patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

The EQUALS_ANY in this object overrides the Text EQUALS_ANY operator to operate on all the instances of the current header type. Returns Boolean TRUE if any of the patterns associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Patset Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

The EQUALS_INDEX in this object overrides the Text EQUALS_INDEX operator to operate on all the instances of the current header type. Returns the index of the matching pattern associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Patset Name

`Returns:` num_at

`*EQ` (double_at i)

Returns Boolean TRUE if the double value is equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*EQ` (ip_address_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (num_at i)

Returns Boolean TRUE if the number value is equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*EQ` (time_local_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (time_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EXISTS`

Returns TRUE if an instance of the current header type exists.

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (double_at i)

Returns Boolean TRUE if the double value is greater than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (num_at i)

Returns Boolean TRUE if the number value is greater than or equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (double_at i)

Returns Boolean TRUE if the double value is greater than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (num_at i)

Returns Boolean TRUE if the number value is greater than the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"
```

```
    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*INSTANCE` (`uint` lineno)

An SIP header can have multiple occurrences. INSTANCE(0) will select the last header line of the current type, INSTANCE(1) will select the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").INSTANCE(1) will return a Text object referring to "MyHdr: abc\\r\\n". It can not be used in SIP response processing contexts.

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (double_at i)

Returns Boolean TRUE if the double value is lesser than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (num_at i)

Returns Boolean TRUE if the number value is lesser than or equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LIST`

A SIP header can have multiple comma separated parameter list in a single line. LIST operation will give a list of comma separated entities. LIST.GET(0) will select the first entity in the comma separated header line. LIST.GET(1) will select the second entity and so on.

SIP/2.0 200 OK\\r\\n MyHdr: abc;param1=1;param2=2,abc2=second;paramabc2=3\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example : SIP.REQ.HEADER("MyHdr").LIST.GET(1) will return a text object referring to "abc2=second;paramabc2=3"

`Returns:` list_t

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LSHIFT` (`uint` i)

Return the Number Value after bitwise left shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 32. For example, let HTTP.REQ.URL.LENGTH be 4. Then, HTTP.REQ.URL.LENGTH.LSHIFT(1) = HTTP.REQ.URL.LENGTH.LSHIFT(33) = 8, since 33 on division by 32 yields a remainder of 1.

`Parameters``:`

i- Left Shift Length

`Returns:` num_at

`*LT` (double_at i)

Returns Boolean TRUE if the double value is lesser than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (num_at i)

Returns Boolean TRUE if the number value is lesser than the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (double_at i)

Return the maximum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MAX` (ip_address_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (unsigned_long_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (num_at i)

Return the maximum value after comparing the argument with the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MAX` (time_local_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (double_at i)

Return the minimum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MIN` (ip_address_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (unsigned_long_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (num_at i)

Return the minimum value after comparing the argument with the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (time_local_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (ip_address_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (unsigned_long_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (num_at i)

Return the Number Value that is the renaminder after dividing the current number value by the argument.

`Parameters``:`

i- Number

`Returns:` num_at

`*MOD` (time_local_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (double_at i)

Return the Double Value after multiplying the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MUL` (ip_address_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (unsigned_long_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (num_at i)

Return the Number Value after multiplying the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MUL` (time_local_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*NEG`

Return the Number Value after negating the current number value.

`Returns:` num_at

`*NE` (double_at i)

Returns Boolean TRUE if the double value is not equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*NE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (num_at i)

Returns Boolean TRUE if the number value is not equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (time_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XXDP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ> <InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AUnw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/ mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/ AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/ 7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </ RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

The REGEX_MATCH operator in this object overrides the Text REGEX_MATCH operator to operate on all the instances of the current header type. Returns Boolean TRUE if the input regular expression matches any instance of the header value. The order in which the header instances will be matched is from the last to the first.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at sip://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended to not use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

The REGEX_SELECT operator in this object overrides the Text REGEX_SELECT operator to operate on all the instances of the current header type. Selects the Text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*RSHIFT` (`uint` i)

Return the Number Value after bitwise right shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 32. For example, let HTTP.REQ.URL.LENGTH be 4. Then, HTTP.REQ.URL.LENGTH.RSHIFT(1) = HTTP.REQ.URL.LENGTH.RSHIFT(33) = 2, since 33 on division by 32 yields a remainder of 1.

`Parameters``:`

i- Right Shift Length

`Returns:` num_at

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sip_content_length_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be

performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sip_content_length_t

`*SIGNED16_STRING` (endian_e endianness)

Create a signed 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*SIGNED32_STRING` (endian_e endianness)

Create a signed 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*SIGNED8_STRING`

Create a signed 8-bit binary string from the number.

`Returns:` text_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

The SUBSTR operator in this object overrides the Text SUBSTR operator to operate on all the instances of the current header type. Selects Text that matches the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: 111abc\\r\\n Content-Length: 200\\r\\n MyHdr: 111def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").SUBSTR("111") selects "111" in the last instance of MyHdr, the one with value "111def". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUB` (double_at i)

Return the Double Value after subtracting the argument from the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*SUB` (ip_address_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (unsigned_long_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (num_at i)

Return the Number Value after subtracting the argument from the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*SUB` (time_local_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or

more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Typecast the Number Value to a Double value.

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the

remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the

beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Typecast the Number Value to an IP Address value.

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-

value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP

Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TEXT_T`

Typecast the Number Value to its string representation.

`Returns:` text_t

`*TYPECAST_TIME_AT`

Typecast the Number Value to a Time value.

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Typecast the Number Value to a local time value.

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Typecast the Number Value to a Unsigned Long value.

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining

characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*UNSIGNED16_STRING` (endian_e endianness)

Create an unsigned 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED32_STRING` (endian_e endianness)

Create an unsigned 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED64_STRING` (endian_e endianness)

Create an unsigned 64-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED8_STRING`

Create an unsigned 8-bit binary string from the number.

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*VALUE` (`uint` lineno)

An SIP header can have multiple occurrences. VALUE(0) will select the value in the last header line of the current type, VALUE(1) will select the value in the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").VALUE(1) will return a Text object referring to "abc\\r\\n".

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*WEEKDAY_STRING`

Given the numeric day of the week, e.g. SYS.TIME.WEEKDAY, return the long form of the string name for that day, e.g. 0 = "Sunday", 6 = "Saturday".

`Returns:` text_t

`*WEEKDAY_STRING_SHORT`

Given the numeric day of the week, e.g. SYS.TIME.WEEKDAY, return the short form of the string name for that day, e.g. 0 = "Sun", 6 = "Sat".

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

SIP_FROM_HEADER_T

This object provides operations for parsing the SIP From header.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from sip_header_t sip_address_at

- `TYPECAST_SIP_HEADER_T`

  Convert sip_from_header_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : Typecast an SIP Header object of a specific type to SIP Header.For example: SIP.REQ.CONTENT_LENGTH.TYPECAST_SIP_HEADER_T)

`Returns:` sip_header_t

`*ADDRESS`

Returns the SIP URI in the "To" or "From" header

`Returns:` sip_url_t

`*AFTER_REGEX` (`re` regex)

The AFTER_REGEX operator in this object overrides the Text AFTER_REGEX operator to operate on all the instances of the current header type. Selects the Text after the text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: SIP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

The AFTER_STR operator in this object overrides the Text AFTER_STR operator to operate on all the instances of the current header type. Selects Text after the first occurrence of the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: 111abc\\r\\n Content-Length: 200\\r\\n MyHdr: 111def\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").AFTER_STR("111") selects "def" in the last instance of MyHdr, the one with value "111def". SIP.RES.HEADER("MyHdr").AFTER_STR("1ab") selects "c" in the first instance of MyHdr, the one with value "abc111". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

The BEFORE_REGEX operator in this object overrides the Text BEFORE_REGEX operator to operate on all the instances of the current header type. Selects the Text before the text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: SIP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

The BEFORE_STR operator in this object overrides the Text BEFORE_STR operator to operate on all the instances of the current header type. Selects Text before the first occurrence of the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: abc111\\r\\n Content-Length: 200\\r\\n MyHdr: def111\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").BEFORE_STR("111") selects "def" in the last instance of MyHdr, the one with value "def111". SIP.RES.HEADER("MyHdr").BEFORE_STR("bc1") selects "a" in the first instance of MyHdr, the one with value "abc111". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patclass_name)

The CONTAINS_ANY in this object overrides the Text CONTAINS_ANY operator to operate on all the instances of the current header type. Returns Boolean TRUE if any of the patterns associated with input patclass is present in any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patclass_name- Patclass Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patclass_name)

The CONTAINS_INDEX in this object overrides the Text CONTAINS_INDEX operator to operate on all the instances of the current header type. Returns the index of the matching pattern associated with input patclass that is present in any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patclass_name- Patclass Name

`Returns:` num_at

`*CONTAINS` (text_t s)

The CONTAINS in this object overrides the Text CONTAINS operator to operate on all the instances of the current header type. Returns Boolean TRUE if the input Pattern String is present in any instance of the header value.

GET / SIP/2.0\\r\\n Host: abc.com\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").CONTAINS("de") is TRUE.
SIP.RES.HEADER("MyHdr").CONTAINS("bcd") is FALSE.
SIP.REQ.HEADER("MyHdr").CONTAINS("de") is TRUE.
SIP.REQ.HEADER("MyHdr").CONTAINS("bcd") is FALSE. The system does not concatenate the different values. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- Pattern String

`Returns:` bool_at

`*COUNT`

An SIP header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").COUNT will return Number 2. The system does not keep track of more than 15 SIP headers. The result will be undefined if there are more than 15 instances of the header.

`Returns:` num_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*DISPLAY_NAME`

Returns the display name in the "To" or "From" header

`Returns:` sip_url_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

The EQUALS_ANY in this object overrides the Text EQUALS_ANY operator to operate on all the instances of the current header type. Returns Boolean TRUE if any of the patterns associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Patset Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

The EQUALS_INDEX in this object overrides the Text EQUALS_INDEX operator to operate on all the instances of the current header type. Returns the index of the matching pattern associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Patset Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*EXISTS`

Returns TRUE if an instance of the current header type exists.

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"
```

```
    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*INSTANCE` (`uint` lineno)

An SIP header can have multiple occurrences. INSTANCE(0) will select the last header line of the current type, INSTANCE(1) will select the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").INSTANCE(1) will return a Text object referring to "MyHdr: abc\\r\\n". It can not be used in SIP response processing contexts.

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LIST`

A SIP header can have multiple comma separated parameter list in a single line. LIST operation will give a list of comma separated entities. LIST.GET(0) will select the first entity in the comma separated header line. LIST.GET(1) will select the second entity and so on.

SIP/2.0 200 OK\\r\\n MyHdr: abc;param1=1;param2=2,abc2=second;paramabc2=3\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example : SIP.REQ.HEADER("MyHdr").LIST.GET(1) will return a text object referring to "abc2=second;paramabc2=3"

`Returns:` list_t

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable.

Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too

long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/ mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/ AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/ 7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/ J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/ IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/ Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ> <InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/ tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/ 5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </ RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

The REGEX_MATCH operator in this object overrides the Text REGEX_MATCH operator to operate on all the instances of the current header type. Returns Boolean TRUE if the input regular

expression matches any instance of the header value. The order in which the header instances will be matched is from the last to the first.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at sip://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended to not use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

The REGEX_SELECT operator in this object overrides the Text REGEX_SELECT operator to operate on all the instances of the current header type. Selects the Text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sip_from_header_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters.

NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sip_from_header_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

The SUBSTR operator in this object overrides the Text SUBSTR operator to operate on all the instances of the current header type. Selects Text that matches the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: 111abc\\r\\n Content-Length: 200\\r\\n MyHdr: 111def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").SUBSTR("111") selects "111" in the last instance of MyHdr, the one with value "111def". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TAG`

Returns the "tag" parameter in the "To" or "From" header

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing

the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be

the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the

value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TEXT_T`

Convert sip_header_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a

Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining

characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*VALUE` (`uint` lineno)

An SIP header can have multiple occurrences. VALUE(0) will select the value in the last header line of the current type, VALUE(1) will select the value in the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").VALUE(1) will return a Text object referring to "abc\\r\\n".

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

SIP_HEADER_T

The SIP.REQ.HEADER("header name") or SIP.RES.HEADER("header name") object represents the multiple lines of a particular SIP header type. This object is also a Text object. Direct Text operations on this object will mostly operate only on the value in the last header line of this type. Some Text operations like CONTAINS have been overridden to operate on values in all the header lines of this type.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t

`AFTER_REGEX` (`re` regex)

The AFTER_REGEX operator in this object overrides the Text AFTER_REGEX operator to operate on all the instances of the current header type. Selects the Text after the text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: SIP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR` (text_t s)

The AFTER_STR operator in this object overrides the Text AFTER_STR operator to operate on all the instances of the current header type. Selects Text after the first occurrence of the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: 111abc\\r\\n Content-Length: 200\\r\\n MyHdr: 111def\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").AFTER_STR("111") selects "def" in the last instance of MyHdr, the one with value "111def". SIP.RES.HEADER("MyHdr").AFTER_STR("1ab") selects "c" in the first instance of MyHdr, the one with value "abc111". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

The BEFORE_REGEX operator in this object overrides the Text BEFORE_REGEX operator to operate on all the instances of the current header type. Selects the Text before the text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: SIP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR` (text_t s)

The BEFORE_STR operator in this object overrides the Text BEFORE_STR operator to operate on all the instances of the current header type. Selects Text before the first occurrence of the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: abc111\\r\\n Content-Length: 200\\r\\n MyHdr: def111\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").BEFORE_STR("111") selects "def" in the last instance of MyHdr, the one with value "def111". SIP.RES.HEADER("MyHdr").BEFORE_STR("bc1") selects "a" in the first instance of MyHdr, the one with value "abc111". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*CONTAINS_ANY` (text_t patclass_name)

The CONTAINS_ANY in this object overrides the Text CONTAINS_ANY operator to operate on all the instances of the current header type. Returns Boolean TRUE if any of the patterns associated with input patclass is present in any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patclass_name- Patclass Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patclass_name)

The CONTAINS_INDEX in this object overrides the Text CONTAINS_INDEX operator to operate on all the instances of the current header type. Returns the index of the matching pattern associated with input patclass that is present in any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patclass_name- Patclass Name

`Returns:` num_at

`*CONTAINS` (text_t s)

The CONTAINS in this object overrides the Text CONTAINS operator to operate on all the instances of the current header type. Returns Boolean TRUE if the input Pattern String is present in any instance of the header value.

GET / SIP/2.0\\r\\n Host: abc.com\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").CONTAINS("de") is TRUE.
SIP.RES.HEADER("MyHdr").CONTAINS("bcd") is FALSE.
SIP.REQ.HEADER("MyHdr").CONTAINS("de") is TRUE.
SIP.REQ.HEADER("MyHdr").CONTAINS("bcd") is FALSE. The system does not concatenate the different values. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- Pattern String

`Returns:` bool_at

`*COUNT`

An SIP header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").COUNT will return Number 2. The system does not keep track of more than 15 SIP headers. The result will be undefined if there are more than 15 instances of the header.

`Returns:` num_at

`*EQUALS_ANY` (text_t patset_name)

The EQUALS_ANY in this object overrides the Text EQUALS_ANY operator to operate on all the instances of the current header type. Returns Boolean TRUE if any of the patterns associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Patset Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

The EQUALS_INDEX in this object overrides the Text EQUALS_INDEX operator to operate on all the instances of the current header type. Returns the index of the matching pattern associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Patset Name

`Returns:` num_at

`*EXISTS`

Returns TRUE if an instance of the current header type exists.

`Returns:` bool_at

`*INSTANCE` (`uint` lineno)

An SIP header can have multiple occurrences. INSTANCE(0) will select the last header line of the current type, INSTANCE(1) will select the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").INSTANCE(1) will return a Text object referring to "MyHdr: abc\\r\\n". It can not be used in SIP response processing contexts.

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*LIST`

A SIP header can have multiple comma separated parameter list in a single line. LIST operation will give a list of comma separated entities. LIST.GET(0) will select the first entity in the comma separated header line. LIST.GET(1) will select the second entity and so on.

SIP/2.0 200 OK\\r\\n MyHdr: abc;param1=1;param2=2,abc2=second;paramabc2=3\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example : SIP.REQ.HEADER("MyHdr").LIST.GET(1) will return a text object referring to "abc2=second;paramabc2=3"

`Returns:` list_t

`*REGEX_MATCH` (`re` regex)

The REGEX_MATCH operator in this object overrides the Text REGEX_MATCH operator to operate on all the instances of the current header type. Returns Boolean TRUE if the input regular

expression matches any instance of the header value. The order in which the header instances will be matched is from the last to the first.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at sip://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended to not use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_SELECT` (`re` regex)

The REGEX_SELECT operator in this object overrides the Text REGEX_SELECT operator to operate on all the instances of the current header type. Selects the Text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*SUBSTR` (text_t s)

The SUBSTR operator in this object overrides the Text SUBSTR operator to operate on all the instances of the current header type. Selects Text that matches the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: 111abc\\r\\n Content-Length: 200\\r\\n MyHdr: 111def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").SUBSTR("111") selects "111" in the last instance of MyHdr, the one with value "111def". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*TYPECAST_TEXT_T`

Convert sip_header_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*VALUE` (`uint` lineno)

An SIP header can have multiple occurrences. VALUE(0) will select the value in the last header line of the current type, VALUE(1) will select the value in the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").VALUE(1) will return a Text object referring to "abc\\r\\n".

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"
```

```
    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XXDP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ> <InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AUnw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/ mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/ AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/ 7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </ RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sip_header_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sip_header_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).

- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a

HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX,

DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."
```

```
    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

```

SIP_HOSTNAME_T

This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t

- `DOMAIN`

  Operate as Text on the Domain name part of the hostname. If the hostname is www.foobar.com or www.foobar.com:5060, then domain is foobar.com. This operation will return incorrect results if the hostname has an IP address. This method also sets the text mode to case-insensitive. So all text operations after this method will operate in a case-insensitive manner.

`Returns:` text_t

`*EQ` (text_t hostname)

Operates on the text contents of hostname. Results in Boolean TRUE value if the hostname matches the input argument. The comparison will be case-insensitive and if textmode is URLENCODED the hostname will be decoded before comparison. If hostname is www.foobar.com or www.foobar.com., then EQ(www.forbar.com) returns TRUE.

`Parameters``:`

hostname- Hostname

`Returns:` bool_at

`*PORT`

Operate as Number on the port part of the hostname. The string following and including the first : is considered the port value. Examples:

If the hostname is www.foo.com:5060 then the port is ":5060". If the hostname is www.foo.com: then the port is ":". If the hostname is www.foo.com then the port is "" and points to just after ".com".

When the numerical value in the port is missing then it assumes a default value of 5060.

`Returns:` num_t

`*SERVER`

Operate as Text on the Server name part of the hostname. If the hostname is www.foobar.com or www.foobar.com:5060, then server is www.foobar.com. This method also sets the text mode to case-insensitive. So all text operations after this method will operate in a case-insensitive manner.

`Returns:` text_t

`*TYPECAST_TEXT_T`

Convert sip_hostname_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed)`:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed)`:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed)`:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input

text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +
```

```
"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw=="
<DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ>
<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/

5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter

matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sip_hostname_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sip_hostname_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given

format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH

- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining

characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

SIP_METHOD_E

This object represents one of the SIP Request Methods.

Enumerations

INVITE

REGISTER

CANCEL

BYE

ACK

OPTIONS

UNKNOWN_METHOD

This topic lists the expressions that are provided by this class.

`EQ` (sip_method_e m)

The result is Boolean TRUE if the input argument is equal to the SIP Request Method represented by this object.

`Parameters` (expressions not allowed) `:`

m- SIP Request Method Name

`Returns:` bool_at

`NE` (sip_method_e m)

The result is Boolean TRUE if the input argument is not equal to the SIP Request Method represented by this object.

`Parameters` (expressions not allowed) `:`

m- SIP Request Method Name

`Returns:` bool_at

SIP_METHOD_T

This object provides Text operations and SIP Request Method Enum operations on the SIP request method.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t sip_method_e

- `TYPECAST_TEXT_T`

  Convert sip_method_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings

longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (sip_method_e m)

The result is Boolean TRUE if the input argument is equal to the SIP Request Method represented by this object.

`Parameters` (expressions not allowed) `:`

m- SIP Request Method Name

`Returns:` bool_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"
```

```
    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (sip_method_e m)

The result is Boolean TRUE if the input argument is not equal to the SIP Request Method represented by this object.

`Parameters` (expressions not allowed) `:`

m- SIP Request Method Name

`Returns:` bool_at

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ> <InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)

- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you

wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sip_method_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text

"http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\ \72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\ \b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sip_method_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).

- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a

HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX,

DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."
```

```
    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

```

SIP_PROTOCOL_T

This is the starting point for SIP protocol based expressions

This topic lists the expressions that are provided by this class.

- `REQ`

  Operates on SIP Request.

`Returns:` sip_req_t

- `RES`

  Operates on SIP Response.

`Returns:` sip_res_t

SIP_REQ_T

Operates on SIP Request.

This topic lists the expressions that are provided by this class.

`BODY` (`uint` i)

Operate as Text on the SIP request body. The length of the body is equal to the number in the argument. If there aren't enough characters in the body then the entire body is selected.

`Parameters``:`

i- Body length

`Returns:` text_t

- `CALLID`

  Returns the content of the "Callid" header

`Returns:` sip_callid_header_t

- `CONTENT_LENGTH`

  Returns the length of the SIP request as a number.

`Returns:` sip_content_length_t

- `CSEQ`

  Returns the SIP Cseq number

`Returns:` num_t

- `CS_VSERVER`

  Returns the CS vserver serving the current request.

`Returns:` vserver_t

- `FROM`

Returns the content of the "From" header

`Returns:` sip_from_header_t

- `FULL_HEADER`

  Returns the entire request header (including the terminating \\r\\n\\r\\n)

`Returns:` text_t

`HEADER` (text_t header_name)

Returns the contents of the SIP header specified by the String argument. The header name cannot be longer than 32 characters.

`Parameters` (expressions not allowed) `:`

header_name- Header Name

`Returns:` sip_header_t

- `IS_VALID`

  Returns TRUE if the SIP request is properly formed.

`Returns:` bool_at

- `LB_VSERVER`

  Returns the LB vserver serving the current request.

`Returns:` vserver_t

- `METHOD`

  Returns the SIP method object from the request.

`Returns:` sip_method_t

- `TO`

  Returns the content of the "To" header

`Returns:` sip_to_header_t

- `URL`

Obtain the SIP URL object from the request. The Text object backing the SIP URL object has the Text Mode set to URLENCODED by default.

`Returns:` sip_url_t

- `VERSION`

  Returns the SIP version.

`Returns:` sip_version_t

- `VIA`

  Returns the content of the "Via" header

`Returns:` sip_via_header_t

SIP_RES_T

Operates SIP Response.

This topic lists the expressions that are provided by this class.

`BODY` (`uint` i)

Operate as Text on the SIP response body. The length of the body is equal to the number in the argument. If there aren't enough characters in the body then the entire body is selected.

`Parameters``:`

i- Body length

`Returns:` text_t

- `CALLID`

  Returns the content of the "Callid" header

`Returns:` text_t

- `CONTENT_LENGTH`

  Returns the length of the SIP response as a number.

`Returns:` sip_content_length_t

- `CSEQ`

  Returns the SIP Cseq number

`Returns:` num_t

- `FROM`

  Returns the content of the "From" header

`Returns:` sip_from_header_t

- `FULL_HEADER`

Returns the entire response header (including the terminating \\r\\n\\r\\n)

`Returns:` text_t

`HEADER` (text_t header_name)

Returns the contents of the SIP header specified by the String argument. The header name cannot be longer than 32 characters.

`Parameters` (expressions not allowed) `:`

header_name- Header Name

`Returns:` sip_header_t

- `IS_GLOBAL_FAILURE`

  Returns True if response code is 6xx.

`Returns:` bool_at

- `IS_PROVISIONAL`

  Returns True if response code is 1xx.

`Returns:` bool_at

- `IS_REDIRECT`

  Returns True if response code is 3xx

`Returns:` bool_at

- `IS_REQUEST_FAILURE`

  Returns True if response code is 4xx.

`Returns:` bool_at

- `IS_SERVER_FAILURE`

  Returns True if response code is a 5xx.

`Returns:` bool_at

- `IS_SUCCESSFUL`

Returns True if response code is 2xx.

`Returns:` bool_at

- `IS_VALID`

  Returns TRUE if the SIP response is properly formed.

`Returns:` bool_at

- `METHOD`

  Returns the SIP method. this is extracted from the Cseq header in the response.

`Returns:` sip_method_t

- `STATUS`

  Returns the SIP response status code.

`Returns:` num_t

- `STATUS_MSG`

  Returns the SIP response status message.

