. The TTL values of existing records are not changed. Default value: 604800 Minimum value = 1 Maximum value = 604800
cachehitbypass	<String>	Read-write	This parameter is applicable only in proxy mode and if this parameter is enabled we will forward all the client requests to the backend DNS server and the response served will be cached on Citrix ADC.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
maxcachesize	<Double>	Read-write	Maximum memory, in megabytes, that can be used for dns caching per Packet Engine.
maxnegativecachesize	<Double>	Read-write	Maximum memory, in megabytes, that can be used for caching of negative DNS responses per packet engine.
cachenoexpire	<String>	Read-write	If this flag is set to YES, the existing entries in cache do not age out. On reaching the max limit the cache records are frozen. Default value: DISABLED Possible values = ENABLED, DISABLED
splitpktqueryprocessing	<String>	Read-write	Processing requests split across multiple packets. Default value: ALLOW

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ALLOW, DROP
cacheecszeroprefix	<String>	Read-write	Cache ECS responses with a Scope Prefix length of zero. Such a cached response will be used for all queries with this domain name and any subnet. When disabled, ECS responses with Scope Prefix length of zero will be cached, but not tied to any subnet. This option has no effect if caching of ECS responses is disabled in the corresponding DNS profile. Default value: ENABLED Possible values = ENABLED, DISABLED
maxudppacketsize	<Double>	Read-write	Maximum UDP packet size that can be handled by Citrix ADC. This is the value advertised by Citrix ADC when responding as an authoritative server and it is also used when Citrix ADC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			queries other name servers as a forwarder. When acting as a proxy, requests from clients are limited by this parameter - if a request contains a size greater than this value in the OPT record, it will be replaced. Default value: 1280 Minimum value = 512 Maximum value = 16384

dnspolicy

Configuration for DNS policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DNS policy.
rule	<String>	Read-write	Expression against which DNS traffic is evaluated. Note: * On the command line interface, if the expression includes blank spaces, the entire expression must be enclosed in double quotation marks. * If the expression itself includes double quotation marks, you must escape the quotations by using the character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Example: CLIENT.UDP.DNS.DOMAIN.EQ("domainname").
viewname	<String>	Read-write	The view name that must be used for the given policy.
preferredlocation	<String>	Read-write	The location used for the given policy. This is deprecated attribute. Please use -prefLocList.
preferredloclist	<String[]>	Read-write	The location list in priority order used for the given policy. Minimum length = 1
drop	<String>	Read-write	The dns packet must be dropped. Possible values = YES, NO
cachebypass	<String>	Read-write	By pass dns cache for this. Possible values = YES, NO
actionname	<String>	Read-write	Name of the DNS action to perform when the rule evaluates to TRUE. The built in actions function as follows: * dns_default_act_Dr

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			op. Drop the DNS request. * dns_default_act_Cachebypass. Bypass the DNS cache and forward the request to the name server. You can create custom actions by using the add dns action command in the CLI or the DNS > Actions > Create DNS Action dialog box in the Citrix ADC configuration utility.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
hits	<Double>	Read-only	The number of times the policy has been hit.
undefhits	<Double>	Read-only	Number of Undef hits.
description	<String>	Read-only	Description of the policy.
__count	<Double>	Read-only	count parameter

```

dnspolicy64

Configuration for dns64 policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DNS64 policy.
rule	<String>	Read-write	Expression against which DNS traffic is evaluated. Note:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* On the command line interface, if the expression includes blank spaces, the entire expression must be enclosed in double quotation marks. * If the expression itself includes double quotation marks, you must escape the quotations by using the character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks. Example: CLIENT.IP.SRC.IN_SUBENT(23.34.0.0/16).
action	<String>	Read-write	Name of the DNS64 action to perform when the rule evaluates to TRUE. The built in actions function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* A default dns64 action with prefix <default prefix> and mapped and exclude are any You can create custom actions by using the add dns action command in the CLI or the DNS64 > Actions > Create DNS64 Action dialog box in the Citrix ADC configuration utility.
hits	<Double>	Read-only	The number of times the policy has been hit.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
undefhits	<Double>	Read-only	Number of Undef hits.
description	<String>	Read-only	Description of the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

ADD| DELETE| UPDATE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnspolicy64

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnspolicy64":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b>"action":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnspolicy64/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnspolicy64

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/dnspolicylabel_dnspolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"dnspolicylabel_dnspolicy_binding":{

<b>"labelname":<String_value>,

</b><b>"policyname":<String_value>,

</b><b>"priority":<Double_value>,

</b>"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"invoke_labelname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnspolicylabel_dnspolicy_binding/labelname_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnspolicylabel_dnspolicy_binding/labelname_value<String>?**args=policyname:<String_value>,priority:<Double_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

dnsprofile

Configuration for DNS profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dnsprofilename	<String>	Read-write	Name of the DNS profile. Minimum length = 1 Maximum length = 127
dnsquerylogging	<String>	Read-write	DNS query logging; if enabled, DNS query information such as DNS query id, DNS query flags , DNS domain name and DNS query type will be logged. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dnsanswersecloggin g	<String>	Read-write	DNS answer section; if enabled, answer section in the response will be logged. Default value: DISABLED Possible values = ENABLED, DISABLED
dnsextendedlogging	<String>	Read-write	DNS extended logging; if enabled, authority and additional section in the response will be logged. Default value: DISABLED Possible values = ENABLED, DISABLED
dnserrorlogging	<String>	Read-write	DNS error logging; if enabled, whenever error is encountered in DNS module reason for the error will be logged. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
cacherecords	<String>	Read-write	Cache resource records in the DNS cache. Applies to resource records obtained through proxy configurations only. End resolver and forwarder configurations always cache records in the DNS cache, and you cannot disable this behavior. When you disable record caching, the appliance stops caching server responses. However, cached records are not flushed. The appliance does not serve requests from the cache until record caching is enabled again. Default value: ENABLED Possible values = ENABLED, DISABLED
cachenegativerespo nses	<String>	Read-write	Cache negative responses in the DNS cache. When

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			disabled, the appliance stops caching negative responses except referral records. This applies to all configurations - proxy, end resolver, and forwarder. However, cached responses are not flushed. The appliance does not serve negative responses from the cache until this parameter is enabled again. Default value: ENABLED Possible values = ENABLED, DISABLED
dropmultiqueryrequest	<String>	Read-write	Drop the DNS requests containing multiple queries. When enabled, DNS requests containing multiple queries will be dropped. In case of proxy configuration by default the DNS request containing multiple queries is forwarded to the backend and in case of ADNS and Resolver

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configuration NOCODE error response will be sent to the client. Default value: DISABLED Possible values = ENABLED, DISABLED
cacheecsresponses	<String>	Read-write	Cache DNS responses with EDNS Client Subnet(ECS) option in the DNS cache. When disabled, the appliance stops caching responses with ECS option. This is relevant to proxy configuration. Enabling/disabling support of ECS option when Citrix ADC is authoritative for a GSLB domain is supported using a knob in GSLB vserver. In all other modes, ECS option is ignored. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
referencecount	<Double>	Read-only	Number of entities using this profile.
__count	<Double>	Read-only	count parameter

ADD| UPDATE| UNSET| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Request Payload:

```
{"dnsproxyrecords":{

"type":<String_value>,

"negrectype":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

dnsptrrec

Configuration for PTR record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reversedomain	<String>	Read-write	Reversed domain name representation of the IPv4 or IPv6 address for which to create the PTR

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			record. Use the "in-addr.arpa." suffix for IPv4 addresses and the "ip6.arpa." suffix for IPv6 addresses. Minimum length = 1
domain	<String>	Read-write	Domain name for which to configure reverse mapping. Minimum length = 1
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached PTR record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 31
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
__count	<Double>	Read-only	count parameter

dnssoarec

Configuration for SOA record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name for which to add the SOA record. Minimum length = 1
originserver	<String>	Read-write	Domain name of the name server that responds authoritatively for the domain. Minimum length = 1
contact	<String>	Read-write	Email address of the contact to whom domain issues can be addressed. In the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			email address, replace the @ sign with a period (.). For example, enter domainadmin.example.com instead of domainadmin@example.com. Minimum length = 1
serial	<Double>	Read-write	The secondary server uses this parameter to determine whether it requires a zone transfer from the primary server. Default value: 100 Minimum value = 0 Maximum value = 4294967294
refresh	<Double>	Read-write	Time, in seconds, for which a secondary server must wait between successive checks on the value of the serial number. Default value: 3600 Minimum value = 0 Maximum value = 4294967294
retry	<Double>	Read-write	Time, in seconds, between retries if a secondary server's attempt to contact

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the primary server for a zone refresh fails. Default value: 3 Minimum value = 0 Maximum value = 4294967294
expire	<Double>	Read-write	Time, in seconds, after which the zone data on a secondary name server can no longer be considered authoritative because all refresh and retry attempts made during the period have failed. After the expiry period, the secondary server stops serving the zone. Typically one week. Not used by the primary server. Default value: 3600 Minimum value = 0 Maximum value = 4294967294
minimum	<Double>	Read-write	Default time to live (TTL) for all records in the zone. Can be overridden for individual records. Default value: 5

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 2147483647
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached SOA record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Record type. Possible values = ALL, ADNS, PROXY

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

dnssrvrec

Configuration for server record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Domain name, which, by convention, is prefixed by the symbolic name of the desired service and the symbolic name of the desired protocol, each with an underscore (_) prepended. For example, if an SRV-aware client wants to discover a SIP service that is provided over UDP, in the domain example.com, the client performs a lookup for _sip._udp.example.com. Minimum length = 1
target	<String>	Read-write	Target host for the specified service.
priority	<Double>	Read-write	Integer specifying the priority of the target host. The lower the number,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the higher the priority. If multiple target hosts have the same priority, selection is based on the Weight parameter. Minimum value = 0 Maximum value = 65535
weight	<Double>	Read-write	Weight for the target host. Aids host selection when two or more hosts have the same priority. A larger number indicates greater weight. Minimum value = 0 Maximum value = 65535
port	<Double>	Read-write	Port on which the target host listens for client requests. Minimum value = 0 Maximum value = 65535
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
ecssubnet	<String>	Read-write	Subnet for which the cached SRV record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records. Possible values = ALL, ADNS, PROXY
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Record type. Possible values = ALL, ADNS, PROXY
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| UPDATE| UNSET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnssrvrec

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnssrvrec":{

<b>"domain":<String_value>,

</b><b>"target":<String_value>,

</b><b>"priority":<Double_value>,
```

```
</b><b>"weight":<Double_value>,

</b><b>"port":<Double_value>,

</b>"ttl":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnssrvrec/domain_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnssrvrec

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnssrvrec":{

<b>"domain":<String_value>,

</b><b>"target":<String_value>,

</b>"priority":<Double_value>,

"weight":<Double_value>,

"port":<Double_value>,

"ttl":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnssrvrec?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnssrvrec":{

<b>"domain":<String_value>,
```

```
</b><b>"target":<String_value>,

</b>"ttl":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnssrvrec

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnssrvrec?**args=domain:<String_value>,target:<String_value>,type:<String_value>,nodeid:<Double_value>**

Use this query-parameter to get dnssrvrec resources based on additional properties.

attrs

dnstxtrec

Configuration for TXT record resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-write	Name of the domain for the TXT record. Minimum length = 1
String	<String[]>	Read-write	Information to store in the TXT resource record. Enclose the string in single or double quotation marks. A TXT resource record can contain up to six strings, each of which can contain up to 255 characters. If you want to add a string of more than 255 characters, evaluate whether splitting it into two or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			more smaller strings, subject to the six-string limit, works for you. Maximum length = 255
ttl	<Double>	Read-write	Time to Live (TTL), in seconds, for the record. TTL is the time for which the record must be cached by DNS proxies. The specified TTL is applied to all the resource records that are of the same record type and belong to the specified domain name. For example, if you add an address record, with a TTL of 36000, to the domain name example.com, the TTLs of all the address records of example.com are changed to 36000. If the TTL is not specified, the Citrix ADC uses either the DNS zone's minimum TTL or, if the SOA record is not available on the appliance, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			default value of 3600. Default value: 3600 Minimum value = 0 Maximum value = 2147483647
recordid	<Double>	Read-write	Unique, internally generated record ID. View the details of the TXT record to obtain its record ID. Mutually exclusive with the string parameter. Minimum value = 1 Maximum value = 65535
ecssubnet	<String>	Read-write	Subnet for which the cached TXT record need to be removed.
type	<String>	Read-write	Type of records to display. Available settings function as follows: * ADNS - Display all authoritative address records. * PROXY - Display all proxy address records. * ALL - Display all address records.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ADNS Possible values = ALL, ADNS, PROXY
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
authtype	<String>	Read-only	Authentication type. Possible values = ALL, ADNS, PROXY
__count	<Double>	Read-only	count parameter

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnstxtrec?**args=domain:<String_value>,type:<String_value>,nodeid:<Double_value>**

Use this query-parameter to get dnstxtrec resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnstxtrec?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnstxtrec?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dnstxtrec resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnstxtrec?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnstxtrec?**pagesize=#no;pageno=#no**

Use this query-parameter to get the dnstxtrec resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

```

dnsview

Configuration for DNS view resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viewname	<String>	Read-write	Name for the DNS view. Minimum length = 1
flags	<Double>	Read-only	Flags controlling display.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"dnsview":{

<b>"viewname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview/viewname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dnsview resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview?**pagesize=#no;pageno=#no**

Use this query-parameter to get the dnsview resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnsview": [ {

"viewname":<String_value>,

"servicename":<String_value>,

"flags":<Double_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview/viewname_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview/viewname_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview/viewname_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnsview": [ { "__count": "#no"} ] }
```

dnsview_binding

Binding object which returns the resources bound to dnsview.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viewname	<String>	Read-write	Name of the view to display. Minimum length = 1
dnsview_gslbservice_binding	<dnsview_gslbservice_binding[]>	Read-only	gslbservice that can be bound to dnsview.
dnsview_dnspolicy_binding	<dnsview_dnspolicy_binding[]>	Read-only	dnspolicy that can be bound to dnsview.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnsview_binding/viewname_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnsview_binding": [ {
```

```
"viewname":<String_value>,

```

dnszone

Configuration for DNS zone resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
zonename	<String>	Read-write	Name of the zone to create. Minimum length = 1
proxymode	<String>	Read-write	Deploy the zone in proxy mode. Enable in the following scenarios: * The load balanced DNS servers are authoritative for the zone and all resource records that are part of the zone. * The load balanced DNS servers are authoritative for the zone, but the Citrix ADC owns a subset of the resource records that belong to the zone (partial zone ownership

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configuration). Typically seen in global server load balancing (GSLB) configurations, in which the appliance responds authoritatively to queries for GSLB domain names but forwards queries for other domain names in the zone to the load balanced servers. In either scenario, do not create the zone's Start of Authority (SOA) and name server (NS) resource records on the appliance. Disable if the appliance is authoritative for the zone, but make sure that you have created the SOA and NS records on the appliance before you create the zone.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = YES, NO
dnssecoffload	<String>	Read-write	Enable dnssec offload for this zone. Default value: DISABLED Possible values = ENABLED, DISABLED
nsec	<String>	Read-write	Enable nsec generation for dnssec offload. Default value: DISABLED Possible values = ENABLED, DISABLED
keyname	<String[]>	Read-write	Name of the public/ private DNS key pair with which to sign the zone. You can sign a zone with up to four keys. Minimum length = 1
type	<String>	Read-write	Type of zone to display. Mutually exclusive with the DNS Zone (zoneName) parameter. Available

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			settings function as follows: * ADNS - Display all the zones for which the Citrix ADC is authoritative. * PROXY - Display all the zones for which the Citrix ADC is functioning as a proxy server. * ALL - Display all the zones configured on the appliance. Possible values = ALL, ADNS, PROXY
flags	<Double>	Read-only	Flags controlling display.
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnszone

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnszone?**args=zonename:<String_value>,type:<String_value>**

Use this query-parameter to get dnszone resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnszone?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnszone?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of dnszone resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnszone?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnszone?**pagesize=#no;pageno=#no**

Use this query-parameter to get the dnszone resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

```
{ "dnszone": [ { "__count": "#no"} ] }
```

dnszone_binding

Binding object which returns the resources bound to dnszone.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
zonename	<String>	Read-write	Name of the zone. Mutually exclusive with the type parameter. Minimum length = 1
dnszone_domain_binding	<dnszone_domain_binding[]>	Read-only	domain that can be bound to dnszone.
dnszone_dnskey_binding	<dnszone_dnskey_binding[]>	Read-only	dnskey that can be bound to dnszone.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnszone_binding/zonename_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnszone_binding": [ {

"zonename":<String_value>,

"dnszone_dnskey_binding":<dnszone_dnskey_binding[]_value>,

"dnszone_domain_binding":<dnszone_domain_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnszone_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/dnszone_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "dnszone_binding": [ {

"zonename":<String_value>,

"dnszone_dnskey_binding":<dnszone_dnskey_binding[]_value>,

"dnszone_domain_binding":<dnszone_domain_binding[]_value>

}]}
```

dnszone_dnskey_binding

Binding object showing the dnskey that can be bound to dnszone.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
zonename	<String>	Read-write	Name of the zone. Mutually exclusive with the type parameter. Minimum length = 1
keyname	<String[]>	Read-write	Name of the public/ private DNS key pair with which to sign the zone. You can sign a zone with up to four keys. Minimum length = 1
siginceptiontime	<Double[]>	Read-only	The time when sign was done with this key. Minimum value = 1
signed	<Double>	Read-only	Integer which denote status of keys.
expires	<Double>	Read-only	Time period for which to consider the key valid, after the key is used to sign a zone.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Filter

Filter

Filter configuration. Protection from malicious attacks can be achieved for web sites at the content level with the system's content filtering feature. When this feature is enabled, the system inspects every incoming request with the user-configured rules based on any HTTP URL or headers.