`Returns:` text_t

- `TO`

  Returns the content of the "To" header

`Returns:` sip_to_header_t

- `VERSION`

  Returns the SIP version.

`Returns:` sip_version_t

- `VIA`

  Returns the content of the "Via" header

`Returns:` sip_via_header_t

SIP_TO_HEADER_T

This object provides operations for parsing the SIP From header.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from sip_header_t sip_address_at

- `TYPECAST_SIP_HEADER_T`

  Convert sip_to_header_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : Typecast an SIP Header object of a specific type to SIP Header.For example: SIP.REQ.CONTENT_LENGTH.TYPECAST_SIP_HEADER_T)

`Returns:` sip_header_t

`*ADDRESS`

Returns the SIP URI in the "To" or "From" header

`Returns:` sip_url_t

`*AFTER_REGEX` (`re` regex)

The AFTER_REGEX operator in this object overrides the Text AFTER_REGEX operator to operate on all the instances of the current header type. Selects the Text after the text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: SIP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

The AFTER_STR operator in this object overrides the Text AFTER_STR operator to operate on all the instances of the current header type. Selects Text after the first occurrence of the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: 111abc\\r\\n Content-Length: 200\\r\\n MyHdr: 111def\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").AFTER_STR("111") selects "def" in the last instance of MyHdr, the one with value "111def". SIP.RES.HEADER("MyHdr").AFTER_STR("1ab") selects "c" in the first instance of MyHdr, the one with value "abc111". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

The BEFORE_REGEX operator in this object overrides the Text BEFORE_REGEX operator to operate on all the instances of the current header type. Selects the Text before the text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: SIP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

The BEFORE_STR operator in this object overrides the Text BEFORE_STR operator to operate on all the instances of the current header type. Selects Text before the first occurrence of the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: abc111\\r\\n Content-Length: 200\\r\\n MyHdr: def111\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").BEFORE_STR("111") selects "def" in the last instance of MyHdr, the one with value "def111". SIP.RES.HEADER("MyHdr").BEFORE_STR("bc1") selects "a" in the first instance of MyHdr, the one with value "abc111". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patclass_name)

The CONTAINS_ANY in this object overrides the Text CONTAINS_ANY operator to operate on all the instances of the current header type. Returns Boolean TRUE if any of the patterns associated with input patclass is present in any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patclass_name- Patclass Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patclass_name)

The CONTAINS_INDEX in this object overrides the Text CONTAINS_INDEX operator to operate on all the instances of the current header type. Returns the index of the matching pattern associated with input patclass that is present in any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patclass_name- Patclass Name

`Returns:` num_at

`*CONTAINS` (text_t s)

The CONTAINS in this object overrides the Text CONTAINS operator to operate on all the instances of the current header type. Returns Boolean TRUE if the input Pattern String is present in any instance of the header value.

GET / SIP/2.0\\r\\n Host: abc.com\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").CONTAINS("de") is TRUE.
SIP.RES.HEADER("MyHdr").CONTAINS("bcd") is FALSE.
SIP.REQ.HEADER("MyHdr").CONTAINS("de") is TRUE.
SIP.REQ.HEADER("MyHdr").CONTAINS("bcd") is FALSE. The system does not concatenate the different values. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- Pattern String

`Returns:` bool_at

`*COUNT`

An SIP header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").COUNT will return Number 2. The system does not keep track of more than 15 SIP headers. The result will be undefined if there are more than 15 instances of the header.

`Returns:` num_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*DISPLAY_NAME`

Returns the display name in the "To" or "From" header

`Returns:` sip_url_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

The EQUALS_ANY in this object overrides the Text EQUALS_ANY operator to operate on all the instances of the current header type. Returns Boolean TRUE if any of the patterns associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Patset Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

The EQUALS_INDEX in this object overrides the Text EQUALS_INDEX operator to operate on all the instances of the current header type. Returns the index of the matching pattern associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Patset Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*EXISTS`

Returns TRUE if an instance of the current header type exists.

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"
```

```
    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*INSTANCE` (`uint` lineno)

An SIP header can have multiple occurrences. INSTANCE(0) will select the last header line of the current type, INSTANCE(1) will select the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").INSTANCE(1) will return a Text object referring to "MyHdr: abc\\r\\n". It can not be used in SIP response processing contexts.

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LIST`

A SIP header can have multiple comma separated parameter list in a single line. LIST operation will give a list of comma separated entities. LIST.GET(0) will select the first entity in the comma separated header line. LIST.GET(1) will select the second entity and so on.

SIP/2.0 200 OK\\r\\n MyHdr: abc;param1=1;param2=2,abc2=second;paramabc2=3\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example : SIP.REQ.HEADER("MyHdr").LIST.GET(1) will return a text object referring to "abc2=second;paramabc2=3"

`Returns:` list_t

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable.

Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too

long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/ mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/ AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/ 7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/ J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/ IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/ Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ> <InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/ tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/ 5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </ RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

The REGEX_MATCH operator in this object overrides the Text REGEX_MATCH operator to operate on all the instances of the current header type. Returns Boolean TRUE if the input regular

expression matches any instance of the header value. The order in which the header instances will be matched is from the last to the first.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at sip://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended to not use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

The REGEX_SELECT operator in this object overrides the Text REGEX_SELECT operator to operate on all the instances of the current header type. Selects the Text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sip_to_header_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters.

NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sip_to_header_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

The SUBSTR operator in this object overrides the Text SUBSTR operator to operate on all the instances of the current header type. Selects Text that matches the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: 111abc\\r\\n Content-Length: 200\\r\\n MyHdr: 111def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").SUBSTR("111") selects "111" in the last instance of MyHdr, the one with value "111def". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TAG`

Returns the "tag" parameter in the "To" or "From" header

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing

the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be

the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the

value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TEXT_T`

Convert sip_header_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a

Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining

characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*VALUE` (`uint` lineno)

An SIP header can have multiple occurrences. VALUE(0) will select the value in the last header line of the current type, VALUE(1) will select the value in the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").VALUE(1) will return a Text object referring to "abc\\r\\n".

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

SIP_URL_T

SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t

- `HOSTNAME`

  Operate as SIP Host Name on the hostname present in the URL. Sets the text mode to case insensitive. It can not be used in SIP response processing contexts.

`Returns:` sip_hostname_t

`*PROTOCOL`

Operate as Text on the protocol present in the URL. It can not be used in SIP response processing contexts.

`Returns:` text_t

`*TYPECAST_TEXT_T`

Convert sip_url_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*USERNAME`

Operate as Text on the username present in the SIP URI. Sets the text mode to case insensitive.

`Returns:` text_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many

other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"
```

```
    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ>
<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)

- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you

wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sip_url_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text

"http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\ \72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\ \b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sip_url_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).

- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a

HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX,

DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."
```

```
    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

SIP_VERSION_T

SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t

- `MAJOR`

  Operate as Number on the major component of the SIP Version string.

`Returns:` num_t

`*MINOR`

Operate as Number on the minor component of the SIP Version string.

`Returns:` num_t

`*TYPECAST_TEXT_T`

Convert sip_version_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED,

NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"
```

```
    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".

- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'

- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +
```

```
"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ> <InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74A
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sip_version_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\

\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\ \b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sip_version_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing

the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be

the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the

value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining

characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

SIP_VIA_HEADER_T

This object provides operations for parsing the SIP Via header.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from sip_header_t

- `BRANCH`

  Returns the BRANCH used for SIP communication

`Returns:` text_t

`*RECEIVED`

Returns the source IP address from the which the end host received the SIP request.

`Returns:` ip_address_at

`*RECEIVED_IPV6`

Returns the source IPV6 address from the which the end host received the SIP request.

`Returns:` ipv6_address_at

`*RPORT`

Returns the RPORT used for SIP communication

`Returns:` num_t

`*SENTBY_ADDRESS`

Returns the IP address of the end host which sent the SIP request.

`Returns:` ip_address_at

`*SENTBY_ADDRESS_IPV6`

Returns the IPV6 address of the end host which sent the SIP request.

`Returns:` ipv6_address_at

`*SENTBY_PORT`

Returns the source port of the end host which send the SIP request.

`Returns:` num_t

`*TYPECAST_SIP_HEADER_T`

Convert sip_via_header_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : Typecast an SIP Header object of a specific type to SIP Header.For example: SIP.REQ.CONTENT_LENGTH.TYPECAST_SIP_HEADER_T)

`Returns:` sip_header_t

`*AFTER_REGEX` (`re` regex)

The AFTER_REGEX operator in this object overrides the Text AFTER_REGEX operator to operate on all the instances of the current header type. Selects the Text after the text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: SIP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

The AFTER_STR operator in this object overrides the Text AFTER_STR operator to operate on all the instances of the current header type. Selects Text after the first occurrence of the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: 111abc\\r\\n Content-Length: 200\\r\\n MyHdr: 111def\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").AFTER_STR("111") selects "def" in the last instance of MyHdr, the one with value "111def". SIP.RES.HEADER("MyHdr").AFTER_STR("1ab") selects "c" in the first instance of MyHdr, the one with value "abc111". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

The BEFORE_REGEX operator in this object overrides the Text BEFORE_REGEX operator to operate on all the instances of the current header type. Selects the Text before the text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: SIP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

The BEFORE_STR operator in this object overrides the Text BEFORE_STR operator to operate on all the instances of the current header type. Selects Text before the first occurrence of the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: abc111\\r\\n Content-Length: 200\\r\\n MyHdr: def111\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").BEFORE_STR("111") selects "def" in the last instance of MyHdr, the one with value "def111". SIP.RES.HEADER("MyHdr").BEFORE_STR("bc1") selects "a" in the first instance of MyHdr, the one with value "abc111". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patclass_name)

The CONTAINS_ANY in this object overrides the Text CONTAINS_ANY operator to operate on all the instances of the current header type. Returns Boolean TRUE if any of the patterns associated with input patclass is present in any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patclass_name- Patclass Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patclass_name)

The CONTAINS_INDEX in this object overrides the Text CONTAINS_INDEX operator to operate on all the instances of the current header type. Returns the index of the matching pattern associated with input patclass that is present in any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patclass_name- Patclass Name

`Returns:` num_at

`*CONTAINS` (text_t s)

The CONTAINS in this object overrides the Text CONTAINS operator to operate on all the instances of the current header type. Returns Boolean TRUE if the input Pattern String is present in any instance of the header value.

GET / SIP/2.0\\r\\n Host: abc.com\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

Examples: SIP.RES.HEADER("MyHdr").CONTAINS("de") is TRUE.
SIP.RES.HEADER("MyHdr").CONTAINS("bcd") is FALSE.
SIP.REQ.HEADER("MyHdr").CONTAINS("de") is TRUE.
SIP.REQ.HEADER("MyHdr").CONTAINS("bcd") is FALSE. The system does not concatenate the different values. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- Pattern String

`Returns:` bool_at

`*COUNT`

An SIP header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").COUNT will return Number 2. The system does not keep track of more than 15 SIP headers. The result will be undefined if there are more than 15 instances of the header.

`Returns:` num_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

The EQUALS_ANY in this object overrides the Text EQUALS_ANY operator to operate on all the instances of the current header type. Returns Boolean TRUE if any of the patterns associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Patset Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

The EQUALS_INDEX in this object overrides the Text EQUALS_INDEX operator to operate on all the instances of the current header type. Returns the index of the matching pattern associated with input patset is equal to any instance of the header value. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Patset Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*EXISTS`

Returns TRUE if an instance of the current header type exists.

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"
```

```
    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*INSTANCE` (`uint` lineno)

An SIP header can have multiple occurrences. INSTANCE(0) will select the last header line of the current type, INSTANCE(1) will select the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").INSTANCE(1) will return a Text object referring to "MyHdr: abc\\r\\n". It can not be used in SIP response processing contexts.

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'

- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LIST`

A SIP header can have multiple comma separated parameter list in a single line. LIST operation will give a list of comma separated entities. LIST.GET(0) will select the first entity in the comma separated header line. LIST.GET(1) will select the second entity and so on.

SIP/2.0 200 OK\\r\\n MyHdr: abc;param1=1;param2=2,abc2=second;paramabc2=3\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example : SIP.REQ.HEADER("MyHdr").LIST.GET(1) will return a text object referring to "abc2=second;paramabc2=3"

`Returns:` list_t

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too

long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +
```

```
"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ>
<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74A
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </

RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

The REGEX_MATCH operator in this object overrides the Text REGEX_MATCH operator to operate on all the instances of the current header type. Returns Boolean TRUE if the input regular expression matches any instance of the header value. The order in which the header instances will be matched is from the last to the first.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at sip://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended to not use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

The REGEX_SELECT operator in this object overrides the Text REGEX_SELECT operator to operate on all the instances of the current header type. Selects the Text that matches the input regular expression in any instance of the header value. The order in which the header instances will be matched is from the last to the first.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sip_via_header_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all

%HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sip_via_header_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

The SUBSTR operator in this object overrides the Text SUBSTR operator to operate on all the instances of the current header type. Selects Text that matches the input string argument. The order in which the instances of the header are matched is from the last instance to the first.

SIP/2.0 200 OK\\r\\n MyHdr: 111abc\\r\\n Content-Length: 200\\r\\n MyHdr: 111def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").SUBSTR("111") selects "111" in the last instance of MyHdr, the one with value "111def". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given

format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', '"') handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH

- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TEXT_T`

Convert sip_header_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL

and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*VALUE` (`uint` lineno)

An SIP header can have multiple occurrences. VALUE(0) will select the value in the last header line of the current type, VALUE(1) will select the value in the last but one header line and so on. The counting goes backward. Only the last 15 instances of a header are accessible. Therefore Instance Number cannot be greater than 14.

SIP/2.0 200 OK\\r\\n MyHdr: abc\\r\\n Content-Length: 200\\r\\n MyHdr: def\\r\\n \\r\\n

For example: SIP.RES.HEADER("MyHdr").VALUE(1) will return a Text object referring to "abc\\r\\n".

`Parameters` (expressions not allowed) `:`

lineno- Instance Number

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;

- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

SMPP_BIND_E

This object represents one of the Bind Type.

Enumerations

TRANSMITTER

RECEIVER

TRANSCEIVER

This topic lists the expressions that are provided by this class.

`EQ` (smpp_bind_e m)

Result is boolean TRUE if input argument is equal to bind type of this connection.

`Parameters` (expressions not allowed) `:`

m- SMPP Bind Type

`Returns:` bool_at

`NE` (smpp_bind_e m)

Result is boolean TRUE if input argument is equal to bind type of this connection.

`Parameters` (expressions not allowed) `:`

m- SMPP Bind Type

`Returns:` bool_at

SMPP_BINDINFO_T

This object operates on bindinfo message of the SMPP Connection.

This topic lists the expressions that are provided by this class.

- `ADDRESS_RANGE`

  Returns the ESME address or range of the ESME adresses.

`Returns:` text_t

- `ADDR_NPI`

  Returns the Numbering Plan Indicator (NPI) for the ESME address.

`Returns:` num_at

- `ADDR_TON`

  Returns the Type of Number (ToN) of the ESME address.

`Returns:` num_at

- `SYSTEM_ID`

  Returns the ESME system requesting to bind with the Message Center.

`Returns:` text_t

- `SYSTEM_TYPE`

  Returns the ESME system requesting to bind with the Message Center.

`Returns:` text_t

- `TYPE`

  Enum for the type of bind command. The different values of the enum will be TRANSCEIVER/ TRANSMITTER/RECEIVER.

`Returns:` smpp_bind_e

SMPP_PROTOCOL_T

Models the SMPP protocol.

This topic lists the expressions that are provided by this class.

- `BINDINFO`

  Operates on SMPP BINDINFO. BINDINFO contains the parameters used by client while doing bind.

`Returns:` smpp_bindinfo_t

SNI_TEXT_AT

Sni Text Interface

SNMP_TABLE_T

The SYS.VSERVER("vserver name").SNMP_TABLE object represents the snmp load table on the vserver. This table contains the load value aggregated across all the services, servicegroup items bound to the vserver. The load values themselves are retrieved via the snmp load monitor bound to the services and servicegroup items.

This topic lists the expressions that are provided by this class.

- `AVERAGE_VALUE`

  Returns the average value of the load parameter at the index.

`Returns:` unsigned_long_at

SQL_QUERY_T

Describes a SQL query.

SSL_REQ_PROTOCOL_T

SSL Protocol

This topic lists the expressions that are provided by this class.

- `CIPHER_BITS`

  Returns the number of bits in the cryptographic key. Returns 0 if the transaction is not SSL based.

`Returns:` num_at

- `CIPHER_EXPORTABLE`

  Returns TRUE if the SSL cryptographic key is exportable.

`Returns:` bool_at

- `CIPHER_NAME`

  Returns SSL Cipher name. Returns a NULL string if invoked from a non SSL connnection

`Returns:` text_t

- `CLIENT_CERT`

  Returns the SSL client certificate in the current SSL transaction.

`Returns:` x509_certificate_t

- `CLIENT_HELLO`

  Returns SSL Client Hello fields.

`Returns:` client_hello_t

- `DETECTED_DOMAIN`

  Returns SSL detected domain. Returns a NULL string if invoked from a non SSL connnection

`Returns:` text_t

- `IS_SSL`

  Returns TRUE if the current connection is SSL-based.

`Returns:` bool_at

- `JA3_FINGERPRINT`
- `ORIGIN_SERVER_CERT`

  Returns the certificate of Origin Server in the current SSL transaction.

`Returns:` x509_certificate_t

- `VERSION`

  Returns the SSL protocol version. Returns 0 if the transaction is not SSL based. Returns 0x002 if the transaction is SSLv2. Returns 0x300 if the transaction is SSLv3. Returns 0x301 if the transaction is TLSv1.

`Returns:` num_at

SSL_RES_PROTOCOL_T

SSL Protocol

This topic lists the expressions that are provided by this class.

- `SESSIONID`

  Returns the Session ID/Client ID of the Server SSL transaction. In case of non-SSL transaction or error, raises undef.

`Returns:` text_t

- `CLIENT_HELLO`

  Returns the Server SSL Client Hello fields for the Server SSL transaction, from which the SNI can be accessed. In the case of non-SSL transaction or error, raises undef.

`Returns:` server_ssl_client_hello_t

SSL_TEXT_T

The client.ssl.client_hello.sni object represents sni. This object is of type text_t.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t sni_text_at

- `TYPECAST_TEXT_T`

  Convert ssl_text_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed)`:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed)`:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed)`:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"
```

```
    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data

from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of

SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/

IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/ Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ> <InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/ tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/ 5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </ RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/ mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/ AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/

7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` ssl_text_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character

using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` ssl_text_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*SNI_CERT`

Operate as SNI on the Ssl Text component. Returns the SSL certificate based on the text provided.

`Returns:` x509_certificate_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a

number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL

and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests:
  DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses:
  DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example:

HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

STACK_OF_EXTENSION_T

STACK_OF(X509_EXTENSION) Extensions in the certificate

This topic lists the expressions that are provided by this class.

- `object` (String s)

  If object is present in the extensions of the certificate, returns value for the object else returns NULL. The argument specifies the oid or short-name for the object of an extension. If the extension having an object with the matching oid or short name is present in the extensions of the client certificate, returns the value for the object, else returns NULL.

`Parameters:`

```
s- The argument specifies the oid or short-name for the object of an
extension.
```

`Returns:` asn1_octet_string_t

- `count`

  Returns the number of extensions present in the certificate.

`Returns:` num_at

- `has_object` (String s)

  If object is present in the extensions of the certificate, returns true else returns false. The argument specifies the oid or short-name for the object of an extension. If the extension having an object with the matching oid or short name is present in the extensions of the client certificate, returns true, else false.

`Parameters:`

```
s- The argument specifies the oid or short-name for the object of an
extension.
```

`Returns:` bool_at

SSLVPN_MODE_E

This object represents one of the SSLVPN Modes.

Enumerations

SECURE_CLIENT_MODE

CLIENTLESS_TRANSPARENT_MODE

CLIENTLESS_OPAQUE_MODE

CLIENTLESS_ENC_MODE

ICA_PROXY_MODE

UNDEFINED_MODE

This topic lists the expressions that are provided by this class.

`EQ` (sslvpn_mode_e m)

The result is Boolean TRUE if the input argument is equal to the SSLVPN Mode enum represented by this object.This is not used currently since there is no way of passing an enum object from PI expression for comparision.

`Parameters` (expressions not allowed) `:`

m- SSLVPN mode enum

`Returns:` bool_at

SSLVPN_MODE_T

This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t sslvpn_mode_e

- `TYPECAST_TEXT_T`

  Convert sslvpn_mode_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings

longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (sslvpn_mode_e m)

The result is Boolean TRUE if the input argument is equal to the SSLVPN Mode enum represented by this object.This is not used currently since there is no way of passing an enum object from PI expression for comparision.

`Parameters` (expressions not allowed) `:`

m- SSLVPN mode enum

`Returns:` bool_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"
```

```
    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XXDP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ> <InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AUnw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` sslvpn_mode_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\ \72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text

"http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\ \b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` sslvpn_mode_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has

same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code

258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the

beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the

current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses,

A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL

and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example:

HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

SSLVPN_REQ_PROTOCOL_T

SSLVPN Protocol

This topic lists the expressions that are provided by this class.

- `IS_SSLVPN`

  Returns TRUE if the current connection is SSLVPN-based.

`Returns:` bool_at

- `MODE`

  Returns sslvpn mode + URL Encoding Valid values are : "SECURE_ACCESS_CLIENT" -> Mode = Vpn Client "CVPN_OPAQUE" -> Mode = ClientlessVPN Url Encoding = Opaque "CVPN_ENCRYPT" -> Mode = ClientlessVPN Url Encoding = Encrypt "CVPN_TRANSPARENT" -> Mode = ClientlessVPN Url Encoding = Transparent "ICAPROXY" -> Mode = ICA

`Returns:` sslvpn_mode_t

STREAM_ACTION_E

This object provides stream analytics action types.

Enumerations

DROP

RESET

STREAM_MODE_E

This object provides stream analytics check limit modes.

Enumerations

BANDWIDTH

REQUEST_RATE

RESPONSE_TIME

CONNECTIONS

STREAM_T

Stream

This topic lists the expressions that are provided by this class.

- `BANDWIDTH`

  Returns the bandwidth on an object.

`Returns:` unsigned_long_at

`CHECK_BREACH_THRESHOLD` (stream_transaction_track_mode_e mode)

Returns true if an object corresponding to the stream identifier has hit maximum breaching transactions threshold. Transaction Tracking needs to be enabled in stream identifier configuration to use this expression. Transaction Tracking mode: RESPONSE TIME in milli seconds. `add stream identifier sid -interval 5 -tracktransactions RESPTIME -maxTransactionThreshold 100 -BreachThreshold 10 Expression: ANALYTIC.STREAM("sid").CHECK_BREACH_THRESHOLD(RESPONSE_TIME)`

`Parameters` (expressions not allowed) `:`

mode- CHECK BREACH mode

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, ip_address_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(BANDWIDTH, 100000)` Note: maxthreshold should always be greater than 0.

`Parameters` (expressions not allowed) `:`

mode- Check Limit mode

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, num_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(BANDWIDTH, 100000)` Note: maxthreshold should always be greater than 0.

`Parameters` (expressions not allowed) `:`

mode- Check Limit mode

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_local_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(BANDWIDTH, 100000)` Note: maxthreshold should always be greater than 0.

`Parameters` (expressions not allowed) `:`

mode- Check Limit mode

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(BANDWIDTH, 100000)` Note: maxthreshold should always be greater than 0.

`Parameters` (expressions not allowed) `:`

mode- Check Limit mode

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, unsigned_long_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5` `Expression: ANALYTIC.STREAM("sid").check_limit(BANDWIDTH, 100000)` Note: maxthreshold should always be greater than 0.

`Parameters` (expressions not allowed) `:`

mode- Check Limit mode

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, ip_address_at minthreshold, ip_address_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5` `Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example:` `ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, ip_address_at minthreshold, num_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, ip_address_at minthreshold, time_local_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, ip_address_at minthreshold, time_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, ip_address_at minthreshold, unsigned_long_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, num_at minthreshold, ip_address_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, num_at minthreshold, num_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, num_at minthreshold, time_local_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, num_at minthreshold, time_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, num_at minthreshold, unsigned_long_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_local_at minthreshold, ip_address_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_local_at minthreshold, num_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_local_at minthreshold, time_local_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_local_at minthreshold, time_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_local_at minthreshold, unsigned_long_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_at minthreshold, ip_address_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_at minthreshold, num_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_at minthreshold, time_local_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_at minthreshold, time_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, time_at minthreshold, unsigned_long_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, unsigned_long_at minthreshold, ip_address_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, unsigned_long_at minthreshold, num_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, unsigned_long_at minthreshold, time_local_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, unsigned_long_at minthreshold, time_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

`CHECK_LIMIT` (stream_mode_e mode, unsigned_long_at minthreshold, unsigned_long_at maxthreshold)

Returns true if an object corresponding to the stream identifier has hit the limit parameter. mode: BANDWIDTH in kbps, RESPONSE TIME in milli seconds, REQUEST RATE in Requests/second, CONNECTIONS i.e. Total Active Connections. `add stream identifier sid -interval 5 Expression: ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 1000)` Note: maxthreshold and minthreshold cannot be negative. maxthreshold cannot be less than minthreshold. Note: If maxthreshold is 0, then max threshold is not applied. minthreshold and maxthreshold cannot both be zero. `Example:`

`ANALYTIC.STREAM("sid").check_limit(REQUEST_RATE, 10, 0)` Above expression returns true only if Request Rate is less than 10 requests per second. There is no upper limit here.