NAME	DESCRIPTION
filteraction	Configuration for filter action

NAME	DESCRIPTION
filterglobal_binding	Binding object showing the resources that can be bound to filterglobal
filterglobal_filterpolicy_binding	Binding object showing the filterpolicy that can be bound to filterglobal
filterhtmlinjectionparameter	Configuration for HTML injection parameter
filterhtmlinjectionvariable	Configuration for HTML injection variable
filterpolicy	Configuration for filter policy
filterpolicy_binding	Binding object showing the resources that can be bound to filterpolicy
filterpolicy_crvserver_binding	Binding object showing the crvserver that can be bound to filterpolicy
filterpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to filterpolicy
filterpolicy_filterglobal_binding	Binding object showing the filterglobal that can be bound to filterpolicy
filterpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to filterpolicy
filterpostbodyinjection	Configuration for HTML Injection postbody
filterprebodyinjection	Configuration for HTML Injection prebody

filteraction

Configuration for filter action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the filtering action. Must begin with a letter, number, or the underscore character (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at sign (@), equals (=), and colon (:) characters. Choose a name that helps identify the type of action. The name of a filter action cannot be changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
qual	<String>	Read-write	Qualifier, which is the action to be performed. The qualifier cannot be changed after it is set. The available options function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADD - Adds the specified HTTP header. RESET - Terminates the connection, sending the appropriate termination notice to the user's browser. FORWARD - Redirects the request to the designated service. You must specify either a service name or a page, but not both. DROP - Silently deletes the request, without sending a response to the user's browser. CORRUPT - Modifies the designated HTTP header to prevent it from performing the function it was intended to perform, then sends the request/response to the server/browser.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ERRORCODE. Returns the designated HTTP error code to the user's browser (for example, 404, the standard HTTP code for a non-existent Web page). Possible values = reset, add, corrupt, forward, errorcode, drop
servicename	<String>	Read-write	Service to which to forward HTTP requests. Required if the qualifier is FORWARD. Minimum length = 1
value	<String>	Read-write	String containing the header_name and header_value. If the qualifier is ADD, specify <header_name>:<header_value>. If the qualifier is CORRUPT, specify only the header_name. Minimum length = 1
respcode	<Double>	Read-write	Response code to be returned for HTTP requests (for use with the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ERRORCODE qualifier). Minimum value = 1
page	<String>	Read-write	HTML page to return for HTTP requests (For use with the ERRORCODE qualifier). Minimum length = 1
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default filteraction.
__count	<Double>	Read-only	count parameter

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
filterglobal_filterpolicy_binding	<filterglobal_filterpolicy_binding[]>	Read-only	filterpolicy that can be bound to filterglobal.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_binding

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "filterglobal_binding": [ {

"filterglobal_filterpolicy_binding":<filterglobal_filterpolicy_binding[]_v
```

```
alue>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "filterglobal_binding": [ {

"filterglobal_filterpolicy_binding":<filterglobal_filterpolicy_binding[]_v
alue>

}]}
```

filterglobal_filterpolicy_binding

Binding object showing the filterpolicy that can be bound to filterglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policy.
state	<String>	Read-write	State of the binding. Possible values = ENABLED, DISABLED
policyname	<String>	Read-write	The name of the filter policy.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/filterglobal_filterpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"filterglobal_filterpolicy_binding":{

<b>"policyname":<String_value>,

</b>"priority":<Double_value>,

"state":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_filterpolicy_binding

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_filterpolicy_binding?**args=policyname:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_filterpolicy_binding

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_filterpolicy_binding?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of filterglobal_filterpolicy_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_filterpolicy_binding?**pagesize=#no;pageno=#no**

Use this query-parameter to get the filterglobal_filterpolicy_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "filterglobal_filterpolicy_binding": [ {

"priority":<Double_value>,

"state":<String_value>,

"policyname":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_filterpolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_filterpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "filterglobal_filterpolicy_binding": [ {

"priority":<Double_value>,

"state":<String_value>,

"policyname":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterglobal_filterpolicy_binding?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "filterglobal_filterpolicy_binding": [ { "__count": "#no"} ] }
```

filterhtmlinjectionparameter

Configuration for HTML injection parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rate	<Double>	Read-write	For a rate of x, HTML injection is done for 1 out of x policy matches. Default value: 1 Minimum value = 1
frequency	<Double>	Read-write	For a frequency of x, HTML injection is done at least once per x milliseconds. Default value: 1 Minimum value = 1
strict	<String>	Read-write	Searching for <html> tag. If this parameter is enabled, HTML injection does not insert the prebody or postbody content unless the <html> tag is found.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
htmlsearchlen	<Double>	Read-write	Number of characters, in the HTTP body, in which to search for the <html> tag if strict mode is set. Default value: 1024 Minimum value = 1

Operations

filterpolicy

Configuration for filter policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the filtering action. Must begin with a letter, number, or the underscore character (_). Other characters allowed, after the first

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			character, are the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), and colon (:) characters. Choose a name that helps identify the type of action. The name cannot be updated after the policy is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Citrix ADC classic expression specifying the type of connections that match this policy. Minimum length = 1
reqaction	<String>	Read-write	Name of the action to be performed on requests that match the policy. Cannot be specified if the rule includes condition to be evaluated for responses.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
resaction	<String>	Read-write	The action to be performed on the response. The string value can be a filter action created filter action or a built-in action. Minimum length = 1
hits	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

"filterpolicy_csvserver_binding":<filterpolicy_csvserver_binding[]_value>

}]}
```

filterpolicy_crvserver_binding

Binding object showing the crvserver that can be bound to filterpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the filter policy to be displayed. If a name is not provided, information about all the filter policies is shown. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterpolicy_crvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterpolicy_crvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of filterpolicy_crvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/filterpolicy_crvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the filterpolicy_crvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "filterpolicy_crvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

Front-end Optimization

Front-end-optimization

Front end optimization configuration. The system's feature to optimize Web content for performance.

NAME	DESCRIPTION
feoaction	Configuration for Front end optimization action
feoglobal_binding	Binding object showing the resources that can be bound to feoglobal
feoglobal_feopolicy_binding	Binding object showing the feopolicy that can be bound to feoglobal
feoparameter	Configuration for FEO parameter
feopolicy	Configuration for Front end optimization policy
feopolicy_binding	Binding object showing the resources that can be bound to feopolicy

NAME	DESCRIPTION
feopolicy_csvserver_binding	Binding object showing the csvserver that can be bound to feopolicy
feopolicy_feoglobal_binding	Binding object showing the feoglobal that can be bound to feopolicy
feopolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to feopolicy

feoaction

Configuration for Front end optimization action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the front end optimization action. Minimum length = 1
pageextendcache	<Boolean>	Read-write	Extend the time period during which the browser can use the cached resource.
cachemaxage	<Double>	Read-write	Maxage for cache extension. Default value: 30 Minimum value = 0 Maximum value = 360
imgshrinktoattrib	<Boolean>	Read-write	Shrink image dimensions as per the height and width

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			attributes specified in the <img> tag.
imggiftopng	<Boolean>	Read-write	Convert GIF image formats to PNG formats.
imgtowebp	<Boolean>	Read-write	Convert JPEG, GIF, PNG image formats to WEBP format.
imgtojpegxr	<Boolean>	Read-write	Convert JPEG, GIF, PNG image formats to JXR format.
imginline	<Boolean>	Read-write	Inline images whose size is less than 2KB.
cssimginline	<Boolean>	Read-write	Inline small images (less than 2KB) referred within CSS files as background-URLs.
jpgoptimize	<Boolean>	Read-write	Remove non-image data such as comments from JPEG images.
imglazyload	<Boolean>	Read-write	Download images, only when the user scrolls the page to view them.
cssminify	<Boolean>	Read-write	Remove comments and whitespaces from CSSs.
cssinline	<Boolean>	Read-write	Inline CSS files, whose size is less

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			than 2KB, within the main page.
csscombine	<Boolean>	Read-write	Combine one or more CSS files into one file.
convertimporttolink	<Boolean>	Read-write	Convert CSS import statements to HTML link tags.
jsminify	<Boolean>	Read-write	Remove comments and whitespaces from JavaScript.
jsinline	<Boolean>	Read-write	Convert linked JavaScript files (less than 2KB) to inline JavaScript files.
htmlminify	<Boolean>	Read-write	Remove comments and whitespaces from an HTML page.
cssmovetohead	<Boolean>	Read-write	Move any CSS file present within the body tag of an HTML page to the head tag.
jsmovetoend	<Boolean>	Read-write	Move any JavaScript present in the body tag to the end of the body tag.
domainsharding	<String>	Read-write	Domain name of the server.
dnsshards	<String[]>	Read-write	Set of domain names that replaces the parent domain.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientsidemeasurements	<Boolean>	Read-write	Send AppFlow records about the web pages optimized by this action. The records provide FEO statistics, such as the number of HTTP requests that have been reduced for this page. You must enable the Appflow feature before enabling this parameter.
imgadddimensions	<Boolean>	Read-only	Add dimension attributes to images, if not specified within the <img> tag.
imgshrinkformobile	<Boolean>	Read-only	Serve smaller images for mobile users.
imgweaken	<Boolean>	Read-only	Reduce the image quality.
jpgprogressive	<Boolean>	Read-only	Convert JPEG image formats to progressive formats.
cssflattenimports	<Boolean>	Read-only	Replace CSS import statements with the file content.
jscombine	<Boolean>	Read-only	Combine one or more JavaScript files into one file.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
htmlrmdefaultattribs	<Boolean>	Read-only	Remove default redundant attributes from an HTML file.
htmlrmattribquotes	<Boolean>	Read-only	Remove unnecessary quotes present within the HTML attributes.
htmltrimurls	<Boolean>	Read-only	Trim URLs.
hits	<Double>	Read-only	The number of times the action has been taken.
undefhits	<Double>	Read-only	Total number of undefined policy hits.
__count	<Double>	Read-only	count parameter

Operations

ADD| UPDATE| UNSET| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feoaction

HTTP Method:POST

Request Headers:

feoglobal_binding

Binding object which returns the resources bound to feoglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feoglobal_feopolicy_binding	<feoglobal_feopolicy_binding[]>	Read-only	feopolicy that can be bound to feoglobal.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feoglobal_binding

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "feoglobal_binding": [ {

"feoglobal_feopolicy_binding":<feoglobal_feopolicy_binding[]_value>
```

```
}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feoglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feoglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "feoglobal_binding": [ {

"feoglobal_feopolicy_binding":<feoglobal_feopolicy_binding[]_value>

}]}
```

feoglobal_feopolicy_binding

Binding object showing the feopolicy that can be bound to feoglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority assigned to the policy binding.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	The name of the globally bound front end optimization policy.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
type	<String>	Read-write	Bindpoint to which the policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT, NONE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

feopolicy

Configuration for Front end optimization policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the front end optimization policy. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rule	<String>	Read-write	The rule associated with the front end optimization policy.
action	<String>	Read-write	The front end optimization action that has to be performed when the rule matches. Minimum length = 1
hits	<Double>	Read-only	Total number of hits.
undefhits	<Double>	Read-only	Total number of undefined policy hits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"feopolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"feopolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"feopolicy":{

<b>"name":<String_value>,

</b>"rule":true,

"action":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of feopolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the feopolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "feopolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"hits":<Double_value>,
```

```
"undefhits":<Double_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "feopolicy": [ {
```

```
"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"hits":<Double_value>,

"undefhits":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "feopolicy": [ { "__count": "#no"} ] }
```

feopolicy_binding

Binding object which returns the resources bound to feopolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the front end optimization policy. Minimum length = 1
feopolicy_csvserver_binding	<feopolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to feopolicy.
feopolicy_lbvserver_binding	<feopolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to feopolicy.
feopolicy_feoglobal_binding	<feopolicy_feoglobal_binding[]>	Read-only	feoglobal that can be bound to feopolicy.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "feopolicy_binding": [ {

"name":<String_value>,

"feopolicy_csvserver_binding":<feopolicy_csvserver_binding[]_value>,

"feopolicy_lbvserver_binding":<feopolicy_lbvserver_binding[]_value>,

"feopolicy_feoglobal_binding":<feopolicy_feoglobal_binding[]_value>
```

```
}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/feopolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "feopolicy_binding": [ {

"name":<String_value>,

"feopolicy_csvserver_binding":<feopolicy_csvserver_binding[]_value>,

"feopolicy_lbvserver_binding":<feopolicy_lbvserver_binding[]_value>,

"feopolicy_feoglobal_binding":<feopolicy_feoglobal_binding[]_value>

}]}
```

feopolicy_csvserver_binding

Binding object showing the csvserver that can be bound to feopolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where the policy is bound to.
name	<String>	Read-write	The name of the front end optimization policy. Minimum length = 1
priority	<Double>	Read-only	Priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
activepolicy	<Integer>	Read-only	Indicates whether a policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

Global Server Load Balancing

Global Server Load Balancing

Global Server Load Balancing (GSLB) configuration. GSLB feature ensures that client requests are directed to a best performing site available in a global enterprise and distributed Internet environment.

NAME	DESCRIPTION
gslbconfig	Configuration for gslb config
gslbdomain	Configuration for GSLB domain
gslbdomain_binding	Binding object showing the resources that can be bound to gslbdomain
gslbdomain_gslbservice_binding	Binding object showing the gslbservice that can be bound to gslbdomain
gslbdomain_gslbservicegroup_binding	Binding object showing the gslbservicegroup that can be bound to gslbdomain

NAME	DESCRIPTION
gslbdomain_gslbservicegroupmember_binding	Binding object showing the gslbservicegroupmember that can be bound to gslbdomain
gslbdomain_gslbvserver_binding	Binding object showing the gslbvserver that can be bound to gslbdomain
gslbdomain_lbmonitor_binding	Binding object showing the lbmonitor that can be bound to gslbdomain
gslbldnsentries	Configuration for LDNS entry
gslbldnsentry	Configuration for LDNS entry
gslbparameter	Configuration for GSLB parameter
gslbrunningconfig	Configuration for running GSLB configuration
gslbservice	Configuration for GSLB service
gslbservice_binding	Binding object showing the resources that can be bound to gslbservice
gslbservice_dnsview_binding	Binding object showing the dnsview that can be bound to gslbservice
gslbservice_lbmonitor_binding	Binding object showing the lbmonitor that can be bound to gslbservice
gslbservicegroup	Configuration for GSLB service group
gslbservicegroup_binding	Binding object showing the resources that can be bound to gslbservicegroup
gslbservicegroup_gslbservicegroupmember_binding	Binding object showing the gslbservicegroupmember that can be bound to gslbservicegroup
gslbservicegroup_lbmonitor_binding	Binding object showing the lbmonitor that can be bound to gslbservicegroup

NAME	DESCRIPTION
gslbservicegroup_servicegroupentitymonbindings_binding	Binding object showing the servicegroupentitymonbindings that can be bound to gslbservicegroup
gslbsite	Configuration for GSLB site
gslbsite_binding	Binding object showing the resources that can be bound to gslbsite
gslbsite_gslbservice_binding	Binding object showing the gslbservice that can be bound to gslbsite
gslbsite_gslbservicegroup_binding	Binding object showing the gslbservicegroup that can be bound to gslbsite
gslbsite_gslbservicegroupmember_binding	Binding object showing the gslbservicegroupmember that can be bound to gslbsite
gslbsyncstatus	Configuration for sync status
gslbvserver	Configuration for Global Server Load Balancing Virtual Server
gslbvserver_binding	Binding object showing the resources that can be bound to gslbvserver
gslbvserver_domain_binding	Binding object showing the domain that can be bound to gslbvserver
gslbvserver_gslbservice_binding	Binding object showing the gslbservice that can be bound to gslbvserver
gslbvserver_gslbservicegroup_binding	Binding object showing the gslbservicegroup that can be bound to gslbvserver
gslbvserver_gslbservicegroupmember_binding	Binding object showing the gslbservicegroupmember that can be bound to gslbvserver
gslbvserver_spilloverpolicy_binding	Binding object showing the spilloverpolicy that can be bound to gslbvserver

gslbconfig

Configuration for gslb config resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
preview	<Boolean>	Read-write	Do not synchronize the GSLB sites, but display the commands that would be applied on the slave node upon synchronization. Mutually exclusive with the Save Configuration option.
debug	<Boolean>	Read-write	Generate verbose output when synchronizing the GSLB sites. The Debug option generates more verbose output than the sync gslb config command in which the option is not used, and is useful for analyzing synchronization issues.
forcesync	<String>	Read-write	Force synchronization of the specified site even if a dependent configuration on the remote site is preventing synchronization or if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			one or more GSLB entities on the remote site have the same name but are of a different type. You can specify either the name of the remote site that you want to synchronize with the local site, or you can specify All Sites in the configuration utility (the string all-sites in the CLI). If you specify All Sites, all the sites in the GSLB setup are synchronized with the site on the master node. Note: If you select the Force Sync option, the synchronization starts without displaying the commands that are going to be executed.
nowarn	<Boolean>	Read-write	Suppress the warning and the confirmation prompt that are displayed before site synchronization begins. This option can be used in automation scripts

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that must not be interrupted by a prompt.
saveconfig	<Boolean>	Read-write	Save the configuration on all the nodes participating in the synchronization process, automatically. The master saves its configuration immediately before synchronization begins. Slave nodes save their configurations after the process of synchronization is complete. A slave node saves its configuration only if the configuration difference was successfully applied to it. Mutually exclusive with the Preview option.
command	<String>	Read-write	Run the specified command on the master node and then on all the slave nodes. You cannot use this option with the force sync and preview options.

Operations

(click to see Properties)

SYNC

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

sync

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbconfig?**action=sync**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"gslbconfig":{

"preview":<Boolean_value>,

"debug":<Boolean_value>,

"forcesync":<String_value>,

"nowarn":<Boolean_value>,

"saveconfig":<Boolean_value>,

"command":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

gslbdomain

Configuration for GSLB domain resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of gslbdomain resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain?**pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbdomain resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbdomain": [ {
```

```
"name":<String_value>,

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbdomain": [ {

"name":<String_value>,

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbdomain": [ { "__count": "#no"} ] }
```

gslbdomain_binding

Binding object which returns the resources bound to gslbdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain. Minimum length = 1
gslbdomain_gslbservicegroup_binding	<gslbdomain_gslbservicegroup_binding[]>	Read-only	gslbservicegroup that can be bound to gslbdomain.
gslbdomain_gslbservice_binding	<gslbdomain_gslbservice_binding[]>	Read-only	gslbservice that can be bound to gslbdomain.
gslbdomain_lbmonitor_binding	<gslbdomain_lbmonitor_binding[]>	Read-only	lbmonitor that can be bound to gslbdomain.
gslbdomain_gslbservicegroupmember_binding	<gslbdomain_gslbservicegroupmember_binding[]>	Read-only	gslbservicegroupmember that can be bound to gslbdomain.
gslbdomain_gslbvserver_binding	<gslbdomain_gslbvserver_binding[]>	Read-only	gslbvserver that can be bound to gslbdomain.

Operations

mber_binding[]_value>,

"gslbdomain_lbmonitor_binding":<gslbdomain_lbmonitor_binding[]_value>,

"gslbdomain_gslbvserver_binding":<gslbdomain_gslbvserver_binding[]_value>,

"gslbdomain_gslbservice_binding":<gslbdomain_gslbservice_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbdomain_binding": [ {

"name":<String_value>,

"gslbdomain_gslbservicegroup_binding":<gslbdomain_gslbservicegroup_binding
[]_value>,

"gslbdomain_gslbservicegroupmember_binding":<gslbdomain_gslbservicegroupme
mber_binding[]_value>,

"gslbdomain_lbmonitor_binding":<gslbdomain_lbmonitor_binding[]_value>,

"gslbdomain_gslbvserver_binding":<gslbdomain_gslbvserver_binding[]_value>,

"gslbdomain_gslbservice_binding":<gslbdomain_gslbservice_binding[]_value>

}]}
```

gslbdomain_gslbservice_binding

Binding object showing the gslbservice that can be bound to gslbdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain. Minimum length = 1
servicename	<String>	Read-write	The service name.
cnameentry	<String>	Read-only	The cname of the gslb service.
gslbthreshold	<Integer>	Read-only	The threshold value of the service.
port	<Integer>	Read-only	Port Number.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
state	<String>	Read-only	The state of the vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
vservername	<String>	Read-only	.
svreffgslbstate	<String>	Read-only	GSLB server state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dynamicconfwt	<Double>	Read-only	dynamic weight.
weight	<Double>	Read-only	weight assigned. Minimum value = 1 Maximum value = 100
ipaddress	<String>	Read-only	The Ip address of the service.
servicetype	<String>	Read-only	The type GSLB service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
cumulativeweight	<Double>	Read-only	cumlative weight.
__count	<Double>	Read-only	count parameter

```

gslbdomain_gslbvserver_binding

Binding object showing the gslbvserver that can be bound to gslbdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain. Minimum length = 1
vservername	<String>	Read-write	.
sitename	<String>	Read-only	Name of the site to which the service belongs.
backuplbmethod	<String>	Read-only	Indicates the backup method in case the primary fails. Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, SOURCEIPHASH, LEASTBANDWIDTH, LEASTPACKETS, STATICPROXIMITY, RTT, CUSTOMLOAD

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
customheaders	<String>	Read-only	The string that is sent to the service. Applicable to HTTP ,HTTP-ECV and RTSP monitor types.
persistenceid	<Double>	Read-only	Persistence id of the gslb vserver.
state	<String>	Read-only	The state of the vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
edr	<String>	Read-only	Send clients an empty DNS response when the GSLB virtual server is DOWN. Default value: DISABLED Possible values = ENABLED, DISABLED
lbmethod	<String>	Read-only	The load balancing method set for the virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, SOURCEIPHASH, LEASTBANDWIDTH, LEASTPACKETS, STATICPROXIMITY, RTT, CUSTOMLOAD
cip	<String>	Read-only	Indicates if Client IP option is enabled. Possible values = ENABLED, DISABLED
statechangetimesec	<String>	Read-only	Time since last state change.
netmask	<String>	Read-only	Netmask. Minimum length = 1
dnsrecordtype	<String>	Read-only	The IP type for this GSLB vserver. Possible values = A, AAAA, CNAME, NAPTR
persistmask	<String>	Read-only	The optional IPv4 network mask applied to IPv4 addresses to establish source IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address based persistence. Minimum length = 1
sitepersistence	<String>	Read-only	Indicates the type of cookie persistence set. Possible values = ConnectionProxy, HTTPRedirect, NONE
servicetype	<String>	Read-only	The type GSLB service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
v6persistmasklen	<Double>	Read-only	Number of bits to consider in an IPv6 source IP address when creating source IP address based persistence sessions. Default value: 128 Minimum value = 1 Maximum value = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
v6netmasklen	<Double>	Read-only	Number of bits to consider, in an IPv6 source IP address, for creating the hash that is required by the SOURCEIPHASH load balancing method. Default value: 128 Minimum value = 1 Maximum value = 128
persistencetype	<String>	Read-only	Indicates if persistence is set on the gslb vserver. Possible values = SOURCEIP, NONE
siteprefix	<String>	Read-only	The site prefix string.
dynamicweight	<String>	Read-only	Dynamic weight method of the vserver. Default value: DISABLED Possible values = SERVICECOUNT, SERVICEWEIGHT, DISABLED
mir	<String>	Read-only	. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_gslbvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_gslbvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of gslbdomain_gslbvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_gslbvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbdomain_gslbvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

```

gslbdomain_lbmonitor_binding

Binding object showing the lbmonitor that can be bound to gslbdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the Domain. Minimum length = 1
monitorname	<String>	Read-write	Monitor name.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
lastresponse	<String>	Read-only	The string form of monstatcode.
customheaders	<String>	Read-only	The string that is sent to the service. Applicable to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			HTTP ,HTTP-ECV and RTSP monitor types.
iptunnel	<String>	Read-only	The state of the monitor for tunneled devices. Possible values = YES, NO
servicename	<String>	Read-only	The service name.
monitortotalprobes	<Double>	Read-only	Total monitor probes.
respcode	<String>	Read-only	The response codes.
vservername	<String>	Read-only	.
httprequest	<String>	Read-only	HTTP request to the backend server.
responsetime	<Double>	Read-only	Response time of this monitor.
monitortotalfailedprobes	<Double>	Read-only	Total probes failed.
monitorcurrentfailedprobes	<Double>	Read-only	Total number of current failed probes.
monstate	<String>	Read-only	Monitor state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Unknown, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_lbmonitor_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_lbmonitor_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of gslbdomain_lbmonitor_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_lbmonitor_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbdomain_lbmonitor_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbdomain_lbmonitor_binding": [ {

```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_lbmonitor_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"gslbdomain_lbmonitor_binding": [ { "__count": "#no"} ] }
```

gslbldnsentries

Configuration for LDNS entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
sitename	<String>	Read-only	The GSLB site name.
numsites	<Double>	Read-only	Specifies the number of gslb sites.
ipaddress	<String>	Read-only	IP address of the LDNS server.
ttl	<Double>	Read-only	TTL value of the LDNS entry.
name	<String>	Read-only	Monitor that is currently being used to monitor the LDNS ip..
rtt	<Double[]>	Read-only	RTT value of the LDNS entry for all gslb sites.
__count	<Double>	Read-only	count parameter

Operations

CLEAR| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

clear

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbldnsentries?**action=clear**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"gslbldnsentries":{

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbldnsentries

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbldnsentries?**args=nodeid:<Double_value>**

Use this query-parameter to get gslbldnsentries resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbldnsentries?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbldnsentries?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of gslbldnsentries resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbldnsentries?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbldnsentries?**pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbldnsentries resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbldnsentries": [ {

nodeid:<Double_value>"sitename":<String_value>,

DELETE

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbldnsentry

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

gslbparameter

Configuration for GSLB parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ldnsentrytimeout	<Double>	Read-write	Time, in seconds, after which an inactive LDNS entry is removed. Default value: 180 Minimum value = 30 Maximum value = 65534
rtttolerance	<Double>	Read-write	Tolerance, in milliseconds, for newly learned round-trip time (RTT) values. If the difference between the old RTT value and the newly computed RTT value is less than or equal to the specified tolerance value, the LDNS entry in the network metric table is not updated with the new RTT value. Prevents the exchange of metrics when variations in RTT values are negligible. Default value: 5 Minimum value = 1 Maximum value = 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ldnsmask	<String>	Read-write	The IPv4 network mask with which to create LDNS entries. Minimum length = 1
v6ldnsmasklen	<Double>	Read-write	Mask for creating LDNS entries for IPv6 source addresses. The mask is defined as the number of leading bits to consider, in the source IP address, when creating an LDNS entry. Default value: 128 Minimum value = 1 Maximum value = 128
ldnsprobeorder	<String[]>	Read-write	Order in which monitors should be initiated to calculate RTT. Possible values = PING, DNS, TCP
dropldnsreq	<String>	Read-write	Drop LDNS requests if round-trip time (RTT) information is not available. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslbsvcstatedelaytime	<Double>	Read-write	Amount of delay in updating the state of GSLB service to DOWN when MEP goes down. This parameter is applicable only if monitors are not bound to GSLB services. Default value: 0 Minimum value = 0 Maximum value = 3600
automaticconfigsync	<String>	Read-write	GSLB configuration will be synced automatically to remote gslb sites if enabled. Default value: DISABLED Possible values = ENABLED, DISABLED
flags	<Double>	Read-only	State of the GSLB parameter.
builtin	<String[]>	Read-only	. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