`Parameters` (expressions not allowed) `:`

mode- Check Limit Mode

minthreshold- Check Limit min threshold

maxthreshold- Check Limit maximum threshold

`Returns:` bool_at

- `COLLECT_STATS`

  Returns true if statistics collection on an object was successful.

`Returns:` bool_at

`COLLECT_STATS` (`uint` amplification_factor)

Returns true if statistics collection on an object was successful.

`Parameters` (expressions not allowed) `:`

amplification_factor- Amplification factor

`Returns:` bool_at

`COLLECT_STATS` (text_t mode, `uint` max_threshold, stream_action_e action)

Returns true if statistics collection on an object was successful. This expression is used to rate limit connections per packet level. When an object/connection corresponding to the stream identifier has received more than configured percentage (max_threshold) of bad packets, configured action is triggered. `add stream identifier packetcreditrateidentifier packetcreditrateselector -interval 1 add responder policy packetcreditratesessionpolicy "ANALYTICS.STREAM(\"packetcreditrateidentifier\").COLLECT_STATS(\"PACKET_CREDITS\", 75, RESET)" NOOP` Valid mode: PACKET_CREDITS Valid action: RESET/DROP Valid max_threshold: 0-100

`Parameters` (expressions not allowed) `:`

mode- stream mode

max_threshold- maximum threshold percentage of bad packets.

action- Action

`Returns:` bool_at

`COLLECT_STATS` (text_t mode, `uint` max_threshold, stream_action_e action, `uint` type)

Returns true if statistics collection on an object was successful. This expression is used to rate limit packets per second. When an object/connection corresponding to the stream identifier has received more than configured (max_threshold) number of packets, configured action is triggered. `add stream identifier packetrateidentifier packetrateselector -interval 1 add responder policy packetratesessionpolicy "ANALYTICS.STREAM(\"packetrateidentifier\").COLLECT_STATS(\"PACKET_LIMIT\", 5000, RESET, 1)" NOOP` Valid mode: PACKET_LIMIT Valid action: RESET/DROP Valid max_threshold: strictly greater than zero. Valid type: 0/1 0 for bursty 1 for smooth

`Parameters` (expressions not allowed) `:`

mode- stream mode

max_threshold- maximum threshold of packets per second.

action- Action

type- rate limiting type like smooth/bursty.

`Returns:` bool_at

- `CONNECTIONS`

  Returns the number of connections on an object.

`Returns:` unsigned_long_at

`IS_TOP_FREQUENTS` (`uint` n)

Returns true if a given object is in the top n of a identifier.

`Parameters` (expressions not allowed) `:`

n- Given object must be in the top n frequents of the collected objects.

`Returns:` bool_at

`IS_TOP` (`uint` n)

Returns true if a given object is in the top n of a identifier.

`Parameters` (expressions not allowed) `:`

n- Given object must be in the top n of the collected objects.

`Returns:` bool_at

- `REQUESTS`

  Returns the number of requests on an object.

`Returns:` unsigned_long_at

- `RESPTIME`

  Returns the average response time of an object.

`Returns:` unsigned_long_at

STREAM_TRANSACTION_TRACK_MODE_E

This object provides stream analytics transaction tracking modes.

Enumerations

RESPONSE_TIME

SUBSCRIBER_T

Retrieves AVPs and other subscriber attributes from a subscriber session.

This topic lists the expressions that are provided by this class.

`AVP` (`uint` avpcode)

Returns the AVP with the given AVP code from the subscriber session.

`Parameters` (expressions not allowed) `:`

avpcode- AVP code

`Returns:` avp_t

`AVP` (`uint` avpcode, `uint` vendorid)

Returns the AVP with the given code and within given Vendor ID namespace from this subscriber session.

`Parameters` (expressions not allowed) `:`

avpcode- AVP code

vendorid- Vendor ID

`Returns:` avp_t

`RULE_ACTIVE` (text_t rulename)

Returns true if given rulename is active for this subscriber session.

- Expression RULE_ACTIVE searches the current policies of subscriber and returns TRUE if it is present, otherwise returns FALSE.

`Parameters` (expressions not allowed) `:`

rulename- Polname

`Returns:` bool_at

- `SERVICEPATH`

  Returns the SERVICEPATH name as a string.

- Expression SERVICEPATH fetches the value in servicepathAVP for dynamic subscribers, or configured servicepath for static subscribers.
- It returns NULL if servicepathAVP is not present or servicepath is not configured.

`Returns:` servicepath_t

SYS_T

Designates an expression that refers to the ApplicationSwitch, rather than the client or server.

This topic lists the expressions that are provided by this class.

`CHECK_LIMIT` (text_t identifier_name)

Used for rate limiting. Returns a boolean Result.

`Parameters` (expressions not allowed) `:`

identifier_name- Identifier Name

`Returns:` bool_at

`CI_CALLOUT` (`ci_callout_bool` cic)

Make a Content Inspection callout. Returns a boolean result.

`Parameters` (expressions not allowed) `:`

cic- Name of Content Inspection callout that returns boolean result.

`Returns:` bool_at

`CI_CALLOUT` (`ci_callout_num` cic)

Make a Content Inspection callout. Returns a number result.

`Parameters` (expressions not allowed) `:`

cic- Name of Content Inspection callout that returns number result.

`Returns:` num_at

`CI_CALLOUT` (`ci_callout_text` cic)

Make a Content Inspection callout. Returns a text result.

`Parameters` (expressions not allowed) `:`

cic- Name of Content Inspection callout that returns text result.

`Returns:` text_t

`CLIENT_EXPR` (text_t s)

Evaluates a client expression. Returns a boolean result. Examples:

CLIENT_EXPR("client.av(Norton).exists") add some more examples

`Parameters` (expressions not allowed) `:`

s- Client Expression

`Returns:` bool_at

- `ERROR`

  Returns the error encountered when performing the last operation.

`Returns:` error_t

`HTTP_CALLOUT` (`http_callout_bool` hc)

Make a http callout. Returns a boolean result.

`Parameters` (expressions not allowed) `:`

hc- Name of Http callout that returns boolean result.

`Returns:` bool_at

`HTTP_CALLOUT` (`http_callout_num` hc)

Make a http callout. Returns a number result.

`Parameters` (expressions not allowed) `:`

hc- Name of Http callout that returns number result.

`Returns:` num_at

`HTTP_CALLOUT` (`http_callout_text` hc)

Make a http callout. Returns a text result.

`Parameters` (expressions not allowed) `:`

hc- Name of Http callout that returns text as result.

`Returns:` text_t

- `NANO_TIME`

  Returns the current system time as the number of nanoseconds since "GMT Jan 1 1970 0h 0m 0.000000000s". Accuracy may be at larger granularity than nanosecond resolution.

`Returns:` unsigned_long_at

`NON_BLOCKING_HTTP_CALLOUT` (`http_callout_bool` hc)

Make a non blocking http callout. Returns a boolean result 'true'.

`Parameters` (expressions not allowed) `:`

hc- Name of Http callout that returns boolean result that is ignored.

`Returns:` bool_at

`NON_BLOCKING_HTTP_CALLOUT` (`http_callout_num` hc)

Make a non blocking http callout. Returns a number that is '0'.

`Parameters` (expressions not allowed) `:`

hc- Name of Http callout that returns number which is ignored.

`Returns:` num_at

`NON_BLOCKING_HTTP_CALLOUT` (`http_callout_text` hc)

Make a non blocking http callout. Returns a text that is of zero length.

`Parameters` (expressions not allowed) `:`

hc- Name of Http callout that returns text as result which is ignored.

`Returns:` text_t

- `NSIP`

  Returns the netscaler's IPV4 address.

`Returns:` ip_address_at

- `RANDOM`

  Returns a random number between 0 and 1, inclusive of 0 but exclusive of 1

`Returns:` double_at

`SERVICEGROUP` (text_t servicegroup_name)

Used for Servicegroup expressions.These expression raises an undef if servicegroup with the given name doesn't exist.

`Parameters` (expressions not allowed) `:`

servicegroup_name- ServiceGroup Name

`Returns:` servicegroup_t

`SERVICE` (text_t service_name)

Used for Service expressions.These expression raises an undef if service with the given name doesn't exist.

`Parameters` (expressions not allowed) `:`

service_name- Service Name

`Returns:` service_t

- `TIME`

  Returns the current system time as the number of seconds since "GMT Jan 1 1970 0h 0m 0s". NOTE: It is not possible to set the system time to date and time before 1970.

`Returns:` time_at

- `UUID`

  Returns a newly generated UUID.

`Returns:` text_t

`VSERVER` (text_t vserver_name)

Used for vserver expressions.These expressions raise undef if virtual server with name doesn't exist.

`Parameters` (expressions not allowed) `:`

vserver_name- Virtual Server

`Returns:` vserver_t

`VSERVER_COUNT` (vserver_type_e vserver_type)

Returns the count of virtual servers configured of the specified type. In case of partition context, it returns the count of virtual servers in that partition.

`Parameters` (expressions not allowed) `:`

```
vserver_type- vserver type
```

`Returns:` num_at

`ACTION_COUNT` (action_type_e action_type)

Returns the count of actions configured of the specified type. In case of partition context, it returns the count of actions in that partition.

`Parameters` (expressions not allowed) `:`

```
action_type- action type
```

`Returns:` num_at

TCP_OPTIONS_T

TCP Protocol Options

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t

- `COUNT`

  Returns the value of number of tcp options present.

`Returns:` num_at

`*TYPECAST_TEXT_T`

Convert tcp_options_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*TYPE_NAME` (tcp_options_type_name_e m)

Returns the value of tcp option as sequence of bytes whose type is specified as an argument.

`Parameters` (expressions not allowed) `:`

m- TCP Option Type Name

`Returns:` tcp_options_type_t

`*TYPE` (`uint` type)

Returns the value of tcp option as sequence of bytes whose type is specified as an argument.

`Parameters` (expressions not allowed) `:`

type- Type value

`Returns:` tcp_options_type_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many

other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"
```

```
    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ>
<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)

- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you

wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` tcp_options_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text

"http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\ \72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\ \b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` tcp_options_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).

- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a

HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX,

DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."
```

```
    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

TCP_OPTIONS_TYPE_NAME_E

This object represents one of the TCP Options Type Name.

Enumerations

REPEATER

TIMESTAMP

SACK_PERMITTED

WINDOW

MAXSEG

TCP_OPTIONS_TYPE_T

TCP Protocol Options Type

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t

- `EXISTS`

  Returns TRUE if an instance of the current tcp option type exists.

`Returns:` bool_at

`*OPTION_LENGTH`

Returns length of the current tcp option type in bytes This is the total length of the TCP option that got inserted in the TCP header and is not same as the string length of the option value

`Returns:` num_at

`*TYPECAST_TEXT_T`

Convert tcp_options_type_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED,

NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"
```

```
    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".

- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'

- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +
```

```
"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ>
<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` tcp_options_type_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\

\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\ \b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` tcp_options_type_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing

the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be

the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the

value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining

characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests:
  DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses:
  DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

TCP_REPEATER_OPTION_T

TCP Protocol Option : Repeater

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t

- `EXISTS`

  Returns TRUE if Repeater option type exists.

`Returns:` bool_at

`*IP`

Returns IPV4 address present in the Repeater option.

`Returns:` ip_address_at

`*MAC`

Returns MAC address present in the Repeater option.

`Returns:` mac_address_at

`*OPTION_LENGTH`

Returns length of the Repeater option in bytes This is the total length of the TCP option that got inserted in the TCP header and is not same as the string length of the option value

`Returns:` num_at

`*TYPECAST_TEXT_T`

Convert tcp_repeater_option_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many

other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"
```

```
    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ>
<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)

- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you

wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` tcp_repeater_option_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text

"http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\ \72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\ \b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` tcp_repeater_option_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).

- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a

HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX,

DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."
```

```
    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

TCP_REQ_PROTOCOL_T

TCP Protocol Request

This topic lists the expressions that are provided by this class.

- `BANDWIDTH`

  Returns the bandwidth of the TCP connection.

`Returns:` num_at

- `CS_VSERVER`

  Returns the CS vserver serving the current request.

`Returns:` vserver_t

- `DSTPORT`

  Returns the ID of the current packet's destination port as a number.

`Returns:` num_at

- `LB_VSERVER`

  Returns the LB vserver serving the current request.

`Returns:` vserver_t

- `MSS`

  Returns the maximum segment size (MSS) for the current connection as a number.

`Returns:` num_at

- `OPTIONS`

  Returns the tcp options.

`Returns:` tcp_options_t

`PAYLOAD` (`uint` i)

Returns the specified portion of the TCP payload data as a string, beginning with the first character and continuing for the number of characters designated in uint.

`Parameters``:`

i- Body length

`Returns:` text_t

- `REPEATER_OPTION`

  Returns the branch repeater tcp option.

`Returns:` tcp_repeater_option_t

- `SMOOTHRTT`

  Returns the smoothed round trip time of the TCP connection.

`Returns:` num_at

- `SRCPORT`

  Returns the ID of the current packet's source port as a number.

`Returns:` num_at

TCP_RES_PROTOCOL_T

TCP Protocol Response

This topic lists the expressions that are provided by this class.

- `BANDWIDTH`

  Returns the bandwidth of the TCP connection.

`Returns:` num_at

- `DSTPORT`

  Returns the ID of the current packet's destination port as a number.

`Returns:` num_at

- `MSS`

  Returns the maximum segment size (MSS) for the current connection as a number. Note: The MSS on the server side connection is derived using internal NetScaler logic. Typically users cannot attribute any meaning to the MSS value on the server connection and should not use this expression in policies.

`Returns:` num_at

- `OPTIONS`

  Returns the tcp options.

`Returns:` tcp_options_t

`PAYLOAD` (`uint` i)

Returns the specified portion of the TCP payload data as a string, beginning with the first character and continuing for the number of characters designated in uint.

`Parameters``:`

i- Body length

`Returns:` text_t

- `SMOOTHRTT`

  Returns the smoothed round trip time of the TCP connection.

`Returns:` num_at

- `SRCPORT`

  Returns the ID of the current packet's source port as a number.

`Returns:` num_at

TCP_STATE_E

TCP states

Enumerations

CLOSED

CLOSING

CLOSE_WAIT

ESTABLISHED

FIN_WAIT_1

FIN_WAIT_2

LAST_ACK

LISTEN

SYN_RECEIVED

SYN_SENT

TIME_WAIT

NOT_APPLICABLE

This topic lists the expressions that are provided by this class.

`EQ` (tcp_state_e state)

Returns Boolean True if the TCP state matches the argument. Example: CONNECTION.TCPSTATE.EQ(ESTABLISHED)

`Parameters` (expressions not allowed) `:`

state- TCP State

`Returns:` bool_at

`NE` (tcp_state_e state)

Returns Boolean True if the TCP state do not matches the argument. Example: CONNECTION.TCPSTATE.NE(ESTABLISHED)

`Parameters` (expressions not allowed) `:`

state- TCP State

`Returns:` bool_at

TEXT_T

Designates any piece of text.

This topic lists the expressions that are provided by this class.

`AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`APPEND` (ip_address_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`APPEND` (time_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`APPEND` (unsigned_long_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

- `B64DECODE`

  Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

- `B64ENCODE`

  Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

- `BLOB_TO_HEX`

  Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

- `CRC32`

  Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

- `DECODE_USING_TEXT_MODE`

  Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

- `DECRYPT`

  Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

- `ENCRYPT`

  Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

- `GRPC`

  Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

- `HASH`

  Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

- `HTML_XML_SAFE`

  Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

- `HTTP_HEADER_SAFE`

  Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

- `HTTP_URL_SAFE`

  Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"
```

```
Open and close parentheses: "(", ")"

Semi-colon: ";"

Colon: ":"

At symbol: "@"

Question mark: "?"

Equals: "="

Dollar: "$"

Percent: "%"

Ampersand: "&"

Plus: "+"

Comma: ","

Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

- `IS_BOOL_AT`

  Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

- `IS_DOUBLE_AT`

  Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

- `IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

- `IS_IPV6_SUBNET_AT`

  Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

- `IS_IP_AT`

  Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

- `IS_MAC_ADDRESS_AT`

  Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

- `IS_NUM_AT`

  Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".

- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

- `IS_TIME_AT`

  Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

- `IS_UNSIGNED_LONG_AT`

  Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'

- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

- `LENGTH`

  Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

- `LOCATION_LONG`

  Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

- `MARK_SAFE`

  Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

- `NORMALIZE_URL`

  Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +
```

```
"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ> <InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74A
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` text_t

`SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\

\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\ \b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` text_t

`SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

- `STRIP_END_WS`

  Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

- `STRIP_START_WS`

  Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

- `TO_LOWER`

  Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

- `TO_UPPER`

  Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

- `TYPECAST_AVP_T`

  Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

- `TYPECAST_AVP_UNUM_T`

  Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

- `TYPECAST_BOOL_AT`

  Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

- `TYPECAST_COOKIE_T`

  Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

- `TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

- `TYPECAST_DNS_DOMAINNAME_T`

  Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

- `TYPECAST_DNS_FLAG_T`

  Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

- `TYPECAST_DOUBLE_AT`

  Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

- `TYPECAST_HTTP_CACHE_CONTROL_T`

  Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

- `TYPECAST_HTTP_CONTENT_LENGTH_T`

  Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as

a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

- `TYPECAST_HTTP_COOKIE_T`

  Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

- `TYPECAST_HTTP_DATE_T`

  Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

- `TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

- `TYPECAST_HTTP_METHOD_T`

  Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

- `TYPECAST_HTTP_SET_COOKIE_T`

  Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

- `TYPECAST_HTTP_URL_T`

  Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

- `TYPECAST_HTTP_VERSION_T`

  Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

- `TYPECAST_IPV6_ADDRESS_AT`

  Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

- `TYPECAST_IPV6_ADDRESS_T`

  Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

- `TYPECAST_IPV6_SUBNET_AT`

  Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

- `TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

- `TYPECAST_IP_ADDRESS_AT`

  Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

- `TYPECAST_IP_ADDRESS_T`

  Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

- `TYPECAST_IP_OPTIONS_T`

  Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

- `TYPECAST_IP_OPTIONS_TYPE_T`

  Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

- `TYPECAST_IP_TOS_T`

  Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

- `TYPECAST_MAC_ADDRESS_AT`

  Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

- `TYPECAST_MAC_ADDRESS_T`

  Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

- `TYPECAST_NUM_AT`

  Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

- `TYPECAST_PROTOCOL_BUFFER_T`

  Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

- `TYPECAST_RADIUS_AVP_T`

  Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

- `TYPECAST_RADIUS_AVP_VALUE_T`

  Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

- `TYPECAST_SEQ_TEXT_T`

  Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

- `TYPECAST_SERVICEPATH_T`

  Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

- `TYPECAST_SIP_CALLID_HEADER_T`

  Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

- `TYPECAST_SIP_CONTENT_LENGTH_T`

  Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

- `TYPECAST_SIP_FROM_HEADER_T`

  Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

- `TYPECAST_SIP_HOSTNAME_T`

  Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

- `TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

- `TYPECAST_SIP_TO_HEADER_T`

  Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

- `TYPECAST_SIP_URL_T`

  Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

- `TYPECAST_SIP_VERSION_T`

  Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

- `TYPECAST_SIP_VIA_HEADER_T`

  Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

- `TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

- `TYPECAST_TCP_OPTIONS_T`

  Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

- `TYPECAST_TCP_OPTIONS_TYPE_T`

  Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

- `TYPECAST_TCP_REPEATER_OPTION_T`

  Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

- `TYPECAST_TIME_AT`

  Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

- `TYPECAST_TIME_LOCAL_AT`

  Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

- `TYPECAST_TIME_T`

  Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

- `TYPECAST_UNSIGNED_LONG_AT`

  Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL

and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

- `TYPECAST_UNUM_TEXT_T`

  Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

- `TYPECAST_URL_CATEGORY_T`

  Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

- `TYPECAST_VENDOR_SPEC_APPID_AVP_T`

  Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests:
  DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

- For responses:
  DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

- `TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

  Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

- `URL_RESERVED_CHARS_SAFE`

  Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

  ```
  Based on RFC3986, following are considered URL unreserved characters:

      Alpha-numeric characters: a-z, A-Z, 0-9

      Hyphen and underscore: "-", "_"

      Dot: "."

      Tilde: "~"
  ```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

```

- `JSON_SAFE`

  Escapes double quotes (`"`), backslashes (`\`), and control characters (U+0000 through U+001F) using standard JSON escape sequences (for example, `\"`, `\\`, `\n`, `\t`, `\u00XX`). Other characters in the input are not modified. This transform ensures the text can be safely embedded as a JSON string value.

- `KEEP_CHARS` (String s)

Strips every character from the input except those named in the argument. For example: Say the selected text is "foo.xaz=bar". Then on executing KEEP_CHARS('oa') the selected text will become ooaa. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

```
s- String
```

- `REGEX_COUNT` (RE regex)

  Returns the number of regular expression matches on the input text. This method is affected by whether the text mode is case sensitive or insensitive.