Operations

}]}
```

gslbservice

Configuration for GSLB service resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name for the GSLB service. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			changed after the GSLB service is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my gslbsvc" or 'my gslbsvc'). Minimum length = 1
cnameentry	<String>	Read-write	Canonical name of the GSLB service. Used in CNAME-based GSLB. Minimum length = 1
ip	<String>	Read-write	IP address for the GSLB service. Should represent a load balancing, content switching, or VPN virtual server on the Citrix ADC, or the IP address of another load balancing device. Minimum length = 1
servername	<String>	Read-write	Name of the server hosting the GSLB service. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicetype	<String>	Read-write	Type of service to create. Default value: NSSVC_SERVICE_UNKNOWN Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
port	<Integer>	Read-write	Port on which the load balancing entity represented by this GSLB service listens. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
publicip	<String>	Read-write	The public IP address that a NAT device translates to the GSLB service's private IP address. Optional.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
publicport	<Integer>	Read-write	The public port associated with the GSLB service's public IP address. The port is mapped to the service's private port number. Applicable to the local GSLB service. Optional.
maxclient	<Double>	Read-write	The maximum number of open connections that the service can support at any given time. A GSLB service whose connection count reaches the maximum is not considered when a GSLB decision is made, until the connection count drops below the maximum. Minimum value = 0 Maximum value = 4294967294
healthmonitor	<String>	Read-write	Monitor the health of the GSLB service. Default value: YES Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sitename	<String>	Read-write	Name of the GSLB site to which the service belongs. Minimum length = 1
state	<String>	Read-write	Enable or disable the service. Default value: ENABLED Possible values = ENABLED, DISABLED
cip	<String>	Read-write	In the request that is forwarded to the GSLB service, insert a header that stores the client's IP address. Client IP header insertion is used in connection-proxy based site persistence. Default value: DISABLED Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	Name for the HTTP header that stores the client's IP address. Used with the Client IP option. If client IP header insertion is enabled on the service and a name is not specified

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for the header, the Citrix ADC uses the name specified by the cipHeader parameter in the set ns param command or, in the GUI, the Client IP Header parameter in the Configure HTTP Parameters dialog box. Minimum length = 1
sitepersistence	<String>	Read-write	Use cookie-based site persistence. Applicable only to HTTP and SSL GSLB services. Possible values = ConnectionProxy, HTTPRedirect, NONE
cookietimeout	<Double>	Read-write	Timeout value, in minutes, for the cookie, when cookie based site persistence is enabled. Minimum value = 0 Maximum value = 1440
siteprefix	<String>	Read-write	The site's prefix string. When the service is bound to a GSLB virtual server, a GSLB site domain is generated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			internally for each bound service-domain pair by concatenating the site prefix of the service and the name of the domain. If the special string NONE is specified, the site-prefix string is unset. When implementing HTTP redirect site persistence, the Citrix ADC redirects GSLB requests to GSLB services by using their site domains.
clttimeout	<Double>	Read-write	Idle time, in seconds, after which a client connection is terminated. Applicable if connection proxy based site persistence is used. Minimum value = 0 Maximum value = 31536000
svrtimeout	<Double>	Read-write	Idle time, in seconds, after which a server connection is terminated. Applicable if connection proxy based site persistence is used.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 31536000
maxbandwidth	<Double>	Read-write	Integer specifying the maximum bandwidth allowed for the service. A GSLB service whose bandwidth reaches the maximum is not considered when a GSLB decision is made, until its bandwidth consumption drops below the maximum.
downstateflush	<String>	Read-write	Flush all active transactions associated with the GSLB service when its state transitions from UP to DOWN. Do not enable this option for services that must complete their transactions. Applicable if connection proxy based site persistence is used. Possible values = ENABLED, DISABLED
maxaaausers	<Double>	Read-write	Maximum number of SSL VPN users that can be logged on concurrently to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VPN virtual server that is represented by this GSLB service. A GSLB service whose user count reaches the maximum is not considered when a GSLB decision is made, until the count drops below the maximum. Minimum value = 0 Maximum value = 65535
monthreshold	<Double>	Read-write	Monitoring threshold value for the GSLB service. If the sum of the weights of the monitors that are bound to this GSLB service and are in the UP state is not equal to or greater than this threshold value, the service is marked as DOWN. Minimum value = 0 Maximum value = 65535
hashid	<Double>	Read-write	Unique hash identifier for the GSLB service, used by hash based load balancing methods. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Any comments that you might want to associate with the GSLB service.
appflowlog	<String>	Read-write	Enable logging appflow flow information. Default value: ENABLED Possible values = ENABLED, DISABLED
naptrreplacement	<String>	Read-write	The replacement domain name for this NAPTR. Maximum length = 255
naptrorder	<Double>	Read-write	An integer specifying the order in which the NAPTR records MUST be processed in order to accurately represent the ordered list of Rules. The ordering is from lowest to highest. Default value: 1 Minimum value = 1 Maximum value = 65535
naptrservices	<String>	Read-write	Service Parameters applicable to this delegation path.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 255
naptrdomainttl	<Double>	Read-write	Modify the TTL of the internally created naptr domain. Default value: 3600 Minimum value = 1
naptrpreference	<Double>	Read-write	An integer specifying the preference of this NAPTR among NAPTR records having same order. lower the number, higher the preference. Default value: 1 Minimum value = 1 Maximum value = 65535
ipaddress	<String>	Read-write	The new IP address of the service.
viewname	<String>	Read-write	Name of the DNS view of the service. A DNS view is used in global server load balancing (GSLB) to return a predetermined IP address to a specific group of clients, which are identified by using a DNS policy. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viewip	<String>	Read-write	IP address to be used for the given view.
weight	<Double>	Read-write	Weight to assign to the monitor-service binding. A larger number specifies a greater weight. Contributes to the monitoring threshold, which determines the state of the service. Minimum value = 1 Maximum value = 100
monitor_name_svc	<String>	Read-write	Name of the monitor to bind to the service. Minimum length = 1
newname	<String>	Read-write	New name for the GSLB service. Minimum length = 1
gslb	<String>	Read-only	. Default value: GSLB Possible values = REMOTE, LOCAL
svrstate	<String>	Read-only	Server state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
svreffgslbstate	<String>	Read-only	Effective state of the gslb svc. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
gslbthreshold	<Integer>	Read-only	Indicates if gslb svc has reached threshold.
gslbsvcstats	<Integer>	Read-only	Indicates if gslb svc has stats of the primary or the whole chain.
monstate	<String>	Read-only	State of the monitor bound to gslb service. Possible values = ENABLED, DISABLED
preferredlocation	<String>	Read-only	Prefered location.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitor_state	<String>	Read-only	The running state of the monitor on this service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
tickssincelaststatechange	<Double>	Read-only	Time in 10 millisecond ticks since the last state change.
threshold	<String>	Read-only	. Possible values = ABOVE, BELOW
clmonowner	<Double>	Read-only	Tells the mon owner of the gslb service. Minimum value = 0 Maximum value = 32
clmonview	<Double>	Read-only	Tells the view id of the monitoring owner.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslbsvchealth	<Integer>	Read-only	This parameter displays effective health of a GSLB service.
glsbsvchealthdescr	<String>	Read-only	Displays the warning message related to health a of GSLB service.
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservice

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservice

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservice?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservice?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of gslbservice resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservice?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservice?**pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbservice resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

gslbservice_binding

Binding object which returns the resources bound to gslbservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name of the GSLB service. Minimum length = 1
gslbservice_dnsview_binding	<gslbservice_dnsview_binding[]>	Read-only	dnsview that can be bound to gslbservice.
gslbservice_lbmonitor_binding	<gslbservice_lbmonitor_binding[]>	Read-only	lbmonitor that can be bound to gslbservice.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservice_binding/servicename_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbservice_binding": [ {

"servicename":<String_value>,

"gslbservice_lbmonitor_binding":<gslbservice_lbmonitor_binding[]_value>,

"gslbservice_dnsview_binding":<gslbservice_dnsview_binding[]_value>
```

```
}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservice_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservice_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

gslbservice_lbmonitor_binding

Binding object showing the lbmonitor that can be bound to gslbservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name of the GSLB service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
weight	<Double>	Read-write	Weight to assign to the monitor-service binding. A larger number specifies a greater weight. Contributes to the monitoring threshold, which determines the state of the service. Minimum value = 1 Maximum value = 100
monitor_name	<String>	Read-write	Monitor name.
monstate	<String>	Read-write	State of the monitor bound to gslb service. Possible values = ENABLED, DISABLED
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
lastresponse	<String>	Read-only	Displays the gslb monitor status in string format.
failedprobes	<Double>	Read-only	Number of the current failed monitoring probes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
monitor_state	<String>	Read-only	The running state of the monitor on this service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
monitortotalprobes	<Double>	Read-only	Total number of probes sent to monitor this service.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
responsetime	<Double>	Read-only	Response time of this monitor.
monitortotalfailedprobes	<Double>	Read-only	Total number of failed probes.
monitorcurrentfailedprobes	<Double>	Read-only	Total number of currently failed probes.
totalfailedprobes	<Double>	Read-only	The total number of failed probs.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

gslbsite

Configuration for GSLB site resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sitename	<String>	Read-write	Name for the GSLB site. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			gslbsite" or 'my gslbsite'). Minimum length = 1
sitetype	<String>	Read-write	Type of site to create. If the type is not specified, the appliance automatically detects and sets the type on the basis of the IP address being assigned to the site. If the specified site IP address is owned by the appliance (for example, a MIP address or SNIP address), the site is a local site. Otherwise, it is a remote site. Default value: NONE Possible values = REMOTE, LOCAL
siteipaddress	<String>	Read-write	IP address for the GSLB site. The GSLB site uses this IP address to communicate with other GSLB sites. For a local site, use any IP address that is owned by the appliance (for example, a SNIP or MIP address, or the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IP address of the ADNS service). Minimum length = 1
publicip	<String>	Read-write	Public IP address for the local site. Required only if the appliance is deployed in a private address space and the site has a public IP address hosted on an external firewall or a NAT device. Minimum length = 1
metricexchange	<String>	Read-write	Exchange metrics with other sites. Metrics are exchanged by using Metric Exchange Protocol (MEP). The appliances in the GSLB setup exchange health information once every second. If you disable metrics exchange, you can use only static load balancing methods (such as round robin, static proximity, or the hash-based methods), and if you disable metrics exchange when a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			dynamic load balancing method (such as least connection) is in operation, the appliance falls back to round robin. Also, if you disable metrics exchange, you must use a monitor to determine the state of GSLB services. Otherwise, the service is marked as DOWN. Default value: ENABLED Possible values = ENABLED, DISABLED
nwmetricexchange	<String>	Read-write	Exchange, with other GSLB sites, network metrics such as round-trip time (RTT), learned from communications with various local DNS (LDNS) servers used by clients. RTT information is used in the dynamic RTT load balancing method, and is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			exchanged every 5 seconds. Default value: ENABLED Possible values = ENABLED, DISABLED
sessionexchange	<String>	Read-write	Exchange persistent session entries with other GSLB sites every five seconds. Default value: ENABLED Possible values = ENABLED, DISABLED
triggermonitor	<String>	Read-write	Specify the conditions under which the GSLB service must be monitored by a monitor, if one is bound. Available settings function as follows: * ALWAYS - Monitor the GSLB service at all times. * MEPDOWN - Monitor the GSLB service only when the exchange of metrics through the Metrics Exchange

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Protocol (MEP) is disabled. MEPDOWN_SVCDOWN - Monitor the service in either of the following situations: * The exchange of metrics through MEP is disabled. * The exchange of metrics through MEP is enabled but the status of the service, learned through metrics exchange, is DOWN. Default value: ALWAYS Possible values = ALWAYS, MEPDOWN, MEPDOWN_SVCDOWN
parentsite	<String>	Read-write	Parent site of the GSLB site, in a parent-child topology.
clip	<String>	Read-write	Cluster IP address. Specify this parameter to connect

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to the remote cluster site for GSLB auto-sync. Note: The cluster IP address is defined when creating the cluster.
publicclip	<String>	Read-write	IP address to be used to globally access the remote cluster when it is deployed behind a NAT. It can be same as the normal cluster IP address.
naptrreplacementsuffix	<String>	Read-write	The naptr replacement suffix configured here will be used to construct the naptr replacement field in NAPTR record. Minimum length = 1
backupparentlist	<String[]>	Read-write	The list of backup gslb sites configured in preferred order. Need to be parent gsb sites. Default value: "None"
status	<String>	Read-only	Current metric exchange status. Possible values = ACTIVE, INACTIVE, DOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
persistencemepstatus	<String>	Read-only	Network metric and persistence exchange MEP connection status. Possible values = ACTIVE, INACTIVE, DOWN
version	<Double>	Read-only	will be true if the remote site's version is ncore compatible with the local site.(>= 9.2).
curbackupparentip	<String>	Read-only	Current active backup parent IP address since the configured is DOWN.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsite

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"gslbsite":{

gslbsite_binding

Binding object which returns the resources bound to gslbsite.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sitename	<String>	Read-write	Name of the GSLB site. If you specify a site name, details of all the site's constituent services are also displayed. Minimum length = 1
gslbsite_gslbservicegroup_binding	<gslbsite_gslbservicegroup_binding[]>	Read-only	gslbservicegroup that can be bound to gslbsite.
gslbsite_gslbservice_binding	<gslbsite_gslbservice_binding[]>	Read-only	gslbservice that can be bound to gslbsite.
gslbsite_gslbservicegroupmember_binding	<gslbsite_gslbservicegroupmember_binding[]>	Read-only	gslbservicegroupmember that can be bound to gslbsite.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsite_gslbservice_binding/sitename_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"gslbsite_gslbservice_binding": [ { "__count": "#no"} ] }
```

gslbsyncstatus

Configuration for sync status resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
summary	<Boolean>	Read-write	sync status summary to be displayed in one line (Success/ Failure), in case of Failure stating reason for failure.
response	<String>	Read-only	gslb sync status as text blob.

Operations

(click to see Properties)

GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsyncstatus

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsyncstatus?
args=summary:<Boolean_value>

Use this query-parameter to get gslbsyncstatus resources based on additional properties.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbsyncstatus": [ {

summary:<Boolean_value>"response":<String_value>

}]}
```

gslbvserver

Configuration for Global Server Load Balancing Virtual Server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the GSLB virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). Minimum length = 1
servicetype	<String>	Read-write	Protocol used by services bound to the virtual server. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
iptype	<String>	Read-write	The IP type for this GSLB vserver. Default value: IPV4 Possible values = IPV4, IPV6

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dnsrecordtype	<String>	Read-write	DNS record type to associate with the GSLB virtual server's domain name. Default value: A Possible values = A, AAAA, CNAME, NAPTR
lbmethod	<String>	Read-write	Load balancing method for the GSLB virtual server. Default value: LEASTCONNECTION Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, SOURCEIPHASH, LEASTBANDWIDTH, LEASTPACKETS, STATICPROXIMITY, RTT, CUSTOMLOAD
backupsessiontimeout	<Double>	Read-write	A non zero value enables the feature whose minimum value is 2 minutes. The feature can be disabled by setting the value to zero. The created session

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is in effect for a specific client per domain. Minimum value = 0 Maximum value = 1440
backuplbmethod	<String>	Read-write	Backup load balancing method. Becomes operational if the primary load balancing method fails or cannot be used. Valid only if the primary method is based on either round-trip time (RTT) or static proximity. Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, SOURCEIPHASH, LEASTBANDWIDTH, LEASTPACKETS, STATICPROXIMITY, RTT, CUSTOMLOAD
netmask	<String>	Read-write	IPv4 network mask for use in the SOURCEIPHASH load balancing method. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
v6netmasklen	<Double>	Read-write	Number of bits to consider, in an IPv6 source IP address, for creating the hash that is required by the SOURCEIPHASH load balancing method. Default value: 128 Minimum value = 1 Maximum value = 128
tolerance	<Double>	Read-write	Site selection tolerance, in milliseconds, for implementing the RTT load balancing method. If a site's RTT deviates from the lowest RTT by more than the specified tolerance, the site is not considered when the Citrix ADC makes a GSLB decision. The appliance implements the round robin method of global server load balancing between sites whose RTT values are within the specified tolerance. If the tolerance is 0 (zero), the appliance always sends clients

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the IP address of the site with the lowest RTT. Minimum value = 0 Maximum value = 100
persistencetype	<String>	Read-write	Use source IP address based persistence for the virtual server. After the load balancing method selects a service for the first packet, the IP address received in response to the DNS query is used for subsequent requests from the same client. Possible values = SOURCEIP, NONE
persistenceid	<Double>	Read-write	The persistence ID for the GSLB virtual server. The ID is a positive integer that enables GSLB sites to identify the GSLB virtual server, and is required if source IP address based or spill over based persistence is enabled on the virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 65535
persistmask	<String>	Read-write	The optional IPv4 network mask applied to IPv4 addresses to establish source IP address based persistence. Minimum length = 1
v6persistmasklen	<Double>	Read-write	Number of bits to consider in an IPv6 source IP address when creating source IP address based persistence sessions. Default value: 128 Minimum value = 1 Maximum value = 128
timeout	<Double>	Read-write	Idle time, in minutes, after which a persistence entry is cleared. Default value: 2 Minimum value = 2 Maximum value = 1440
edr	<String>	Read-write	Send clients an empty DNS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			response when the GSLB virtual server is DOWN. Default value: DISABLED Possible values = ENABLED, DISABLED
ecs	<String>	Read-write	If enabled, respond with EDNS Client Subnet (ECS) option in the response for a DNS query with ECS. The ECS address will be used for persistence and spillover persistence (if enabled) instead of the LDNS address. Persistence mask is ignored if ECS is enabled. Default value: DISABLED Possible values = ENABLED, DISABLED
ecsaddrvalidation	<String>	Read-write	Validate if ECS address is a private or unroutable address and in such cases, use the LDNS IP. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
mir	<String>	Read-write	Include multiple IP addresses in the DNS responses sent to clients. Default value: DISABLED Possible values = ENABLED, DISABLED
disableprimaryondown	<String>	Read-write	Continue to direct traffic to the backup chain even after the primary GSLB virtual server returns to the UP state. Used when spillover is configured for the virtual server. Default value: DISABLED Possible values = ENABLED, DISABLED
dynamicweight	<String>	Read-write	Specify if the appliance should consider the service count, service weights, or ignore both when using weight-based load balancing methods. The state of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number of services bound to the virtual server help the appliance to select the service. Default value: DISABLED Possible values = SERVICECOUNT, SERVICEWEIGHT, DISABLED
state	<String>	Read-write	State of the GSLB virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
considereffectivestate	<String>	Read-write	If the primary state of all bound GSLB services is DOWN, consider the effective states of all the GSLB services, obtained through the Metrics Exchange Protocol (MEP), when determining the state of the GSLB virtual server. To consider the effective state, set the parameter to STATE_ONLY. To disregard the effective state, set

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the parameter to NONE. The effective state of a GSLB service is the ability of the corresponding virtual server to serve traffic. The effective state of the load balancing virtual server, which is transferred to the GSLB service, is UP even if only one virtual server in the backup chain of virtual servers is in the UP state. Default value: NONE Possible values = NONE, STATE_ONLY
comment	<String>	Read-write	Any comments that you might want to associate with the GSLB virtual server.
somethod	<String>	Read-write	Type of threshold that, when exceeded, triggers spillover. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* CONNECTION - Spillover occurs when the number of client connections exceeds the threshold. * DYNAMICCONNECTION - Spillover occurs when the number of client connections at the GSLB virtual server exceeds the sum of the maximum client (Max Clients) settings for bound GSLB services. Do not specify a spillover threshold for this setting, because the threshold is implied by the Max Clients settings of the bound GSLB services. * BANDWIDTH - Spillover occurs when the bandwidth consumed by the GSLB virtual server's incoming and outgoing traffic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			exceeds the threshold. * HEALTH - Spillover occurs when the percentage of weights of the GSLB services that are UP drops below the threshold. For example, if services gslbSvc1, gslbSvc2, and gslbSvc3 are bound to a virtual server, with weights 1, 2, and 3, and the spillover threshold is 50%, spillover occurs if gslbSvc1 and gslbSvc3 or gslbSvc2 and gslbSvc3 transition to DOWN. * NONE - Spillover does not occur. Possible values = CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, NONE
sopersistence	<String>	Read-write	If spillover occurs, maintain source IP address based

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			persistence for both primary and backup GSLB virtual servers. Default value: DISABLED Possible values = ENABLED, DISABLED
sopersistencetimeout	<Double>	Read-write	Timeout for spillover persistence, in minutes. Default value: 2 Minimum value = 2 Maximum value = 1440
sothreshold	<Double>	Read-write	Threshold at which spillover occurs. Specify an integer for the CONNECTION spillover method, a bandwidth value in kilobits per second for the BANDWIDTH method (do not enter the units), or a percentage for the HEALTH method (do not enter the percentage symbol). Minimum value = 1 Maximum value = 4294967287
sobackupaction	<String>	Read-write	Action to be performed if spillover

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is to take effect, but no backup chain to spillover is usable or exists. Possible values = DROP, ACCEPT, REDIRECT
appflowlog	<String>	Read-write	Enable logging appflow flow information. Default value: ENABLED Possible values = ENABLED, DISABLED
backupvserver	<String>	Read-write	Name of the backup GSLB virtual server to which the appliance should to forward requests if the status of the primary GSLB virtual server is down or exceeds its spillover threshold. Minimum length = 1
servicename	<String>	Read-write	Name of the GSLB service for which to change the weight. Minimum length = 1
weight	<Double>	Read-write	Weight to assign to the GSLB service. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 100
domainname	<String>	Read-write	Domain name for which to change the time to live (TTL) and/or backup service IP address. Minimum length = 1
ttl	<Double>	Read-write	Time to live (TTL) for the domain. Minimum value = 1
backupip	<String>	Read-write	The IP address of the backup service for the specified domain name. Used when all the services bound to the domain are down, or when the backup chain of virtual servers is down. Minimum length = 1
cookie_domain	<String>	Read-write	The cookie domain for the GSLB site. Used when inserting the GSLB site cookie in the HTTP response. Minimum length = 1
cookietimeout	<Double>	Read-write	Timeout, in minutes, for the GSLB site cookie. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 1440
sitedomainttl	<Double>	Read-write	TTL, in seconds, for all internally created site domains (created when a site prefix is configured on a GSLB service) that are associated with this virtual server. Minimum value = 1
newname	<String>	Read-write	New name for the GSLB virtual server. Minimum length = 1
curstate	<String>	Read-only	State of the gslb vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
status	<Integer>	Read-only	Current status of the gslb vserver. During the initial phase if the configured lb method is not round robin , the vserver will adopt round robin to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			distribute traffic for a predefined number of requests.
lbrrreason	<Integer>	Read-only	Reason why a vserver is in RR. The following are the reasons: 1 - MEP is DOWN (GSLB) 2 - LB method has changed 3 - Bound service's state changed to UP 4 - A new service is bound 5 - Startup RR factor has changed 6 - LB feature is enabled 7 - Load monitor is not active on a service 8 - Vserver is Enabled 9 - SSL feature is Enabled 10 - All bound services have reached threshold. Using effective state

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to load balance (GSLB) 11 - Primary state of bound services are not UP. Using effective state to load balance (GSLB) 12 - No LB decision can be made as all bound services have either reached threshold or are not UP (GSLB) 13 - All load monitors are active .
iscname	<String>	Read-only	is cname feature set on vserver. Possible values = ENABLED, DISABLED
sitepersistence	<String>	Read-only	Type of Site Persistence set. Possible values = ConnectionProxy, HTTPRedirect, NONE
totalservices	<Double>	Read-only	Total number of services bound to the vserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
activeservices	<Double>	Read-only	Total number of active services bound to the vserver.
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
statechangetimemsec	<Double>	Read-only	Time at which last state change happened. Milliseconds part.
tickssincelaststatechange	<Double>	Read-only	Time in 10 millisecond ticks since the last state change.
health	<Double>	Read-only	Health of vserver based on percentage of weights of active svcs/all svcs. This does not consider administratively disabled svcs.
policyname	<String>	Read-only	Name of the policy bound to the GSLB vserver.
priority	<Double>	Read-only	Priority. Minimum value = 1 Maximum value = 2147483647
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy rule evaluates to TRUE. o If gotoPriorityExpression is not present or if it is equal to END then the policy bank evaluation ends here o Else if the gotoPriorityExpression is equal to NEXT then the next policy in the priority order is evaluated. o Else gotoPriorityExpression is evaluated. The result of gotoPriorityExpression (which has to be a number) is processed as follows: - An UNDEF event is triggered if . gotoPriorityExpression cannot be evaluated . gotoPriorityExpression evaluates to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number which is smaller than the maximum priority in the policy bank but is not same as any policy's priority . gotoPriorityExpression evaluates to a priority that is smaller than the current policy's priority - If the gotoPriorityExpression evaluates to the priority of the current policy then the next policy in the priority order is evaluated. - If the gotoPriorityExpression evaluates to the priority of a policy further ahead in the list then that policy will be evaluated next. This field is applicable only to rewrite and responder policies.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-only	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE
vsvrbindsvcip	<String>	Read-only	used for showing the ip of bound entities.
vsvrbindsvcport	<Integer>	Read-only	used for showing ports of bound entities. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
servername	<String>	Read-only	This field is used to display server name in case of GSLB servicegroup binding to GSLB vserver .
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of gslbvserver resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver?**pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbvserver resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

gslbvserver_binding

Binding object which returns the resources bound to gslbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the GSLB virtual server. Minimum length = 1
gslbvserver_gslbservicegroup_binding	<gslbvserver_gslbservicegroup_binding[]>	Read-only	gslbservicegroup that can be bound to gslbvserver.
gslbvserver_gslbservicegroupmember_binding	<gslbvserver_gslbservicegroupmember_binding[]>	Read-only	gslbservicegroupmember that can be bound to gslbvserver.
gslbvserver_spillover policy_binding	<gslbvserver_spillover policy_binding[]>	Read-only	spilloverpolicy that can be bound to gslbvserver.
gslbvserver_gslbservice_binding	<gslbvserver_gslbservice_binding[]>	Read-only	gslbservice that can be bound to gslbvserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslbvserver_domain_binding	<gslbvserver_domain_binding[]>	Read-only	domain that can be bound to gslbvserver.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbvserver_binding": [ {

"name":<String_value>,