```
regex- Regular Expression
```

THIS_T

This is a special marker class.If the return type of a method is this_t then the current context's type does not change.

TIME_AT

Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from num_at

`APPEND` (text_t str)

Appends the given string to the string representation of the current time value.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*BETWEEN` (time_at time1, time_at time2)

Results in a Boolean TRUE value if the time value is between the Lower and the Upper time arguments. Both the Lower and the Upper time arguments must be fully specified.

For example - GMT 1995 Jan is fully specified. But GMT Jan or GMT 1995 20 or GMT Jan Mon_2 are not fully specified. The Upper and Lower arguments must be both GMT or both Local. The day of the week must not be present in either the Lower or the Upper argument. It is OK to specify the day of the month as the 1st, 2nd, 3rd or 4th weekday of the month (example Wed_3 is the 3rd Wednesday of the month). The Upper Time argument must be bigger than the Lower Time argument.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005. BETWEEN(GMT 2004, GMT 2006): TRUE BETWEEN(GMT 2004 Jan, GMT 2006 Nov): TRUE BETWEEN(GMT 2004 Jan, GMT 2006): TRUE BETWEEN(GMT 2005 May Sun_1, GMT 2005 May Sun_3): TRUE BETWEEN(GMT 2005 May 1, GMT May 2005 1): TRUE BETWEEN(LOCAL 2005 May 1, LOCAL May 2005 1): Answer depends on the NetScaler system's timezone.

`Parameters` (expressions not allowed) `:`

time1- Lower Time

time2- Upper Time

`Returns:` bool_at

`*BETWEEN` (time_at time1, time_at time2)

Returns Boolean TRUE if the time value is greater than or equal to the Lower argument and the time value is lesser than or equal to the Upper argument.

`Parameters``:`

time1- Lower GMT Time Value

time2- Upper GMT Time Value

`Returns:` bool_at

`*DAY`

Extracts the day of the month from the current system time, and returns that value as a number from 1 through 31 representing that day.

`Returns:` num_at

`*EQ` (time_at t)

Results in Boolean TRUE value if the time value is equal to the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

EQ(GMT 2005): TRUE EQ(GMT 2005 Dec): FALSE EQ(Local 2005 May): TRUE or FALSE depending on the current timezone. EQ(GMT 10h): TRUE EQ(GMT 10h 30s): TRUE EQ(GMT May 10h): TRUE EQ(GMT Sun): TRUE EQ(GMT May Sun_1): TRUE

`Parameters` (expressions not allowed)`:`

t- Time

`Returns:` bool_at

`*EQ` (time_at t)

Results in Boolean TRUE value if the time value is equal to the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*GE` (time_at t)

Results in Boolean TRUE value if the time value is greater than or equal to the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

GE(GMT 2004): TRUE GE(GMT 2005 Jan): TRUE GE(Local 2005 May): TRUE or FALSE depending on the current timezone. GE(GMT 8h): TRUE GE(GMT 30m): FALSE GE(GMT May 10h): TRUE GE(GMT May 10h 0m): TRUE GE(GMT Sun): TRUE GE(GMT May Sun_1): TRUE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*GE` (time_at t)

Results in Boolean TRUE value if the time value is greater than or equal to the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*GT` (time_at t)

Results in Boolean TRUE value if the time value is greater than the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

GT(GMT 2004): TRUE GT(GMT 2005 Jan): TRUE GT(Local 2005 May): TRUE or FALSE depending on the current timezone. GT(GMT 8h): TRUE GT(GMT 30m): FALSE GT(GMT May 10h): FALSE GT(GMT May 10h 0m): TRUE GT(GMT Sun): FALSE GT(GMT May Sun_1): FALSE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*GT` (time_at t)

Results in Boolean TRUE value if the time value is greater than the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*HOURS`

Extracts the hour from the current system time, and returns that value as an integer from 0 to 23.

`Returns:` num_at

`*LE` (time_at t)

Results in Boolean TRUE value if the time value is lesser than or equal to the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

LE(GMT 2006): TRUE LE(GMT 2005 Dec): TRUE LE(Local 2005 May): TRUE or FALSE depending on the current timezone. LE(GMT 8h): FALSE LE(GMT 30m): TRUE LE(GMT May 10h): TRUE LE(GMT Jun 11h): TRUE LE(GMT Wed): TRUE LE(GMT May Sun_1): TRUE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*LE` (time_at t)

Results in Boolean TRUE value if the time value is less than or equal to the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*LT` (time_at t)

Results in Boolean TRUE value if the time value is lesser than the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

LT(GMT 2006): TRUE LT(GMT 2005 Dec): TRUE LT(Local 2005 May): TRUE or FALSE depending on the current timezone. LT(GMT 8h): FALSE LT(GMT 30m): TRUE LT(GMT May 10h): FALSE LT(GMT Jun 11h): TRUE LT(GMT Wed): TRUE LT(GMT May Sun_1): FALSE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*LT` (time_at t)

Results in Boolean TRUE value if the time value is less than the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*MINUTES`

Extracts the minute from the current system time, and returns that value as an integer from 0 to 59.

`Returns:` num_at

`*MONTH`

Extracts the month from the current system time, and returns that value as an integer from 1 (January) to 12 (December).

`Returns:` num_at

`*NE` (time_at t)

Results in Boolean TRUE value if the time value is not equal to the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

NE(GMT 2005): FALSE NE(GMT 2005 Dec): TRUE NE(Local 2005 May): TRUE or FALSE depending on the current timezone. NE(GMT 10h): FALSE NE(GMT 10h 30s): FALSE NE(GMT May 10h): FALSE NE(GMT Sun): FALSE NE(GMT May Sun_1): FALSE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*NE` (time_at t)

Results in Boolean TRUE value if the time value is not equal to the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*RELATIVE_BOOT`

Calculates the number of seconds to the closest previous or scheduled reboot, and returns an integer. If the closest boot time is in the past, the integer is negative; if it is in the future, the integer is positive.

`Returns:` num_at

`*RELATIVE_NOW`

Calculates the number of seconds between the current system time and the specified time, and returns an integer showing that number. If the designated time is in the past, the integer is negative; if it is in the future, the integer is positive.

`Returns:` num_at

`*SECONDS`

Extracts the seconds from the current system time, and returns that value as an integer from 0 to 59.

`Returns:` num_at

`*TO_LOCAL`

Convert the time to the local time zone

`Returns:` time_local_at

`*TYPECAST_NUM_AT`

Convert time_at to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_TEXT_T`

Typecast the Time Value to its string representation.

`Returns:` text_t

`*WEEKDAY`

Results in a Number Value between 0 (Sunday) and 6 (Saturday) which gives the week day in the time value.

`Returns:` num_at

`*WITHIN` (time_at time1, time_at time2)

Results in a Boolean TRUE value if the time value lies within all the ranges defined by the Lower and Upper time arguments.

If an element of time like day or hour is left unspecified in the Lower argument then it is assumed to have the lowest value of its range. If an element is left unspecified in the Upper argument then it is assumed to have the highest value of its range. If the year is specified in one of the argument then it must be specified in the other argument as well. The ranges for different elements of time are month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. Each element of time defines a range. For the result to be TRUE each element of time in the time value must lie in the corresponding range present in the Lower and Upper arguments.

Assume the time value is GMT 2005 May 10 10h 15m 30s. This is the second Tuesday of the month. WITHIN(GMT 2004, GMT 2006): TRUE WITHIN(GMT 2004 Jan, GMT 2006 Mar): FALSE (May doesn't fall in the Jan-Mar range.) WITHIN(GMT Feb, GMT): TRUE (May falls in the Feb-Dec

range.) WITHIN(GMT Sun_1, GMT Sun_3): TRUE (2nd Tuesday lies within 1st Sunday and the 3rd Sunday.) WITHIN(GMT 2005 May 1 10h, GMT May 2005 1 17h): TRUE WITHIN(LOCAL 2005 May 1, LOCAL May 2005 1): Answer depends on the NetScaler system's timezone.

`Parameters` (expressions not allowed) `:`

time1- Lower Time

time2- Upper Time

`Returns:` bool_at

`*YEAR`

Extracts the year from the current system time, and returns that value as a four-digit integer.

`Returns:` num_at

`*ABS`

Return the absolute value of the number.

`Returns:` num_at

`*ADD` (double_at i)

Return the Double Value after adding the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*ADD` (ip_address_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (unsigned_long_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (num_at i)

Return the Number Value after adding the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*ADD` (time_local_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (time_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*AS_MICROSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.ffffff GMT ffffff represents microseconds Examples:

Mon, 05 Mar 2018 10:23:36.568419 GMT

`Returns:` text_t

`*AS_MILLISEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fff GMT fff represents milliseconds Examples:

Mon, 05 Mar 2018 10:23:36.568 GMT

`Returns:` text_t

`*AS_NANOSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fffffffff GMT fffffffff represents nanoseconds Accuracy may be at larger granularity than nanosecond resolution. Examples:

Mon, 05 Mar 2018 10:23:36.568419567 GMT

`Returns:` text_t

`*BETWEEN` (double_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, ip_address_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, unsigned_long_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, num_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_local_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, num_at j)

Returns Boolean TRUE if the number value is greater than or equal to the Lower argument and the number value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BITAND` (ip_address_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (num_at i)

Return the Number Value after bitwise ANDing the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*BITAND` (time_local_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (time_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITNEG`

Return the Number Value after bitwise negating the current number value.

`Returns:` num_at

`*BITOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (num_at i)

Return the Number Value after bitwise ORing the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*BITOR` (time_local_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (time_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (num_at i)

Return the Number Value after bitwise XORing the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*BITXOR` (time_local_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (time_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (double_at i)

Return the Double Value after dividing the current double value by the argument.

`Parameters``:`

i- Double

`Returns:` double_at

`*DIV` (ip_address_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (unsigned_long_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (num_at i)

Return the Number Value after dividing the current number value by the argument.

`Parameters``:`

i- Number

`Returns:` num_at

`*DIV` (time_local_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (time_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*EQ` (double_at i)

Returns Boolean TRUE if the double value is equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*EQ` (ip_address_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (num_at i)

Returns Boolean TRUE if the number value is equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*EQ` (time_local_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (double_at i)

Returns Boolean TRUE if the double value is greater than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (num_at i)

Returns Boolean TRUE if the number value is greater than or equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*GE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (double_at i)

Returns Boolean TRUE if the double value is greater than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (num_at i)

Returns Boolean TRUE if the number value is greater than the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*GT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (double_at i)

Returns Boolean TRUE if the double value is lesser than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (num_at i)

Returns Boolean TRUE if the number value is lesser than or equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*LE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LSHIFT` (`uint` i)

Return the Number Value after bitwise left shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 32. For example, let HTTP.REQ.URL.LENGTH be 4. Then, HTTP.REQ.URL.LENGTH.LSHIFT(1) = HTTP.REQ.URL.LENGTH.LSHIFT(33) = 8, since 33 on division by 32 yields a remainder of 1.

`Parameters``:`

i- Left Shift Length

`Returns:` num_at

`*LT` (double_at i)

Returns Boolean TRUE if the double value is lesser than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (num_at i)

Returns Boolean TRUE if the number value is lesser than the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*LT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*MAX` (double_at i)

Return the maximum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MAX` (ip_address_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (unsigned_long_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (num_at i)

Return the maximum value after comparing the argument with the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MAX` (time_local_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (double_at i)

Return the minimum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MIN` (ip_address_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (unsigned_long_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (num_at i)

Return the minimum value after comparing the argument with the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MIN` (time_local_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (ip_address_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (unsigned_long_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (num_at i)

Return the Number Value that is the renaminder after dividing the current number value by the argument.

`Parameters``:`

i- Number

`Returns:` num_at

`*MOD` (time_local_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (double_at i)

Return the Double Value after multiplying the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MUL` (ip_address_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (unsigned_long_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (num_at i)

Return the Number Value after multiplying the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MUL` (time_local_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*NEG`

Return the Number Value after negating the current number value.

`Returns:` num_at

`*NE` (double_at i)

Returns Boolean TRUE if the double value is not equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*NE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (num_at i)

Returns Boolean TRUE if the number value is not equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*NE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*RSHIFT` (`uint` i)

Return the Number Value after bitwise right shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 32. For example, let HTTP.REQ.URL.LENGTH be 4. Then, HTTP.REQ.URL.LENGTH.RSHIFT(1) = HTTP.REQ.URL.LENGTH.RSHIFT(33) = 2, since 33 on division by 32 yields a remainder of 1.

`Parameters``:`

i- Right Shift Length

`Returns:` num_at

`*SIGNED16_STRING` (endian_e endianness)

Create a signed 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*SIGNED32_STRING` (endian_e endianness)

Create a signed 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*SIGNED8_STRING`

Create a signed 8-bit binary string from the number.

`Returns:` text_t

`*SUB` (double_at i)

Return the Double Value after subtracting the argument from the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*SUB` (ip_address_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (unsigned_long_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (num_at i)

Return the Number Value after subtracting the argument from the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*SUB` (time_local_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*TYPECAST_DOUBLE_AT`

Typecast the Number Value to a Double value.

`Returns:` double_at

`*TYPECAST_IP_ADDRESS_AT`

Typecast the Number Value to an IP Address value.

`Returns:` ip_address_at

`*TYPECAST_TIME_AT`

Typecast the Number Value to a Time value.

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Typecast the Number Value to a local time value.

`Returns:` time_local_at

`*TYPECAST_UNSIGNED_LONG_AT`

Typecast the Number Value to a Unsigned Long value.

`Returns:` unsigned_long_at

`*UNSIGNED16_STRING` (endian_e endianness)

Create an unsigned 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED32_STRING` (endian_e endianness)

Create an unsigned 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED64_STRING` (endian_e endianness)

Create an unsigned 64-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED8_STRING`

Create an unsigned 8-bit binary string from the number.

`Returns:` text_t

`*WEEKDAY_STRING`

Given the numeric day of the week, e.g. SYS.TIME.WEEKDAY, return the long form of the string name for that day, e.g. 0 = "Sunday", 6 = "Saturday".

`Returns:` text_t

`*WEEKDAY_STRING_SHORT`

Given the numeric day of the week, e.g. SYS.TIME.WEEKDAY, return the short form of the string name for that day, e.g. 0 = "Sun", 6 = "Sat".

`Returns:` text_t

TIME_LOCAL_T

Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjusted for the local time zone.

This class extends text_t and inherits all expressions from it.

TIME_LOCAL_AT

Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from num_at

`APPEND` (text_t str)

Appends the given string to the string representation of the local time value.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*BETWEEN` (time_local_at time1, time_local_at time2)

Returns Boolean TRUE if the time value is greater than or equal to the Lower argument and the time value is lesser than or equal to the Upper argument.

`Parameters``:`

time1- Lower Local Time

time2- Upper Local Time

`Returns:` bool_at

`*DAY`

Extracts the day of the month from the local time, and returns that value as a number from 1 through 31 representing that day.

`Returns:` num_at

`*EQ` (time_local_at t)

Results in Boolean TRUE value if the time value is equal to the argument Local time value.

`Parameters``:`

t- Local Time

`Returns:` bool_at

`*GE` (time_local_at t)

Results in Boolean TRUE value if the time value is greater than or equal to the argument Local time value.

`Parameters``:`

t- Local Time

`Returns:` bool_at

`*GT` (time_local_at t)

Results in Boolean TRUE value if the time value is greater than the argument Local time value.

`Parameters``:`

t- Local Time

`Returns:` bool_at

`*HOURS`

Extracts the hour from the local time, and returns that value as an integer from 0 to 23.

`Returns:` num_at

`*LE` (time_local_at t)

Results in Boolean TRUE value if the time value is less than or equal to the argument Local time value.

`Parameters``:`

t- Local Time

`Returns:` bool_at

`*LT` (time_local_at t)

Results in Boolean TRUE value if the time value is less than the argument Local time value.

`Parameters``:`

t- Local Time

`Returns:` bool_at

`*MINUTES`

Extracts the minute from the local time, and returns that value as an integer from 0 to 59.

`Returns:` num_at

`*MONTH`

Extracts the month from the local time, and returns that value as an integer from 1 (January) to 12 (December).

`Returns:` num_at

`*NE` (time_local_at t)

Results in Boolean TRUE value if the time value is not equal to the argument Local time value.

`Parameters``:`

t- Local Time

`Returns:` bool_at

`*SECONDS`

Extracts the seconds from the local time, and returns that value as an integer from 0 to 59.

`Returns:` num_at

`*TO_GMT`

Generate the GMT time from the local time.

`Returns:` time_at

`*TYPECAST_NUM_AT`

Convert time_local_at to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_TEXT_T`

Typecast the Local time value to its string representation.

`Returns:` text_t

`*WEEKDAY`

Results in a Number Value between 0 (Sunday) and 6 (Saturday) which gives the week day in the time value.

`Returns:` num_at

`*YEAR`

Extracts the year from the local time, and returns that value as a four-digit integer.

`Returns:` num_at

`*ABS`

Return the absolute value of the number.

`Returns:` num_at

`*ADD` (double_at i)

Return the Double Value after adding the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*ADD` (ip_address_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (unsigned_long_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (num_at i)

Return the Number Value after adding the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*ADD` (time_local_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (time_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*AS_MICROSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.ffffff GMT ffffff represents microseconds Examples:

Mon, 05 Mar 2018 10:23:36.568419 GMT

`Returns:` text_t

`*AS_MILLISEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fff GMT fff represents milliseconds Examples:

Mon, 05 Mar 2018 10:23:36.568 GMT

`Returns:` text_t

`*AS_NANOSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fffffffff GMT fffffffff represents nanoseconds Accuracy may be at larger granularity than nanosecond resolution. Examples:

Mon, 05 Mar 2018 10:23:36.568419567 GMT

`Returns:` text_t

`*BETWEEN` (double_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, ip_address_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, unsigned_long_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, num_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_local_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, num_at j)

Returns Boolean TRUE if the number value is greater than or equal to the Lower argument and the number value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BITAND` (ip_address_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (num_at i)

Return the Number Value after bitwise ANDing the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*BITAND` (time_local_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (time_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITNEG`

Return the Number Value after bitwise negating the current number value.

`Returns:` num_at

`*BITOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (num_at i)

Return the Number Value after bitwise ORing the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*BITOR` (time_local_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (time_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (num_at i)

Return the Number Value after bitwise XORing the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*BITXOR` (time_local_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (time_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (double_at i)

Return the Double Value after dividing the current double value by the argument.

`Parameters``:`

i- Double

`Returns:` double_at

`*DIV` (ip_address_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (unsigned_long_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (num_at i)

Return the Number Value after dividing the current number value by the argument.

`Parameters``:`

i- Number

`Returns:` num_at

`*DIV` (time_local_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (time_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*EQ` (double_at i)

Returns Boolean TRUE if the double value is equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*EQ` (ip_address_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (num_at i)

Returns Boolean TRUE if the number value is equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*EQ` (time_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (double_at i)

Returns Boolean TRUE if the double value is greater than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (num_at i)

Returns Boolean TRUE if the number value is greater than or equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*GE` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (double_at i)

Returns Boolean TRUE if the double value is greater than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (num_at i)

Returns Boolean TRUE if the number value is greater than the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*GT` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (double_at i)

Returns Boolean TRUE if the double value is lesser than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (num_at i)

Returns Boolean TRUE if the number value is lesser than or equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*LE` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LSHIFT` (`uint` i)

Return the Number Value after bitwise left shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 32. For example, let HTTP.REQ.URL.LENGTH be 4. Then, HTTP.REQ.URL.LENGTH.LSHIFT(1) = HTTP.REQ.URL.LENGTH.LSHIFT(33) = 8, since 33 on division by 32 yields a remainder of 1.

`Parameters``:`

i- Left Shift Length

`Returns:` num_at

`*LT` (double_at i)

Returns Boolean TRUE if the double value is lesser than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (num_at i)

Returns Boolean TRUE if the number value is lesser than the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*LT` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*MAX` (double_at i)

Return the maximum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MAX` (ip_address_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (unsigned_long_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (num_at i)

Return the maximum value after comparing the argument with the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MAX` (time_local_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (double_at i)

Return the minimum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MIN` (ip_address_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (unsigned_long_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (num_at i)

Return the minimum value after comparing the argument with the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MIN` (time_local_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (ip_address_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (unsigned_long_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (num_at i)

Return the Number Value that is the renaminder after dividing the current number value by the argument.

`Parameters``:`

i- Number

`Returns:` num_at

`*MOD` (time_local_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (double_at i)

Return the Double Value after multiplying the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MUL` (ip_address_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (unsigned_long_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (num_at i)

Return the Number Value after multiplying the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MUL` (time_local_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*NEG`

Return the Number Value after negating the current number value.

`Returns:` num_at

`*NE` (double_at i)

Returns Boolean TRUE if the double value is not equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*NE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (num_at i)

Returns Boolean TRUE if the number value is not equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*NE` (time_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*RSHIFT` (`uint` i)

Return the Number Value after bitwise right shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 32. For example, let HTTP.REQ.URL.LENGTH be 4. Then, HTTP.REQ.URL.LENGTH.RSHIFT(1) = HTTP.REQ.URL.LENGTH.RSHIFT(33) = 2, since 33 on division by 32 yields a remainder of 1.

`Parameters``:`

i- Right Shift Length

`Returns:` num_at

`*SIGNED16_STRING` (endian_e endianness)

Create a signed 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*SIGNED32_STRING` (endian_e endianness)

Create a signed 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*SIGNED8_STRING`

Create a signed 8-bit binary string from the number.

`Returns:` text_t

`*SUB` (double_at i)

Return the Double Value after subtracting the argument from the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*SUB` (ip_address_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (unsigned_long_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (num_at i)

Return the Number Value after subtracting the argument from the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*SUB` (time_local_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*TYPECAST_DOUBLE_AT`

Typecast the Number Value to a Double value.

`Returns:` double_at

`*TYPECAST_IP_ADDRESS_AT`

Typecast the Number Value to an IP Address value.

`Returns:` ip_address_at

`*TYPECAST_TIME_AT`

Typecast the Number Value to a Time value.

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Typecast the Number Value to a local time value.

`Returns:` time_local_at

`*TYPECAST_UNSIGNED_LONG_AT`

Typecast the Number Value to a Unsigned Long value.

`Returns:` unsigned_long_at

`*UNSIGNED16_STRING` (endian_e endianness)

Create an unsigned 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED32_STRING` (endian_e endianness)

Create an unsigned 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED64_STRING` (endian_e endianness)

Create an unsigned 64-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED8_STRING`

Create an unsigned 8-bit binary string from the number.

`Returns:` text_t

`*WEEKDAY_STRING`

Given the numeric day of the week, e.g. SYS.TIME.WEEKDAY, return the long form of the string name for that day, e.g. 0 = "Sunday", 6 = "Saturday".

`Returns:` text_t

`*WEEKDAY_STRING_SHORT`

Given the numeric day of the week, e.g. SYS.TIME.WEEKDAY, return the short form of the string name for that day, e.g. 0 = "Sun", 6 = "Sat".

`Returns:` text_t

TIME_T

This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t time_at

- `TYPECAST_NUM_AT`

  Convert time_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_TEXT_T`

Convert time_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*TYPECAST_TIME_AT`

Convert time_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*ABS`

Return the absolute value of the number.

`Returns:` num_at

`*ADD` (double_at i)

Return the Double Value after adding the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*ADD` (ip_address_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (unsigned_long_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (num_at i)

Return the Number Value after adding the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*ADD` (time_local_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (time_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the string representation of the current time value.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*AS_MICROSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.ffffff GMT ffffff represents microseconds Examples:

Mon, 05 Mar 2018 10:23:36.568419 GMT

`Returns:` text_t

`*AS_MILLISEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fff GMT fff represents milliseconds Examples:

Mon, 05 Mar 2018 10:23:36.568 GMT

`Returns:` text_t

`*AS_NANOSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fffffffff GMT fffffffff represents nanoseconds Accuracy may be at larger granularity than nanosecond resolution. Examples:

Mon, 05 Mar 2018 10:23:36.568419567 GMT

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (double_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, ip_address_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, unsigned_long_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, num_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_local_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, num_at j)

Returns Boolean TRUE if the number value is greater than or equal to the Lower argument and the number value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BETWEEN` (time_at time1, time_at time2)

Results in a Boolean TRUE value if the time value is between the Lower and the Upper time arguments. Both the Lower and the Upper time arguments must be fully specified.

For example - GMT 1995 Jan is fully specified. But GMT Jan or GMT 1995 20 or GMT Jan Mon_2 are not fully specified. The Upper and Lower arguments must be both GMT or both Local. The day of the week must not be present in either the Lower or the Upper argument. It is OK to specify the day of the month as the 1st, 2nd, 3rd or 4th weekday of the month (example Wed_3 is the 3rd Wednesday of the month). The Upper Time argument must be bigger than the Lower Time argument.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005. BETWEEN(GMT 2004, GMT 2006): TRUE BETWEEN(GMT 2004 Jan, GMT 2006 Nov): TRUE BETWEEN(GMT 2004 Jan, GMT 2006): TRUE BETWEEN(GMT 2005 May Sun_1, GMT 2005 May Sun_3): TRUE BETWEEN(GMT 2005 May 1, GMT May 2005 1): TRUE BETWEEN(LOCAL 2005 May 1, LOCAL May 2005 1): Answer depends on the NetScaler system's timezone.

`Parameters` (expressions not allowed) `:`

time1- Lower Time

time2- Upper Time

`Returns:` bool_at

`*BETWEEN` (time_local_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at time1, time_at time2)

Returns Boolean TRUE if the time value is greater than or equal to the Lower argument and the time value is lesser than or equal to the Upper argument.

`Parameters``:`

time1- Lower GMT Time Value

time2- Upper GMT Time Value

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BITAND` (ip_address_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (num_at i)

Return the Number Value after bitwise ANDing the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*BITAND` (time_local_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (time_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITNEG`

Return the Number Value after bitwise negating the current number value.

`Returns:` num_at

`*BITOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (num_at i)

Return the Number Value after bitwise ORing the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*BITOR` (time_local_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (time_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (num_at i)

Return the Number Value after bitwise XORing the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*BITXOR` (time_local_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (time_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DAY`

Extracts the day of the month from the current system time, and returns that value as a number from 1 through 31 representing that day.

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*DIV` (double_at i)

Return the Double Value after dividing the current double value by the argument.

`Parameters``:`

i- Double

`Returns:` double_at

`*DIV` (ip_address_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (unsigned_long_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (num_at i)

Return the Number Value after dividing the current number value by the argument.

`Parameters``:`

i- Number

`Returns:` num_at

`*DIV` (time_local_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (time_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (double_at i)

Returns Boolean TRUE if the double value is equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*EQ` (ip_address_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (num_at i)

Returns Boolean TRUE if the number value is equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*EQ` (time_at t)

Results in Boolean TRUE value if the time value is equal to the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

EQ(GMT 2005): TRUE EQ(GMT 2005 Dec): FALSE EQ(Local 2005 May): TRUE or FALSE depending on the current timezone. EQ(GMT 10h): TRUE EQ(GMT 10h 30s): TRUE EQ(GMT May 10h): TRUE EQ(GMT Sun): TRUE EQ(GMT May Sun_1): TRUE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*EQ` (time_local_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (time_at t)

Results in Boolean TRUE value if the time value is equal to the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (double_at i)

Returns Boolean TRUE if the double value is greater than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (num_at i)

Returns Boolean TRUE if the number value is greater than or equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GE` (time_at t)

Results in Boolean TRUE value if the time value is greater than or equal to the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

GE(GMT 2004): TRUE GE(GMT 2005 Jan): TRUE GE(Local 2005 May): TRUE or FALSE depending on the current timezone. GE(GMT 8h): TRUE GE(GMT 30m): FALSE GE(GMT May 10h): TRUE GE(GMT May 10h 0m): TRUE GE(GMT Sun): TRUE GE(GMT May Sun_1): TRUE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*GE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (time_at t)

Results in Boolean TRUE value if the time value is greater than or equal to the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (double_at i)

Returns Boolean TRUE if the double value is greater than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (num_at i)

Returns Boolean TRUE if the number value is greater than the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GT` (time_at t)

Results in Boolean TRUE value if the time value is greater than the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

GT(GMT 2004): TRUE GT(GMT 2005 Jan): TRUE GT(Local 2005 May): TRUE or FALSE depending on the current timezone. GT(GMT 8h): TRUE GT(GMT 30m): FALSE GT(GMT May 10h): FALSE GT(GMT May 10h 0m): TRUE GT(GMT Sun): FALSE GT(GMT May Sun_1): FALSE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*GT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (time_at t)

Results in Boolean TRUE value if the time value is greater than the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HOURS`

Extracts the hour from the current system time, and returns that value as an integer from 0 to 23.

`Returns:` num_at

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"
```

```
    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (double_at i)

Returns Boolean TRUE if the double value is lesser than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (num_at i)

Returns Boolean TRUE if the number value is lesser than or equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LE` (time_at t)

Results in Boolean TRUE value if the time value is lesser than or equal to the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

LE(GMT 2006): TRUE LE(GMT 2005 Dec): TRUE LE(Local 2005 May): TRUE or FALSE depending on the current timezone. LE(GMT 8h): FALSE LE(GMT 30m): TRUE LE(GMT May 10h): TRUE LE(GMT Jun 11h): TRUE LE(GMT Wed): TRUE LE(GMT May Sun_1): TRUE

`Parameters` (expressions not allowed)`:`

t- Time

`Returns:` bool_at

`*LE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (time_at t)

Results in Boolean TRUE value if the time value is less than or equal to the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LSHIFT` (`uint` i)

Return the Number Value after bitwise left shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 32. For example, let HTTP.REQ.URL.LENGTH be 4. Then, HTTP.REQ.URL.LENGTH.LSHIFT(1) = HTTP.REQ.URL.LENGTH.LSHIFT(33) = 8, since 33 on division by 32 yields a remainder of 1.

`Parameters``:`

i- Left Shift Length

`Returns:` num_at

`*LT` (double_at i)

Returns Boolean TRUE if the double value is lesser than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (num_at i)

Returns Boolean TRUE if the number value is lesser than the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LT` (time_at t)

Results in Boolean TRUE value if the time value is lesser than the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

LT(GMT 2006): TRUE LT(GMT 2005 Dec): TRUE LT(Local 2005 May): TRUE or FALSE depending on the current timezone. LT(GMT 8h): FALSE LT(GMT 30m): TRUE LT(GMT May 10h): FALSE LT(GMT Jun 11h): TRUE LT(GMT Wed): TRUE LT(GMT May Sun_1): FALSE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*LT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (time_at t)

Results in Boolean TRUE value if the time value is less than the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".

- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (double_at i)

Return the maximum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MAX` (ip_address_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (unsigned_long_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (num_at i)

Return the maximum value after comparing the argument with the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MAX` (time_local_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MINUTES`

Extracts the minute from the current system time, and returns that value as an integer from 0 to 59.

`Returns:` num_at

`*MIN` (double_at i)

Return the minimum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MIN` (ip_address_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (unsigned_long_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (num_at i)

Return the minimum value after comparing the argument with the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (time_local_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (ip_address_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (unsigned_long_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (num_at i)

Return the Number Value that is the renaminder after dividing the current number value by the argument.

`Parameters``:`

i- Number

`Returns:` num_at

`*MOD` (time_local_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MONTH`

Extracts the month from the current system time, and returns that value as an integer from 1 (January) to 12 (December).

`Returns:` num_at

`*MUL` (double_at i)

Return the Double Value after multiplying the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MUL` (ip_address_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (unsigned_long_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (num_at i)

Return the Number Value after multiplying the argument to the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*MUL` (time_local_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*NEG`

Return the Number Value after negating the current number value.

`Returns:` num_at

`*NE` (double_at i)

Returns Boolean TRUE if the double value is not equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*NE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (num_at i)

Returns Boolean TRUE if the number value is not equal to the argument.

`Parameters``:`

i- Number

`Returns:` bool_at

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NE` (time_at t)

Results in Boolean TRUE value if the time value is not equal to the argument time.

Assume the current time value is GMT 2005 May 1 10h 15m 30s. This is the 1st Sunday of the month of May in 2005.

NE(GMT 2005): FALSE NE(GMT 2005 Dec): TRUE NE(Local 2005 May): TRUE or FALSE depending on the current timezone. NE(GMT 10h): FALSE NE(GMT 10h 30s): FALSE NE(GMT May 10h): FALSE NE(GMT Sun): FALSE NE(GMT May Sun_1): FALSE

`Parameters` (expressions not allowed) `:`

t- Time

`Returns:` bool_at

`*NE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (time_at t)

Results in Boolean TRUE value if the time value is not equal to the argument GMT time value.

`Parameters``:`

t- GMT Time Value

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +
```

```
"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw=="
<DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ>
<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB

- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*RELATIVE_BOOT`

Calculates the number of seconds to the closest previous or scheduled reboot, and returns an integer. If the closest boot time is in the past, the integer is negative; if it is in the future, the integer is positive.

`Returns:` num_at

`*RELATIVE_NOW`

Calculates the number of seconds between the current system time and the specified time, and returns an integer showing that number. If the designated time is in the past, the integer is negative; if it is in the future, the integer is positive.

`Returns:` num_at

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*RSHIFT` (`uint` i)

Return the Number Value after bitwise right shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 32. For example, let HTTP.REQ.URL.LENGTH be 4. Then, HTTP.REQ.URL.LENGTH.RSHIFT(1) = HTTP.REQ.URL.LENGTH.RSHIFT(33) = 2, since 33 on division by 32 yields a remainder of 1.

`Parameters``:`

i- Right Shift Length

`Returns:` num_at

`*SECONDS`

Extracts the seconds from the current system time, and returns that value as an integer from 0 to 59.

`Returns:` num_at

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` time_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the

character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` time_t

`*SIGNED16_STRING` (endian_e endianness)

Create a signed 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*SIGNED32_STRING` (endian_e endianness)

Create a signed 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*SIGNED8_STRING`

Create a signed 8-bit binary string from the number.

`Returns:` text_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUB` (double_at i)

Return the Double Value after subtracting the argument from the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*SUB` (ip_address_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (unsigned_long_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (num_at i)

Return the Number Value after subtracting the argument from the current number value.

`Parameters``:`

i- Number

`Returns:` num_at

`*SUB` (time_local_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOCAL`

Convert the time to the local time zone

`Returns:` time_local_at

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Typecast the Number Value to a Double value.

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the

beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the

current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses,

A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Typecast the Number Value to an IP Address value.

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_LOCAL_AT`

Typecast the Number Value to a local time value.

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Typecast the Number Value to a Unsigned Long value.

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL

and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests:
  DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses:
  DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*UNSIGNED16_STRING` (endian_e endianness)

Create an unsigned 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED32_STRING` (endian_e endianness)

Create an unsigned 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED64_STRING` (endian_e endianness)

Create an unsigned 64-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED8_STRING`

Create an unsigned 8-bit binary string from the number.

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*WEEKDAY`

Results in a Number Value between 0 (Sunday) and 6 (Saturday) which gives the week day in the time value.

`Returns:` num_at

`*WEEKDAY_STRING`

Given the numeric day of the week, e.g. SYS.TIME.WEEKDAY, return the long form of the string name for that day, e.g. 0 = "Sunday", 6 = "Saturday".

`Returns:` text_t

`*WEEKDAY_STRING_SHORT`

Given the numeric day of the week, e.g. SYS.TIME.WEEKDAY, return the short form of the string name for that day, e.g. 0 = "Sun", 6 = "Sat".

`Returns:` text_t

`*WITHIN` (time_at time1, time_at time2)

Results in a Boolean TRUE value if the time value lies within all the ranges defined by the Lower and Upper time arguments.

If an element of time like day or hour is left unspecified in the Lower argument then it is assumed to have the lowest value of its range. If an element is left unspecified in the Upper argument then it is assumed to have the highest value of its range. If the year is specified in one of the argument then it must be specified in the other argument as well. The ranges for different elements of time are month 1-12, day 1-31, weekday 0-6, hour 0-23, minutes 0-59 and seconds 0-59. Each element of time defines a range. For the result to be TRUE each element of time in the time value must lie in the corresponding range present in the Lower and Upper arguments.

Assume the time value is GMT 2005 May 10 10h 15m 30s. This is the second Tuesday of the month. WITHIN(GMT 2004, GMT 2006): TRUE WITHIN(GMT 2004 Jan, GMT 2006 Mar): FALSE (May doesn't fall in the Jan-Mar range.) WITHIN(GMT Feb, GMT): TRUE (May falls in the Feb-Dec range.) WITHIN(GMT Sun_1, GMT Sun_3): TRUE (2nd Tuesday lies within 1st Sunday and the 3rd Sunday.) WITHIN(GMT 2005 May 1 10h, GMT May 2005 1 17h): TRUE WITHIN(LOCAL 2005 May 1, LOCAL May 2005 1): Answer depends on the NetScaler system's timezone.

`Parameters` (expressions not allowed) `:`

time1- Lower Time

time2- Upper Time

`Returns:` bool_at

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

TRAFFIC_DOMAIN_REQ_T

TRAFFIC_DOMAIN Request

This topic lists the expressions that are provided by this class.

- `ID`

  Returns Traffic Domain Identifier through which the current packet entered the Application Switch as a number.

`Returns:` num_at

UDP_DNS_REQ_PROTOCOL_T

DNS Protocol

This topic lists the expressions that are provided by this class.

- `DOMAIN`

  Returns domain name. Sets the text mode to case insensitive.

`Returns:` dns_domainname_t

- `IS_AAAAREC`

  Returns TRUE if it is of AAAA record type.

`Returns:` bool_at

- `IS_ANYREC`

  Returns TRUE if it is of ANY record type.

`Returns:` bool_at

- `IS_AREC`

  Returns TRUE if it is of A record type.

`Returns:` bool_at

- `IS_CNAMEREC`

  Returns TRUE if it is of CNAME record type.

`Returns:` bool_at

- `IS_MXREC`

  Returns TRUE if it is of MX record type.

`Returns:` bool_at

- `IS_NAPTRREC`

  Returns TRUE if it is of NAPTR record type.

`Returns:` bool_at

- `IS_NSREC`

  Returns TRUE if it is of NS record type.

`Returns:` bool_at

- `IS_PTRREC`

  Returns TRUE if it is of PTR record type.

`Returns:` bool_at

- `IS_SOAREC`

  Returns TRUE if it is of SOA record type.

`Returns:` bool_at

- `IS_SRVREC`

  Returns TRUE if it is of SRV record type.

`Returns:` bool_at

UDP_PROTOCOL_CLIENT_T

UDP Protocol - Client Side

This topic lists the expressions that are provided by this class.

- `SRCPORT`

  Returns the current packet's UDP source port as a number.

`Returns:` num_at

- `DSTPORT`

  Returns the current packet's UDP destination port as a number.

`Returns:` num_at

- `LENGTH`

  Returns the current packet's UDP length as a number.

`Returns:` num_at

- `CHECKSUM`

  Returns the current packet's UDP checksum as a number.

`Returns:` num_at

- `PAYLOAD`

  Returns the current packet's UDP Payload.

`Returns:` text_t

- `DNS`

  Returns DNS data for the current packet's UDP source port.

`Returns:` udp_dns_req_protocol_t

- `RADIUS`