```

```
"gslbvserver_gslbservicegroup_binding":<gslbvserver_gslbservicegroup_binding[]_value>

}]}
```

gslbvserver_domain_binding

Binding object showing the domain that can be bound to gslbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
backupipflag	<Boolean>	Read-write	The IP address of the backup service for the specified domain name. Used when all the services bound to the domain are down, or when the backup chain of virtual servers is down.
cookietimeout	<Double>	Read-write	Timeout, in minutes, for the GSLB site cookie. Minimum value = 0 Maximum value = 1440
backupip	<String>	Read-write	The IP address of the backup service for the specified domain name. Used when all the services bound to the domain are down, or when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the backup chain of virtual servers is down. Minimum length = 1
name	<String>	Read-write	Name of the virtual server on which to perform the binding operation. Minimum length = 1
ttl	<Double>	Read-write	Time to live (TTL) for the domain. Minimum value = 1
domainname	<String>	Read-write	Domain name for which to change the time to live (TTL) and/or backup service IP address. Minimum length = 1
sitedomainttl	<Double>	Read-write	TTL, in seconds, for all internally created site domains (created when a site prefix is configured on a GSLB service) that are associated with this virtual server. Minimum value = 1
cookie_domainflag	<Boolean>	Read-write	The cookie domain for the GSLB site. Used when inserting the GSLB site cookie in the HTTP response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cookie_domain	<String>	Read-write	The cookie domain for the GSLB site. Used when inserting the GSLB site cookie in the HTTP response. Minimum length = 1
__count	<Double>	Read-write	count parameter

gslbvserver_gslbservice_binding

Binding object showing the gslbservice that can be bound to gslbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
weight	<Double>	Read-write	Weight to assign to the GSLB service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 100
name	<String>	Read-write	Name of the virtual server on which to perform the binding operation. Minimum length = 1
servicename	<String>	Read-write	Name of the GSLB service for which to change the weight. Minimum length = 1
domainname	<String>	Read-write	Domain name for which to change the time to live (TTL) and/or backup service IP address. Minimum length = 1
cnameentry	<String>	Read-only	The cname of the gslb service.
svcsitepersistence	<String>	Read-only	Type of Site Persistence set on the bound service. Possible values = ConnectionProxy, HTTPRedirect, NONE
gslbboundsvctype	<String>	Read-only	Protocol used by services bound to the GSLBvirtual server. Possible values = HTTP, FTP, TCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
preferredlocation	<String>	Read-only	The target site to be returned in the DNS response when a policy is successfully evaluated against the incoming DNS request. Target site is specified in dotted notation with up to 6 qualifiers. Wildcard `*' is accepted as a valid qualifier token.
dynamicconfwt	<Double>	Read-only	Weight obtained by the virtue of bound service count or weight.
cumulativeweight	<Double>	Read-only	Cumulative weight is the weight of GSLB service considering both its configured weight and dynamic weight. It is equal to product of dynamic weight and configured weight of the gslb service .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslbthreshold	<Integer>	Read-only	Indicates if gslb svc has reached threshold.
sitepersistcookie	<String>	Read-only	This field is introduced for displaying the cookie in cluster setup. Minimum length = 1
port	<Integer>	Read-only	Port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
iscname	<String>	Read-only	is cname feature set on vserver. Possible values = ENABLED, DISABLED
curstate	<String>	Read-only	State of the gslb vserver. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svreffgslbstate	<String>	Read-only	Effective state of the gslb svc. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
thresholdvalue	<Integer>	Read-only	Tells whether threshold exceeded for this service participating in CUSTOMLB.
ipaddress	<String>	Read-only	IP address.
__count	<Double>	Read-only	count parameter

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/gslbvserver_spilloverpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"gslbvserver_spilloverpolicy_binding":{

<b>"name":<String_value>,

</b>"policyname":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"type":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver_spilloverpolicy_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver_spilloverpolicy_binding/name_value<String>?**args=policyname:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver_spilloverpolicy_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver_spilloverpolicy_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of gslbvserver_spilloverpolicy_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver_spilloverpolicy_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbvserver_spilloverpolicy_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbvserver_spilloverpolicy_binding": [ {

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"policyname":<String_value>,

"name":<String_value>,

"type":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver_spilloverpolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbvserver_spilloverpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

```

gslbservicegroup

Configuration for GSLB service group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the GSLB service group. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the name is created. Minimum length = 1
servicetype	<String>	Read-write	Protocol used to exchange data with the GSLB service. Possible values = HTTP, FTP, TCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
maxclient	<Double>	Read-write	Maximum number of simultaneous open connections for the GSLB service group. Minimum value = 0 Maximum value = 4294967294
cip	<String>	Read-write	Insert the Client IP header in requests forwarded to the GSLB service. Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	Name of the HTTP header whose value must be set to the IP address of the client. Used with the Client IP parameter. If client IP insertion is enabled, and the client IP header is not specified, the value of Client IP Header parameter or the value set by the set ns config

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			command is used as client's IP header name. Minimum length = 1
healthmonitor	<String>	Read-write	Monitor the health of this GSLB service.Available settings function are as follows: YES - Send probes to check the health of the GSLB service. NO - Do not send probes to check the health of the GSLB service. With the NO option, the appliance shows the service as UP at all times. Default value: YES Possible values = YES, NO
clttimeout	<Double>	Read-write	Time, in seconds, after which to terminate an idle client connection. Minimum value = 0 Maximum value = 31536000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svrtimeout	<Double>	Read-write	Time, in seconds, after which to terminate an idle server connection. Minimum value = 0 Maximum value = 31536000
maxbandwidth	<Double>	Read-write	Maximum bandwidth, in Kbps, allocated for all the services in the GSLB service group. Minimum value = 0 Maximum value = 4294967287
monthreshold	<Double>	Read-write	Minimum sum of weights of the monitors that are bound to this GSLB service. Used to determine whether to mark a GSLB service as UP or DOWN. Minimum value = 0 Maximum value = 65535
state	<String>	Read-write	Initial state of the GSLB service group. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
downstateflush	<String>	Read-write	Flush all active transactions associated with all the services in the GSLB service group whose state transitions from UP to DOWN. Do not enable this option for applications that must complete their transactions. Default value: ENABLED Possible values = ENABLED, DISABLED
comment	<String>	Read-write	Any information about the GSLB service group.
appflowlog	<String>	Read-write	Enable logging of AppFlow information for the specified GSLB service group. Default value: ENABLED Possible values = ENABLED, DISABLED
autoscale	<String>	Read-write	Auto scale option for a GSLB servicegroup. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DISABLED, DNS
sitename	<String>	Read-write	Name of the GSLB site to which the service group belongs. Minimum length = 1
sitepersistence	<String>	Read-write	Use cookie-based site persistence. Applicable only to HTTP and SSL non-autoscale enabled GSLB servicegroups. Possible values = ConnectionProxy, HTTPRedirect, NONE
servername	<String>	Read-write	Name of the server to which to bind the service group. Minimum length = 1
port	<Integer>	Read-write	Server port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
weight	<Double>	Read-write	Weight to assign to the servers in the service group. Specifies the capacity of the servers relative to the other servers in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the load balancing configuration. The higher the weight, the higher the percentage of requests sent to the service. Minimum value = 1 Maximum value = 100
hashid	<Double>	Read-write	The hash identifier for the service. This must be unique for each service. This parameter is used by hash based load balancing methods. Minimum value = 1
publicip	<String>	Read-write	The public IP address that a NAT device translates to the GSLB service's private IP address. Optional. Minimum length = 1
publicport	<Integer>	Read-write	The public port associated with the GSLB service's public IP address. The port is mapped to the service's private port number. Applicable to the local GSLB service. Optional. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
siteprefix	<String>	Read-write	The site's prefix string. When the GSLB service group is bound to a GSLB virtual server, a GSLB site domain is generated internally for each bound serviceitem-domain pair by concatenating the site prefix of the service item and the name of the domain. If the special string NONE is specified, the site-prefix string is unset. When implementing HTTP redirect site persistence, the Citrix ADC redirects GSLB requests to GSLB services by using their site domains.
monitor_name_svc	<String>	Read-write	Name of the monitor bound to the GSLB service group. Used to assign a weight to the monitor. Minimum length = 1
dup_weight	<Double>	Read-write	weight of the monitor that is bound to GSLB servicegroup. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
delay	<Double>	Read-write	The time allowed (in seconds) for a graceful shutdown. During this period, new connections or requests will continue to be sent to this service for clients who already have a persistent session on the system. Connections or requests from fresh or new clients who do not yet have a persistence sessions on the system will not be sent to the service. Instead, they will be load balanced among other available services. After the delay time expires, no new requests or connections will be sent to the service.
graceful	<String>	Read-write	Wait for all existing connections to the service to terminate before shutting down the service. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
includemembers	<Boolean>	Read-write	Display the members of the listed GSLB service groups in addition to their settings. Can be specified when no service group name is provided in the command. In that case, the details displayed for each service group are identical to the details displayed when a service group name is provided, except that bound monitors are not displayed.
newname	<String>	Read-write	New name for the GSLB service group. Minimum length = 1
numofconnections	<Integer>	Read-only	This will tell the number of client side connections are still open.
serviceconftype	<Boolean>	Read-only	The configuration type of the GSLB service group.
value	<String>	Read-only	SSL Status. Possible values = Certkey not bound, SSL feature disabled

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svrstate	<String>	Read-only	The state of the GSLB service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
ip	<String>	Read-only	IP Address.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
statechangetimemsec	<Double>	Read-only	Time when last state change occurred. Milliseconds part.
stateupdatereason	<Double>	Read-only	Checks state update reason on the secondary node.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clmonowner	<Double>	Read-only	Tells the mon owner of the service.
clmonview	<Double>	Read-only	Tells the view id of the monitoring owner.
groupcount	<Double>	Read-only	Servicegroup Count.
serviceipstr	<String>	Read-only	This field has been intorduced to show the dbs services ip.
servicegroupeffective state	<String>	Read-only	Indicates the effective GSLB servicegroup state based on the state of the bound service items.If all services are UP the effective state is UP, if all are DOWN its DOWN,if all are OFS its OFS.If atleast one serviceis UP and rest are either DOWN or OFS, the effective state is PARTIAL-UP.If atleast one bound service is DOWN and rest are OFS the effective state is PARTIAL DOWN. Possible values = UP, DOWN, OUT OF SERVICE, PARTIAL-UP, PARTIAL-DOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslb	<String>	Read-only	. Default value: GSLB Possible values = REMOTE, LOCAL
svreffgslbstate	<String>	Read-only	Effective state of the gslb svc. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
nodefaultbindings	<String>	Read-only	to determine if the configuration is from stylebooks. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbservicegroup": [ { "__count": "#no"} ] }
```

gslbservicegroup_binding

Binding object which returns the resources bound to gslbservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the GSLB service group. Minimum length = 1
gslbservicegroup_servicegroupentitymonbindings_binding	<gslbservicegroup_servicegroupentitymonbindings_binding[]>	Read-only	servicegroupentitymonbindings that can be bound to gslbservicegroup.
gslbservicegroup_lbmonitor_binding	<gslbservicegroup_lbmonitor_binding[]>	Read-only	lbmonitor that can be bound to gslbservicegroup.
gslbservicegroup_gslbservicegroupmember_binding	<gslbservicegroup_gslbservicegroupmember_binding[]>	Read-only	gslbservicegroupmember that can be bound to gslbservicegroup.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservicegroup_binding/servicegroupname_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbservicegroup_binding": [ {