  Returns RADIUS data for the current packet.

`Returns:` radius_protocol_t

- `LB_VSERVER`

  Returns the LB vserver serving the current request.

`Returns:` vserver_t

- `CS_VSERVER`

  Returns the CS vserver serving the current request.

`Returns:` vserver_t

UDP_PROTOCOL_SERVER_T

UDP Protocol - Server side

This topic lists the expressions that are provided by this class.

- `SRCPORT`

  Returns the current packet's UDP source port as a number.

`Returns:` num_at

- `DSTPORT`

  Returns the current packet's UDP destination port as a number.

`Returns:` num_at

- `LENGTH`

  Returns the current packet's UDP length as a number.

`Returns:` num_at

- `CHECKSUM`

  Returns the current packet's UDP checksum as a number.

`Returns:` num_at

- `PAYLOAD`

  Returns the current packet's UDP Payload.

`Returns:` text_t

UDP_REQ_PROTOCOL_T

UDP Protocol

This topic lists the expressions that are provided by this class.

- `CS_VSERVER`

  Returns the CS vserver serving the current request.

`Returns:` vserver_t

- `DNS`

  Returns DNS data for the current packet's UDP source port.

`Returns:` udp_dns_req_protocol_t

- `DSTPORT`

  Returns the ID of the current packet's UDP destination port as a number.

`Returns:` num_at

- `LB_VSERVER`

  Returns the LB vserver serving the current request.

`Returns:` vserver_t

- `RADIUS`

  Returns RADIUS data for the current packet

`Returns:` radius_protocol_t

- `SRCPORT`

  Returns the ID of the current packet's UDP source port as a number.

`Returns:` num_at

UNSIGNED_LONG_AT

Unsigned Long(64bit) Value

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from

`ADD` (double_at i)

Return the Double Value after adding the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*ADD` (ip_address_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (num_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (time_local_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (time_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (unsigned_long_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*APPEND` (text_t str)

Appends the given string to the string representation of the current unsigned long.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*AS_MICROSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.ffffff GMT ffffff represents microseconds Examples:

Mon, 05 Mar 2018 10:23:36.568419 GMT

`Returns:` text_t

`*AS_MILLISEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fff GMT fff represents milliseconds Examples:

Mon, 05 Mar 2018 10:23:36.568 GMT

`Returns:` text_t

`*AS_NANOSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fffffffff GMT fffffffff represents nanoseconds Accuracy may be at larger granularity than nanosecond resolution. Examples:

Mon, 05 Mar 2018 10:23:36.568419567 GMT

`Returns:` text_t

`*BETWEEN` (double_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, ip_address_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, num_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_local_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, unsigned_long_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BITAND` (ip_address_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (num_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (time_local_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (time_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITNEG`

Return the Unsigned Long Value after bitwise negating the current unsigned long value.

`Returns:` unsigned_long_at

`*BITOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (num_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (time_local_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (time_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (num_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (time_local_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (time_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (double_at i)

Return the Double Value after dividing the current double value by the argument.

`Parameters``:`

i- Double

`Returns:` double_at

`*DIV` (ip_address_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (num_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (time_local_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (time_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (unsigned_long_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*EQ` (double_at i)

Returns Boolean TRUE if the double value is equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*EQ` (ip_address_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (num_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (time_local_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (time_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (double_at i)

Returns Boolean TRUE if the double value is greater than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (num_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (double_at i)

Returns Boolean TRUE if the double value is greater than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (num_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (double_at i)

Returns Boolean TRUE if the double value is lesser than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (num_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LSHIFT` (`uint` i)

Return the Unsigned Long Value after bitwise left shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 64.

`Parameters``:`

i- Left Shift Length

`Returns:` unsigned_long_at

`*LT` (double_at i)

Returns Boolean TRUE if the double value is lesser than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (num_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*MAX` (double_at i)

Return the maximum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MAX` (ip_address_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (num_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_local_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (unsigned_long_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (double_at i)

Return the minimum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MIN` (ip_address_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (num_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_local_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (unsigned_long_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (ip_address_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (num_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_local_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (unsigned_long_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (double_at i)

Return the Double Value after multiplying the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MUL` (ip_address_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (num_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_local_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (unsigned_long_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*NE` (double_at i)

Returns Boolean TRUE if the double value is not equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*NE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (num_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (time_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*RSHIFT` (`uint` i)

Return the Unsigned Long Value after bitwise right shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 64.

`Parameters``:`

i- Right Shift Length

`Returns:` unsigned_long_at

`*SUB` (double_at i)

Return the Double Value after subtracting the argument from the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*SUB` (ip_address_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (num_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_local_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (unsigned_long_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*TYPECAST_DOUBLE_AT`

Typecast the Unsigned Long Value to a Double value.

`Returns:` double_at

`*TYPECAST_NUM_AT`

Typecast the Unsigned Long Value to a Number value.

`Returns:` num_at

`*TYPECAST_TEXT_T`

Typecast the Unsigned Long Value to its string representation.

`Returns:` text_t

`*UNSIGNED16_STRING` (endian_e endianness)

Create an unsigned 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED32_STRING` (endian_e endianness)

Create an unsigned 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED64_STRING` (endian_e endianness)

Create an unsigned 64-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED8_STRING`

Create an unsigned 8-bit binary string from the number.

`Returns:` text_t

`*ABS`

Return absolute double value of the double value.

`Returns:` double_at

`*NEG`

Return the Double Value after negating the current double value.

`Returns:` double_at

`*TYPECAST_UNSIGNED_LONG_AT`

Typecast the Double Value to a Unsigned Long value.

`Returns:` unsigned_long_at

UNSIGNED_LONG_FORMAT_E

Unsigned Long Format Enum

Enumerations

DECIMAL

Decimal representation of a positive or a negative integer. White spaces before and after the number are OK

HEX

Hexadecimal representation of a positive or a negative integer. White spaces before and after the number are OK

DECIMAL_PREFIX

Decimal representation of a positive or a negative integer followed by arbitrary characters Examples " -123" " 234 " "- 123abc" "234 abc"

HEX_PREFIX

Hexadecimal representation of a positive integer followed by arbitrary characters Examples "f" "fxyz" " f ff" all represent the number 15.

UNSIGNED_LONG_T

Provides operations to treat the underlying text as a Unsigned Long either in the DECIMAL or the HEX format.

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t unsigned_long_at

- `TYPECAST_TEXT_T`

  Convert unsigned_long_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert unsigned_long_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*ABS`

Return absolute double value of the double value.

`Returns:` double_at

`*ADD` (double_at i)

Return the Double Value after adding the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*ADD` (ip_address_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (num_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (time_local_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (time_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (unsigned_long_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the string representation of the current unsigned long.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*AS_MICROSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.ffffff GMT ffffff represents microseconds Examples:

Mon, 05 Mar 2018 10:23:36.568419 GMT

`Returns:` text_t

`*AS_MILLISEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fff GMT fff represents milliseconds Examples:

Mon, 05 Mar 2018 10:23:36.568 GMT

`Returns:` text_t

`*AS_NANOSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fffffffff GMT fffffffff represents nanoseconds Accuracy may be at larger granularity than nanosecond resolution. Examples:

Mon, 05 Mar 2018 10:23:36.568419567 GMT

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BETWEEN` (double_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, ip_address_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, num_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_local_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, unsigned_long_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BITAND` (ip_address_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (num_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (time_local_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (time_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITNEG`

Return the Unsigned Long Value after bitwise negating the current unsigned long value.

`Returns:` unsigned_long_at

`*BITOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (num_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (time_local_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (time_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (num_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (time_local_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (time_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*DIV` (double_at i)

Return the Double Value after dividing the current double value by the argument.

`Parameters``:`

i- Double

`Returns:` double_at

`*DIV` (ip_address_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (num_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (time_local_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (time_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (unsigned_long_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*EQ` (double_at i)

Returns Boolean TRUE if the double value is equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*EQ` (ip_address_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (num_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (time_local_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (time_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GE` (double_at i)

Returns Boolean TRUE if the double value is greater than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (num_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GT` (double_at i)

Returns Boolean TRUE if the double value is greater than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (num_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"
```

```
    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LE` (double_at i)

Returns Boolean TRUE if the double value is lesser than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (num_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LSHIFT` (`uint` i)

Return the Unsigned Long Value after bitwise left shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 64.

`Parameters``:`

i- Left Shift Length

`Returns:` unsigned_long_at

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LT` (double_at i)

Returns Boolean TRUE if the double value is lesser than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (num_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MAX` (double_at i)

Return the maximum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MAX` (ip_address_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (num_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_local_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (unsigned_long_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (double_at i)

Return the minimum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MIN` (ip_address_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (num_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_local_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (unsigned_long_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (ip_address_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (num_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_local_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (unsigned_long_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (double_at i)

Return the Double Value after multiplying the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MUL` (ip_address_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (num_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_local_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (unsigned_long_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*NEG`

Return the Double Value after negating the current double value.

`Returns:` double_at

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NE` (double_at i)

Returns Boolean TRUE if the double value is not equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*NE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (num_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (time_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ>
<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)

- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you

wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*RSHIFT` (`uint` i)

Return the Unsigned Long Value after bitwise right shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 64.

`Parameters``:`

i- Right Shift Length

`Returns:` unsigned_long_at

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` unsigned_long_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` unsigned_long_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUB` (double_at i)

Return the Double Value after subtracting the argument from the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*SUB` (ip_address_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (num_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_local_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (unsigned_long_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code

258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Typecast the Unsigned Long Value to a Double value.

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the

remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the

current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses,

A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Typecast the Unsigned Long Value to a Number value.

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*UNSIGNED16_STRING` (endian_e endianness)

Create an unsigned 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED32_STRING` (endian_e endianness)

Create an unsigned 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED64_STRING` (endian_e endianness)

Create an unsigned 64-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED8_STRING`

Create an unsigned 8-bit binary string from the number.

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

UNUM_TEXT_T

Provides operations to treat the underlying OctectString as Binary String or unsigned long value .

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t unsigned_long_at

- `TYPECAST_TEXT_T`

  Convert unum_text_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert unum_text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*ABS`

Return absolute double value of the double value.

`Returns:` double_at

`*ADD` (double_at i)

Return the Double Value after adding the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*ADD` (ip_address_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (num_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (time_local_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (time_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ADD` (unsigned_long_at i)

Return the Unsigned Long after adding the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the string representation of the current unsigned long.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*AS_MICROSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.ffffff GMT ffffff represents microseconds Examples:

Mon, 05 Mar 2018 10:23:36.568419 GMT

`Returns:` text_t

`*AS_MILLISEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fff GMT fff represents milliseconds Examples:

Mon, 05 Mar 2018 10:23:36.568 GMT

`Returns:` text_t

`*AS_NANOSEC_STR`

Returns the current system time in the following format Format: Wday, day Month year hh:mm:ss.fffffffff GMT fffffffff represents nanoseconds Accuracy may be at larger granularity than nanosecond resolution. Examples:

Mon, 05 Mar 2018 10:23:36.568419567 GMT

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BETWEEN` (double_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, ip_address_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, num_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_local_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, time_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (double_at i, unsigned_long_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (ip_address_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (num_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_local_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (time_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, double_at j)

Returns Boolean TRUE if the double value is greater than or equal to the Lower argument and the double value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, ip_address_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, num_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_local_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, time_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BETWEEN` (unsigned_long_at i, unsigned_long_at j)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the Lower argument and the unsigned long value is lesser than or equal to the Upper argument.

`Parameters``:`

i- Lower

j- Upper

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BITAND` (ip_address_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (num_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (time_local_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (time_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITAND` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ANDing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITNEG`

Return the Unsigned Long Value after bitwise negating the current unsigned long value.

`Returns:` unsigned_long_at

`*BITOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (num_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (time_local_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (time_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise ORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (ip_address_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (num_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (time_local_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (time_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BITXOR` (unsigned_long_at i)

Return the Unsigned Long Value after bitwise XORing the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*DIV` (double_at i)

Return the Double Value after dividing the current double value by the argument.

`Parameters``:`

i- Double

`Returns:` double_at

`*DIV` (ip_address_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (num_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (time_local_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (time_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*DIV` (unsigned_long_at i)

Return the Unsigned Long Value after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*EQ` (double_at i)

Returns Boolean TRUE if the double value is equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*EQ` (ip_address_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (num_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (time_local_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (time_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*EQ` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long is equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GE` (double_at i)

Returns Boolean TRUE if the double value is greater than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (num_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GT` (double_at i)

Returns Boolean TRUE if the double value is greater than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*GT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (num_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (time_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*GT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is greater than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"
```

```
    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LE` (double_at i)

Returns Boolean TRUE if the double value is lesser than or equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (num_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than or equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LSHIFT` (`uint` i)

Return the Unsigned Long Value after bitwise left shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 64.

`Parameters``:`

i- Left Shift Length

`Returns:` unsigned_long_at

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LT` (double_at i)

Returns Boolean TRUE if the double value is lesser than the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*LT` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (num_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (time_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*LT` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is lesser than the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MAX` (double_at i)

Return the maximum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MAX` (ip_address_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (num_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_local_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (time_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MAX` (unsigned_long_at i)

Return the maximum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (double_at i)

Return the minimum double value after comparing the argument with the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MIN` (ip_address_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (num_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_local_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (time_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MIN` (unsigned_long_at i)

Return the minimum unsigned long value after comparing the argument value to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (ip_address_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (num_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_local_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (time_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MOD` (unsigned_long_at i)

Return the Unsigned Long Value that is the renaminder after dividing the current unsigned long value by the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (double_at i)

Return the Double Value after multiplying the argument to the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*MUL` (ip_address_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (num_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_local_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (time_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*MUL` (unsigned_long_at i)

Return the Unsigned Long Value after multiplying the argument to the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*NEG`

Return the Double Value after negating the current double value.

`Returns:` double_at

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NE` (double_at i)

Returns Boolean TRUE if the double value is not equal to the argument.

`Parameters``:`

i- Double

`Returns:` bool_at

`*NE` (ip_address_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (num_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (time_local_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (time_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NE` (unsigned_long_at i)

Returns Boolean TRUE if the unsigned long value is not equal to the argument.

`Parameters``:`

i- Unsigned Long

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw=="
<DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/

<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74A
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)

- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you

wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*RSHIFT` (`uint` i)

Return the Unsigned Long Value after bitwise right shifting the current number value by the argument number of bits. Note that the number of bits shifted is i modulo 64.

`Parameters``:`

i- Right Shift Length

`Returns:` unsigned_long_at

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` unum_text_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` unum_text_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUB` (double_at i)

Return the Double Value after subtracting the argument from the current double value.

`Parameters``:`

i- Double

`Returns:` double_at

`*SUB` (ip_address_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (num_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_local_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (time_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUB` (unsigned_long_at i)

Return the Unsigned Long Value after subtracting the argument from the current unsigned long value.

`Parameters``:`

i- Unsigned Long

`Returns:` unsigned_long_at

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code

258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Typecast the Unsigned Long Value to a Double value.

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the

remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the

current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses,

A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Typecast the Unsigned Long Value to a Number value.

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*UNSIGNED16_STRING` (endian_e endianness)

Create an unsigned 16-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED32_STRING` (endian_e endianness)

Create an unsigned 32-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED64_STRING` (endian_e endianness)

Create an unsigned 64-bit binary string from the number.

`Parameters` (expressions not allowed) `:`

endianness- Select little or big endian

`Returns:` text_t

`*UNSIGNED8_STRING`

Create an unsigned 8-bit binary string from the number.

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

URL_CATEGORY_T

Retrieves URL category and attributes from an URL

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from text_t

- `CATEGORY`

  Returns the category string of the URL. If the URL does not have a category, or if the URL is malformed, this value will be "Uncategorized".

`Returns:` text_t

`*GROUP`

Returns the category group of the URL. This is a higher level grouping of various category strings. If the URL does not have a category, or if the URL is malformed, this value will be "Uncategorized".

`Returns:` text_t

`*REPUTATION`

Returns the reputation score of the URL. Where a score 5 is most risky and 1 is least risky. If the URL does not have a category, or if the URL is malformed, this value will be -1.

`Returns:` num_t

`*TYPECAST_TEXT_T`

Convert url_category_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within

the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"
```

```
    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'

- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Results in a Number Value that is the number of characters (not bytes) in the Text object.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +
```

```
"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw=="
<DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/

<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB

- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` url_category_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out

after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` url_category_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).

- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a

HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX,

DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."
```

```
    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

VENDOR_SPEC_APPID_AVP_T

Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests:
  DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses:
  DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

This topic lists the expressions that are provided by this class.

`*Note`*: Expressions with the * symbol are inherited / promoted from avp_t

- `ACCT_APPLICATION_ID`

  Returns the Acct-Application-Id AVP (code 259) that is nested inside the Vendor_Specific_Application_Id AVP. `Note:` expression can be used to retrieve the value as Unsigned32

`Returns:` avp_unum_t

`*AUTH_APPLICATION_ID`

Returns the Auth-Application-Id AVP (code 258) that is nested inside the Vendor_Specific_Application_Id AVP. `Note:` expression can be used to retrieve the value as Unsigned32

`Returns:` avp_unum_t

`*TYPECAST_AVP_T`

Convert vendor_spec_appid_avp_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).
- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*VENDORID`

Returns the Vendor-Id AVP (code 266) that is nested inside the Vendor_Specific_Application_Id AVP. `Note:` expression can be used to retrieve the value as Unsigned32

`Returns:` avp_unum_t

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*AVPLIST_AFTER`

Returns the region after this AVP in diameter message (or in other words returns location at end of this AVP and length covering end of this AVP to end of diameter message. If this AVP is inside a Grouped AVP, this method returns region after this AVP in parent Grouped AVP.

`Returns:` text_t

`*AVPLIST_BEFORE`

Returns the region till this AVP in diameter message (or in other words returns location at start of AVPs and length equal to offset of this AVP). If this AVP is inside a Grouped AVP, this method returns region till this AVP in parent AVP.

`Returns:` text_t

`*AVP` (`uint` avpcode)

Returns the AVP nested inside the GROUPED AVP (the Data field is a sequence of AVPs).

For example, to retrieve AVP(263) that is nested in AVP(99999) in a request, the expression is: DIAMETER.REQ.AVP(999999).AVP(263).

`Parameters` (expressions not allowed) `:`

avpcode- AVP code

`Returns:` avp_t

`*AVP` (`uint` avpcode, `uint` vendorid)

Returns the specified AVP in given vendor-id namespace and that is nested inside a GROUPED AVP in the message.

For example, to get the AVP with code 1005 and VendorId 10415 from a Request, that is nested inside 1001 (vendor-id 10415). Use this expression: DIAMETER.REQ.AVP(1001, 10415).AVP(1004, 10415).

`Note:` To get AVP that is nested inside a grouped AVP, use the AVP method from the avp_t class.

`Parameters` (expressions not allowed) `:`

avpcode- AVP code

vendorid- Vendor Id

`Returns:` avp_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound

to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*COUNT`

Returns the number of occurences of an AVP in diameter message. The system does not keep track of more than 16 AVP occurences of an AVP. The result will be undefined if there are more than 16 instances of that AVP.

`Returns:` num_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*EXISTS`

Returns true if the AVP exists in the message.

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed) `:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."
```

```
    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"

    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*INSTANCE` (`uint` instanceno)

Returns instances of the AVP.

The first instance of the AVP can be retrieved by simply using the expression: DIAMETER.REQ.AVP(266). However, subsequent instances must be retrieved using this method.

INSTANCE(0) retrieves the first instance, INSTANCE(1) retrieves the second instance, and so on.

For example, lets assume the Route-Record AVP (code 282) has three instances in a request.

- Route-Record: abcd1.netscaler.com
- Route-Record: abcd2.netscaler.com
- Route-Record: abcd3.netscaler.com

To get the second instance, the expression would be: DIAMETER.REQ.AVP(282).INSTANCE(1).

`Parameters` (expressions not allowed) `:`

instanceno- AVP instance number. Maximum value: 15.

`Returns:` avp_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_MANDATORY`

Returns true if the AVP has the Mandatory bit set.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_VENDOR_SPECIFIC`

Returns true if the AVP has Vendor-Specific bit (V) set.

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Returns the AVP length including AVP header.

If the AVP is not present, it returns length 0. If multiple occurences of the AVP exist, it returns the length of first occurence.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +
```

```
"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/

5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)
- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB

- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` vendor_spec_appid_avp_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out

after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\\72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\\b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` vendor_spec_appid_avp_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a

number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL

and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_T`

Convert text_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TEXT_T`

Convert avp_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining

characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests:
  DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses:
  DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*VALUE`

Returns the value of first instance of the AVP as OctetString..

For example, lets assume the Route-Record AVP (code 282) has three instances in a request.

- Route-Record: abcd1.netscaler.com
- Route-Record: abcd2.netscaler.com
- Route-Record: abcd3.netscaler.com

To get the first instance, the expression would be: DIAMETER.REQ.AVP(282).VALUE.

Alternatively, you can use the expression: DIAMETER.REQ.AVP(282).

`Returns:` text_t

`*VALUE` (`uint` instanceno)

Returns value of an instance of the AVP.

The first instance of the AVP can be retrieved by simply using the expression: DIAMETER.REQ.AVP(266). However, subsequent instances must be retrieved using this method.

VALUE(0) retrieves the first instance, VALUE(1) retrieves the second instance, and so on.

For example, lets assume the Route-Record AVP (code 282) has three instances in a request.

- Route-Record: abcd1.netscaler.com
- Route-Record: abcd2.netscaler.com
- Route-Record: abcd3.netscaler.com

To get the second instance, the expression would be: DIAMETER.REQ.AVP(282).VALUE(1).

`Parameters` (expressions not allowed) `:`

instanceno- AVP instance number. Maximum value: 15.

`Returns:` text_t

`*VENDOR_ID`

Returns the Vendor ID if the AVP has the Vendor-Specific bit set.

`Returns:` unsigned_long_at

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

VENDOR_SPEC_RADIUS_AVP_T

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

This topic lists the expressions that are provided by this class.

`*Note` *: Expressions with the * symbol are inherited / promoted from radius_avp_t

- `TYPECAST_RADIUS_AVP_T`

  Convert vendor_spec_radius_avp_t to radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a radius message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(0).
- To get the fourth value of AVP code 26 from a request, use: radius.REQ.AVP(26).VALUE(3).

)

`Returns:` radius_avp_t

`*VENDORID`

Returns the Vendor-Id inside the Vendor_Specific AVP (AVP code 26). `Note:` expression can be used to retrieve the value as Unsigned32

`Returns:` num_at

`*AFTER_REGEX` (`re` regex)

Selects the text after the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

Example: HTTP.REQ.HEADER("etag").AFTER_REGEX(re/KX/) will select "DAPPER" from "KXDAPPER". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*AFTER_STR_ANY` (text_t patset_name)

Selects the Text that is present after the first occurrence of any of the strings that are bound to the patset named by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*AFTER_STR` (text_t s)

Selects the Text that is present after the first occurrence of the string argument. If there is no match for the argument in the current Text then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*APPEND` (bool_at b)

Appends the given boolean's string representation to the current string.

`Parameters``:`

b- the boolean value to append.

`Returns:` text_t

`*APPEND` (double_at i)

Appends the given double's string representation to the current string.

`Parameters``:`

i- the double value to append.

`Returns:` text_t

`*APPEND` (ip_address_at addr)

Appends the given IPv4's string representation to the current string.

`Parameters``:`

addr- the IPv4 address to append.

`Returns:` text_t

`*APPEND` (num_at i)

Appends the given number's string representation to the current string.

`Parameters``:`

i- the number value to append.

`Returns:` text_t

`*APPEND` (time_local_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*APPEND` (unsigned_long_at i)

Appends the given unsigned long's string representation to the current string.

`Parameters``:`

i- the unsigned long value to append.

`Returns:` text_t

`*APPEND` (ipv6_address_at addr)

Appends the given IPv6's string representation to the current string.

`Parameters``:`

addr- the IPv6 address to append.

`Returns:` text_t

`*APPEND` (ipv6_subnet_at addr)

Appends the given IPv6 subnet's string representation to the current string.

`Parameters``:`

addr- the IPv6 subnet to append.

`Returns:` text_t

`*APPEND` (mac_address_at addr)

Appends the given MAC's string representation to the current string.

`Parameters``:`

addr- the MAC address to append.

`Returns:` text_t

`*APPEND` (text_t str)

Appends the given string to the current string.

`Parameters``:`

str- the string to append.

`Returns:` text_t

`*APPEND` (time_at t)

Appends the given time's string representation to the current string.

`Parameters``:`

t- the time value to append.

`Returns:` text_t

`*AVPLIST_AFTER`

Returns the region after this AVP in radius message (or in other words returns location at end of this AVP and length covering end of this AVP to end of radius message.

`Returns:` text_t

`*AVPLIST_BEFORE`

Returns the region till this AVP in radius message (or in other words returns location at start of AVPs and length equal to offset of this AVP).

`Returns:` text_t

`*B64DECODE`

Decodes the selected text using base64 decoding.

For example, the string "TWFu" is converted to "Man"

`Returns:` text_t

`*B64ENCODE`

Encodes the selected text using base64 encoding.

For example, the string "Man" is converted to "TWFu"

`Returns:` text_t

`*BEFORE_REGEX` (`re` regex)

Selects the text before the portion that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.RES.HEADER("content-type").BEFORE_REGEX(re#/#) will select "text" from "text/plain". This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*BEFORE_STR_ANY` (text_t patset_name)

Selects the Text that is present before the first occurrence of any of the strings that are bound to the patset or datasetnamed by the string argument. If there is no match to any of the strings bound to the patset in the current Text object then the result Text object has 0 length. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*BEFORE_STR` (text_t s)

Selects the Text that is present before the first occurrence of the string argument. If there is no match for the argument in the current Text object then the result Text object has 0 length. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*BETWEEN` (text_t start, text_t end)

Results in Boolean TRUE value if length of the Text object is greater than or equal to the sum of the Start and End argument lengths and if the prefix of the Text object matches the Start string argument and if the Suffix of the Text object matches the End string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- Start

end- End

`Returns:` bool_at

`*BIN_DECODE` (binary_encoding_e encoding)

Decode the encoded input into its original byte sequence. An incorrectly enooded input will result in an Undef error.

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are encoded.

`Returns:` text_t

`*BIN_ENCODE` (binary_encoding_e encoding)

Encode the input byte sequence. Note that BIN_ENCODE(hex_colons) is equivalent to BLOB_TO_HEX().

`Parameters` (expressions not allowed) `:`

encoding- specifies how the bytes are to be encoded.

`Returns:` text_t

`*BLOB_TO_HEX`

Convert to hexadecimal representation and select text.

For example, the byte string abc is converted to 61:62:63.

`Returns:` text_t

`*COMPARE` (text_t s)

Results in a Number Value which is the result of comparison of the input argument with the Text object. The result is greater than 0 if the Text object is lexicographically greater than the argument. The result is 0 if the Text object and the argument match. The result is less than 0 if the Text object is lexicographically lesser than the argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` num_at

`*CONTAINS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*CONTAINS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text contains any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed)`:`

patset_name- Pattern Set Name

`Returns:` num_at

`*CONTAINS` (text_t s)

Results in Boolean TRUE value if the Text contains the string given in the argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*COUNT`

Returns the number of occurences of an AVP in radius message. The system does not keep track of more than 16 AVP occurences of an AVP. The result will be undefined if there are more than 16 instances of that AVP.

`Returns:` num_at

`*CRC32`

Returns a 32-bit integer computed by applying a CRC (cyclic redundancy check) function to the selected text. This is the CRC function used by Ethernet, MPEG-2, PKZIP, GZIP, PNG, and many other applications. For example, the expression to compute the CRC value of the (first 1000 bytes of the) body of an HTTP request is: HTTP.REQ.BODY(1000).CRC32

`Returns:` num_at

`*DECODE_USING_TEXT_MODE`

Decodes the selected text using the currently configured text encoding methods like URLENCODED, BACKSLASH_ENCODED, PLUS_AS_SPACE, NOURLENCODED, NO_BACKSLASH_ENCODED and NO_PLUS_AS_SPACE. Text encoding methods are set using SET_TEXT_MODE method.

`Returns:` text_t

`*DECRYPT`

Decrypt the selected base64-encoded ciphertext using the configured encryptionParams.

`Returns:` text_t

`*DECRYPT` (binary_encoding_e in_encoding)

Decrypt the selected ciphertext using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*DECRYPT` (text_t encryptionKey, binary_encoding_e in_encoding)

Decrypt the selected base64-encoded encrypted bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format, and optional initialization vector (IV).

in_encoding- specifies how the input ciphertext is encoded. If the ciphertext is not encoded as specified, causes an Undef error.

`Returns:` text_t

`*DIGEST` (digest_method_e method)

Returns a byte sequence computed by applying the the specified message digest method to the selected text.

`Parameters` (expressions not allowed) `:`

method- digest method to apply to the input text

`Returns:` text_t

`*ENCRYPT`

Encrypt the selected plaintext bytes using the configured encryptionParams. The resulting ciphertext is base64-encoded.

`Returns:` text_t

`*ENCRYPT` (binary_encoding_e out_encoding)

Encrypt the selected plaintext bytes using the configured encryptionParams.

`Parameters` (expressions not allowed) `:`

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

`Returns:` text_t

`*ENCRYPT` (text_t encryptionKey, binary_encoding_e out_encoding)

Encrypt the selected cleartext bytes using the configured encryption key.

`Parameters` (expressions not allowed) `:`

encryptionKey- identifies the encryptionKey object to provide the cipher method, mode, padding, key, encrypted format and optional initialization vector (IV).

out_encoding- specifies how the resulting ciphertext is encoded.

`Returns:` text_t

`*ENDSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*ENDSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text ends with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*ENDSWITH` (text_t end)

Results in Boolean TRUE value if a suffix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

end- String

`Returns:` bool_at

`*EQUALS_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*EQUALS_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text equals any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*EQ` (text_t s)

Results in Boolean TRUE value if the Text object matches the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*EXISTS`

Returns true if the AVP exists in the message.

`Returns:` bool_at

`*GET_SIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_SIGNED8` (`uint` n)

Get the 8-bit signed binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_UNSIGNED16` (`uint` n, endian_e endianness)

Get the 16-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` num_at

`*GET_UNSIGNED32` (`uint` n, endian_e endianness)

Get the 32-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED64` (`uint` n, endian_e endianness)

Get the 64-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

endianness- Select little or big endian

`Returns:` unsigned_long_at

`*GET_UNSIGNED8` (`uint` n)

Get the 8-bit unsigned binary integer at the given offset.

`Parameters``:`

n- Offset in bytes

`Returns:` num_at

`*GET_URLSET_METADATA` (text_t urlset_name)

Returns metadata value corresponding to pattern in the urlset. The matching is case-insensitive for domains, but case-sensitive for paths. If no pattern is matched within the urlset, the return value is a NULL string. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).GET_URLSET_METADATA("urlset_forbidden") returns value when the combined domain and URL is looked up in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed)`:`

urlset_name- urlset name

`Returns:` text_t

`*GE` (text_t s)

Results in Boolean TRUE value if the Text object is greater than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*GRPC`

Interprets a text_t string as a Protocol Buffer (protocol_buffer_t type). Example: HTTP.REQ.BODY(1000).GRPC.STRING(1).EQ("bookname")

`Returns:` protocol_buffer_t

`*GT` (text_t s)

Results in Boolean TRUE value if the Text object is greater than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*HASH`

Returns a positive 31 bit integer value computed by applying a proprietary NetScaler hash function to the selected text. This function is not case- sensitive and ignores whitespaces. For example, applying the HASH function to two strings "Ab c" and "abc" would produce the same value. This function should not be used for security purposes; use instead the DIGEST function with one of the standard digest methods.

`Returns:` num_at

`*HMAC` (text_t hmacKey)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key.

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

`Returns:` text_t

`*HMAC` (text_t hmacKey, binary_encoding_e out_encoding)

Returns a byte sequence computed by applying the HMAC (Hash Message Authenticastion Code) function to the selected text using the configured HMAC key .

`Parameters` (expressions not allowed)`:`

hmacKey- indentifies the hmacKey object to provide the digest (hash) method and the key.

out_encoding- specifies how the resulting HMAC is encoded.

`Returns:` text_t

`*HTML_XML_SAFE`

Apply XML safe transform and select text.

Converts '<', '>' and '&' in the input text to '<', '>' and '&' respectively; other characters in the input are not modified. This transform safeguards against XSS based attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_HEADER_SAFE`

Apply Header safe transform and select text. Converts all new line ('\\n') characters present in the input text to '%0A' so that they can safely be used in HTTP headers. This transform safeguards against response-splitting attacks. This is a read only operation.

`Returns:` text_t

`*HTTP_URL_SAFE`

Apply URL safe transform and select text. Converts URL unsafe characters to corresponding '%xx' values and retains the rest. This is a read only operation.

```
Based on RFC2396, following are considered URL safe characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Exclamation mark: "!"

    Tilde: "~"

    Asterix: "&ast;"

    Single quote: "'"

    Open and close parentheses: "(", ")"

    Semi-colon: ";"

    Colon: ":"
```

```
    At symbol: "@"

    Question mark: "?"

    Equals: "="

    Dollar: "$"

    Percent: "%"

    Ampersand: "&"

    Plus: "+"

    Comma: ","

    Forward slash: ".html"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL unreserved characters, please consider using URL_RESERVED_CHARS_SAFE method.

`Returns:` text_t

`*INSTANCE` (`uint` instanceno)

Returns instances of the AVP.

The first instance of the AVP can be retrieved by simply using the expression: radius.REQ.AVP(26). However, subsequent instances must be retrieved using this method.

INSTANCE(0) retrieves the first instance, INSTANCE(1) retrieves the second instance, and so on.

For example, to get the second instance, the expression would be: radius.REQ.AVP(282).INSTANCE(1).

`Parameters` (expressions not allowed) `:`

instanceno- AVP instance number. Maximum value: 15.

`Returns:` radius_avp_t

`*IS_BOOL_AT`

Results in Boolean TRUE value if the Text is of boolean type.

`Returns:` bool_at

`*IS_DOUBLE_AT`

Results in Boolean TRUE value if the Text is of double data type.

`Returns:` bool_at

`*IS_IPV6_AT`

Results in Boolean TRUE value if the Text is of IPv6 data type.

`Returns:` bool_at

`*IS_IPV6_SUBNET_AT`

Results in Boolean TRUE value if the Text is of IPv6 subnet data type.

`Returns:` bool_at

`*IS_IP_AT`

Results in Boolean TRUE value if the Text is of IPv4 data type.

`Returns:` bool_at

`*IS_MAC_ADDRESS_AT`

Results in Boolean TRUE value if the Text is of mac address data type.

`Returns:` bool_at

`*IS_NUM_AT`

Results in Boolean TRUE value if the Text is of number type.

`Returns:` bool_at

`*IS_NUM_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of number type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*IS_STRINGMAP_KEY` (text_t string_map_name)

Returns true if the string that it operates on is present in the string map. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). IS_STRINGMAP_KEY("url_stringmap") returns true if value of HTTP.REQ.URL is present as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` bool_at

`*IS_TIME_AT`

Results in Boolean TRUE if the Text follows any of the standard time formats given below, otherwise false. Tue, 05 Nov 1994 08:12:31 GMT RFC822 Tuesday, 05-Nov-94 08:12:31 GMT RFC850 Tue Nov 4 08:12:31 1994 asctime

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT`

Results in Boolean TRUE value if the Text is of unsigned long data type.

`Returns:` bool_at

`*IS_UNSIGNED_LONG_AT` (num_format_e format)

Results in Boolean TRUE value if the Text is of unsigned long data type with given input base.

`Parameters` (expressions not allowed) `:`

format- number format

`Returns:` bool_at

`*JWT_VERIFY_CERTKEY` (text_t certkey_name)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key in the X.509 certificate in the specified certkey object. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*JWT_VERIFY_XML` (text_t xml_pkey)

Verifies the signature on the input JSON Web Token (JWT), using the RSA public key supplied by the specified XML element. The token has the format HEADER.PAYLOAD.SIGNATURE where

- HEADER is a base64-encoded JSON structure indicating a signature algorithm and token type, e.g.'{"alg":"RS256","typ":"JWT"}'
- PAYLOAD is a base64-encoded JSON structure with asserted claims, e.g. '{"loggedInAs":"admin","iat":1422779638}'
- SIGNATURE is the base64-encoded bytes for the signature on HEADER.PAYLOAD.

Returns true if the signature is verified for the header and payload using the specified public key; false if the signature is not verified

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the public key. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, if the token is not correctly formatted, or if the verification operation cannot complete.

`Returns:` bool_at

`*LENGTH`

Returns the AVP length including AVP header.

If the AVP is not present, it returns length 0. If multiple occurences of the AVP exist, it returns the length of first occurence.

`Returns:` num_at

`*LE` (text_t s)

Results in Boolean TRUE value if the Text object is less than or equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*LOCATION_LONG`

Get the location qualifier from CLIENT.IP.SRC.LOCATION.GET(n) (ISO short name) and then convert it to human readable long name. This conversion is valid only for country names. Correct Country qualifier value (number) in GET(n) is left up to the user as qualifiers are user configurable. Expression example: CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG For example: Data from each expression CLIENT.IP.SRC.LOCATION: NA.US.California.SantaClara.*.* CLIENT.IP.SRC.LOCATION.GET(1): US CLIENT.IP.SRC.LOCATION.GET(1).LOCATION_LONG: United States

`Returns:` text_t

`*LT` (text_t s)

Results in Boolean TRUE value if the Text object is less than the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*MAP_STRING_DEFAULT_TO_KEY` (text_t string_map_name)

Returns the value corresponding to the key in the string map. This is similar to the MAP_STRING method, but if the key is not present then instead of returning a null string, it returns the key itself. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MAP_STRING` (text_t string_map_name)

Returns value corresponding to key in the string map. Key is the string that it is given as input. Text mode IGNORECASE, NOIGNORECASE - controls whether key lookup in string map is case sensitive or not. For example:

- HTTP.REQ.URL.MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap".
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE). MAP_STRING("url_stringmap") returns value when the value of HTTP.REQ.URL is used as key in the string map whose name is "url_stringmap". Key lookup in this case is done case-insensitively.

`Parameters` (expressions not allowed) `:`

string_map_name- identifies the string map.

`Returns:` text_t

`*MARK_SAFE`

Mark the PIXL expression safe without applying any safe transform.

`Returns:` text_t

`*MAX` (text_t s)

Compares the string argument with the current string and returns the max string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*MIN` (text_t s)

Compares the string argument with the current string and returns the min string. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*NE` (text_t s)

Results in Boolean TRUE value if the Text object is not equal to the input argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` bool_at

`*NORMALIZE_URL`

Normalize URL. Normalizes a URL by doing "percent" decoding. See the description for URLENCODED in the SET_TEXT_MODE function. This performs the equivalent of SET_TEXT_MODE(URLENCODED).DECODE_USING_TEXT_MODE, except that it does not change the value of the current text mode.

`Returns:` text_t

`*PKEY_ENCRYPT_PEM_NO_PADDING` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and RSA_NO_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_ENCRYPT_PEM` (text_t pem_pkey)

Encrypts the input text using the RSA public key provided by the PEM string and the RSA_PKCS1_PADDING padding method. The input text to be encrypted cannot be longer than the public key length minus 11 bytes for padding. For example, for a 1024-bit (128 byte) key, the input text cannot be longer than 128 - 11 = 117 bytes. An Undef error will occur if the input text is too long. A null input will also cause an Undef error. Returns the (unencoded binary) encrypted text, which is typically base-64 encoded for use in a message.

`Parameters``:`

pem_pkey- a text expression that supplies a RSA public key in the PEM format. If the text value is not a valid PEM RSA PUBLIC KEY encoding, an Undef error will occur. Example (a 1024-bit public key):

```
"-----BEGIN RSA PUBLIC KEY-----" +

"MIGJAoGBAKl5vgQEj73Kxp+9yn1v5gPR1pnc4oLM2a0kaWwBOsB6rzCIy6znwnvw" +

"CY1xRvQhRlJSAyJbloL7wZFIJ2FOR8Cz+8ZQWXU2syG+udi4EnWqLgFYowF9zK+o" +

"79az597eNPAjsHZ/C2oL/+6qY5a/f1z8bQPrHC4GpFfAEJhh/+NnAgMBAAE=" +

"-----END RSA PUBLIC KEY-----"
```

`Returns:` text_t

`*PKEY_SIGN_CERTKEY` (text_t certkey_name)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified SSL certKey object.

`Parameters``:`

certkey_name- identifies the configured certKey object. Results in an Undef error if the certkey object does not exist or does not contain an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_SIGN_XML` (text_t xml_pkey)

Generates a binary digital signature using the SHA-256 message digest function and an RSA private key from the specified XML element.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyValue> element with the private key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/
mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/
AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/
7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent>"zNjysxcIJV/
J9cTpIgPp2/x1IXHT5GTH8OMuNad0qtRSLjU1QYUmmkm9QcJJAN+7h8FEXWGabySUzBrHj/
IEbw==" <DP>QavUDQLLQpnPJXtVAo6CYhxOMCd68mwTxYKKNLjmC0pd54SFHllTLPE1FZU5EjK6q3nCeijonpfH+XX
DP> <DQ>EiXOKouJzzXTQJC3TqomF7Uf81yQNxWumOqnd11kepXgyfMwyqMvLlAGEkNSEF/
Bz18R3Wv+MIZ/IC3nLBt2xQ==</DQ>
<InverseQ>ocuCmz36CP+N2aGqxaU+BKD5+3RLgRq9LFhULEz2jKx0iV9r76jsAxn3sLcTYYO9eqRPy2cz74AU
nw==</InverseQ> <D>fTBD773a3GzcmgVdfZlaBLpN1ux2mf5uUVrTUQf7eVFm9egm4/
tzC5A9zjC+I/oscwTH8epL3UfRLdtp05Q6pWfJBXEnGo0QmOFFBK4pLx/
5JJpPGZ69ovDFEVOUHyiCfKE/g97T4WX3us0nFe1272zwGlHarM1YYwvfeE08UdE=</D> </
RSAKeyValue> Results in an Undef error if the XML element is invalid or does not correctly specify an RSA private key, or if the signing operation cannot complete.

`Returns:` text_t

`*PKEY_VERIFY_CERTKEY` (text_t certkey_name, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the specified RSA public key in the X.509 certificate in the specified certKey object. Returns true if the signature is verified, false otherwise.

`Parameters``:`

certkey_name- identifies the certkey object containing an X.509 certificate holding the RSA public key.

signature- the binary signature. Results in an Undef error if the certkey object does not exist or does not contain an X.509 certificate with an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PKEY_VERIFY_XML` (text_t xml_pkey, text_t signature)

Verifies if the input text matches the specified signature generated using the SHA-256 messge digest function and the RSA private key associated with the RSA public key supplied by the specified XML element. Returns true if the signature is verified, false otherwise.

`Parameters``:`

xml_pkey- an expression that supplies an <RSAKeyVAlue> element with the public key. Example: <RSAKeyValue> <Modulus>qXm+BASPvcrGn73KfW/mA9HWmdzigszZrSRpbAE6wHqvMIjLrOfCe/AJjXFG9CFGUlIDIluWgvvBkUgnYU5HwLP7xlBZdTazIb652LgSdaouAVijAX3Mr6jv1rPn3t408COwdn8Lagv/7qpjlr9/XPxtA+scLgakV8AQmGH/42c=</Modulus> <Exponent>AQAB</Exponent> </RSAKeyValue>

signature- the binary signature. Results in an Undef error if the XML element is invalid or does not correctly specify an RSA public key, or if the verification operation cannot complete.

`Returns:` bool_at

`*PREFIX` (`char` c, `uint` i)

Select a prefix of the Text. The selected prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*PREFIX` (`uint` i)

Select a prefix of the Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Prefix Length

`Returns:` text_t

`*REGEX_MATCH` (`re` regex)

Returns TRUE if and only if the text contains at least one match of the regular expression argument. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex.

The regular expression has to be of the format: `re<delimiter>regular expression<same delimiter>`

The regular expression cannot be bigger than 1499 characters.

The regular expression should be acceptable by the PCRE regular expression library. Look at http://www.pcre.org/pcre.txt for documentation on the regular expression syntax. In particular, look at the pcrepattern man page.

There are some differences in the allowed syntax w.r.t PCRE syntax. Backreferences are not allowed. It is recommended not to use recursive regular expressions. The dot metacharacter matches newlines also. Unicode is not supported. SET_TEXT_MODE(IGNORECASE) overrides the (?i) internal option specified in the regular expression.

The PCRE library configuration can be seen in the system log, after executing 'nsapimgr -B" call ns_pixl_regex_show_config()"' at the shell prompt.

Some examples:

- HTTP.REQ.HOSTNAME.REGEX_MATCH(re/\[\[:alpha:\]\]+(abc){2,3}/)
- HTTP.REQ.URL.SET_TEXT_MODE(URLENCODED).REGEX_MATCH(re#(a*b+c*)#)

- HTTP.REQ.URL.REGEX_MATCH(re/a(?i)b/) matches ab and aB
- HTTP.REQ.URL.SET_TEXT_MODE(IGNORECASE).REGEX_MATCH(re/ab/) matches ab, aB, Ab and AB
- HTTP.REQ.BODY.REGEX_MATCH(re/(?ixm) (\^ab (.*) cd$) /) does a case-insensitive, multiline match where the dot metacharacter matches newline also. The regex itself can contain whitespace which will be ignored during the matching (x - extended regex).

This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` bool_at

`*REGEX_REPLACE` (`re` regex, text_t replacement, replacemode_e mode)

Selects the text that matches the given regular expression argument and replaces it with the the text given in the second argument. The third argument specifies whether the first match is only replaced when multiple matches occur in the text or all matches are replaced. The match may occur anywhere within the text - if you wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string then the same string is returned.

For example: HTTP.RES.BODY(999).REGEX_REPLACE(re!\\bpassword:\\s*\\b!, "password: ***", ALL) will replace all occurrences of "password:" with "password: ***" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

replacement- String to replace the match

mode- Mode of replacement

`Returns:` text_t

`*REGEX_SELECT` (`re` regex)

Selects the text that matches the given regular expression argument. The first match is returned when multiple matches occur in the text. The match may occur anywhere within the text - if you

wish to "anchor" this, use "\^" at the start of the regex and/or "$" at the end of the regex. When the regular expression does not match the given string, a Text object of length of 0 is returned.

For example: HTTP.REQ.HEADER("via").REGEX_SELECT(re!NS-CACHE-\\d\\.\\d:\\s*\\d{1,3}!) will select "NS-CACHE-7.0: 70" This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

regex- Regular Expression

`Returns:` text_t

`*REPEAT` (`uint` i)

Produces a string which contains 'i' sequential copies of the input string.

`Parameters``:`

i- the number of times to repeat the string (0 or more)

`Returns:` text_t

`*SET_CHAR_SET` (charset_e charset)

Set the character set to use for subsequent functions that use text.

`Parameters` (expressions not allowed) `:`

charset- Character Set

`Returns:` vendor_spec_radius_avp_t

`*SET_TEXT_MODE` (textmode_e mode)

The mode setting of a Text object controls the behavior of many Text operations. The Text mode settings may also control the behavior of some operations in objects (like List) that build upon the Text object. IGNORECASE, NOIGNORECASE - controls whether string comparison is case sensitive or not. URLENCODED - If set then all Text operations are carried out after translating all %HH or %uHHHH encodings in the underlying byte stream. 1. %HH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http%3a/.html" will be decoded to "http:/.html" 2. %uWWHH will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and HH denotes the ascii value of character Z in hexadecimal. For example, the encoded text

"http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" NOURLENCODED - Indicates that no percent encodings are present in the Text object. No percent decoding will be performed on the Text object. PLUS_AS_SPACE - If set then all Text operations are carried out after converting occurrences of the plus character to whitespace. For example, the text "hello+world" will be decoded to "hello world" NO_PLUS_AS_SPACE - If set, then the plus character will not be converted to whitespace in the Text object. BACKSLASH_ENCODED - If set, then all Text operations are carried out after performing the following operations: 1. \\XXX will be translated to the character Y where XXX denotes the ascii value of character Y in octal. The valid range of octal values for this type of encoding is \\0 to \\377. For example, the encoded text "http\ \72/.html" and "http\\072/.html" will both be decoded to "http:/.html" 2. \\xHH will be translated to the character Y where HH denotes the ascii value of character Y in hexadecimal. For example, the encoded text "http\\x3a/.html" will be decoded to "http:/.html" 3. \\\\uWWXX will be translated to the character sequence YZ where WW denotes the ascii value of character Y in hexadecimal and XX denotes the ascii value of character Z in hexadecimal. For example, the encoded text "http%u3a2f.html" and "http%u003a/.html" will both be decoded to"http:/.html" 4. Occurences of "\ \b", "\\n", "\\t", "\\f" and "\\r" are translated to the corresponding ascii characters. NO_BACKSLASH_ENCODED - If set, then backslash decoding will not be performed on the Text object. BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF is raised if either the URLENCODED or BACKSLASH_ENCODED mode is set and a bad encoding corresponding to the specified encoding mode is encountered. NO_BAD_ENCODE_RAISE_UNDEF - If set, then UNDEF will not be raised when a bad encoding is encountered in the Text object. The Text operations operate on characters (as opposed to operating on bytes). By default a single byte represents a character using the ASCII encoding. But if URLENCODED mode is set then 3 bytes may represent a character. A PREFIX(3) operation will select the first 3 characters in the Text object. That means it may select up to 9 bytes for URLENCODED Text object. In the case of multibyte decodings as a result of %uXXXX or \\\\uXXXX, Text operations which attempt to treat the multiple decoded bytes as distinct characters are not allowed.

`Parameters` (expressions not allowed) `:`

mode- Text Mode

`Returns:` vendor_spec_radius_avp_t

`*SKIP` (`char` c, `uint` i)

Select the Text after skipping over a prefix of the current Text. The skipped over prefix is the longest prefix that has at most Count (2nd argument) occurrences of character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SKIP` (`uint` i)

Select the Text after skipping over a prefix in the current Text. The length of the prefix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is skipped over.

`Parameters` (expressions not allowed) `:`

i- Prefix Length

`Returns:` text_t

`*STARTSWITH_ANY` (text_t patset_name)

Results in Boolean TRUE value if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` bool_at

`*STARTSWITH_INDEX` (text_t patset_name)

Returns the numerical index of the matching string, if the Text starts with any of the strings that are bound to the patset or dataset named by the string argument. Returns 0 if there is no match. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` num_at

`*STARTSWITH` (text_t start)

Results in Boolean TRUE value if a prefix of the Text object matches the string argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

start- String

`Returns:` bool_at

`*STRIP_CHARS` (text_t s)

From the selected text remove the characters specified in the string.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_CHARS('.=') or STRIP_CHARS('..=') the selected text will become /fooxyzbar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_CHARS` (text_t s)

Selects the Text after stripping off characters in the end of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_END_CHARS('ar') the selected text will become /foo.xyz=b /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_END_WS`

Selects the Text after stripping off white space in the end of the current Text object.

`Returns:` text_t

`*STRIP_START_CHARS` (text_t s)

Selects the Text after stripping off characters in the beginning of the current Text object.

For example: Say the selected text is / "foo.xyz=bar" /. Then on executing STRIP_START_CHARS('of') the selected text will become /.xyz=bar /. Note that repeating character has same effect as it would be if it present only once. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*STRIP_START_WS`

Selects the Text after stripping off white space in the beginning of the current Text object.

`Returns:` text_t

`*SUBSTR_ANY` (text_t patset_name)

Select any one sub-string that matches any string in the given patset or dataset. The patset cannot have strings longer than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

patset_name- Pattern Set Name

`Returns:` text_t

`*SUBSTR` (`uint` start, `uint` len)

Select the Text object of the given length at the given offset. Offset it 0 based. If there aren't enough characters after the offset then all the remaining characters are selected.

`Parameters``:`

start- Offset

len- Length

`Returns:` text_t

`*SUBSTR` (text_t s)

Select the first Text object that matches the input string argument. The input string cannot be bigger than 255 characters. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

s- String

`Returns:` text_t

`*SUFFIX` (`char` c, `uint` i)

Select a suffix of the Text. The selected suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*SUFFIX` (`uint` i)

Select a suffix of the Text. The length of the suffix is equal to the number in the argument. If there aren't enough characters in the Text object then the entire Text is selected.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TO_LOWER`

Converts the selected text to lower case.

For example, the string "ABCd" is converted to "abcd"

`Returns:` text_t

`*TO_UPPER`

Converts the selected text to upper case.

For example, the string "abcD" is converted to "ABCD"

`Returns:` text_t

`*TRUNCATE` (`char` c, `uint` i)

Select the Text after truncating a suffix from the current Text object. The truncated suffix is the longest possible suffix containing at most Count (2nd arg) occurrences of the character in the 1st argument. This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters``:`

c- Character

i- Count

`Returns:` text_t

`*TRUNCATE` (`uint` i)

Select the Text after truncating a suffix of the Text. The length of the suffix truncated is equal to the number in the argument. If there aren't enough characters in the Text then then all the characters are truncated.

`Parameters``:`

i- Suffix Length

`Returns:` text_t

`*TYPECAST_AVP_T`

Convert text_t to avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_t : Operations that can be performed on the returned AVPs.

`Note:` An AVP can have multiple instances in a Diameter message. However, the system can access only the first 16 instances.

`Example:`

- To get the first value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(0).

- To get the fourth value of AVP code 266 from a request, use: DIAMETER.REQ.AVP(266).VALUE(3).
- To check if AVP code 1000 in the response has the vendor-specific bit set, use: DIAMETER.RES.AVP(1000).IS_VENDOR_SPECIFIC.

)

`Returns:` avp_t

`*TYPECAST_AVP_UNUM_T`

Convert text_t to avp_unum_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (avp_unum_t : In Diameter AVP based expressions can be written as DIAMETER.REQ.AVP(<avpcode>). For example Auth-Application-Id AVP (AVP code 258) can be extracted as DIAMETER.REQ.AVP(258) For few of the important AVPs we provide aliases. For example this AVP based expression can also be written as DIAMETER.REQ.AUTH_APPLICATION_ID. This expression returns either a object of class avp_t or returns a numerical value (object of class unsigned_long_at). The numerical value for this object is derived from the value in first instance of the AVP.)

`Returns:` avp_unum_t

`*TYPECAST_BOOL_AT`

Convert text_t to bool_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (bool_at : Boolean Operations)

`Returns:` bool_at

`*TYPECAST_COOKIE_T`

Convert text_t to cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (cookie_t : The HTTP Cookie type provides operations for a cookie as it appears in the Set-Cookie and Set-Cookie2 header. In this type the Name-Value List operations are also available. The first delimiter is = and the element delimiter is ;. Multiple consecutive ; are treated as one. (Same as applying the method IGNORE_EMPTY_ELEMENTS on a Name-Value List.) You can use the Name-value List operations to access cookie attributes. The name comparison for all list operations is case insensitive. In this type Text operations are also available. Each cookie begins with a COOKIE_NAME=COOKIE_VALUE pair followed by zero or more semi-colon separated attribute-value pairs. If an attribute appears more than once in a cookie, the value associated with the first appearance of the attribute is returned.

Format Cookie: Cookie1=Value;Version=decimal;Value;Domain=Value;Path=Value)

`Returns:` cookie_t

`*TYPECAST_DIAMETER_FLAG_T`

Convert text_t to diameter_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (diameter_flag_t : Provides operation to treat the underlying 1 byte as set of bit flags. then set/unset/test/reset_all operations can be done on flag)

`Returns:` diameter_flag_t

`*TYPECAST_DNS_DOMAINNAME_T`

Convert text_t to dns_domainname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_domainname_t : This object provides operations for parsing the DNS domain name as it appears at various places in the DNS data. The format is abc.foo.com.)

`Returns:` dns_domainname_t

`*TYPECAST_DNS_FLAG_T`

Convert text_t to dns_flag_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (dns_flag_t : Provides operations to test/set/unset a flag in dns header.)

`Returns:` dns_flag_t

`*TYPECAST_DOUBLE_AT`

Convert text_t to double_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_at : Double Value)

`Returns:` double_at

`*TYPECAST_DOUBLE_T` (double_format_e format)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, double_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, ip_address_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, num_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_local_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, time_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one

or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_DOUBLE_T` (double_format_e format, unsigned_long_at default_value)

Convert text_t to double_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (double_t : Treat the underlying text as a Double in the given format. The supported formats are DECIMAL, DECIMAL_PREFIX. All the formats strip off the beginning white space. DECIMAL also strips off trailing white space. DECIMAL requires that all the remaining characters must be a proper double value. DECIMAL_PREFIX requires that at least one or more more characters in the prefix must be a proper double value. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Double

`Returns:` double_t

`*TYPECAST_HTTP_CACHE_CONTROL_T`

Convert text_t to http_cache_control_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cache_control_t : This object provides for the ability to work on HTTP Cache-Control headers. The name comparison for all list operations is case insensitive.)

`Returns:` http_cache_control_t

`*TYPECAST_HTTP_CONTENT_LENGTH_T`

Convert text_t to http_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_content_length_t : The HTTP.REQ.CONTENT_LENGTH or HTTP.RES.CONTENT_LENGTH object can be treated as a

HTTP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` http_content_length_t

`*TYPECAST_HTTP_COOKIE_T`

Convert text_t to http_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_cookie_t : This object provides operations for parsing the HTTP cookie header. The name-value pair is derived from the value in the last instance of Cookie header. The format is Cookie : name0=value0; name1=value1; An HTTP Cookie header can have multiple occurrences. COUNT will return a Number containing how many headers of the current type exist. The name comparison for all list operations is case insensitive. The system does not keep track of more than 15 HTTP headers. The result will be undefined if there are more than 15 instances of the header.)

`Returns:` http_cookie_t

`*TYPECAST_HTTP_DATE_T`

Convert text_t to http_date_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_date_t : The HTTP.REQ.DATE or HTTP.RES.DATE object can be treated as a HTTP header or a Time object. The Time value is derived from the value in the last instance of the Date header. The date formats supported are RFC 822 (updated by RFC 1123), RFC 1036 (obsoletes RFC850) and ANSI C asctime() formats.)

`Returns:` http_date_t

`*TYPECAST_HTTP_HEADER_T` (text_t name)

Convert text_t to http_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_header_t : When typecasting a Text object to HTTP Header a header name must be provided.For example: HTTP.REQ.HEADER("MyHdr").TYPECAST_HTTP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` http_header_t

`*TYPECAST_HTTP_HOSTNAME_T`

Convert text_t to http_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_hostname_t : This object provides operations for parsing the HTTP hostname as it appears at various places in the HTTP protocol data. The format is abc.foo.com:8080.)

`Returns:` http_hostname_t

`*TYPECAST_HTTP_METHOD_T`

Convert text_t to http_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_method_t : This object provides Text operations and HTTP Request Method Enum operations on the HTTP request method.)

`Returns:` http_method_t

`*TYPECAST_HTTP_SET_COOKIE_T`

Convert text_t to http_set_cookie_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_set_cookie_t : HTTP.RES.SET_COOKIE provides operations for parsing and operating on the SET-COOKIE header that is present in the HTTP response. HTTP Set-Cookie header supports Text and HTTP Header operations. For most Text operations the value in the last Set-Cookie header is selected. HTTP Set-Cookie header also supports special operations to extract cookies from the response. It is assumed that there will be only one cookie in a Set-Cookie header.)

`Returns:` http_set_cookie_t

`*TYPECAST_HTTP_URL_T`

Convert text_t to http_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_url_t : HTTP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the HTTP request header. The supported format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a HTTP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` http_url_t

`*TYPECAST_HTTP_VERSION_T`

Convert text_t to http_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (http_version_t : HTTP.REQ.VERSION or HTTP.RES.VERSION provide operations to extract HTTP version information.)

`Returns:` http_version_t

`*TYPECAST_IPV6_ADDRESS_AT`

Convert text_t to ipv6_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_at : Provides operations for the 128-bit IPv6 address value. Some general information regarding IPv6 expressions: IPv6 PIXL expressions can be combined with other PIXL expressions using the '+' operator. The output is expected to be the concatenation of the string representations of the individual PIXL expressions. No other operator other than '+' is expected to work when any of the operands is an IPv6 PIXL expression. Also, IPv6 PIXL expressions can be combined with any other type of PIXL expression except a PIXL expression that produces a bool result. In other words, if A and/or B are two IPv6 addresses, A+B should result in the string AB. When one of A or B is an IPv6 address, the other can only be a number or a string and not a boolean. Further, when A and/or B is an IPv6 address, the only operator allowed between them is '+'.

Example: Let the client source IPv6 address be ABCD:1234::ABCD. Let the server destination IPv4 address be 10.100.10.100. Then the expression CLIENT.IPV6.SRC + SERVER.IP.DST should produce the output "ABCD:1234::ABCD10.100.10.100". Similarly, CLIENT.IPV6.SRC + 5 should produce the result ABCD:1234::ABCD5)

`Returns:` ipv6_address_at

`*TYPECAST_IPV6_ADDRESS_T`

Convert text_t to ipv6_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_address_t : This object represents an IPv6 address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF format.)

`Returns:` ipv6_address_t

`*TYPECAST_IPV6_SUBNET_AT`

Convert text_t to ipv6_subnet_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_at : Provides operations for the integral IPv6 subnet address value.)

`Returns:` ipv6_subnet_at

`*TYPECAST_IPV6_SUBNET_T`

Convert text_t to ipv6_subnet_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ipv6_subnet_t : This object represents an IPv6 subnet address present in the 1000:1001:CD10:0000:0000:89AB:4567:CDEF/64 format.)

`Returns:` ipv6_subnet_t

`*TYPECAST_IP_ADDRESS_AT`

Convert text_t to ip_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_at : Provides operations for the 32-bit integral IP address value.)

`Returns:` ip_address_at

`*TYPECAST_IP_ADDRESS_T`

Convert text_t to ip_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_address_t : Represents an IP address present in the 10.100.200.1 format.)

`Returns:` ip_address_t

`*TYPECAST_IP_OPTIONS_T`

Convert text_t to ip_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_t : IP protocol options)

`Returns:` ip_options_t

`*TYPECAST_IP_OPTIONS_TYPE_T`

Convert text_t to ip_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_options_type_t : IP Options Type)

`Returns:` ip_options_type_t

`*TYPECAST_IP_TOS_T`

Convert text_t to ip_tos_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ip_tos_t : Provides operations to TOS field in IP header.)

`Returns:` ip_tos_t

`*TYPECAST_LIST_T` (`char` sep)

Convert text_t to list_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (list_t : The character separator has to be provided when typecasting a textual context to list type. The current text mode has no effect on the character separator. For example if the current text mode is IGNORECASE and the separator is p then P will not be treated as a separator.)

`Parameters` (expressions not allowed) `:`

sep- Separator

`Returns:` list_t

`*TYPECAST_MAC_ADDRESS_AT`

Convert text_t to mac_address_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_at : Provides operations for the 48-bit MAC address value.)

`Returns:` mac_address_at

`*TYPECAST_MAC_ADDRESS_T`

Convert text_t to mac_address_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (mac_address_t : Represents a MAC address present in the 12:34:56:78:9a:bc format.)