"servicegroupname":<String_value>,

"gslbservicegroup_servicegroupentitymonbindings_binding":<gslbservicegroup
_servicegroupentitymonbindings_binding[]_value>,

"gslbservicegroup_lbmonitor_binding":<gslbservicegroup_lbmonitor_binding[]
_value>,
```

```
"gslbservicegroup_gslbservicegroupmember_binding":<gslbservicegroup_gslbse
rvicegroupmember_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservicegroup_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservicegroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbservicegroup_binding": [ {

"servicegroupname":<String_value>,

"gslbservicegroup_servicegroupentitymonbindings_binding":<gslbservicegroup
_servicegroupentitymonbindings_binding[]_value>,

"gslbservicegroup_lbmonitor_binding":<gslbservicegroup_lbmonitor_binding[]
```

```
_value>,

"gslbservicegroup_gslbservicegroupmember_binding":<gslbservicegroup_gslbse
rvicegroupmember_binding[]_value>

}]}
```

gslbservicegroup_gslbservicegroupmember_binding

Binding object showing the gslbservicegroupmember that can be bound to gslbservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Initial state of the GSLB service group. Default value: ENABLED Possible values = ENABLED, DISABLED
publicport	<Integer>	Read-write	The public port associated with the GSLB service's public IP address. The port is mapped to the service's private port number. Applicable to the local GSLB service. Optional. Minimum value = 1
weight	<Double>	Read-write	Weight to assign to the servers in the service group. Specifies the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			capacity of the servers relative to the other servers in the load balancing configuration. The higher the weight, the higher the percentage of requests sent to the service. Minimum value = 1 Maximum value = 100
port	<Integer>	Read-write	Server port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
servername	<String>	Read-write	Name of the server to which to bind the service group. Minimum length = 1
siteprefix	<String>	Read-write	The site's prefix string. When the GSLB service group is bound to a GSLB virtual server, a GSLB site domain is generated internally for each bound serviceitem-domain pair by concatenating the site prefix of the service item and the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name of the domain. If the special string NONE is specified, the site-prefix string is unset. When implementing HTTP redirect site persistence, the Citrix ADC redirects GSLB requests to GSLB services by using their site domains.
ip	<String>	Read-write	IP Address.
servicegroupname	<String>	Read-write	Name of the GSLB service group. Minimum length = 1
hashid	<Double>	Read-write	The hash identifier for the service. This must be unique for each service. This parameter is used by hash based load balancing methods. Minimum value = 1
publicip	<String>	Read-write	The public IP address that a NAT device translates to the GSLB service's private IP address. Optional. Minimum length = 1
threshold	<String>	Read-only	. Possible values = ABOVE, BELOW

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
delay	<Double>	Read-only	The time allowed (in seconds) for a graceful shutdown. During this period, new connections or requests will continue to be sent to this service for clients who already have a persistent session on the system. Connections or requests from fresh or new clients who do not yet have a persistence sessions on the system will not be sent to the service. Instead, they will be load balanced among other available services. After the delay time expires, no new requests or connections will be sent to the service.
statechangetimesec	<String>	Read-only	Time when last state change occurred. Seconds part.
preferredlocation	<String>	Read-only	Prefered location.
svrstate	<String>	Read-only	The state of the GSLB service. Possible values = UP, DOWN, UNKNOWN, BUSY,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
gslbthreshold	<Integer>	Read-only	Indicates if gslb svc has reached threshold.
tickssincelaststatechange	<Double>	Read-only	Time in 10 millisecond ticks since the last state change.
graceful	<String>	Read-only	Wait for all existing connections to the service to terminate before shutting down the service. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbservicegroup_servicegroupentitymonbindings_binding/servicegroupname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"gslbservicegroup_servicegroupentitymonbindings_binding": [ { "__count":
"#no"} ] }
```

gslbsite_gslbservicegroup_binding

Binding object showing the gslbservicegroup that can be bound to gslbsite.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sitename	<String>	Read-write	Name of the GSLB site. If you specify a site name, details of all the site's constituent services are also displayed. Minimum length = 1
servicegroupname	<String>	Read-write	Servicegroup name.
servicetype	<String>	Read-only	Service type. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, DNS, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, RTSP, PUSH, SSL_PUSH, RADIUS, RDP, MYSQL, MSSQL, DIAMETER,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL_DIAMETER, TFTP, ORACLE, SMPP, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, PROXY, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsite_gslbservicegroup_binding/sitename_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsite_gslbservicegroup_binding/sitename_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of gslbsite_gslbservicegroup_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsite_gslbservicegroup_binding/sitename_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbsite_gslbservicegroup_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbsite_gslbservicegroup_binding": [ {

"sitename":<String_value>,

"servicegroupname":<String_value>,

"servicetype":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsite_gslbservicegroup_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsite_gslbservicegroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbsite_gslbservicegroup_binding": [ {

"sitename":<String_value>,

"servicegroupname":<String_value>,

"servicetype":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsite_gslbservicegroup_binding/sitename_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"gslbsite_gslbservicegroup_binding": [ { "__count": "#no"} ] }
```

gslbsite_gslbservicegroupmember_binding

Binding object showing the gslbservicegroupmember that can be bound to gslbsite.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sitename	<String>	Read-write	Name of the GSLB site. If you specify a site name, details of all the site's constituent services are also displayed. Minimum length = 1
servicegroupname	<String>	Read-write	Servicegroup name.
state	<String>	Read-only	State of the gslb service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
servicetype	<String>	Read-only	Service type. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, DNS, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DNS_TCP, RTSP, PUSH, SSL_PUSH, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, SMPP, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, PROXY, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
port	<Integer>	Read-only	Port number of the gslb service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
ipaddress	<String>	Read-only	IP Address of the gslb service.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbsite_gslbservicegroupmember_binding/sitename_value<String>

gslbvserver_gslbservicegroupmember_binding

Binding object showing the gslbservicegroupmember that can be bound to gslbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
weight	<Double>	Read-write	Weight to assign to the GSLB service. Minimum value = 1 Maximum value = 100
name	<String>	Read-write	Name of the virtual server on which to perform the binding operation. Minimum length = 1
servicegroupname	<String>	Read-write	The GSLB service group name bound to the selected GSLB virtual server.
svcsitepersistence	<String>	Read-only	Type of Site Persistence set on the bound service. Possible values = ConnectionProxy, HTTPRedirect, NONE
preferredlocation	<String>	Read-only	The target site to be returned in the DNS response when a policy is successfully evaluated against the incoming DNS request. Target site is specified in dotted notation with up to 6 qualifiers. Wildcard

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			`*' is accepted as a valid qualifier token.
servicetype	<String>	Read-only	Protocol used by services bound to the virtual server. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
gslbthreshold	<Integer>	Read-only	Indicates if gslb svc has reached threshold.
sitepersistcookie	<String>	Read-only	This field is introduced for displaying the cookie in cluster setup. Minimum length = 1
port	<Integer>	Read-only	Port number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
curstate	<String>	Read-only	State of the gslb vserver. Possible values = UP, DOWN,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
svreffgslbstate	<String>	Read-only	Effective state of the gslb svc. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
dynamicweight	<String>	Read-only	Specify if the appliance should consider the service count, service weights, or ignore both when using weight-based load balancing methods. The state of the number of services bound to the virtual server help the appliance to select the service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = SERVICECOUNT, SERVICEWEIGHT, DISABLED
thresholdvalue	<Integer>	Read-only	Tells whether threshold exceeded for this service participating in CUSTOMLB.
ipaddress	<String>	Read-only	IP address.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_gslbservicegroup_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_gslbservicegroup_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of gslbdomain_gslbservicegroup_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_gslbservicegroup_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the gslbdomain_gslbservicegroup_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbdomain_gslbservicegroup_binding": [ {

"servicegroupname":<String_value>,

"name":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_gslbservicegroup_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_gslbservicegroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "gslbdomain_gslbservicegroup_binding": [ {

"servicegroupname":<String_value>,

"name":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/gslbdomain_gslbservicegroup_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"gslbdomain_gslbservicegroup_binding": [ { "__count": "#no"} ] }
```

gslbdomain_gslbservicegroupmember_binding

Binding object showing the gslbservicegroupmember that can be bound to gslbdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The GSLB service group name bound to the selected GSLB virtual server.
name	<String>	Read-write	Name of the Domain. Minimum length = 1
gslbthreshold	<Integer>	Read-only	The threshold value of the service.
port	<Integer>	Read-only	Port Number. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
svreffgslbstate	<String>	Read-only	GSLB server state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Unknown, DISABLED
weight	<Double>	Read-only	weight assigned. Minimum value = 1 Maximum value = 100
servicetype	<String>	Read-only	The type GSLB service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, ANY, SIP_UDP, SIP_TCP, SIP_SSL, RADIUS, RDP, RTSP, MYSQL, MSSQL, ORACLE
ipaddress	<String>	Read-only	The Ip address of the service.
__count	<Double>	Read-only	count parameter

Operations

```

High-Availability

High Availability

High-availability commands.

NAME	DESCRIPTION
hafailover	Configuration for failover
hafiles	Configuration for files
hanode	Configuration for node
hanode_binding	Binding object showing the resources that can be bound to hanode
hanode_ci_binding	Binding object showing the ci that can be bound to hanode
hanode_fis_binding	Binding object showing the fis that can be bound to hanode
hanode_partialfailureinterfaces_binding	Binding object showing the partialfailureinterfaces that can be bound to hanode
hanode_routemonitor6_binding	Binding object showing the routemonitor6 that can be bound to hanode
hanode_routemonitor_binding	Binding object showing the routemonitor that can be bound to hanode
hasync	Configuration for sync

hafailover

Configuration for failover resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
force	<Boolean>	Read-write	Force a failover without prompting for confirmation.

Operations

(click to see Properties)

FORCE

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Force

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/hafailover?**action=Force**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"hafailover":{

"force":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

hafiles

Configuration for files resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mode	<String[]>	Read-write	Specify one of the following modes of synchronization. * all - Synchronize files related to system configuration, Access Gateway bookmarks, SSL certificates, SSL CRL lists, HTML injection scripts, and Application

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Firewall XML objects. * bookmarks - Synchronize all Access Gateway bookmarks. * ssl - Synchronize all certificates, keys, and CRLs for the SSL feature. * htmlinjection. Synchronize all scripts configured for the HTML injection feature. * imports. Synchronize all XML objects (for example, WSDLs, schemas, error pages) configured for the application firewall. * misc - Synchronize all license files and the rc.conf file. * all_plus_misc - Synchronize files related to system configuration, Access Gateway

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bookmarks, SSL certificates, SSL CRL lists, HTML injection scripts, application firewall XML objects, licenses, and the rc.conf file. Possible values = all, bookmarks, ssl, htmlinjection, imports, misc, dns, krb, AAA, app_catalog, all_plus_misc, all_minus_misc

Operations

SYNC

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

sync

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/hafiles?**action=sync**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"hafiles":{

"mode":<String[]_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

hanode

Configuration for node resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Number that uniquely identifies the node. For self node, it will always be 0. Peer node values can range from 1-64. Minimum value = 1 Maximum value = 64
ipaddress	<String>	Read-write	The NSIP or NSIP6 address of the node to be added for an HA configuration. This setting is neither propagated nor synchronized. Minimum length = 1
inc	<String>	Read-write	This option is required if the HA nodes reside on different networks. When this mode is enabled, the following independent network entities and configurations are neither propagated nor synced to the other node: MIPs, SNIPs, VLANs, routes (except LLB routes), route

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			monitors, RNAT rules (except any RNAT rule with a VIP as the NAT IP), and dynamic routing configurations. They are maintained independently on each node. Default value: DISABLED Possible values = ENABLED, DISABLED
hastatus	<String>	Read-write	The HA status of the node. The HA status STAYSECONDARY is used to force the secondary device stay as secondary independent of the state of the Primary device. For example, in an existing HA setup, the Primary node has to be upgraded and this process would take few seconds. During the upgradation, it is possible that the Primary node may suffer from a downtime for a few seconds. However, the Secondary should not take over as the Primary node. Thus, the Secondary

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			node should remain as Secondary even if there is a failure in the Primary node. STAYPRIMARY configuration keeps the node in primary state in case if it is healthy, even if the peer node was the primary node initially. If the node with STAYPRIMARY setting (and no peer node) is added to a primary node (which has this node as the peer) then this node takes over as the new primary and the older node becomes secondary. ENABLED state means normal HA operation without any constraints/ preferences. DISABLED state disables the normal HA operation of the node. Possible values = ENABLED, STAYSECONDARY,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DISABLED, STAYPRIMARY
hasync	<String>	Read-write	Automatically maintain synchronization by duplicating the configuration of the primary node on the secondary node. This setting is not propagated. Automatic synchronization requires that this setting be enabled (the default) on the current secondary node. Synchronization uses TCP port 3010. Default value: ENABLED Possible values = ENABLED, DISABLED
haprop	<String>	Read-write	Automatically propagate all commands from the primary to the secondary node, except the following: * All HA configuration related commands. For example, add ha node, set ha

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			node, and bind ha node. * All Interface related commands. For example, set interface and unset interface. * All channels related commands. For example, add channel, set channel, and bind channel. The propagated command is executed on the secondary node before it is executed on the primary. If command propagation fails, or if command execution fails on the secondary, the primary node executes the command and logs an error. Command propagation uses port 3010. Note: After enabling propagation, run force

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			synchronization on either node. Default value: ENABLED Possible values = ENABLED, DISABLED
hellointerval	<Double>	Read-write	Interval, in milliseconds, between heartbeat messages sent to the peer node. The heartbeat messages are UDP packets sent to port 3003 of the peer node. Default value: 200 Minimum value = 200 Maximum value = 1000
deadinterval	<Double>	Read-write	Number of seconds after which a peer node is marked DOWN if heartbeat messages are not received from the peer node. Default value: 3 Minimum value = 3 Maximum value = 60

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
failsafe	<String>	Read-write	Keep one node primary if both nodes fail the health check, so that a partially available node can back up data and handle traffic. This mode is set independently on each node. Default value: OFF Possible values = ON, OFF
maxflips	<Double>	Read-write	Max number of flips allowed before becoming sticky primary. Default value: 0
maxfliptime	<Double>	Read-write	Interval after which flipping of node states can again start. Default value: 0
syncvlan	<Double>	Read-write	Vlan on which HA related communication is sent. This include sync, propagation , connection mirroring , LB persistency config sync, persistent session sync and session state sync. However HA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			heartbeats can go all interfaces. Minimum value = 1 Maximum value = 4094
name	<String>	Read-only	Node Name.
flags	<Double>	Read-only	The flags for this entry.
state	<String>	Read-only	HA Master State. Possible values = Primary, Secondary, UNKNOWN
enaifaces	<String>	Read-only	Enabled interfaces.
disifaces	<String>	Read-only	Disabled interfaces.
hamonifaces	<String>	Read-only	HAMON ON interfaces.
haheartbeatifaces	<String>	Read-only	HAHEARTBEAT OFF interfaces.
pfifaces	<String>	Read-only	Interfaces causing Partial Failure.
ifaces	<String>	Read-only	Interfaces on which non-multicast is not seen.
netmask	<String>	Read-only	The netmask.
ssl2	<String>	Read-only	SSL card status. Possible values = DOWN, UP, NOT PRESENT, UNKNOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
masterstatetime	<Double>	Read-only	Time elapsed in current master state.
routemonitor	<String>	Read-only	The IP address (IPv4 or IPv6).
curflips	<Double>	Read-only	Keeps track of number of flips that have happened till now in current interval.
completedfliptime	<Double>	Read-only	To inform user whether flip time is elapsed or not.
routemonitorstate	<String>	Read-only	State for route monitor. Possible values = UP, DOWN
hasyncfailurereason	<String>	Read-only	Displays the reason for HA SYNC Failure. Possible values =
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "hanode": [ { "__count": "#no"} ] }
```

hanode_binding

Binding object which returns the resources bound to hanode.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	ID of the node whose HA settings you want to display. (The ID of the local node is always 0.). Minimum value = 0 Maximum value = 64
hanode_partialfailure interfaces_binding	<hanode_partialfailur einterfaces_binding[] >	Read-only	partialfailureinterface s that can be bound to hanode.
hanode_routemonito r6_binding	<hanode_routemonit or6_binding[]>	Read-only	routemonitor6 that can be bound to hanode.
hanode_ci_binding	<hanode_ci_binding[ ]>	Read-only	ci that can be bound to hanode.
hanode_routemonito r_binding	<hanode_routemonit or_binding[]>	Read-only	routemonitor that can be bound to hanode.
hanode_fis_binding	<hanode_fis_binding []>	Read-only	fis that can be bound to hanode.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/hanode_binding/id_value<Double>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "hanode_binding": [ {