`Returns:` mac_address_t

`*TYPECAST_NUM_AT`

Convert text_t to num_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_at : Number Value)

`Returns:` num_at

`*TYPECAST_NUM_T` (num_format_e format)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and

HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` num_t

`*TYPECAST_NUM_T` (num_format_e format, num_at default_value)

Convert text_t to num_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (num_t : Treat the underlying text as a Number in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` num_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters have to be provided when typecasting a Text object to a Name-Value List. The first delimited separates the name from the value. The second delimiter separates list items. For example typecast_nvlist_t('=', '&') handles a URL query string. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

`Returns:` nvlist_t

`*TYPECAST_NVLIST_T` (`char` sep1, `char` sep2, `char` quote)

Convert text_t to nvlist_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (nvlist_t : Two character delimiters and quote-character have to be provided when typecasting a Text object to a Name-Value List that supports quote-character. The first delimited separates the name from the value. The second delimiter separates list items. The third value specifies the quote character. For example typecast_nvlist_t('=', ';', "") handles a name-value list separated by semi-colons that allows quoting. The quote-character specifies that the value can occur within the quotes and the delimiters within the quote-characters should not be taken into account. The Text Mode has no effect on the character delimiters. For example if the current text mode is IGNORECASE and a delimiter is p then P will not be treated as a delimiter.)

`Parameters` (expressions not allowed) `:`

sep1- delimiter1

sep2- delimiter2

quote- quote-character.

`Returns:` nvlist_t

`*TYPECAST_PROTOCOL_BUFFER_T`

Convert text_t to protocol_buffer_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (protocol_buffer_t : gRPC Protocol Buffers interface)

`Returns:` protocol_buffer_t

`*TYPECAST_RADIUS_AVP_VALUE_T`

Convert text_t to radius_avp_value_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (radius_avp_value_t : Provides operations to typecast RADIUS AVP value to Integer value or IP Address.)

`Returns:` radius_avp_value_t

`*TYPECAST_SEQ_TEXT_T`

Convert text_t to seq_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (seq_text_t : Represents the Text Sequence class.)

`Returns:` seq_text_t

`*TYPECAST_SERVICEPATH_T`

Convert text_t to servicepath_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (servicepath_t : Operations that can be performed on the service path.

`Example:`

- To get the name of the service path applicable to current subscriber, use: SUBSCRIBER.SERVICEPATH
- To determine If the service function is the next in the service path applicable to scubscriber, use: SUBSCRIBER.SERVICEPATH.IS_NEXT().

)

`Returns:` servicepath_t

`*TYPECAST_SIP_CALLID_HEADER_T`

Convert text_t to sip_callid_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_callid_header_t : This object provides operations for parsing the SIP callid header.)

`Returns:` sip_callid_header_t

`*TYPECAST_SIP_CONTENT_LENGTH_T`

Convert text_t to sip_content_length_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_content_length_t : The SIP.REQ.CONTENT_LENGTH or SIP.RES.CONTENT_LENGTH object can be treated as a SIP Header or as a Number. The numerical value for this object is derived from the value in the last instance of the Content-Length header.)

`Returns:` sip_content_length_t

`*TYPECAST_SIP_FROM_HEADER_T`

Convert text_t to sip_from_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_from_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_from_header_t

`*TYPECAST_SIP_HEADER_T` (text_t name)

Convert text_t to sip_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_header_t : When typecasting a Text object to SIP Header a header name must be provided.For example: SIP.REQ.HEADER("MyHdr").TYPECAST_SIP_HEADER_T("InHdr"))

`Parameters` (expressions not allowed) `:`

name- Header Name

`Returns:` sip_header_t

`*TYPECAST_SIP_HOSTNAME_T`

Convert text_t to sip_hostname_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_hostname_t : This object provides operations for parsing the SIP hostname as it appears at various places in the SIP protocol data. The format is abc.foo.com:5060.)

`Returns:` sip_hostname_t

`*TYPECAST_SIP_METHOD_T`

Convert text_t to sip_method_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_method_t : This object provides Text operations and SIP Request Method Enum operations on the SIP request method.)

`Returns:` sip_method_t

`*TYPECAST_SIP_TO_HEADER_T`

Convert text_t to sip_to_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_to_header_t : This object provides operations for parsing the SIP From header.)

`Returns:` sip_to_header_t

`*TYPECAST_SIP_URL_T`

Convert text_t to sip_url_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_url_t : SIP.REQ.URL provides operations for parsing and operating on the URL that is present in the first line of the SIP request header. The supported

format is \[<protocol>://<hostname>\]<path>?<query>. The Text object backing a SIP URL object has the Text Mode set to URLENCODED by default.)

`Returns:` sip_url_t

`*TYPECAST_SIP_VERSION_T`

Convert text_t to sip_version_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_version_t : SIP.REQ.VERSION or SIP.RES.VERSION provide operations to extract SIP version information.)

`Returns:` sip_version_t

`*TYPECAST_SIP_VIA_HEADER_T`

Convert text_t to sip_via_header_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sip_via_header_t : This object provides operations for parsing the SIP Via header.)

`Returns:` sip_via_header_t

`*TYPECAST_SSLVPN_MODE_T`

Convert text_t to sslvpn_mode_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (sslvpn_mode_t : This object provides Text operations and SSLVPN Mode Enum operations on the SSLVPN request method.)

`Returns:` sslvpn_mode_t

`*TYPECAST_SSL_TEXT_T` (text_t name)

Convert text_t to ssl_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (ssl_text_t : Treat the underlying text object as SSL Text.)

`Parameters` (expressions not allowed) `:`

name- Name

`Returns:` ssl_text_t

`*TYPECAST_TCP_OPTIONS_T`

Convert text_t to tcp_options_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_t : TCP Protocol Options)

`Returns:` tcp_options_t

`*TYPECAST_TCP_OPTIONS_TYPE_T`

Convert text_t to tcp_options_type_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_options_type_t : TCP Protocol Options Type)

`Returns:` tcp_options_type_t

`*TYPECAST_TCP_REPEATER_OPTION_T`

Convert text_t to tcp_repeater_option_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (tcp_repeater_option_t : TCP Protocol Option : Repeater)

`Returns:` tcp_repeater_option_t

`*TYPECAST_TEXT_T`

Convert radius_avp_t to text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (text_t : Designates any piece of text.)

`Returns:` text_t

`*TYPECAST_TIME_AT`

Convert text_t to time_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s.)

`Returns:` time_at

`*TYPECAST_TIME_LOCAL_AT`

Convert text_t to time_local_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_local_at : Treats a number value as number of seconds since GMT Jan 1 1970 0h 0m 0s as adjsuted for the local time zone.)

`Returns:` time_local_at

`*TYPECAST_TIME_T`

Convert text_t to time_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (time_t : This object treats a Text object as a date string. The formats supported are

1\. RFC822 :: Sun, 06 Nov 1994 08:49:37 GMT 2\. RFC850 :: Sunday, 06-Nov-94 08:49:37 GMT 3\. ASCTIME :: Sun Nov 6 08:49:37 1994 4\. ASCTIME like :: Sun Nov 6 08:49:37 1994 5\. ASCTIME like :: Sun Nov 06 08:49:37 1994 6\. Http Set-Cookie Expiry date :: Sun, 06-Nov-1994 08:49:37 GMT)

`Returns:` time_t

`*TYPECAST_UNSIGNED_LONG_AT`

Convert text_t to unsigned_long_at. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_at : Unsigned Long(64bit) Value)

`Returns:` unsigned_long_at

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error.)

`Parameters` (expressions not allowed) `:`

format- Format

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, ip_address_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining

characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, unsigned_long_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, num_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_local_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNSIGNED_LONG_T` (unsigned_long_format_e format, time_at default_value)

Convert text_t to unsigned_long_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unsigned_long_t : Treat the underlying text as a Unsigned Long in the given format. The supported formats are DECIMAL, HEX, DECIMAL_PREFIX, HEX_PREFIX. All the formats strip off the beginning white space. DECIMAL and HEX also strip off trailing white space. DECIMAL and HEX require that all the remaining characters must be proper digits. DECIMAL_PREFIX and HEX_PREFIX require that at least one or more more characters in the prefix must be proper digits. In case of overflow, there will be a parsing error. In case of parsing error the default value will be assumed.)

`Parameters` (expressions not allowed) `:`

format- Format

default_value- Number

`Returns:` unsigned_long_t

`*TYPECAST_UNUM_TEXT_T`

Convert text_t to unum_text_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (unum_text_t : Provides operations to treat the underlying OctectString as Binary String or unsigned long value .)

`Returns:` unum_text_t

`*TYPECAST_URL_CATEGORY_T`

Convert text_t to url_category_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (url_category_t : Retrieves URL category and attributes from an URL)

`Returns:` url_category_t

`*TYPECAST_VENDOR_SPEC_APPID_AVP_T`

Convert text_t to vendor_spec_appid_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_appid_avp_t : Retrieves AVPs that are nested in the grouped AVP Vendor-Specific-Application-Id (code 260). The nested AVPs are:

- Vendor-Id
- Auth-Application-Id
- Acct-Application-Id

For example, to retrieve the Auth-Application-Id AVP from the Vendor-Specific-Application-Id AVP:

- For requests: DIAMETER.REQ.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID
- For responses: DIAMETER.RES.VENDOR_SPECIFIC_APPLICATION_ID.AUTH_APPLICATION_ID

)

`Returns:` vendor_spec_appid_avp_t

`*TYPECAST_VENDOR_SPEC_RADIUS_AVP_T`

Convert text_t to vendor_spec_radius_avp_t. Will raise an undef if the value is null, empty, or the value has an invalid format for the destination type. (vendor_spec_radius_avp_t :

- Vendor-Id

To retrieve the Vendor-Id from the Vendor-Specific AVP:

- RADIUS.REQ.VENDOR_SPECIFIC.VENDORID

)

`Returns:` vendor_spec_radius_avp_t

`*UNQUOTE` (`char` c)

If selected text is quoted by character c, Remove character c from beginning and end.

For example: Say the selected text is / "foo xyz bar " /. Then on executing UNQUOTE("") the selected text will become /foo xyz bar / This method is affected by whether the text mode is case sensitive or insensitive.

`Parameters` (expressions not allowed) `:`

c- Character

`Returns:` text_t

`*URLSET_MATCHES_ANY` (text_t urlset_name)

Results in Boolean TRUE value if and only if the Text matches any of the patterns that are specified in the urlset named by the string argument. The matching is case-insensitive for domains, but case-sensitive for paths. For example:

- HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URLSET_MATCHES_ANY("urlset_forbidden") returns true when the combined domain and URL matches any pattern in the urlset whose name is "urlset_forbidden".

`Parameters` (expressions not allowed) `:`

urlset_name- urlset name

`Returns:` bool_at

`*URL_CATEGORIZE` (`uint` min_reputation, `uint` max_reputation)

Returns the URL category for the supplied URL with the given minimum and maximum reputation score. Where a score of 5 is most risky and 1 is least risky. If either score is set to 0, that bound would be ignored. By specifying the reputation scores, the function will returned the category with the highest score (most risky) based on the bounds. If there was an error getting the category or if the URL is invalid then it will result in an Undef error. For example: HTTP.REQ.HOST.APPEND(HTTP.REQ.URL).URL_CATEGORIZE(0, 0) returns value when the combined domain and URL is looked up for the URL category with the highest reputation score (most risky).

`Parameters` (expressions not allowed) `:`

min_reputation- Minimum reputation score of URL category

max_reputation- Maximum reputation score of URL category

`Returns:` url_category_t

`*URL_RESERVED_CHARS_SAFE`

Converts URL reserved characters to corresponding '%XX' values and retains the rest. This is a read only operation.

```
Based on RFC3986, following are considered URL unreserved characters:

    Alpha-numeric characters: a-z, A-Z, 0-9

    Hyphen and underscore: "-", "_"

    Dot: "."

    Tilde: "~"
```

The rest are converted to %XX encoding, 'XX' is the hex-based representation of the input character. If the requirement is to encode all but URL safe characters, please consider using HTTP_URL_SAFE method.

`Returns:` text_t

`*VALUE`

Returns the value of first instance of the AVP as OctetString.. If there are multiple occurence of AVP(28). To get the first instance the expression would be: radius.REQ.AVP(28).VALUE.

`Returns:` radius_avp_value_t

`*VALUE` (`uint` instanceno)

Returns value of an instance of the AVP.

The first instance of the AVP can be retrieved by simply using the expression: radius.REQ.AVP(266). However, subsequent instances must be retrieved using this method.

VALUE(0) retrieves the first instance, VALUE(1) retrieves the second instance, and so on.

`Parameters` (expressions not allowed) `:`

instanceno- AVP instance number. Maximum value: 15.

`Returns:` radius_avp_value_t

`*XML_DECRYPT` (text_t certKeyName)

Decrypt the selected content, which was encrypted using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing the RSA private key to be used to decrypt the bulk encryption key in the selected EncryptedData element.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

`Returns:` text_t

`*XML_ENCRYPT` (text_t certKeyName, encrypt_method_e method, `uint` flags)

Encrypt the selected cleartext using the W3C XML Encryption standard.

`Parameters` (expressions not allowed) `:`

certKeyName- identifies the certkey object containing an X.509 certificate with the RSA public key to be used to encrypt the generated bulk encryption key. Note that the certKey object need not, and usually will not, include the associated RSA private key.

method- specifies the bulk encryption method (rc4, des3, aes128, aes192, or aes256) used to encrypt the content.

flags- optional bit mask to specify optional elements in the EncryptedData element. These are hints to tell the receiver what private key to use to decrypt the bulk encryption key, providing information from the certKey's X.509 certificate.

- 1 - include a KeyName element with the certKeyName;
- 2 - include a KeyValue element with the RSA public key from the certificate;
- 4 - include an X509IssuerSerial element with the certificate serial number and issuer DN;
- 8 - include an X509SubjectName element with the certificate subject DN;
- 16 - include an X509Certificate element with the entire certificate;

`Returns:` text_t

`*XPATH_HTML_WITH_MARKUP` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string, including markup like element tags. node-sets are converted to strings using the standard XPath string conversion routine. The selected portion of the document can be used as the target for rewrite actions.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML_WITH_MARKUP(xp%//md/head/title%) returns the <title> element in the document's <head> This can be used in a rewrite action to replace or delete the <title> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` text_t

`*XPATH_HTML` (`xpath_bool` xpathex)

Applies an XPath expression to the DOM for an HTML document and a boolean value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%boolean(/md/head/meta)%) returns true if the <meta> element exists as a child of <head> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` bool_at

`*XPATH_HTML` (`xpath_double` xpathex)

Applies an XPath expression to the DOM for an HTML document and a double value.

Examples: HTTP.RES.BODY(1000).XPATH_HTML(xp%number(//video/@height)%) returns the numeric value of the height attribute of the first <video> element.

`Parameters` (expressions not allowed) `:`

xpathex- XPath Expression

`Returns:` double_at

`*XPATH_HTML` (`xpath_str` xpathex)

Applies an XPath expression to the DOM for an HTML document and returns the selected node-set or string. node-sets are converted to strings using the standard XPath string conversion routine.

Examples: HTTP.REQ.BODY(1000).XPATH_HTML(xp%//img/@src%) returns the string value of the src attribute of the first

VLAN_REQ_T

VLAN Request

This topic lists the expressions that are provided by this class.

- `ID`

  Returns the ID of the VLAN through which the current packet entered the Application Switch as a number.

`Returns:` num_at

VLAN_RES_T

VLAN Response

This topic lists the expressions that are provided by this class.

- `ID`

  Returns the ID of the VLAN through which the current packet entered the Application Switch as a number.

`Returns:` num_at

VSERVER_STATE_E

This object represents state of the Vserver.

Enumerations

UP

State is "UP" for vserver that is UP (running).

DOWN

State is "DOWN" for vserver that is DOWN (not running).

OUT_OF_SERVICE

State is "OUT_OF_SERVICE" for vserver that is out of service. No monitoring packets and no requests are sent to the server that is out of service.

This topic lists the expressions that are provided by this class.

`EQ` (vserver_state_e m)

The result is Boolean TRUE if the input argument is equal to the Vserver State represented by this object.

`Parameters` (expressions not allowed) `:`

m- Vserver State Name

`Returns:` bool_at

`NE` (vserver_state_e m)

The result is Boolean TRUE if the input argument is not equal to the Vserver State represented by this object.

`Parameters` (expressions not allowed) `:`

m- Vserver State Name

`Returns:` bool_at

VSERVER_TYPE_E

This object represents type of the Vserver.

Enumerations

LB

Load Balancing Vserver.

CS

Content Switching Vserver.

CR

Cache Redirection Vserver.

GSLB

Global Server Load Balancing VServer.

VPN

VPN VServer.

AUTHN

Authentication VServer.

USER

User VServer.

This topic lists the expressions that are provided by this class.

`EQ` (vserver_type_e vserverType)

The result is Boolean TRUE if the input argument is equal to the Vserver type represented by this object.

Example: `HTTP.REQ.VSERVER.TYPE.EQ(LB)`

`Parameters` (expressions not allowed) `:`

```
vserverType- Vserver Type
```

`Returns:` bool_at

`NE` (vserver_type_e vserverType)

The result is Boolean TRUE if the input argument is not equal to the Vserver type represented by this object.

Example: `HTTP.REQ.VSERVER.TYPE.NE(LB)`

`Parameters` (expressions not allowed) `:`

```
vserverType- Vserver Type
```

`Returns:` bool_at

VSERVER_T

Operates on a vserver

This topic lists the expressions that are provided by this class.

- `ACTIVESERVICES`

  Returns number of active services Raises undef if used on non ADDR based vservers

`Returns:` num_at

- `ACTIVETRANSACTIONS`

  Returns current active transaction counter accumulated on vserver level

`Returns:` unsigned_long_at

- `AVERAGESURGECOUNT`

  Returns average number of requests in surge queue per active service Raises undef if used on non ADDR based vservers

`Returns:` double_at

- `CONNECTIONS`

  Returns number of connections on the vserver as Unsigned long number.

`Returns:` unsigned_long_at

`DETERMINE_SERVICES` (server_attr_e attr, text_t separator)

Determines the services selected by the LoadBalancing Algorithm on a given vserver and returns a list of them in the preference order.

`Parameters` (expressions not allowed) `:`

attr- - Service Attribute which could be service description - 'DESCRIPTION', service name - 'NAME', service IP - 'IP', service port - 'PORT', service IP:port combination - 'IPPORT'

separator- - The string inserted between each of the returned services

`Returns:` text_t

- `HEALTH`

  Returns as number, the percentage of UP services bound to the vserver.

`Returns:` num_at

- `IS_DYNAMIC_LIMIT_REACHED`

  Returns in Boolean TRUE if number of connections on a vserver reached the dynamic threshold, computed as a sum of max clients on all active services under the vserver.

`Returns:` bool_at

- `MAXAUTOSCALEMEMBERS`

  Returns the configured maximum number of autoscale members Raises undef if used on non ADDR based vservers

`Returns:` num_at

- `MINAUTOSCALEMEMBERS`

  Returns the configured minimum number of autoscale members Raises undef if used on non ADDR based vservers

`Returns:` num_at

- `NAME`

  Returns the name of the vserver(CS/LB).

`Returns:` text_t

- `RESPTIME`

  Returns as number, the response time in milli-seconds. RESPTIME is the average TTFB (Time To recieve First Byte) from all the backend services bound to this vserver.

`Returns:` num_at

`SNMP_TABLE` (`uint` index)

Returns the load entry in the SNMP table at given index

`Parameters` (expressions not allowed) `:`

index- Index Raises undef if used on non ADDR based vservers or vserver does not have SNMP load table or the index is out of boundary (valid index values are 0-9)

`Returns:` snmp_table_t

- `STATE`

  Returns the state of vserver.

`Returns:` vserver_state_e

- `SURGECOUNT`

  Returns as number, the number of requests in surge queue of vserver.

`Returns:` unsigned_long_at

- `THROUGHPUT`

  Returns throughput of the vserver in Mbps (Megabits per sec) as Unsigned long number.

`Returns:` unsigned_long_at

- `TYPE`

  Returns the type of this VServer.

`Returns:` vserver_type_e

- `IS_MANAGEMENT_ACCESS_ENABLED`

  Returns true if management access is enabled on this vserver address.

`Returns:` bool_at

- `IS_SYSTEM_ACCESS_SERVER`

  Returns true if this vserver is a system access server.

`Returns:` bool_at

- `IS_AUTHENTICATION_ENABLED`

Returns true if authentication is enabled on this vserver.

`Returns:` bool_at

`IS_MANAGEMENT_ACCESS_ENABLED_FOR` (management_access_type_e mgmt_type)

Returns true if management access is enabled for the given type, on the current vserver IP address.

`Parameters` (expressions not allowed) `:`

```
mgmt_type- Management access type
```

`Returns:` bool_at

- `ASSOCIATED_AUTH_VSERVER`

  Returns the authentication vserver associated with this vserver.

`Returns:` vserver_t

VXLAN_REQ_T

VXLAN Request

This topic lists the expressions that are provided by this class.

- `ID`

  Returns the VNID of the VXLAN through which the current packet entered the Application Switch as a number.

`Returns:` num_at

VXLAN_RES_T

VXLAN Response

This topic lists the expressions that are provided by this class.

- `ID`

  Returns the VNID of the VXLAN through which the current packet entered the Application Switch as a number.

`Returns:` num_at

X509_CERTIFICATE_T

X.509 SSL Certificate

This topic lists the expressions that are provided by this class.

- `AUTH_KEYID`

  Returns a string containing the Authority Key Identifier extension of the X509 V3 certificate.

`Returns:` auth_keyid_t

- `CERT_POLICY`

  Returns a string containing the client certificate policy. Note that this represents a sequence of certificate policies.

`Returns:` seq_text_t

- `DAYS_TO_EXPIRE`

  Returns the number of days before which the certificate is valid. Returns -1 for expired certificates.

`Returns:` num_at

- `EXISTS`

  Returns TRUE if the client has an SSL client certificate.

`Returns:` bool_at

- `ISSUER`

  Returns the Distinguished Name of the Issuer as a separated Name-Value list using the delimiter '=' to separate name and value and the delimiter '/' to separate name-value pairs. Example: /C=IN/ST=KA/L=BLR/O=Netscaler Pvt Ltd/OU=www.netscaler.com/CN=www.netscaler.com/emailAddress=ns@ns.co

`Returns:` nvlist_t

- `IS_VALID`

  Returns true if and only if the client certificate is valid.

`Returns:` bool_at

`KEY_USAGE` (key_usage_e k)

Returns a boolean value indicating whether the specified key usage extension bit value in the X509 certificate is set.

`Parameters` (expressions not allowed) `:`

k- The argument specifies which bit is checked. Valid arguments are: DIGITAL_SIGNATURE. Returns TRUE if the digital signature bit is set; FALSE otherwise. NONREPUDIATION. Returns TRUE if the nonrepudiation bit is set; FALSE otherwise. KEYENCIPHERMENT. Returns TRUE if the key encipherment bit is set; FALSE otherwise. DATAENCIPHERMENT. Returns TRUE if the data encipherment bit is set; FALSE otherwise. KEYAGREEMENT. Returns TRUE if the key agreement bit is set; FALSE otherwise. KEYCERTSIGN. Returns TRUE if the key cert sign bit is set; FALSE otherwise. CRLSIGN. Returns TRUE if the CRL bit is set; FALSE otherwise. ENCIPHERONLY. Returns TRUE if the encipher only bit is set; FALSE otherwise. DECIPHERONLY. Returns TRUE if the decipher only bit is set; FALSE otherwise.

`Returns:` bool_at

- `PK_ALGORITHM`

  Returns the name of the public key algorithm used by the SSL key.

`Returns:` text_t

- `PK_SIZE`

  Returns the size of the public key used in the certificate.

`Returns:` num_at

- `SERIALNUMBER`

  Returns the serial number of the client certificate. In the case of non-SSL transaction or error in certificate, returns an empty string.

`Returns:` text_t

- `SIGNATURE_ALGORITHM`

  Returns the name of the cryptographic algorithm used by the CA to sign this certificate.

`Returns:` text_t

- `SUBJECT`

  Returns the Distinguished Name of the Issuer as a separated Name-Value list using the delimiter '=' to separate name and value and the delimiter '/' to separate name-value pairs. Example: /C=IN/ST=KA/L=BLR/O=Netscaler Pvt Ltd/OU=www.netscaler.com/CN=www.netscaler.com/emailAddress=ns@ns.co

`Returns:` nvlist_t

- `SUBJECT_KEYID`

  Returns the Subject KeyID of the client certificate, if one exists. If there is no Subject KeyID, returns a zero-length text object.

`Returns:` text_t

- `TO_PEM`

  Returns the SSL certificate in binary format

`Returns:` text_t

- `VALID_NOT_AFTER`

  Returns the date after which the client certificate is no longer valid.

`Returns:` time_at

- `VALID_NOT_BEFORE`

  Returns the date before which the client certificate is not valid.

`Returns:` time_at

- `VERSION`

  Returns the version number of the certificate. If the connection is not SSL-based, returns zero (0).

`Returns:` num_at