"id":<Double_value>,

"hanode_routemonitor_binding":<hanode_routemonitor_binding[]_value>,

"hanode_partialfailureinterfaces_binding":<hanode_partialfailureinterfaces
_binding[]_value>,

"hanode_fis_binding":<hanode_fis_binding[]_value>,

"hanode_routemonitor6_binding":<hanode_routemonitor6_binding[]_value>,

"hanode_ci_binding":<hanode_ci_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/hanode_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/hanode_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"hanode_routemonitor_binding": [ { "__count": "#no"} ] }
```

hasync

Configuration for sync resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
force	<Boolean>	Read-write	Force synchronization regardless of the state of HA propagation and HA synchronization on either node.
save	<String>	Read-write	After synchronization, automatically save the configuration in the secondary node configuration file (ns.conf) without prompting for confirmation. Possible values = YES, NO

Operations

(click to see Properties)

FORCE

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Force

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/hasync?**action=Force**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"hasync":{
"force":<Boolean_value>,
"save":<String_value>
}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

HTTP DoS Protection

HTTP DoS Protection

HTTP DOS protection configuration.

NAME	DESCRIPTION
dospolicy	Configuration for DoS policy

dospolicy

Configuration for DoS policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the HTTP DoS protection policy. Must begin with a letter, number, or the underscore

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			character (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), and colon (:) characters. Minimum length = 1
qdepth	<Double>	Read-write	Queue depth. The queue size (the number of outstanding service requests on the system) before DoS protection is activated on the service to which the DoS protection policy is bound. Minimum value = 21
cltdetectrate	<Double>	Read-write	Client detect rate. Integer representing the percentage of traffic to which the HTTP DoS policy is to be applied after the queue depth condition is satisfied. Minimum value = 0 Maximum value = 100
__count	<Double>	Read-only	count parameter

Operations

ICA

Ica

ICA configuration.

NAME	DESCRIPTION
icaaccessprofile	Configuration for ica accessprofile
icaaction	Configuration for ica action
icaglobal_binding	Binding object showing the resources that can be bound to icaglobal
icaglobal_icapolicy_binding	Binding object showing the icapolicy that can be bound to icaglobal
icalatencyprofile	Configuration for Profile for Latency monitoring
icaparameter	Configuration for Config Parameters for NS ICA
icapolicy	Configuration for ICA policy
icapolicy_binding	Binding object showing the resources that can be bound to icapolicy
icapolicy_crvserver_binding	Binding object showing the crvserver that can be bound to icapolicy
icapolicy_icaglobal_binding	Binding object showing the icaglobal that can be bound to icapolicy

NAME	DESCRIPTION
icapolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to icapolicy

icaaccessprofile

Configuration for ica accessprofile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the ICA accessprofile. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the ICA accessprofile is added. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ica accessprofile" or 'my ica accessprofile'). Each of the features can be configured as DEFAULT/ DISABLED. Here, DISABLED means that the policy settings on the backend XenApp/ XenDesktop server are overridden and the Citrix ADC makes the decision to deny access. Whereas DEFAULT means that the Citrix ADC allows the request to reach the XenApp/ XenDesktop that takes the decision to allow/deny access based on the policy configured on it. For

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, if ClientAudioRedirection is enabled on the backend XenApp/XenDesktop server, and the configured profile has ClientAudioRedirection as DISABLED, the Citrix ADC makes the decision to deny the request irrespective of the configuration on the backend. If the configured profile has ClientAudioRedirection as DEFAULT, then the Citrix ADC forwards the requests to the backend XenApp/XenDesktop server.It then makes the decision to allow/deny access based on the policy configured on it. Minimum length = 1
connectclientlptports	<String>	Read-write	Allow Default access/Disable automatic connection of LPT ports from the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			client when the user logs on. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientaudioredirection	<String>	Read-write	Allow Default access/Disable applications hosted on the server to play sounds through a sound device installed on the client computer, also allows or prevents users to record audio input. Default value: DISABLED Possible values = DEFAULT, DISABLED
localremotedatasharing	<String>	Read-write	Allow Default access/Disable file/data sharing via the Receiver for HTML5. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientclipboardredirection	<String>	Read-write	Allow Default access/Disable the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			clipboard on the client device to be mapped to the clipboard on the server. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientcomportredirection	<String>	Read-write	Allow Default access/Disable COM port redirection to and from the client. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientdriveredirection	<String>	Read-write	Allow Default access/Disables drive redirection to and from the client. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientprinterredirection	<String>	Read-write	Allow Default access/Disable client printers to be mapped to a server when a user logs on to a session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = DEFAULT, DISABLED
multistream	<String>	Read-write	Allow Default access/Disable the multistream feature for the specified users. Default value: DISABLED Possible values = DEFAULT, DISABLED
clientusbdriveredirection	<String>	Read-write	Allow Default access/Disable the redirection of USB devices to and from the client. Default value: DISABLED Possible values = DEFAULT, DISABLED
refcnt	<Double>	Read-only	Number of entities using this accessprofile.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default accessprofile.
__count	<Double>	Read-only	count parameter

icaaction

Configuration for ica action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the ICA action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the ICA action is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my ica action" or 'my ica action'). Minimum length = 1
accessprofilename	<String>	Read-write	Name of the ica accessprofile to be associated with this action.
latencyprofilename	<String>	Read-write	Name of the ica latencyprofile to be associated with this action.
newname	<String>	Read-write	New name for the ICA action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#),period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, "my ica action" or 'my ica action'). Minimum length = 1
hits	<Double>	Read-only	The number of times the action has been taken.
referencecount	<Double>	Read-only	The number of references to the action.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default action.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"icaaction":{

<b>"name":<String_value>,

</b>"accessprofilename":<String_value>,

"latencyprofilename":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"icaaction":{

<b>"name":<String_value>,

</b>"accessprofilename":<String_value>,

"latencyprofilename":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"icaaction":{

<b>"name":<String_value>,

</b>"accessprofilename":true,

"latencyprofilename":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"icaaction":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of icaaction resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icaaction?**pagesize=#no;pageno=#no**

Use this query-parameter to get the icaaction resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

icaglobal_icapolicy_binding

Binding object showing the icapolicy that can be bound to icaglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the ICA policy.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
type	<String>	Read-write	Global bind point for which to show detailed information about the policies bound to the bind point. Possible values = ICA_REQ_OVERRIDE, ICA_REQ_DEFAULT
flowtype	<Double>	Read-only	Flow type of the bound ICA policy.
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

icalatencyprofile

Configuration for Profile for Latency monitoring resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the ICA latencyprofile. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the ICA latency profile is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my ica l7latencyprofile" or 'my ica l7latencyprofile'). Minimum length = 1
l7latencymonitoring	<String>	Read-write	Enable/Disable L7 Latency monitoring for L7 latency notifications. Default value: DISABLED Possible values = ENABLED, DISABLED
l7latencythresholdfactor	<Double>	Read-write	L7 Latency threshold factor. This is the factor by which the active latency should be greater than the minimum observed value to determine that the latency is high and may need to be reported. Default value: 4 Minimum value = 2 Maximum value = 65535
l7latencywaittime	<Double>	Read-write	L7 Latency Wait time. This is the time

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for which the Citrix ADC waits after the threshold is exceeded before it sends out a Notification to the Insight Center. Default value: 20 Minimum value = 1 Maximum value = 65535
l7latencynotifyinterval	<Double>	Read-write	L7 Latency Notify Interval. This is the interval at which the Citrix ADC sends out notifications to the Insight Center after the wait time has passed. Default value: 20 Minimum value = 1 Maximum value = 65535
l7latencymaxnotifycount	<Double>	Read-write	L7 Latency Max notify Count. This is the upper limit on the number of notifications sent to the Insight Center within an interval where the Latency is above the threshold. Default value: 5

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 65535
refcnt	<Double>	Read-only	Number of entities using this l7latencyprofile.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default l7latencyprofile.
__count	<Double>	Read-only	count parameter

```

```
"hdxinsightnonnsap":<String_value>

}]}
```

icapolicy

Configuration for ICA policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my ica policy" or 'my ica policy').
rule	<String>	Read-write	Expression or other value against which the traffic is evaluated. Must be a Boolean expression. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
action	<String>	Read-write	Name of the ica action to be associated with this policy.
comment	<String>	Read-write	Any type of information about this ICA policy.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
newname	<String>	Read-write	New name for the policy. Must begin with an ASCII alphabetic or underscore (_)character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), s pace, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my ica policy" or 'my ica policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of policy UNDEF hits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"icapolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>,

</b>"comment":<String_value>,

"logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"icapolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>,

"comment":<String_value>,

"logaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"icapolicy":{

<b>"name":<String_value>,

</b>"comment":true,

"logaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"icapolicy":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of icapolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the icapolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "icapolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"hits":<Double_value>,

"undefhits":<Double_value>,

"comment":<String_value>,

"logaction":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "icapolicy": [ {

"name":<String_value>,

"rule":<String_value>,
```

```
"action":<String_value>,

"hits":<Double_value>,

"undefhits":<Double_value>,

"comment":<String_value>,

"logaction":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "icapolicy": [ { "__count": "#no"} ] }
```

icapolicy_binding

Binding object which returns the resources bound to icapolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the policy about which to display detailed information.
icapolicy_vpnvserver_binding	<icapolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to icapolicy.
icapolicy_icaglobal_binding	<icapolicy_icaglobal_binding[]>	Read-only	icaglobal that can be bound to icapolicy.
icapolicy_crvserver_binding	<icapolicy_crvserver_binding[]>	Read-only	crvserver that can be bound to icapolicy.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "icapolicy_binding": [ {

"name":<String_value>,

"icapolicy_crvserver_binding":<icapolicy_crvserver_binding[]_value>,

"icapolicy_icaglobal_binding":<icapolicy_icaglobal_binding[]_value>,

"icapolicy_vpnvserver_binding":<icapolicy_vpnvserver_binding[]_value>
```

```
}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "icapolicy_binding": [ {

"name":<String_value>,

"icapolicy_crvserver_binding":<icapolicy_crvserver_binding[]_value>,

"icapolicy_icaglobal_binding":<icapolicy_icaglobal_binding[]_value>,

"icapolicy_vpnvserver_binding":<icapolicy_vpnvserver_binding[]_value>

}]}
```

icapolicy_crvserver_binding

Binding object showing the crvserver that can be bound to icapolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the policy about which to display detailed information.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy_vpnvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy_vpnvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "icapolicy_vpnvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"activepolicy":<Integer_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/icapolicy_vpnvserver_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"icapolicy_vpnvserver_binding": [ { "__count": "#no"} ] }
```

Integrated caching

Integrated Caching

Integrated Caching Configuration. The Integrated Caching feature is used to cache static and dynamic web application data.

NAME	DESCRIPTION
cachecontentgroup	Configuration for Integrated Cache content group
cacheforwardproxy	Configuration for forward proxy
cacheglobal_binding	Binding object showing the resources that can be bound to cacheglobal
cacheglobal_cachepolicy_binding	Binding object showing the cachepolicy that can be bound to cacheglobal
cacheobject	Configuration for cache object

NAME	DESCRIPTION
cacheparameter	Configuration for cache parameter
cachepolicy	Configuration for Integrated Cache policy
cachepolicy_binding	Binding object showing the resources that can be bound to cachepolicy
cachepolicy_cacheglobal_binding	Binding object showing the cacheglobal that can be bound to cachepolicy
cachepolicy_cachepolicylabel_binding	Binding object showing the cachepolicylabel that can be bound to cachepolicy
cachepolicy_csvserver_binding	Binding object showing the csvserver that can be bound to cachepolicy
cachepolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to cachepolicy
cachepolicylabel	Configuration for cache policy label
cachepolicylabel_binding	Binding object showing the resources that can be bound to cachepolicylabel
cachepolicylabel_cachepolicy_binding	Binding object showing the cachepolicy that can be bound to cachepolicylabel
cachepolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to cachepolicylabel
cacheselector	Configuration for cache selector

cachecontentgroup

Configuration for Integrated Cache content group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the content group. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the content group is created. Minimum length = 1
weakposrelexpiry	<Double>	Read-write	Relative expiry time, in seconds, for expiring positive responses with response codes between 200 and 399. Cannot be used in combination with other Expiry attributes. Similar to -relExpiry but has lower precedence. Minimum value = 0 Maximum value = 31536000
heurexpiryparam	<Double>	Read-write	Heuristic expiry time, in percent of the duration, since the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			object was last modified. Minimum value = 0 Maximum value = 100
relexpiry	<Double>	Read-write	Relative expiry time, in seconds, after which to expire an object cached in this content group. Minimum value = 0 Maximum value = 31536000
relexpirymillisec	<Double>	Read-write	Relative expiry time, in milliseconds, after which to expire an object cached in this content group. Minimum value = 0 Maximum value = 86400000
absexpiry	<String[]>	Read-write	Local time, up to 4 times a day, at which all objects in the content group must expire. CLI Users: For example, to specify that the objects in the content group should expire by 11:00 PM, type the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			following command: add cache contentgroup <contentgroup name> -absexpiry 23:00 To specify that the objects in the content group should expire at 10:00 AM, 3 PM, 6 PM, and 11:00 PM, type: add cache contentgroup <contentgroup name> -absexpiry 10:00 15:00 18:00 23:00.
absexpirygmt	<String[]>	Read-write	Coordinated Universal Time (GMT), up to 4 times a day, when all objects in the content group must expire.
weaknegrelexpiry	<Double>	Read-write	Relative expiry time, in seconds, for expiring negative responses. This value is used only if the expiry time cannot be determined from any other source. It is applicable only to the following status

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			codes: 307, 403, 404, and 410. Minimum value = 0 Maximum value = 31536000
hitparams	<String[]>	Read-write	Parameters to use for parameterized hit evaluation of an object. Up to 128 parameters can be specified. Mutually exclusive with the Hit Selector parameter. Minimum length = 1
invalparams	<String[]>	Read-write	Parameters for parameterized invalidation of an object. You can specify up to 8 parameters. Mutually exclusive with invalSelector. Minimum length = 1
ignoreparamvaluecase	<String>	Read-write	Ignore case when comparing parameter values during parameterized hit evaluation. (Parameter value case is ignored by default during parameterized invalidation.). Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
matchcookies	<String>	Read-write	Evaluate for parameters in the cookie header also. Possible values = YES, NO
invalrestrictedtohost	<String>	Read-write	Take the host header into account during parameterized invalidation. Possible values = YES, NO
polleverytime	<String>	Read-write	Always poll for the objects in this content group. That is, retrieve the objects from the origin server whenever they are requested. Default value: NO Possible values = YES, NO
ignorereloadreq	<String>	Read-write	Ignore any request to reload a cached object from the origin server. To guard against Denial of Service attacks, set this parameter to YES. For RFC-compliant behavior, set it to NO.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: YES Possible values = YES, NO
removecookies	<String>	Read-write	Remove cookies from responses. Default value: YES Possible values = YES, NO
prefetch	<String>	Read-write	Attempt to refresh objects that are about to go stale. Default value: YES Possible values = YES, NO
prefetchperiod	<Double>	Read-write	Time period, in seconds before an object's calculated expiry time, during which to attempt prefetch. Minimum value = 0 Maximum value = 4294967294
prefetchperiodmillisec	<Double>	Read-write	Time period, in milliseconds before an object's calculated expiry time, during which to attempt prefetch. Minimum value = 0 Maximum value = 4294967290

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
prefetchmaxpending	<Double>	Read-write	Maximum number of outstanding prefetches that can be queued for the content group. Minimum value = 0 Maximum value = 4294967294
flashcache	<String>	Read-write	Perform flash cache. Mutually exclusive with Poll Every Time (PET) on the same content group. Default value: NO Possible values = YES, NO
expireatlastbyte	<String>	Read-write	Force expiration of the content immediately after the response is downloaded (upon receipt of the last byte of the response body). Applicable only to positive responses. Default value: NO Possible values = YES, NO
insertvia	<String>	Read-write	Insert a Via header into the response. Default value: YES

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
insertage	<String>	Read-write	Insert an Age header into the response. An Age header contains information about the age of the object, in seconds, as calculated by the integrated cache. Default value: YES Possible values = YES, NO
insertetag	<String>	Read-write	Insert an ETag header in the response. With ETag header insertion, the integrated cache does not serve full responses on repeat requests. Default value: YES Possible values = YES, NO
cachecontrol	<String>	Read-write	Insert a Cache-Control header into the response. Minimum length = 1
quickabortsize	<Double>	Read-write	If the size of an object that is being downloaded is less than or equal to the quick abort value, and a client aborts during the download,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the cache stops downloading the response. If the object is larger than the quick abort size, the cache continues to download the response. Default value: 4194303 Minimum value = 0 Maximum value = 4194303
minressize	<Double>	Read-write	Minimum size of a response that can be cached in this content group. Default minimum response size is 0. Minimum value = 0 Maximum value = 2097151
maxressize	<Double>	Read-write	Maximum size of a response that can be cached in this content group. Default value: 80 Minimum value = 0 Maximum value = 2097151
memlimit	<Double>	Read-write	Maximum amount of memory that the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cache can use. The effective limit is based on the available memory of the Citrix ADC. Default value: 65536
ignorereqcachinghdrs	<String>	Read-write	Ignore Cache-Control and Pragma headers in the incoming request. Default value: YES Possible values = YES, NO
minhits	<Integer>	Read-write	Number of hits that qualifies a response for storage in this content group. Default value: 0
alwaysevalpolicies	<String>	Read-write	Force policy evaluation for each response arriving from the origin server. Cannot be set to YES if the Prefetch parameter is also set to YES. Default value: NO Possible values = YES, NO
persistha	<String>	Read-write	Setting persistHA to YES causes IC to save objects in contentgroup to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Secondary node in HA deployment. Default value: NO Possible values = YES, NO
pinned	<String>	Read-write	Do not flush objects from this content group under memory pressure. Default value: NO Possible values = YES, NO
lazydnsresolve	<String>	Read-write	Perform DNS resolution for responses only if the destination IP address in the request does not match the destination IP address of the cached response. Default value: YES Possible values = YES, NO
hitselector	<String>	Read-write	Selector for evaluating whether an object gets stored in a particular content group. A selector is an abstraction for a collection of PIXL expressions.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invalselector	<String>	Read-write	Selector for invalidating objects in the content group. A selector is an abstraction for a collection of PIXL expressions.
type	<String>	Read-write	The type of the content group. Default value: HTTP Possible values = HTTP, MYSQL, MSSQL
query	<String>	Read-write	Query string specifying individual objects to flush from this group by using parameterized invalidation. If this parameter is not set, all objects are flushed from the group. Minimum length = 1
host	<String>	Read-write	Flush only objects that belong to the specified host. Do not use except with parameterized invalidation. Also, the Invalidation Restricted to Host parameter for the group must be set to YES. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
selectorvalue	<String>	Read-write	Value of the selector to be used for flushing objects from the content group. Requires that an invalidation selector be configured for the content group. Minimum length = 1
tosecondary	<String>	Read-write	content group whose objects are to be sent to secondary. Default value: NO Possible values = YES, NO
flags	<Double>	Read-only	Flags.
prefetchcur	<Double>	Read-only	Current outstanding prefetches.
memusage	<Double>	Read-only	Current memory usage.
memdusage	<Double>	Read-only	Current disk memory usage.
disklimit	<Double>	Read-only	Maximum amount of disk that the cache can use. The effective limit is based on the available memory of the Citrix ADC. Default value: 0
cachenon304hits	<Double>	Read-only	Cache non 304 hits.
cache304hits	<Double>	Read-only	Cache 304 hits.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cachecells	<Double>	Read-only	Number of cells.
cachegroupincarnation	<Double>	Read-only	Cache group incarnation.
persist	<String>	Read-only	Setting persist to YES causes IC to save objects in contentgroup to disk. Default value: NO Possible values = YES, NO
policyname	<String[]>	Read-only	Active cache policies refering to this group.
cachenuminvalpolicy	<Double>	Read-only	Number of active Invalidation policies refering to this group.
markercells	<Double>	Read-only	Numbers of marker cells in this group.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| EXPIRE| FLUSH| SAVE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachecontentgroup

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachecontentgroup?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachecontentgroup?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of cachecontentgroup resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachecontentgroup?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachecontentgroup?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cachecontentgroup resources in chunks.

HTTP Method:GET

```

cacheforwardproxy

Configuration for forward proxy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the Citrix ADC or a cache server for which the cache acts as a proxy. Requests coming to the Citrix ADC with the configured IP address are forwarded to the particular address, without involving the Integrated Cache in any way. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
port	<Integer>	Read-write	Port on the Citrix ADC or a server for which the cache acts as a proxy. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheforwardproxy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cacheforwardproxy":{

<b>"ipaddress":<String_value>,

</b><b>"port":<Integer_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheforwardproxy/ipaddress_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheforwardproxy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheforwardproxy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheforwardproxy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of cacheforwardproxy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheforwardproxy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheforwardproxy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cacheforwardproxy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cacheforwardproxy": [ {

"ipaddress":<String_value>,

"port":<Integer_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheforwardproxy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cacheforwardproxy": [ { "__count": "#no"} ] }
```

cacheglobal_binding

Binding object which returns the resources bound to cacheglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cacheglobal_cachepolicy_binding	<cacheglobal_cachepolicy_binding[]>	Read-only	cachepolicy that can be bound to cacheglobal.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cacheglobal_binding": [ {

"cacheglobal_cachepolicy_binding":<cacheglobal_cachepolicy_binding[]_value
>

}]}
```

cacheglobal_cachepolicy_binding

Binding object showing the cachepolicy that can be bound to cacheglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
policy	<String>	Read-write	Name of the cache policy.
type	<String>	Read-write	The bind point to which policy is bound. When you specify the type, detailed information about that bind point appears. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT
precededefrules	<String>	Read-write	Specify whether this policy should be evaluated.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
labeltype	<String>	Read-write	Type of policy label to invoke. Possible values = reqvserver, resvserver, policylabel
labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE. (To invoke a label associated with a virtual server, specify the name of the virtual server.).
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority. Applicable only to default-syntax policies.
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
flowtype	<Double>	Read-only	flowtype of the bound cache policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

cacheobject

Configuration for cache object resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
url	<String>	Read-write	URL of the particular object whose details

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is required. Parameter "host" must be specified along with the URL. Minimum length = 1
locator	<Double>	Read-write	ID of the cached object.
httpstatus	<Double>	Read-write	HTTP status of the object.
host	<String>	Read-write	Host name of the object. Parameter "url" must be specified. Minimum length = 1
port	<Integer>	Read-write	Host port of the object. You must also set the Host parameter. Default value: 80 Minimum value = 1
groupname	<String>	Read-write	Name of the content group to which the object belongs. It will display only the objects belonging to the specified content group. You must also set the Host parameter.
httpmethod	<String>	Read-write	HTTP request method that caused the object to be stored.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: GET Possible values = GET, POST
group	<String>	Read-write	Name of the content group whose objects should be listed.
ignoremarkerobjects	<String>	Read-write	Ignore marker objects. Marker objects are created when a response exceeds the maximum or minimum response size for the content group or has not yet received the minimum number of hits for the content group. Possible values = ON, OFF
includenotreadyobjects	<String>	Read-write	Include responses that have not yet reached a minimum number of hits before being cached. Possible values = ON, OFF
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tosecondary	<String>	Read-write	Object will be saved onto Secondary. Default value: NO Possible values = YES, NO
cacheressize	<Double>	Read-only	Cache response size of the object.
cachereshdrsize	<Double>	Read-only	Cache response header size of the object.
cacheetag	<String>	Read-only	Cache ETag of the object.
httpstatusoutput	<Double>	Read-only	HTTP status of the object.
cachereslastmod	<String>	Read-only	Value of "Last-modified" header.
cachecontrol	<String>	Read-only	Cache-Control header of the object.
cacheresdate	<String>	Read-only	Value of "Date" header.
contentgroup	<String>	Read-only	Name of the contentgroup in which it is stored.
destipv46	<String>	Read-only	Destination IP.
destport	<Integer>	Read-only	Destination Port. Range 1 - 65535 * in CLI is represented as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			65535 in NITRO API
cachecellcomplex	<String>	Read-only	The state of the parameterized caching on this cell. Possible values = YES, NO
hitparams	<String[]>	Read-only	Parameterized hit evaluation of an object.
hitvalues	<String[]>	Read-only	Values of hitparams for this object.
cachecellreqtime	<Double>	Read-only	Required time of the cache cell object.
cachecellrestime	<Double>	Read-only	Response time to the cache cell object.
cachecurage	<Double>	Read-only	Current age of the cache object.
cachecellexpires	<Double>	Read-only	Expiry time of the cache cell object in seconds.
cachecellexpiresmillisec	<Double>	Read-only	Expiry time of the cache cell object in milliseconds.
flushed	<String>	Read-only	Specifies whether the object is flushed. Possible values = YES, NO
prefetch	<String>	Read-only	Specifies whether Integrated Cache should attempt to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			refresh an object immediately before it goes stale. Possible values = YES, NO
prefetchperiod	<Double>	Read-only	The duration in seconds of the period during which prefetch should be attempted, immediately before the object's calculated expiry time.
prefetchperiodmillisec	<Double>	Read-only	The duration in milliseconds of the period during which prefetch should be attempted, immediately before the object's calculated expiry time.
cachecellcurreaders	<Double>	Read-only	Current readers of the cache cell object.
cachecellcurmisses	<Double>	Read-only	Current misses of the cache cell object.
cachecellhits	<Double>	Read-only	Cache cell hits.
cachecellmisses	<Double>	Read-only	Cache cell misses.
cachecelldhits	<Double>	Read-only	Cache cell disk hits.
cachecellcompressionformat	<String>	Read-only	Compression format of this object. Identity

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			means not compressed.
cachecellappfwmetadataexists	<String>	Read-only	AppFirewall cache object. Possible values = YES, NO
cachecellhttp11	<String>	Read-only	The state of the response to be HTTP/1.1. Possible values = YES, NO
cachecellweaketag	<String>	Read-only	The state of the weak HTTP Entity Tag in the cell. Possible values = YES, NO
cachecellresbadsize	<String>	Read-only	The marked state of the cell. Possible values = YES, NO
markerreason	<String>	Read-only	Reason for marking the cell. Possible values = Waiting for min hit, Response header is too big, Content-length header said response size is not in group size limit, Content-length response received more data, Content-length response received less data,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Content-length response data is not in group size limit, Chunk response received more data, Chunk response data is not in group size limit, Bad chunk format, Fin terminated response data is not in group size limit
cachecellpolleverytime	<String>	Read-only	The state to poll every time on object. Possible values = YES, NO
cachecelletaginserted	<String>	Read-only	The state of the ETag to be inserted by IC for this object. Possible values = YES, NO
cachecellreadywithlastbyte	<String>	Read-only	The state of the complete arrived response. Possible values = YES, NO
cacheinmemory	<String>	Read-only	The cache data is available in memory. Possible values = YES, NO
cacheindisk	<String>	Read-only	The cache data is available in disk.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
cacheinsecondary	<String>	Read-only	The cache data is available in secondary in HA deployment. Possible values = YES, NO
cachedirname	<String>	Read-only	The directory name used if saved.
cachefilename	<String>	Read-only	The filename used if saved.
cachecelldestipverified	<String>	Read-only	The state of DNS verification. Possible values = YES, NO
cachecellfwpxyobj	<String>	Read-only	The state of the object to be stored on a request to a forward proxy. Possible values = YES, NO
cachecellbasefile	<String>	Read-only	The state of delta being used as a basefile. Possible values = YES, NO
cachecellminhitflag	<String>	Read-only	The state of the minhit feature on this cell. Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cachecellminhit	<Integer>	Read-only	Min hit value for the object.
policy	<Integer>	Read-only	Policy info for the object.
policyname	<String>	Read-only	Policy which created the object.
selectorname	<String[]>	Read-only	The hit selector for the object.
rule	<String[]>	Read-only	Selectors for this object.
selectorvalue	<String[]>	Read-only	The HTTP request method that caused the object to be stored.
cacheurls	<String>	Read-only	List of cache object URLs.
warnbucketskip	<Double>	Read-only	Bucket skipped warning.
totalobjs	<Double>	Read-only	Total objects.
httpcalloutcell	<String>	Read-only	Is it a http callout cell ?. Possible values = YES, NO
httpcalloutname	<String>	Read-only	Name of the http callout.
returntype	<String>	Read-only	Return type of the http callout. Possible values = BOOL, NUM, TEXT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpcalloutresult	<String>	Read-only	First few bytes of http callout response.
locatorshow	<Double>	Read-only	ID of the cached object.
ceflags	<Double>	Read-only	Indicates state and type of cached cell.
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cacheobject": [ { "__count": "#no"} ] }
```

cacheparameter

Configuration for cache parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
memlimit	<Double>	Read-write	Amount of memory available for storing the cache objects. In practice, the amount of memory available for caching can be less than half the total memory of the Citrix ADC.
via	<String>	Read-write	String to include in the Via header. A Via header is inserted into all responses served from a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			content group if its Insert Via flag is set. Minimum length = 1
verifyusing	<String>	Read-write	Criteria for deciding whether a cached object can be served for an incoming HTTP request. Available settings function as follows: HOSTNAME - The URL, host name, and host port values in the incoming HTTP request header must match the cache policy. The IP address and the TCP port of the destination host are not evaluated. Do not use the HOSTNAME setting unless you are certain that no rogue client can access a rogue server through the cache. HOSTNAME_AND_IP - The URL, host name, host port in the incoming HTTP request header, and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the IP address and TCP port of the destination server, must match the cache policy. DNS - The URL, host name and host port in the incoming HTTP request, and the TCP port must match the cache policy. The host name is used for DNS lookup of the destination server's IP address, and is compared with the set of addresses returned by the DNS lookup. Possible values = HOSTNAME, HOSTNAME_AND_IP, DNS
maxpostlen	<Double>	Read-write	Maximum number of POST body bytes to consider when evaluating parameters for a content group for which you have configured hit parameters and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			invalidation parameters. Default value: 4096 Minimum value = 0 Maximum value = 131072
prefetchmaxpending	<Double>	Read-write	Maximum number of outstanding prefetches in the Integrated Cache.
enablebypass	<String>	Read-write	Evaluate the request-time policies before attempting hit selection. If set to NO, an incoming request for which a matching object is found in cache storage results in a response regardless of the policy configuration. If the request matches a policy with a NOCACHE action, the request bypasses all cache processing. This parameter does not affect processing of requests that match any invalidation policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
undefaction	<String>	Read-write	Action to take when a policy cannot be evaluated. Possible values = NOCACHE, RESET
enablehaobjpersist	<String>	Read-write	The HA object persisting parameter. When this value is set to YES, cache objects can be synced to Secondary in a HA deployment. If set to NO, objects will never be synced to Secondary node. Default value: NO Possible values = YES, NO
disklimit	<Double>	Read-only	The disk limit for the Integrated Cache.
maxdisklimit	<Double>	Read-only	The maximum value of the memory limit for the Integrated Cache.
memlimitactive	<Double>	Read-only	Active value of the memory limit for the Integrated Cache.
maxmemlimit	<Double>	Read-only	The maximum value of the memory limit for the Integrated Cache.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
prefetchcur	<Double>	Read-only	Number of current outstanding prefetches in the IC.

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheparameter

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cacheparameter":{

"memlimit":<Double_value>,

"via":<String_value>,

"verifyusing":<String_value>,

"maxpostlen":<Double_value>,

"prefetchmaxpending":<Double_value>,

"enablebypass":<String_value>,

"undefaction":<String_value>,

"enablehaobjpersist":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheparameter?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cacheparameter":{
"memlimit":true,
"via":true,
"verifyusing":true,
"maxpostlen":true,
"prefetchmaxpending":true,
"enablebypass":true,
"undefaction":true,
"enablehaobjpersist":true
}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheparameter

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:
