Configuration for Integrated Cache policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name for the policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the policy is created. Minimum length = 1
rule	<String>	Read-write	Expression against which the traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Action to apply to content that matches the policy. * CACHE or MAY_CACHE action - positive cachability policy * NOCACHE or MAY_NOCACHE action - negative cachability policy * INVAL action - Dynamic Invalidation Policy. Possible values = CACHE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NOCACHE, MAY_CACHE, MAY_NOCACHE, INVAL
storeingroup	<String>	Read-write	Name of the content group in which to store the object when the final result of policy evaluation is CACHE. The content group must exist before being mentioned here. Use the "show cache contentgroup" command to view the list of existing content groups. Minimum length = 1
invalgroups	<String[]>	Read-write	Content group(s) to be invalidated when the INVAL action is applied. Maximum number of content groups that can be specified is 16. Minimum length = 1
invalobjects	<String[]>	Read-write	Content groups(s) in which the objects will be invalidated if the action is INVAL. Minimum length = 1
undefaction	<String>	Read-write	Action to be performed when the result of rule

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluation is undefined. Possible values = NOCACHE, RESET
newname	<String>	Read-write	New name for the cache policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
hits	<Double>	Read-only	Hits.
undefhits	<Double>	Read-only	Number of Undef hits.
flags	<Double>	Read-only	Flag.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cachepolicy":{

<b>"policyname":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>,
```

```
</b>"storeingroup":<String_value>,

"invalgroups":<String[]_value>,

"invalobjects":<String[]_value>,

"undefaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy/policyname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cachepolicy":{

<b>"policyname":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>,

"storeingroup":<String_value>,

"invalgroups":<String[]_value>,

"invalobjects":<String[]_value>,

"undefaction":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cachepolicy":{
```

```
<b>"policyname":<String_value>,

</b>"storeingroup":true,

"invalgroups":true,

"invalobjects":true,

"undefaction":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cachepolicy":{

<b>"policyname":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of cachepolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cachepolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cachepolicy": [ {

"policyname":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"storeingroup":<String_value>,

"invalgroups":<String[]_value>,

"invalobjects":<String[]_value>,

"hits":<Double_value>,

"undefaction":<String_value>,

"undefhits":<Double_value>,

"flags":<Double_value>,

"precededefrules":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy/policyname_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy/policyname_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy/policyname_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cachepolicy": [ {

"policyname":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"storeingroup":<String_value>,

"invalgroups":<String[]_value>,

"invalobjects":<String[]_value>,
```

```
"hits":<Double_value>,

"undefaction":<String_value>,

"undefhits":<Double_value>,

"flags":<Double_value>,

"precededefrules":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cachepolicy": [ { "__count": "#no"} ] }
```

cachepolicylabel

Configuration for cache policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the label. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the label is created.
evaluates	<String>	Read-write	When to evaluate policies bound to this label: request-time or response-time. Possible values = REQ, RES, MSSQL_REQ, MSSQL_RES, MYSQL_REQ, MYSQL_RES
newname	<String>	Read-write	New name for the cache-policy label. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
numpol	<Double>	Read-only	Number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label to invoke: an unnamed label associated with a virtual server, or user-defined policy label. Possible values = reqvserver, resvserver, policylabel
invoke_labelname	<String>	Read-only	Name of the policy label to invoke if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flowtype	<Double>	Read-only	Flowtype of the bound cache policy.
__count	<Double>	Read-only	count parameter

"cachepolicylabel_cachepolicy_binding":<cachepolicylabel_cachepolicy_binding[]_value>

}]}
```

cachepolicylabel_cachepolicy_binding

Binding object showing the cachepolicy that can be bound to cachepolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
policyname	<String>	Read-write	Name of the cache policy to bind to the policy label.
labelname	<String>	Read-write	Name of the cache policy label to which to bind the policy.
invoke_labelname	<String>	Read-write	Name of the policy label to invoke if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next-lower priority.
labeltype	<String>	Read-write	Type of policy label to invoke: an unnamed label associated with a virtual server, or user-defined policy label. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicylabel_cachepolicy_binding/labelname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"cachepolicylabel_cachepolicy_binding": [ { "__count": "#no"} ] }
```

cachepolicylabel_policybinding_binding

Binding object showing the policybinding that can be bound to cachepolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
policyname	<String>	Read-write	Name of the cache policy to bind to the policy label.
labelname	<String>	Read-write	Name of the cache policy label to which to bind the policy.
invoke_labelname	<String>	Read-write	Name of the policy label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or a user-defined policy label. After the invoked policies are evaluated, the flow returns to the policy with the next-lower priority.
labeltype	<String>	Read-write	Type of policy label to invoke: an unnamed label associated with a virtual server, or user-defined policy label. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicylabel_policybinding_binding/labelname_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicylabel_policybinding_binding/labelname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of cachepolicylabel_policybinding_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicylabel_policybinding_binding/labelname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cachepolicylabel_policybinding_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cachepolicylabel_policybinding_binding": [ {

"priority":<Double_value>,

"policyname":<String_value>,

"labelname":<String_value>,

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy_lbvserver_binding/policyname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of cachepolicy_lbvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy_lbvserver_binding/policyname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the cachepolicy_lbvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cachepolicy_lbvserver_binding": [ {
```

```
"policyname":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"labeltype":<String_value>,

"activepolicy":<Integer_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy_lbvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy_lbvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "cachepolicy_lbvserver_binding": [ {

"policyname":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"labelname":<String_value>,

"labeltype":<String_value>,

"activepolicy":<Integer_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cachepolicy_lbvserver_binding/policyname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"cachepolicy_lbvserver_binding": [ { "__count": "#no"} ] }
```

cacheselector

Configuration for cache selector resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
selectorname	<String>	Read-write	Name for the selector. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters.
rule	<String[]>	Read-write	One or multiple PIXL expressions for evaluating an HTTP request or response. Minimum length = 1
flags	<Double>	Read-only	Flags.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheselector

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"cacheselector":{

<b>"selectorname":<String_value>,

</b><b>"rule":<String[]_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheselector/selectorname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/cacheselector

HTTP Method:PUT

Request Headers:

IPsec

Ipsec

IPSEC configuration.

NAME	DESCRIPTION
ipsecparameter	Configuration for IPSEC paramter
ipsecprofile	Configuration for IPSEC profile

ipsecparameter

Configuration for IPSEC paramter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ikeversion	<String>	Read-write	IKE Protocol Version. Default value: V2 Possible values = V1, V2
encalgo	<String[]>	Read-write	Type of encryption algorithm (Note: Selection of AES enables AES128). Default value: AES Possible values = AES, 3DES, AES192, AES256
hashalgo	<String[]>	Read-write	Type of hashing algorithm. Default value: HMAC_SHA256 Possible values = HMAC_SHA1, HMAC_SHA256, HMAC_SHA384, HMAC_SHA512, HMAC_MD5
lifetime	<Double>	Read-write	Lifetime of IKE SA in seconds. Lifetime of IPSec SA will be (lifetime of IKE SA/ 8). Minimum value = 480 Maximum value = 31536000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
livenesscheckinterval	<Double>	Read-write	Number of seconds after which a notify payload is sent to check the liveliness of the peer. Additional retries are done as per retransmit interval setting. Zero value disables liveliness checks. Minimum value = 0 Maximum value = 64999
replaywindowsize	<Double>	Read-write	IPSec Replay window size for the data traffic. Minimum value = 0 Maximum value = 16384
ikeretryinterval	<Double>	Read-write	IKE retry interval for bringing up the connection. Minimum value = 60 Maximum value = 3600
perfectforwardsecrecy	<String>	Read-write	Enable/Disable PFS. Default value: DISABLE Possible values = ENABLE, DISABLE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
retransmissiontime	<Double>	Read-write	The interval in seconds to retry sending the IKE messages to peer, three consecutive attempts are done with doubled interval after every failure, increases for every retransmit till 6 retransmits. Minimum value = 1 Maximum value = 99
responderonly	<String>	Read-only	Responder Only config for IKED. Default value: NO Possible values = YES, NO

IPsecalg

Ipsecalg

IPSECALG configuration.

NAME	DESCRIPTION
ipsecalgprofile	Configuration for IPSEC ALG profile
ipsecalgsession	Configuration for IPSEC ALG session

ipsecalgprofile

Configuration for IPSEC ALG profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the ipsec alg profile. Minimum length = 1 Maximum length = 32
ikesessiontimeout	<Double>	Read-write	IKE session timeout in minutes. Default value: 60 Minimum value = 1 Maximum value = 1440
espsessiontimeout	<Double>	Read-write	ESP session timeout in minutes. Default value: 60 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 1440
espgatetimeout	<Double>	Read-write	Timeout ESP in seconds as no ESP packets are seen after IKE negotiation. Default value: 30 Minimum value = 3 Maximum value = 1200
connfailover	<String>	Read-write	Mode in which the connection failover feature must operate for the IPSec Alg. After a failover, established UDP connections and ESP packet flows are kept active and resumed on the secondary appliance. Recomended setting is ENABLED. Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgprofile?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"ipsecalgprofile":{

<b>"name":<String_value>,

</b>"ikesessiontimeout":true,

"espsessiontimeout":true,

"espgatetimeout":true,

"connfailover":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgprofile/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgprofile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgprofile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgprofile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of ipsecalgprofile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgprofile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgprofile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the ipsecalgprofile resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

ipsecalgsession

Configuration for IPSEC ALG session resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sourceip_alg	<String>	Read-write	Original Source IP address. Minimum length = 1
natip_alg	<String>	Read-write	Natted Source IP address. Minimum length = 1
destip_alg	<String>	Read-write	Destination IP address. Minimum length = 1
sourceip	<String>	Read-write	Original Source IP address. Minimum length = 1
natip	<String>	Read-write	Natted Source IP address. Minimum length = 1
destip	<String>	Read-write	Destination IP address. Minimum length = 1
spiin	<Double>	Read-only	Client SPI for ESP.
spiout	<Double>	Read-only	Server SPI for ESP.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

FLUSH| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

flush

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgsession?**action=flush**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"ipsecalgsession":{

"sourceip":<String_value>,

"natip":<String_value>,

"destip":<String_value>
```

```
}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgsession

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgsession?**args=sourceip_alg:<String_value>,natip_alg:<String_value>,destip_alg:<String_value>**

Use this query-parameter to get ipsecalgsession resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgsession?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgsession?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of ipsecalgsession resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgsession?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ipsecalgsession?**pagesize=#no;pageno=#no**

Use this query-parameter to get the ipsecalgsession resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

"timer":<Double_value>,

"mode":<String_value>

}]}
```

Load Balancing

Load Balancing

Load Balancing configuration. The load balancing methods manage the selection of an appropriate physical server in a server farm.

NAME	DESCRIPTION
lbgroup	Configuration for LB group
lbgroup_binding	Binding object showing the resources that can be bound to lbgroup
lbgroup_lbvserver_binding	Binding object showing the lbvserver that can be bound to lbgroup
lbmetrictable	Configuration for metric table
lbmetrictable_binding	Binding object showing the resources that can be bound to lbmetrictable
lbmetrictable_metric_binding	Binding object showing the metric that can be bound to lbmetrictable
lbmonbindings	Configuration for monitro bindings
lbmonbindings_binding	Binding object showing the resources that can be bound to lbmonbindings

NAME	DESCRIPTION
lbmonbindings_gslbservicegroup_binding	Binding object showing the gslbservicegroup that can be bound to lbmonbindings
lbmonbindings_service_binding	Binding object showing the service that can be bound to lbmonbindings
lbmonbindings_servicegroup_binding	Binding object showing the servicegroup that can be bound to lbmonbindings
lbmonitor	Configuration for monitor
lbmonitor_binding	Binding object showing the resources that can be bound to lbmonitor
lbmonitor_metric_binding	Binding object showing the metric that can be bound to lbmonitor
lbmonitor_service_binding	Binding object showing the service that can be bound to lbmonitor
lbmonitor_servicegroup_binding	Binding object showing the servicegroup that can be bound to lbmonitor
lbmonitor_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to lbmonitor
lbparameter	Configuration for LB parameter
lbpersistentsessions	Configuration for persistence session
lbprofile	Configuration for LB profile
lbroute	Configuration for LB route
lbroute6	Configuration for LB route6
lbsipparameters	Configuration for SIP parameters
lbvserver	Configuration for Load Balancing Virtual Server
lbvserver_analyticsprofile_binding	Binding object showing the analyticsprofile that can be bound to lbvserver

NAME	DESCRIPTION
lbvserver_appflowpolicy_binding	Binding object showing the appflowpolicy that can be bound to lbvserver
lbvserver_appfwpolicy_binding	Binding object showing the appfwpolicy that can be bound to lbvserver
lbvserver_appqoepolicy_binding	Binding object showing the appqoepolicy that can be bound to lbvserver
lbvserver_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to lbvserver
lbvserver_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to lbvserver
lbvserver_authorizationpolicy_binding	Binding object showing the authorizationpolicy that can be bound to lbvserver
lbvserver_binding	Binding object showing the resources that can be bound to lbvserver
lbvserver_cachepolicy_binding	Binding object showing the cachepolicy that can be bound to lbvserver
lbvserver_capolicy_binding	Binding object showing the capolicy that can be bound to lbvserver
lbvserver_cmppolicy_binding	Binding object showing the cmppolicy that can be bound to lbvserver
lbvserver_contentinspectionpolicy_binding	Binding object showing the contentinspectionpolicy that can be bound to lbvserver
lbvserver_csvserver_binding	Binding object showing the csvserver that can be bound to lbvserver
lbvserver_dnspolicy64_binding	Binding object showing the dnspolicy64 that can be bound to lbvserver
lbvserver_dospolicy_binding	Binding object showing the dospolicy that can be bound to lbvserver

NAME	DESCRIPTION
lbvserver_feopolicy_binding	Binding object showing the feopolicy that can be bound to lbvserver
lbvserver_filterpolicy_binding	Binding object showing the filterpolicy that can be bound to lbvserver
lbvserver_pqpolicy_binding	Binding object showing the pqpolicy that can be bound to lbvserver
lbvserver_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to lbvserver
lbvserver_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to lbvserver
lbvserver_scpolicy_binding	Binding object showing the scpolicy that can be bound to lbvserver
lbvserver_service_binding	Binding object showing the service that can be bound to lbvserver
lbvserver_servicegroup_binding	Binding object showing the servicegroup that can be bound to lbvserver
lbvserver_servicegroupmember_binding	Binding object showing the servicegroupmember that can be bound to lbvserver
lbvserver_spilloverpolicy_binding	Binding object showing the spilloverpolicy that can be bound to lbvserver
lbvserver_tmtrafficpolicy_binding	Binding object showing the tmtrafficpolicy that can be bound to lbvserver
lbvserver_transformpolicy_binding	Binding object showing the transformpolicy that can be bound to lbvserver
lbvserver_videooptimizationdetectionpolicy_binding	Binding object showing the videooptimizationdetectionpolicy that can be bound to lbvserver

NAME	DESCRIPTION
lbvserver_videooptimizationpacingpolicy_binding	Binding object showing the videooptimizationpacingpolicy that can be bound to lbvserver
lbwlm	Configuration for web log manager
lbwlm_binding	Binding object showing the resources that can be bound to lbwlm
lbwlm_lbvserver_binding	Binding object showing the lbvserver that can be bound to lbwlm

lbgroup

Configuration for LB group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the load balancing virtual server group. Minimum length = 1
persistencetype	<String>	Read-write	Type of persistence for the group. Available settings function as follows: * SOURCEIP - Create persistence sessions based on the client IP. * COOKIEINSERT - Create persistence sessions based on a cookie in client

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requests. The cookie is inserted by a Set-Cookie directive from the server, in its first response to a client. * RULE - Create persistence sessions based on a user defined rule. * NONE - Disable persistence for the group. Possible values = SOURCEIP, COOKIEINSERT, RULE, NONE
persistencebackup	<String>	Read-write	Type of backup persistence for the group. Possible values = SOURCEIP, NONE
backuppersistenceti meout	<Double>	Read-write	Time period, in minutes, for which backup persistence is in effect. Default value: 2 Minimum value = 2 Maximum value = 1440

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
persistmask	<String>	Read-write	Persistence mask to apply to source IPv4 addresses when creating source IP based persistence sessions. Minimum length = 1
cookiename	<String>	Read-write	Use this parameter to specify the cookie name for COOKIE peristence type. It specifies the name of cookie with a maximum of 32 characters. If not specified, cookie name is internally generated.
v6persistmasklen	<Double>	Read-write	Persistence mask to apply to source IPv6 addresses when creating source IP based persistence sessions. Default value: 128 Minimum value = 1 Maximum value = 128
cookiedomain	<String>	Read-write	Domain attribute for the HTTP cookie. Minimum length = 1
timeout	<Double>	Read-write	Time period for which a persistence session is in effect.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 2 Minimum value = 0 Maximum value = 1440
rule	<String>	Read-write	Expression, or name of a named expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the double quotation marks. Default value: "None"
usevserverpersistency	<String>	Read-write	Use this parameter to enable vserver level persistence on group members. This allows member vservers to have their own persistence, but need to be compatible with other members persistence rules. When this setting is enabled persistence sessions created by any of the members can be shared by other member vservers. Default value: DISABLED Possible values = ENABLED, DISABLED
mastervserver	<String>	Read-write	When USE_VSERVER_PERSISTENCE is enabled, one can use this setting to designate a member vserver as master which is responsible to create the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			persistence sessions.
newname	<String>	Read-write	New name for the load balancing virtual server group. Minimum length = 1
td	<Double>	Read-only	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| UPDATE| UNSET| DELETE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbgroup

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"lbgroup":{

<b>"name":<String_value>,

</b>"persistencetype":<String_value>,

"persistencebackup":<String_value>,

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbgroup

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbgroup?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbgroup?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbgroup resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbgroup?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbgroup?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lbgroup resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbgroup": [ {

"name":<String_value>,

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbgroup_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbgroup_binding": [ {

"name":<String_value>,

"lbgroup_lbvserver_binding":<lbgroup_lbvserver_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbgroup_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbgroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbgroup_binding": [ {

"name":<String_value>,

"lbgroup_lbvserver_binding":<lbgroup_lbvserver_binding[]_value>

}]}
```

lbgroup_lbvserver_binding

Binding object showing the lbvserver that can be bound to lbgroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the load balancing virtual server group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my lbgroup" or 'my lbgroup'). Minimum length = 1
vservername	<String>	Read-write	Virtual server name.
__count	<Double>	Read-write	count parameter

ADD| DELETE| UPDATE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmetrictable

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"lbmetrictable":{

<b>"metrictable":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmetrictable/metrictable_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmetrictable

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"lbmetrictable":{

<b>"metrictable":<String_value>,

</b><b>"metric":<String_value>,

</b><b>"Snmpoid":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmetrictable

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmetrictable?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmetrictable?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbmetrictable resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmetrictable?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmetrictable?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lbmetrictable resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

"monitorname":<String_value>,

"servicegroupname":<String_value>,

"boundservicegroupsvrstate":<String_value>,

"monstate":<String_value>,
```

```
"servicetype":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonbindings_servicegroup_binding/monitorname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"lbmonbindings_servicegroup_binding": [ { "__count": "#no"} ] }
```

lbmonbindings_service_binding

Binding object showing the service that can be bound to lbmonbindings.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	The name of the service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitorname	<String>	Read-write	The name of the monitor. Minimum length = 1
servicetype	<String>	Read-only	The type of service. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, MYSQL, MSSQL, ORACLE, RADIUS, RADIUSListener, RDP, DIAMETER, SSL_DIAMETER, TFTP, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
svrstate	<String>	Read-only	The state of the service. Possible values = UP, DOWN, UNKNOWN, BUSY,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
monsvcstate	<String>	Read-only	The configured state (enable/disable) of Monitor on this service. Possible values = ENABLED, DISABLED
port	<Integer>	Read-only	The port of the service. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
ipaddress	<String>	Read-only	The IPAddress of the service.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonbindings_service_binding/monitorname_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonbindings_service_binding/monitorname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbmonbindings_service_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonbindings_service_binding/monitorname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lbmonbindings_service_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbmonbindings_service_binding": [ {

"servicename":<String_value>,

"monitorname":<String_value>,

"servicetype":<String_value>,

"svrstate":<String_value>,

"monsvcstate":<String_value>,

"port":<Integer_value>,

"ipaddress":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonbindings_service_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonbindings_service_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"lbmonbindings_service_binding": [ { "__count": "#no"} ] }
```

lbmonitor

Configuration for monitor resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitorname	<String>	Read-write	Name for the monitor. Must begin

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my monitor" or 'my monitor'). Minimum length = 1
type	<String>	Read-write	Type of monitor that you want to create. Possible values = PING, TCP, HTTP, TCP-ECV, HTTP-ECV, UDP-ECV, DNS, FTP, LDNS-PING, LDNS-TCP, LDNS-DNS, RADIUS, USER, HTTP-INLINE, SIP-UDP, SIP-TCP, LOAD, FTP-EXTENDED, SMTP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SNMP, NNTP, MYSQL, MYSQL-ECV, MSSQL-ECV, ORACLE-ECV, LDAP, POP3, CITRIX-XML-SERVICE, CITRIX-WEB-INTERFACE, DNS-TCP, RTSP, ARP, CITRIX-AG, CITRIX-AAC-LOGINPAGE, CITRIX-AAC-LAS, CITRIX-XD-DDC, ND6, CITRIX-WI-EXTENDED, DIAMETER, RADIUS_ACCOUNTING, STOREFRONT, APPC, SMPP, CITRIX-XNC-ECV, CITRIX-XDM, CITRIX-STA-SERVICE, CITRIX-STA-SERVICE-NHOP
action	<String>	Read-write	Action to perform when the response to an inline monitor (a monitor of type HTTP-INLINE) indicates that the service is down. A service monitored by an inline monitor is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			considered DOWN if the response code is not one of the codes that have been specified for the Response Code parameter. Available settings function as follows: * NONE - Do not take any action. However, the show service command and the show lb monitor command indicate the total number of responses that were checked and the number of consecutive error responses received after the last successful probe. * LOG - Log the event in NSLOG or SYSLOG. * DOWN - Mark the service as being down, and then do not direct any traffic to the service until the configured down time has expired. Persistent

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connections to the service are terminated as soon as the service is marked as DOWN. Also, log the event in NSLOG or SYSLOG. Default value: DOWN Possible values = NONE, LOG, DOWN
respcode	<String[]>	Read-write	Response codes for which to mark the service as UP. For any other response code, the action performed depends on the monitor type. HTTP monitors and RADIUS monitors mark the service as DOWN, while HTTP-INLINE monitors perform the action indicated by the Action parameter.
httprequest	<String>	Read-write	HTTP request to send to the server (for example, "HEAD /file.html").
rtsprequest	<String>	Read-write	RTSP request to send to the server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(for example, "OPTIONS *").
customheaders	<String>	Read-write	Custom header string to include in the monitoring probes.
maxforwards	<Double>	Read-write	Maximum number of hops that the SIP request used for monitoring can traverse to reach the server. Applicable only to monitors of type SIP-UDP. Default value: 1 Minimum value = 0 Maximum value = 255
sipmethod	<String>	Read-write	SIP method to use for the query. Applicable only to monitors of type SIP-UDP. Possible values = OPTIONS, INVITE, REGISTER
sipuri	<String>	Read-write	SIP URI string to send to the service (for example, sip:sip.test). Applicable only to monitors of type SIP-UDP. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sipreguri	<String>	Read-write	SIP user to be registered. Applicable only if the monitor is of type SIP-UDP and the SIP Method parameter is set to REGISTER. Minimum length = 1
send	<String>	Read-write	String to send to the service. Applicable to TCP-ECV, HTTP-ECV, and UDP-ECV monitors.
recv	<String>	Read-write	String expected from the server for the service to be marked as UP. Applicable to TCP-ECV, HTTP-ECV, and UDP-ECV monitors.
query	<String>	Read-write	Domain name to resolve as part of monitoring the DNS service (for example, example.com).
querytype	<String>	Read-write	Type of DNS record for which to send monitoring queries. Set to Address for querying A records, AAAA for querying AAAA records, and Zone for querying the SOA record.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Address, Zone, AAAA
scriptname	<String>	Read-write	Path and name of the script to execute. The script must be available on the Citrix ADC, in the /nsconfig/monitors/ directory. Minimum length = 1
scriptargs	<String>	Read-write	String of arguments for the script. The string is copied verbatim into the request.
dispatcherip	<String>	Read-write	IP address of the dispatcher to which to send the probe.
dispatcherport	<Integer>	Read-write	Port number on which the dispatcher listens for the monitoring probe.
username	<String>	Read-write	User name with which to probe the RADIUS, NNTP, FTP, FTP-EXTENDED, MYSQL, MSSQL, POP3, CITRIX-AG, CITRIX-XD-DDC, CITRIX-WI-EXTENDED, CITRIX-XNC or CITRIX-XDM server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
password	<String>	Read-write	Password that is required for logging on to the RADIUS, NNTP, FTP, FTP-EXTENDED, MYSQL, MSSQL, POP3, CITRIX-AG, CITRIX-XD-DDC, CITRIX-WI-EXTENDED, CITRIX-XNC-ECV or CITRIX-XDM server. Used in conjunction with the user name specified for the User Name parameter. Minimum length = 1
secondarypassword	<String>	Read-write	Secondary password that users might have to provide to log on to the Access Gateway server. Applicable to CITRIX-AG monitors.
logonpointname	<String>	Read-write	Name of the logon point that is configured for the Citrix Access Gateway Advanced Access Control software. Required if you want to monitor the associated login page or Logon Agent. Applicable to CITRIX-AAC-LAS and CITRIX-AAC-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LOGINPAGE monitors.
lasversion	<String>	Read-write	Version number of the Citrix Advanced Access Control Logon Agent. Required by the CITRIX-AAC-LAS monitor.
radkey	<String>	Read-write	Authentication key (shared secret text string) for RADIUS clients and servers to exchange. Applicable to monitors of type RADIUS and RADIUS_ACCOUNTING. Minimum length = 1
radnasid	<String>	Read-write	NAS-Identifier to send in the Access-Request packet. Applicable to monitors of type RADIUS. Minimum length = 1
radnasip	<String>	Read-write	Network Access Server (NAS) IP address to use as the source IP address when monitoring a RADIUS server. Applicable to monitors of type RADIUS and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RADIUS_ACCOUNTING.
radaccounttype	<Double>	Read-write	Account Type to be used in Account Request Packet. Applicable to monitors of type RADIUS_ACCOUNTING. Default value: 1 Minimum value = 0 Maximum value = 15
radframedip	<String>	Read-write	Source ip with which the packet will go out . Applicable to monitors of type RADIUS_ACCOUNTING.
radapn	<String>	Read-write	Called Station Id to be used in Account Request Packet. Applicable to monitors of type RADIUS_ACCOUNTING. Minimum length = 1
radmsisdn	<String>	Read-write	Calling Stations Id to be used in Account Request Packet. Applicable to monitors of type RADIUS_ACCOUNTING. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
radaccountsession	<String>	Read-write	Account Session ID to be used in Account Request Packet. Applicable to monitors of type RADIUS_ACCOUNTING. Minimum length = 1
lrtm	<String>	Read-write	Calculate the least response times for bound services. If this parameter is not enabled, the appliance does not learn the response times of the bound services. Also used for LRTM load balancing. Possible values = ENABLED, DISABLED
deviation	<Double>	Read-write	Time value added to the learned average response time in dynamic response time monitoring (DRTM). When a deviation is specified, the appliance learns the average response time of bound services and adds the deviation to the average. The final value is then continually adjusted

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to accommodate response time variations over time. Specified in milliseconds, seconds, or minutes. Minimum value = 0 Maximum value = 20939
units1	<String>	Read-write	Unit of measurement for the Deviation parameter. Cannot be changed after the monitor is created. Default value: SEC Possible values = SEC, MSEC, MIN
interval	<Integer>	Read-write	Time interval between two successive probes. Must be greater than the value of Response Time-out. Default value: 5 Minimum value = 1 Maximum value = 20940
units3	<String>	Read-write	monitor interval units. Default value: SEC Possible values = SEC, MSEC, MIN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
resptimeout	<Integer>	Read-write	Amount of time for which the appliance must wait before it marks a probe as FAILED. Must be less than the value specified for the Interval parameter. Note: For UDP-ECV monitors for which a receive string is not configured, response timeout does not apply. For UDP-ECV monitors with no receive string, probe failure is indicated by an ICMP port unreachable error received from the service. Default value: 2 Minimum value = 1 Maximum value = 20939
units4	<String>	Read-write	monitor response timeout units. Default value: SEC Possible values = SEC, MSEC, MIN
resptimeoutthresh	<Double>	Read-write	Response time threshold, specified

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			as a percentage of the Response Time-out parameter. If the response to a monitor probe has not arrived when the threshold is reached, the appliance generates an SNMP trap called monRespTimeoutAboveThresh. After the response time returns to a value below the threshold, the appliance generates a monRespTimeoutBelowThresh SNMP trap. For the traps to be generated, the "MONITOR-RTO-THRESHOLD" alarm must also be enabled. Minimum value = 0 Maximum value = 100
retries	<Integer>	Read-write	Maximum number of probes to send to establish the state of a service for which a monitoring probe failed. Default value: 3 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 127
failureretries	<Integer>	Read-write	Number of retries that must fail, out of the number specified for the Retries parameter, for a service to be marked as DOWN. For example, if the Retries parameter is set to 10 and the Failure Retries parameter is set to 6, out of the ten probes sent, at least six probes must fail if the service is to be marked as DOWN. The default value of 0 means that all the retries must fail if the service is to be marked as DOWN. Minimum value = 0 Maximum value = 32
alertretries	<Integer>	Read-write	Number of consecutive probe failures after which the appliance generates an SNMP trap called monProbeFailed. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 32
successretries	<Integer>	Read-write	Number of consecutive successful probes required to transition a service's state from DOWN to UP. Default value: 1 Minimum value = 1 Maximum value = 32
downtime	<Integer>	Read-write	Time duration for which to wait before probing a service that has been marked as DOWN. Expressed in milliseconds, seconds, or minutes. Default value: 30 Minimum value = 1 Maximum value = 20939
units2	<String>	Read-write	Unit of measurement for the Down Time parameter. Cannot be changed after the monitor is created. Default value: SEC Possible values = SEC, MSEC, MIN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
destip	<String>	Read-write	IP address of the service to which to send probes. If the parameter is set to 0, the IP address of the server to which the monitor is bound is considered the destination IP address.
destport	<Integer>	Read-write	TCP or UDP port to which to send the probe. If the parameter is set to 0, the port number of the service to which the monitor is bound is considered the destination port. For a monitor of type USER, however, the destination port is the port number that is included in the HTTP request sent to the dispatcher. Does not apply to monitors of type PING.
state	<String>	Read-write	State of the monitor. The DISABLED setting disables not only the monitor being configured, but all monitors of the same type, until the parameter is set to ENABLED. If the monitor is bound to a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service, the state of the monitor is not taken into account when the state of the service is determined. Default value: ENABLED Possible values = ENABLED, DISABLED
reverse	<String>	Read-write	Mark a service as DOWN, instead of UP, when probe criteria are satisfied, and as UP instead of DOWN when probe criteria are not satisfied. Default value: NO Possible values = YES, NO
transparent	<String>	Read-write	The monitor is bound to a transparent device such as a firewall or router. The state of a transparent device depends on the responsiveness of the services behind it. If a transparent device is being monitored, a destination IP address must be specified. The probe is sent to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified IP address by using the MAC address of the transparent device. Default value: NO Possible values = YES, NO
iptunnel	<String>	Read-write	Send the monitoring probe to the service through an IP tunnel. A destination IP address must be specified. Default value: NO Possible values = YES, NO
tos	<String>	Read-write	Probe the service by encoding the destination IP address in the IP TOS (6) bits. Possible values = YES, NO
tosid	<Double>	Read-write	The TOS ID of the specified destination IP. Applicable only when the TOS parameter is set. Minimum value = 1 Maximum value = 63
secure	<String>	Read-write	Use a secure SSL connection when monitoring a service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Applicable only to TCP based monitors. The secure option cannot be used with a CITRIX-AG monitor, because a CITRIX-AG monitor uses a secure connection by default. Default value: NO Possible values = YES, NO
validatecred	<String>	Read-write	Validate the credentials of the Xen Desktop DDC server user. Applicable to monitors of type CITRIX-XD-DDC. Default value: NO Possible values = YES, NO
domain	<String>	Read-write	Domain in which the XenDesktop Desktop Delivery Controller (DDC) servers or Web Interface servers are present. Required by CITRIX-XD-DDC and CITRIX-WI-EXTENDED monitors for logging on to the DDC servers and Web

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Interface servers, respectively.
ipaddress	<String[]>	Read-write	Set of IP addresses expected in the monitoring response from the DNS server, if the record type is A or AAAA. Applicable to DNS monitors. Minimum length = 1
group	<String>	Read-write	Name of a newsgroup available on the NNTP service that is to be monitored. The appliance periodically generates an NNTP query for the name of the newsgroup and evaluates the response. If the newsgroup is found on the server, the service is marked as UP. If the newsgroup does not exist or if the search fails, the service is marked as DOWN. Applicable to NNTP monitors. Minimum length = 1
filename	<String>	Read-write	Name of a file on the FTP server. The appliance monitors the FTP service by periodically checking the existence of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			file on the server. Applicable to FTP-EXTENDED monitors. Minimum length = 1
basedn	<String>	Read-write	The base distinguished name of the LDAP service, from where the LDAP server can begin the search for the attributes in the monitoring query. Required for LDAP service monitoring. Minimum length = 1
binddn	<String>	Read-write	The distinguished name with which an LDAP monitor can perform the Bind operation on the LDAP server. Optional. Applicable to LDAP monitors. Minimum length = 1
filter	<String>	Read-write	Filter criteria for the LDAP query. Optional. Minimum length = 1
attribute	<String>	Read-write	Attribute to evaluate when the LDAP server responds to the query. Success or failure of the monitoring probe depends on whether the attribute exists in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the response. Optional. Minimum length = 1
database	<String>	Read-write	Name of the database to connect to during authentication. Minimum length = 1
oraclesid	<String>	Read-write	Name of the service identifier that is used to connect to the Oracle database during authentication. Minimum length = 1
sqlquery	<String>	Read-write	SQL query for a MYSQL-ECV or MSSQL-ECV monitor. Sent to the database server after the server authenticates the connection. Minimum length = 1
evalrule	<String>	Read-write	Expression that evaluates the database server's response to a MYSQL-ECV or MSSQL-ECV monitoring query. Must produce a Boolean result. The result determines the state of the server. If the expression

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			returns TRUE, the probe succeeds. For example, if you want the appliance to evaluate the error message to determine the state of the server, use the rule MYSQL.RES.ROW(10) .TEXT_ELEM(2).EQ("MySQL").
mssqlprotocolversion	<String>	Read-write	Version of MSSQL server that is to be monitored. Default value: 70 Possible values = 70, 2000, 2000SP1, 2005, 2008, 2008R2, 2012, 2014
Snmpoid	<String>	Read-write	SNMP OID for SNMP monitors. Minimum length = 1
snmpcommunity	<String>	Read-write	Community name for SNMP monitors. Minimum length = 1
snmpthreshold	<String>	Read-write	Threshold for SNMP monitors. Minimum length = 1
snmpversion	<String>	Read-write	SNMP version to be used for SNMP monitors.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = V1, V2
metrictable	<String>	Read-write	Metric table to which to bind metrics. Minimum length = 1 Maximum length = 99
application	<String>	Read-write	Name of the application used to determine the state of the service. Applicable to monitors of type CITRIX-XML-SERVICE. Minimum length = 1
sitepath	<String>	Read-write	URL of the logon page. For monitors of type CITRIX-WEB-INTERFACE, to monitor a dynamic page under the site path, terminate the site path with a slash (/). Applicable to CITRIX-WEB-INTERFACE, CITRIX-WI-EXTENDED and CITRIX-XDM monitors. Minimum length = 1
storename	<String>	Read-write	Store Name. For monitors of type STOREFRONT, STORENAME is an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			optional argument defining storefront service store name. Applicable to STOREFRONT monitors. Minimum length = 1
storefrontacctservice	<String>	Read-write	Enable/Disable probing for Account Service. Applicable only to Store Front monitors. For multi-tenancy configuration users my skip account service. Default value: YES Possible values = YES, NO
hostname	<String>	Read-write	Hostname in the FQDN format (Example: porche.cars.org). Applicable to STOREFRONT monitors. Minimum length = 1
netprofile	<String>	Read-write	Name of the network profile. Minimum length = 1 Maximum length = 127
originhost	<String>	Read-write	Origin-Host value for the Capabilities-Exchange-Request

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(CER) message to use for monitoring Diameter servers. Minimum length = 1
originrealm	<String>	Read-write	Origin-Realm value for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. Minimum length = 1
hostipaddress	<String>	Read-write	Host-IP-Address value for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. If Host-IP-Address is not specified, the appliance inserts the mapped IP (MIP) address or subnet IP (SNIP) address from which the CER request (the monitoring probe) is sent. Minimum length = 1
vendorid	<Double>	Read-write	Vendor-Id value for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers.
productname	<String>	Read-write	Product-Name value for the Capabilities-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Exchange-Request (CER) message to use for monitoring Diameter servers. Minimum length = 1
firmwarerevision	<Double>	Read-write	Firmware-Revision value for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers.
authapplicationid	<Double[]>	Read-write	List of Auth-Application-Id attribute value pairs (AVPs) for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. A maximum of eight of these AVPs are supported in a monitoring CER message. Minimum value = 0 Maximum value = 4294967295
acctapplicationid	<Double[]>	Read-write	List of Acct-Application-Id attribute value pairs (AVPs) for the Capabilities-Exchange-Request (CER) message to use for monitoring

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Diameter servers. A maximum of eight of these AVPs are supported in a monitoring message. Minimum value = 0 Maximum value = 4294967295
inbandsecurityid	<String>	Read-write	Inband-Security-Id for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. Possible values = NO_INBAND_SECURITY, TLS
supportedvendorids	<Double[]>	Read-write	List of Supported-Vendor-Id attribute value pairs (AVPs) for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. A maximum eight of these AVPs are supported in a monitoring message. Minimum value = 1 Maximum value = 4294967295
vendorspecificvendorid	<Double>	Read-write	Vendor-Id to use in the Vendor-Specific-Application-Id grouped attribute-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value pair (AVP) in the monitoring CER message. To specify Auth-Application-Id or Acct-Application-Id in Vendor-Specific-Application-Id, use vendorSpecificAuthApplicationIds or vendorSpecificAcctApplicationIds, respectively. Only one Vendor-Id is supported for all the Vendor-Specific-Application-Id AVPs in a CER monitoring message. Minimum value = 1
vendorspecificauthapplicationids	<Double[]>	Read-write	List of Vendor-Specific-Auth-Application-Id attribute value pairs (AVPs) for the Capabilities-Exchange-Request (CER) message to use for monitoring Diameter servers. A maximum of eight of these AVPs are supported in a monitoring message. The specified value is combined with the value of vendorSpecificVendorId to obtain the Vendor-Specific-Application-Id AVP in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the CER monitoring message. Minimum value = 0 Maximum value = 4294967295
vendorspecificacctapplicationids	<Double[]>	Read-write	List of Vendor-Specific-Acct-Application-Id attribute value pairs (AVPs) to use for monitoring Diameter servers. A maximum of eight of these AVPs are supported in a monitoring message. The specified value is combined with the value of vendorSpecificVendorId to obtain the Vendor-Specific-Application-Id AVP in the CER monitoring message. Minimum value = 0 Maximum value = 4294967295
kcdaccount	<String>	Read-write	KCD Account used by MSSQL monitor. Minimum length = 1 Maximum length = 32
storedb	<String>	Read-write	Store the database list populated with

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the responses to monitor probes. Used in database specific load balancing if MSSQL-ECV/MYSQL-ECV monitor is configured. Default value: DISABLED Possible values = ENABLED, DISABLED
storefrontcheckbackendservices	<String>	Read-write	This option will enable monitoring of services running on storefront server. Storefront services are monitored by probing to a Windows service that runs on the Storefront server and exposes details of which storefront services are running. Default value: NO Possible values = YES, NO
trofscode	<Double>	Read-write	Code expected when the server is under maintenance.
trofsstring	<String>	Read-write	String expected from the server for the service to be marked as trofs. Applicable

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to HTTP-ECV/TCP-ECV monitors.
sslprofile	<String>	Read-write	SSL Profile associated with the monitor. Minimum length = 1 Maximum length = 127
metric	<String>	Read-write	Metric name in the metric table, whose setting is changed. A value zero disables the metric and it will not be used for load calculation. Minimum length = 1 Maximum length = 37
metricthreshold	<Double>	Read-write	Threshold to be used for that metric.
metricweight	<Double>	Read-write	The weight for the specified service metric with respect to others. Minimum value = 1 Maximum value = 100
servicename	<String>	Read-write	The name of the service to which the monitor is bound. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The name of the service group to which the monitor is to be bound. Minimum length = 1
lrtmconf	<Integer>	Read-only	State of LRTM configuration on the monitor.
lrtmconfstr	<String>	Read-only	State of LRTM configuration on the monitor as STRING. Possible values = ENABLED, DISABLED
dynamicresponsetimeout	<Integer>	Read-only	Response timeout of the DRTM enabled monitor , calculated dynamically based on the history and current response time.
dynamicinterval	<Integer>	Read-only	Interval between monitoring probes for DRTM enabled monitor , calculated dynamically based monitor response time.
multimetrictable	<String[]>	Read-only	Metric table to which to bind metrics, to be used only for output purposes.
dup_state	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
dup_weight	<Double>	Read-only	. Default value: 1 Minimum value = 1 Maximum value = 100
weight	<Double>	Read-only	. Minimum value = 1 Maximum value = 100
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor?**args=monitorname:<String_value>,type:<String_value>**

Use this query-parameter to get lbmonitor resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbmonitor resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lbmonitor resources in chunks.

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbmonitor": [ { "__count": "#no"} ] }
```

lbmonitor_binding

Binding object which returns the resources bound to lbmonitor.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitorname	<String>	Read-write	Name of the monitor. Minimum length = 1
lbmonitor_metric_binding	<lbmonitor_metric_binding[]>	Read-only	metric that can be bound to lbmonitor.
lbmonitor_sslcertkey_binding	<lbmonitor_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to lbmonitor.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor_binding/monitorname_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbmonitor_binding": [ {

"monitorname":<String_value>,

"lbmonitor_metric_binding":<lbmonitor_metric_binding[]_value>,

"lbmonitor_sslcertkey_binding":<lbmonitor_sslcertkey_binding[]_value>
```

```
}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbmonitor_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbmonitor_binding": [ {

"monitorname":<String_value>,

"lbmonitor_metric_binding":<lbmonitor_metric_binding[]_value>,

"lbmonitor_sslcertkey_binding":<lbmonitor_sslcertkey_binding[]_value>

}]}
```

lbmonitor_metric_binding

Binding object showing the metric that can be bound to lbmonitor.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monitorname	<String>	Read-write	Name of the monitor. Minimum length = 1
metric	<String>	Read-write	Metric name in the metric table, whose setting is changed. A value zero disables the metric and it will not be used for load calculation. Minimum length = 1 Maximum length = 37
metricthreshold	<Double>	Read-write	Threshold to be used for that metric.
metricweight	<Double>	Read-write	The weight for the specified service metric with respect to others. Minimum value = 1 Maximum value = 100
metrictable	<String>	Read-only	Metric table to which to bind metrics. Minimum length = 1 Maximum length = 99

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
metric_unit	<String>	Read-only	Giving the unit of the metric. Possible values = Bytes/s, ms, pkts/s, users
__count	<Double>	Read-only	count parameter

Operations

lbmonitor_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to lbmonitor.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkeyname	<String>	Read-write	The name of the certificate bound to the monitor.
monitorname	<String>	Read-write	Name of the monitor. Minimum length = 1
ocspcheck	<String>	Read-write	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
crlcheck	<String>	Read-write	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	The rule for use of CRL corresponding to this CA certificate during client authentication. If crlCheck is set to Mandatory, the system will deny all SSL clients if the CRL is missing, expired - NextUpdate date is in the past, or is incomplete with remote CRL refresh enabled. If crlCheck is set to optional, the system will allow SSL clients in the above error cases.However, in any case if the client certificate is revoked in the CRL, the SSL client will be denied access.
__count	<Double>	Read-write	count parameter

lbparameter

Configuration for LB parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httponlycookieflag	<String>	Read-write	Include the HttpOnly attribute in persistence cookies. The HttpOnly attribute limits the scope of a cookie to HTTP requests and helps mitigate the risk of cross-site scripting attacks. Default value: ENABLED Possible values = ENABLED, DISABLED
usesecuredpersistencecookie	<String>	Read-write	Encode persistence cookie values using SHA2 hash. Default value: DISABLED Possible values = ENABLED, DISABLED
useencryptedpersistencecookie	<String>	Read-write	Encode persistence cookie values using SHA2 hash. Default value: DISABLED Possible values = ENABLED, DISABLED
cookiepassphrase	<String>	Read-write	Use this parameter to specify the passphrase used to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			generate secured persistence cookie value. It specifies the passphrase with a maximum of 31 characters.
consolidatedlconn	<String>	Read-write	To find the service with the fewest connections, the virtual server uses the consolidated connection statistics from all the packet engines. The NO setting allows consideration of only the number of connections on the packet engine that received the new connection. Default value: YES Possible values = YES, NO
useportforhashlb	<String>	Read-write	Include the port number of the service when creating a hash for hash based load balancing methods. With the NO setting, only the IP address of the service is considered when creating a hash. Default value: YES

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
preferdirectroute	<String>	Read-write	Perform route lookup for traffic received by the Citrix ADC, and forward the traffic according to configured routes. Do not set this parameter if you want a wildcard virtual server to direct packets received by the appliance to an intermediary device, such as a firewall, even if their destination is directly connected to the appliance. Route lookup is performed after the packets have been processed and returned by the intermediary device. Default value: YES Possible values = YES, NO
startuprrfactor	<Double>	Read-write	Number of requests, per service, for which to apply the round robin load balancing method before switching to the configured load balancing method,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			thus allowing services to ramp up gradually to full load. Until the specified number of requests is distributed, the Citrix ADC is said to be implementing the slow start mode (or startup round robin). Implemented for a virtual server when one of the following is true: * The virtual server is newly created. * One or more services are newly bound to the virtual server. * One or more services bound to the virtual server are enabled. * The load balancing method is changed. This parameter applies to all the load balancing virtual servers configured on the Citrix ADC, except for those virtual servers for which

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the virtual server-level slow start parameters (New Service Startup Request Rate and Increment Interval) are configured. If the global slow start parameter and the slow start parameters for a given virtual server are not set, the appliance implements a default slow start for the virtual server, as follows: * For a newly configured virtual server, the appliance implements slow start for the first 100 requests received by the virtual server. * For an existing virtual server, if one or more services are newly bound or newly enabled, or if the load balancing method is changed, the appliance dynamically

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			computes the number of requests for which to implement startup round robin. It obtains this number by multiplying the request rate by the number of bound services (it includes services that are marked as DOWN). For example, if the current request rate is 20 requests/s and ten services are bound to the virtual server, the appliance performs startup round robin for 200 requests. Not applicable to a virtual server for which a hash based load balancing method is configured.
monitorskipmaxclient	<String>	Read-write	When a monitor initiates a connection to a service, do not check to determine whether the number of connections to the service has reached the limit specified by the service's Max

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Clients setting. Enables monitoring to continue even if the service has reached its connection limit. Default value: DISABLED Possible values = ENABLED, DISABLED
monitorconnectionclose	<String>	Read-write	Close monitoring connections by sending the service a connection termination message with the specified bit set. Default value: FIN Possible values = RESET, FIN
vserverspecificmac	<String>	Read-write	Allow a MAC-mode virtual server to accept traffic returned by an intermediary device, such as a firewall, to which the traffic was previously forwarded by another MAC-mode virtual server. The second virtual server can then distribute that traffic across the destination server farm. Also useful

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			when load balancing Branch Repeater appliances. Note: The second virtual server can also send the traffic to another set of intermediary devices, such as another set of firewalls. If necessary, you can configure multiple MAC-mode virtual servers to pass traffic successively through multiple sets of intermediary devices. Default value: DISABLED Possible values = ENABLED, DISABLED
allowboundsvcremoval	<String>	Read-write	This is used, to enable/disable the option of svc/svcgroup removal, if it is bound to one or more vserver. If it is enabled, the svc/svcgroup can be removed, even if it bound to vservers. If disabled, an error will be thrown, when the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			user tries to remove a svc/svcgroup without unbinding from its vservers. Default value: ENABLED Possible values = ENABLED, DISABLED
retainservicestate	<String>	Read-write	This option is used to retain the original state of service or servicegroup member when an enable server command is issued. Default value: OFF Possible values = ON, OFF
dbsttl	<Double>	Read-write	Specify the TTL for DNS record for domain based service. The default value of ttl is 0 which indicates to use the TTL received in DNS response for monitors. Default value: 0
sessionsthreshold	<Double>	Read-only	This option is used to get the upper-limit on the number of persistent sessions set by the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			administrator for this system. Minimum value = 1

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

lbpersistentsessions

Configuration for persistence session resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserver	<String>	Read-write	The name of the virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
persistenceparameter	<String>	Read-write	The persistence parameter whose persistence sessions are to be flushed.
type	<Double>	Read-only	Type of Persistence.
typestring	<String>	Read-only	Type of Persistence as String.
srcip	<String>	Read-only	SOURCE IP.
srcipv6	<String>	Read-only	SOURCE IPv6 ADDRESS.
destip	<String>	Read-only	DESTINATION IP.
destipv6	<String>	Read-only	DESTINATION IPv6 ADDRESS.
flags	<Boolean>	Read-only	IPv6 FLAGS.
destport	<Integer>	Read-only	Destination port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
vservername	<String>	Read-only	Virtual server name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeout	<Double>	Read-only	Persistent Session timeout.
referencecount	<Double>	Read-only	Reference Count.
persistenceparam	<String>	Read-only	Specific persistence information . Callid in case of SIP_CALLID persistence entry , RTSP session id in case of RTSP_SESSIONID persistence entry.
cnamepersparam	<String>	Read-only	The cname that is selected incase of gslb service.
__count	<Double>	Read-only	count parameter

lbprofile

Configuration for LB profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lbprofilename	<String>	Read-write	Name of the LB profile. Minimum length = 1
dbslb	<String>	Read-write	Enable database specific load balancing for MySQL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and MSSQL service types. Default value: DISABLED Possible values = ENABLED, DISABLED
processlocal	<String>	Read-write	By turning on this option packets destined to a vserver in a cluster will not under go any steering. Turn this option for single pa cket request response mode or when the upstream device is performing a proper RSS for connection based distribution. Default value: DISABLED Possible values = ENABLED, DISABLED
httponlycookieflag	<String>	Read-write	Include the HttpOnly attribute in persistence cookies. The HttpOnly attribute limits the scope of a cookie to HTTP requests and helps mitigate the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			risk of cross-site scripting attacks. Default value: ENABLED Possible values = ENABLED, DISABLED
cookiepassphrase	<String>	Read-write	Use this parameter to specify the passphrase used to generate secured persistence cookie value. It specifies the passphrase with a maximum of 31 characters.
usesecuredpersistencecookie	<String>	Read-write	Encode persistence cookie values using SHA2 hash. Default value: DISABLED Possible values = ENABLED, DISABLED
useencryptedpersistencecookie	<String>	Read-write	Encode persistence cookie values using SHA2 hash. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vsvrcount	<Double>	Read-only	Total number of vservers , the profile is bound to.
__count	<Double>	Read-only	count parameter

Response Payload:

```
{ "lbroute": [ { "__count": "#no"} ] }
```

lbroute6

Configuration for LB route6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	The destination network.
gatewayname	<String>	Read-write	The name of the route. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Default value: 0 Minimum value = 0 Maximum value = 4094
flags	<String>	Read-only	State of the configured gateway. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbroute6

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"lbroute6":{

<b>"network":<String_value>,

</b><b>"gatewayname":<String_value>,

</b>"td":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbroute6/network_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbroute6

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbroute6?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbroute6?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lbroute6 resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbroute6?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbroute6?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lbroute6 resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbroute6": [ {

"network":<String_value>,

"td":<Double_value>,

"gatewayname":<String_value>,

"flags":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbroute6?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbroute6": [ { "__count": "#no"} ] }
```

lbsipparameters

Configuration for SIP parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rnatsrcport	<Integer>	Read-write	Port number with which to match the source port in server-initiated SIP traffic. The rport parameter is added, without a value, to SIP packets that have a matching source port number, and CALL-ID based persistence is implemented for the responses received by the virtual server. Default value: 0
rnatdstport	<Integer>	Read-write	Port number with which to match the destination port in server-initiated SIP traffic. The rport parameter is added, without a value, to SIP packets that have a matching destination port number, and CALL-ID based persistence is implemented for the responses received by the virtual server. Default value: 0
retrydur	<Integer>	Read-write	Time, in seconds, for which a client must wait before initiating

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a connection after receiving a 503 Service Unavailable response from the SIP server. The time value is sent in the "Retry-After" header in the 503 response. Default value: 120 Minimum value = 1
addrportvip	<String>	Read-write	Add the rport parameter to the VIA headers of SIP requests that virtual servers receive from clients or servers. Default value: ENABLED Possible values = ENABLED, DISABLED
sip503ratethreshold	<Double>	Read-write	Maximum number of 503 Service Unavailable responses to generate, once every 10 milliseconds, when a SIP virtual server becomes unavailable. Default value: 100
rnatsecuresrcport	<Integer>	Read-write	Port number with which to match the source port in server-initiated SIP over SSL traffic. The rport

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parameter is added, without a value, to SIP packets that have a matching source port number, and CALL-ID based persistence is implemented for the responses received by the virtual server. Default value: 0 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
rnatsecuredstport	<Integer>	Read-write	Port number with which to match the destination port in server-initiated SIP over SSL traffic. The rport parameter is added, without a value, to SIP packets that have a matching destination port number, and CALL-ID based persistence is implemented for the responses received by the virtual server. Default value: 0 Range 1 - 65535 * in CLI is represented as

lbvserver

Configuration for Load Balancing Virtual Server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
servicetype	<String>	Read-write	Protocol used by the service (also called the service type). Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, DNS, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, RTSP, PUSH, SSL_PUSH, RADIUS, RDP, MYSQL, MSSQL, DIAMETER,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL_DIAMETER, TFTP, ORACLE, SMPP, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, PROXY, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
ipv46	<String>	Read-write	IPv4 or IPv6 address to assign to the virtual server.
ippattern	<String>	Read-write	IP address pattern, in dotted decimal notation, for identifying packets to be accepted by the virtual server. The IP Mask parameter specifies which part of the destination IP address is matched against the pattern. Mutually exclusive with the IP Address parameter. For example, if the IP pattern assigned to the virtual server is 198.51.100.0 and the IP mask is 255.255.240.0 (a forward mask), the first 20 bits in the destination IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			addresses are matched with the first 20 bits in the pattern. The virtual server accepts requests with IP addresses that range from 198.51.96.1 to 198.51.111.254. You can also use a pattern such as 0.0.2.2 and a mask such as 0.0.255.255 (a reverse mask). If a destination IP address matches more than one IP pattern, the pattern with the longest match is selected, and the associated virtual server processes the request. For example, if virtual servers vs1 and vs2 have the same IP pattern, 0.0.100.128, but different IP masks of 0.0.255.255 and 0.0.224.255, a destination IP address of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			198.51.100.128 has the longest match with the IP pattern of vs1. If a destination IP address matches two or more virtual servers to the same extent, the request is processed by the virtual server whose port number matches the port number in the request.
ipmask	<String>	Read-write	IP mask, in dotted decimal notation, for the IP Pattern parameter. Can have leading or trailing non-zero octets (for example, 255.255.240.0 or 0.0.255.255). Accordingly, the mask specifies whether the first n bits or the last n bits of the destination IP address in a client request are to be matched with the corresponding bits in the IP pattern. The former is called a forward mask. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			latter is called a reverse mask.
port	<Integer>	Read-write	Port number for the virtual server. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
ipset	<String>	Read-write	The list of IPv4/IPv6 addresses bound to ipset would form a part of listening service on the current lb vserver. Minimum length = 1
range	<Double>	Read-write	Number of IP addresses that the appliance must generate and assign to the virtual server. The virtual server then functions as a network virtual server, accepting traffic on any of the generated IP addresses. The IP addresses are generated automatically, as follows: * For a range of n, the last octet of the address specified by the IP Address

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parameter increments n-1 times. * If the last octet exceeds 255, it rolls over to 0 and the third octet increments by 1. Note: The Range parameter assigns multiple IP addresses to one virtual server. To generate an array of virtual servers, each of which owns only one IP address, use brackets in the IP Address and Name parameters to specify the range. For example: add lb vserver my_vserver[1-3] HTTP 192.0.2.[1-3] 80. Default value: 1 Minimum value = 1 Maximum value = 254

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
persistencetype	<String>	Read-write	Type of persistence for the virtual server. Available settings function as follows: * SOURCEIP - Connections from the same client IP address belong to the same persistence session. * COOKIEINSERT - Connections that have the same HTTP Cookie, inserted by a Set-Cookie directive from a server, belong to the same persistence session. * SSLSESSION - Connections that have the same SSL Session ID belong to the same persistence session. * CUSTOMSERVERID - Connections with the same server ID form part of the same

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			session. For this persistence type, set the Server ID (CustomServerID) parameter for each service and configure the Rule parameter to identify the server ID in a request. * RULE - All connections that match a user defined rule belong to the same persistence session. * URLPASSIVE - Requests that have the same server ID in the URL query belong to the same persistence session. The server ID is the hexadecimal representation of the IP address and port of the service to which the request must be forwarded. This persistence type requires a rule

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to identify the server ID in the request. * DESTIP - Connections to the same destination IP address belong to the same persistence session. * SRCIPDESTIP - Connections that have the same source IP address and destination IP address belong to the same persistence session. * CALLID - Connections that have the same CALL-ID SIP header belong to the same persistence session. * RTSPSID - Connections that have the same RTSP Session ID belong to the same

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			persistence session. * FIXSESSION - Connections that have the same SenderCompID and TargetCompID values belong to the same persistence session. * USERSESSION - Persistence session is created based on the persistence parameter value provided from an extension. Possible values = SOURCEIP, COOKIEINSERT, SSLSESSION, RULE, URLPASSIVE, CUSTOMSERVERID, DESTIP, SRCIPDESTIP, CALLID, RTSPSID, DIAMETER, FIXSESSION, USERSESSION, NONE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeout	<Double>	Read-write	Time period for which a persistence session is in effect. Default value: 2 Minimum value = 0 Maximum value = 1440
persistencebackup	<String>	Read-write	Backup persistence type for the virtual server. Becomes operational if the primary persistence mechanism fails. Possible values = SOURCEIP, NONE
backuppersistencetimeout	<Double>	Read-write	Time period for which backup persistence is in effect. Default value: 2 Minimum value = 2 Maximum value = 1440
lbmethod	<String>	Read-write	Load balancing method. The available settings function as follows: * ROUNDROBIN - Distribute requests in rotation, regardless of the load. Weights can be assigned to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			services to enforce weighted round robin distribution. * LEASTCONNECTION (default) - Select the service with the fewest connections. * LEASTRESPONSETIME - Select the service with the lowest average response time. * LEASTBANDWIDTH - Select the service currently handling the least traffic. * LEASTPACKETS - Select the service currently serving the lowest number of packets per second. * CUSTOMLOAD - Base service selection on the SNMP metrics obtained by custom load monitors.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* LRTM - Select the service with the lowest response time. Response times are learned through monitoring probes. This method also takes the number of active connections into account. Also available are a number of hashing methods, in which the appliance extracts a predetermined portion of the request, creates a hash of the portion, and then checks whether any previous requests had the same hash value. If it finds a match, it forwards the request to the service that served those previous requests. Following are the hashing methods: * URLHASH - Create a hash of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the request URL (or part of the URL). * DOMAINHASH - Create a hash of the domain name in the request (or part of the domain name). The domain name is taken from either the URL or the Host header. If the domain name appears in both locations, the URL is preferred. If the request does not contain a domain name, the load balancing method defaults to LEASTCONNECTION. * DESTINATIONIPHASH - Create a hash of the destination IP address in the IP header. * SOURCEIPHASH - Create a hash of the source IP address in the IP header.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* TOKEN - Extract a token from the request, create a hash of the token, and then select the service to which any previous requests with the same token hash value were sent. * SRCIPDESTIPHASH - Create a hash of the string obtained by concatenating the source IP address and destination IP address in the IP header. * SRCIPSRCPORTHASH - Create a hash of the source IP address and source port in the IP header. * CALLIDHASH - Create a hash of the SIP Call-ID header.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* USER_TOKEN - Same as TOKEN LB method but token needs to be provided from an extension. Default value: LEASTCONNECTION Possible values = ROUNDROBIN, LEASTCONNECTION, LEASTRESPONSETIME, URLHASH, DOMAINHASH, DESTINATIONIPHASH, SOURCEIPHASH, SRCIPDESTIPHASH, LEASTBANDWIDTH, LEASTPACKETS, TOKEN, SRCIPSRCPORTHASH, LRTM, CALLIDHASH, CUSTOMLOAD, LEASTREQUEST, AUDITLOGHASH, STATICPROXIMITY, USER_TOKEN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hashlength	<Double>	Read-write	Number of bytes to consider for the hash value used in the URLHASH and DOMAINHASH load balancing methods. Default value: 80 Minimum value = 1 Maximum value = 4096
netmask	<String>	Read-write	IPv4 subnet mask to apply to the destination IP address or source IP address when the load balancing method is DESTINATIONIPHASH or SOURCEIPHASH. Minimum length = 1
v6netmasklen	<Double>	Read-write	Number of bits to consider in an IPv6 destination or source IP address, for creating the hash that is required by the DESTINATIONIPHASH and SOURCEIPHASH load balancing methods. Default value: 128 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 128
backuplbmethod	<String>	Read-write	Backup load balancing method. Becomes operational if the primary load balancing me thod fails or cannot be used. Valid only if the primary method is based on static proximity. Default value: ROUNDROBIN Possible values = ROUNDROBIN, LEASTCONNECTI ON, LEASTRESPONSE TIME, SOURCEIPHASH, LEASTBANDWIDT H, LEASTPACKETS, CUSTOMLOAD
cookiename	<String>	Read-write	Use this parameter to specify the cookie name for COOKIE peristence type. It specifies the name of cookie with a maximum of 32 characters. If not

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified, cookie name is internally generated.
rule	<String>	Read-write	Expression, or name of a named expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: "none"
listenpolicy	<String>	Read-write	Expression identifying traffic accepted by the virtual server. Can be either an expression (for example, CLIENT.IP.DST.IN_SUBNET(192.0.2.0/24) or the name of a named expression. In the above example, the virtual server accepts all requests whose destination IP address is in the 192.0.2.0/24 subnet. Default value: "NONE"
listenpriority	<Double>	Read-write	Integer specifying the priority of the listen policy. A higher number specifies a lower priority. If a request matches the listen policies of more than one virtual server the virtual server whose listen policy has the highest priority (the lowest priority number) accepts the request. Default value: 101

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 101
resrule	<String>	Read-write	Expression specifying which part of a server's response to use for creating rule based persistence sessions (persistence type RULE). Can be either an expression or the name of a named expression. Example: HTTP.RES.HEADER("setcookie").VALUE(0).TYPECAST_NVLIST_T('=',';').VALUE("server1"). Default value: "none"
persistmask	<String>	Read-write	Persistence mask for IP based persistence types, for IPv4 virtual servers. Minimum length = 1
v6persistmasklen	<Double>	Read-write	Persistence mask for IP based persistence types, for IPv6 virtual servers. Default value: 128 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 128
pq	<String>	Read-write	Use priority queuing on the virtual server. based persistence types, for IPv6 virtual servers. Default value: OFF Possible values = ON, OFF
sc	<String>	Read-write	Use SureConnect on the virtual server. Default value: OFF Possible values = ON, OFF
rtspnat	<String>	Read-write	Use network address translation (NAT) for RTSP data connections. Default value: OFF Possible values = ON, OFF
m	<String>	Read-write	Redirection mode for load balancing. Available settings function as follows: * IP - Before forwarding a request to a server, change the destination IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address to the server's IP address. * MAC - Before forwarding a request to a server, change the destination MAC address to the server's MAC address. The destination IP address is not changed. MAC-based redirection mode is used mostly in firewall load balancing deployments. * IPTUNNEL - Perform IP-in-IP encapsulation for client IP packets. In the outer IP headers, set the destination IP address to the IP address of the server and the source IP address to the subnet IP (SNIP). The client IP packets are not modified. Applicable

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to both IPv4 and IPv6 packets. * TOS - Encode the virtual server's TOS ID in the TOS field of the IP header. You can use either the IPTUNNEL or the TOS option to implement Direct Server Return (DSR). Default value: IP Possible values = IP, MAC, IPTUNNEL, TOS
tosid	<Double>	Read-write	TOS ID of the virtual server. Applicable only when the load balancing redirection mode is set to TOS. Minimum value = 1 Maximum value = 63
datalength	<Double>	Read-write	Length of the token to be extracted from the data segment of an incoming packet, for use in the token method of load balancing. The length of the token, specified in bytes,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must not be greater than 24 KB. Applicable to virtual servers of type TCP. Minimum value = 1 Maximum value = 100
dataoffset	<Double>	Read-write	Offset to be considered when extracting a token from the TCP payload. Applicable to virtual servers, of type TCP, using the token method of load balancing. Must be within the first 24 KB of the TCP payload. Minimum value = 0 Maximum value = 25400
sessionless	<String>	Read-write	Perform load balancing on a per-packet basis, without establishing sessions. Recommended for load balancing of intrusion detection system (IDS) servers and scenarios involving direct server return (DSR), where session information is unnecessary.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
trofspersistence	<String>	Read-write	When value is ENABLED, Trofs persistence is honored. When value is DISABLED, Trofs persistence is not honored. Default value: ENABLED Possible values = ENABLED, DISABLED
state	<String>	Read-write	State of the load balancing virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
connfailover	<String>	Read-write	Mode in which the connection failover feature must operate for the virtual server. After a failover, established TCP connections and UDP packet flows are kept active and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resumed on the secondary appliance. Clients remain connected to the same servers. Available settings function as follows: * STATEFUL - The primary appliance shares state information with the secondary appliance, in real time, resulting in some runtime processing overhead. * STATELESS - State information is not shared, and the new primary appliance tries to re-create the packet flow on the basis of the information contained in the packets it receives. * DISABLED - Connection failover does not occur. Default value: DISABLED Possible values = DISABLED,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			STATEFUL, STATELESS
redirurl	<String>	Read-write	URL to which to redirect traffic if the virtual server becomes unavailable. WARNING! Make sure that the domain in the URL does not match the domain specified for a content switching policy. If it does, requests are continuously redirected to the unavailable virtual server. Minimum length = 1
cacheable	<String>	Read-write	Route cacheable requests to a cache redirection virtual server. The load balancing virtual server can forward requests only to a transparent cache redirection virtual server that has an IP address and port combination of *:80, so such a cache redirection virtual server must be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configured on the appliance. Default value: NO Possible values = YES, NO
clttimeout	<Double>	Read-write	Idle time, in seconds, after which a client connection is terminated. Minimum value = 0 Maximum value = 31536000
somethod	<String>	Read-write	Type of threshold that, when exceeded, triggers spillover. Available settings function as follows: * CONNECTION - Spillover occurs when the number of client connections exceeds the threshold. * DYNAMICCONNECTION - Spillover occurs when the number of client connections at the virtual server exceeds the sum of the maximum client (Max Clients)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			settings for bound services. Do not specify a spillover threshold for this setting, because the threshold is implied by the Max Clients settings of bound services. * BANDWIDTH - Spillover occurs when the bandwidth consumed by the virtual server's incoming and outgoing traffic exceeds the threshold. * HEALTH - Spillover occurs when the percentage of weights of the services that are UP drops below the threshold. For example, if services svc1, svc2, and svc3 are bound to a virtual server, with weights 1, 2, and 3, and the spillover threshold is 50%, spillover occurs if svc1 and svc3 or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			svc2 and svc3 transition to DOWN. * NONE - Spillover does not occur. Possible values = CONNECTION, DYNAMICCONNECTION, BANDWIDTH, HEALTH, NONE
sopersistence	<String>	Read-write	If spillover occurs, maintain source IP address based persistence for both primary and backup virtual servers. Default value: DISABLED Possible values = ENABLED, DISABLED
sopersistencetimeout	<Double>	Read-write	Timeout for spillover persistence, in minutes. Default value: 2 Minimum value = 2 Maximum value = 1440
healththreshold	<Double>	Read-write	Threshold in percent of active services below which vserver state is made down.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If this threshold is 0, vserver state will be up even if one bound service is up. Default value: 0 Minimum value = 0 Maximum value = 100
sothreshold	<Double>	Read-write	Threshold at which spillover occurs. Specify an integer for the CONNECTION spillover method, a bandwidth value in kilobits per second for the BANDWIDTH method (do not enter the units), or a percentage for the HEALTH method (do not enter the percentage symbol). Minimum value = 1 Maximum value = 4294967287
sobackupaction	<String>	Read-write	Action to be performed if spillover is to take effect, but no backup chain to spillover is usable or exists. Possible values = DROP, ACCEPT, REDIRECT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
redirectportrewrite	<String>	Read-write	Rewrite the port and change the protocol to ensure successful HTTP redirects from services. Default value: DISABLED Possible values = ENABLED, DISABLED
downstateflush	<String>	Read-write	Flush all active transactions associated with a virtual server whose state transitions from UP to DOWN. Do not enable this option for applications that must complete their transactions. Default value: ENABLED Possible values = ENABLED, DISABLED
backupvserver	<String>	Read-write	Name of the backup virtual server to which to forward requests if the primary virtual server goes DOWN or reaches its spillover threshold. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
disableprimaryondown	<String>	Read-write	If the primary virtual server goes down, do not allow it to return to primary status until manually enabled. Default value: DISABLED Possible values = ENABLED, DISABLED
insertvserveripport	<String>	Read-write	Insert an HTTP header, whose value is the IP address and port number of the virtual server, before forwarding a request to the server. The format of the header is <vipHeader>: <virtual server IP address>_<port number >, where vipHeader is the name that you specify for the header. If the virtual server has an IPv6 address, the address in the header is enclosed in brackets ([and]) to separate it from the port number. If you have mapped an IPv4 address to a virtual server's IPv6 address, the value of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this parameter determines which IP address is inserted in the header, as follows: * VIPADDR - Insert the IP address of the virtual server in the HTTP header regardless of whether the virtual server has an IPv4 address or an IPv6 address. A mapped IPv4 address, if configured, is ignored. * V6TOV4MAPPING - Insert the IPv4 address that is mapped to the virtual server's IPv6 address. If a mapped IPv4 address is not configured, insert the IPv6 address. * OFF - Disable header insertion. Possible values = OFF, VIPADDR, V6TOV4MAPPING

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vipheader	<String>	Read-write	Name for the inserted header. The default name is vip-header. Minimum length = 1
authenticationhost	<String>	Read-write	Fully qualified domain name (FQDN) of the authentication virtual server to which the user must be redirected for authentication. Make sure that the Authentication parameter is set to ENABLED. Minimum length = 3 Maximum length = 252
authentication	<String>	Read-write	Enable or disable user authentication. Default value: OFF Possible values = ON, OFF
authn401	<String>	Read-write	Enable or disable user authentication with HTTP 401 responses. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authnvsname	<String>	Read-write	Name of an authentication virtual server with which to authenticate users. Minimum length = 1 Maximum length = 252
push	<String>	Read-write	Process traffic with the push virtual server that is bound to this load balancing virtual server. Default value: DISABLED Possible values = ENABLED, DISABLED
pushvserver	<String>	Read-write	Name of the load balancing virtual server, of type PUSH or SSL_PUSH, to which the server pushes updates received on the load balancing virtual server that you are configuring. Minimum length = 1
pushlabel	<String>	Read-write	Expression for extracting a label from the server's response. Can be either an expression or the name of a named expression.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: "none"
pushmulticlients	<String>	Read-write	Allow multiple Web 2.0 connections from the same client to connect to the virtual server and expect updates. Default value: NO Possible values = YES, NO
tcpprofilename	<String>	Read-write	Name of the TCP profile whose settings are to be applied to the virtual server. Minimum length = 1 Maximum length = 127
httpprofilename	<String>	Read-write	Name of the HTTP profile whose settings are to be applied to the virtual server. Minimum length = 1 Maximum length = 127
dbprofilename	<String>	Read-write	Name of the DB profile whose settings are to be applied to the virtual server. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
comment	<String>	Read-write	Any comments that you might want to associate with the virtual server.
l2conn	<String>	Read-write	Use Layer 2 parameters (channel number, MAC address, and VLAN ID) in addition to the 4-tuple (<source IP>:<source port>::<destination IP>:<destination port>) that is used to identify a connection. Allows multiple TCP and non-TCP connections with the same 4-tuple to co-exist on the Citrix ADC. Possible values = ON, OFF
oracleserverversion	<String>	Read-write	Oracle server version. Default value: 10G Possible values = 10G, 11G
mssqlserverversion	<String>	Read-write	For a load balancing virtual server of type MSSQL, the Microsoft SQL Server version. Set this parameter if you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expect some clients to run a version different from the version of the database. This setting provides compatibility between the client-side and server-side connections by ensuring that all communication conforms to the server's version. Default value: 2008R2 Possible values = 70, 2000, 2000SP1, 2005, 2008, 2008R2, 2012, 2014
mysqlprotocolversion	<Double>	Read-write	MySQL protocol version that the virtual server advertises to clients.
mysqlserverversion	<String>	Read-write	MySQL server version string that the virtual server advertises to clients. Minimum length = 1 Maximum length = 31
mysqlcharacterset	<Double>	Read-write	Character set that the virtual server advertises to clients.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mysqlservercapabilities	<Double>	Read-write	Server capabilities that the virtual server advertises to clients.
appflowlog	<String>	Read-write	Apply AppFlow logging to the virtual server. Default value: ENABLED Possible values = ENABLED, DISABLED
netprofile	<String>	Read-write	Name of the network profile to associate with the virtual server. If you set this parameter, the virtual server uses only the IP addresses in the network profile as source IP addresses when initiating connections with servers. Minimum length = 1 Maximum length = 127
icmpvsrresponse	<String>	Read-write	How the Citrix ADC responds to ping requests received for an IP address that is common to one or more virtual servers. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If set to PASSIVE on all the virtual servers that share the IP address, the appliance always responds to the ping requests. * If set to ACTIVE on all the virtual servers that share the IP address, the appliance responds to the ping requests if at least one of the virtual servers is UP. Otherwise, the appliance does not respond. * If set to ACTIVE on some virtual servers and PASSIVE on the others, the appliance responds if at least one virtual server with the ACTIVE setting is UP. Otherwise, the appliance does not respond. Note: This parameter is available at the virtual server level.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			A similar parameter, ICMP Response, is available at the IP address level, for IPv4 addresses of type VIP. To set that parameter, use the add ip command in the CLI or the Create IP dialog box in the GUI. Default value: PASSIVE Possible values = PASSIVE, ACTIVE
rhistate	<String>	Read-write	Route Health Injection (RHI) functionality of the NetSaler appliance for advertising the route of the VIP address associated with the virtual server. When Vserver RHI Level (RHI) parameter is set to VSVR_CNTRLD, the following are different RHI behaviors for the VIP address on the basis of RHIstate (RHI STATE) settings on the virtual servers

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			associated with the VIP address: * If you set RHI STATE to PASSIVE on all virtual servers, the Citrix ADC always advertises the route for the VIP address. * If you set RHI STATE to ACTIVE on all virtual servers, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers is in UP state. * If you set RHI STATE to ACTIVE on some and PASSIVE on others, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers, whose RHI STATE set to ACTIVE, is in UP state.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: PASSIVE Possible values = PASSIVE, ACTIVE
newservicerequest	<Double>	Read-write	Number of requests, or percentage of the load on existing services, by which to increase the load on a new service at each interval in slow-start mode. A non-zero value indicates that slow-start is applicable. A zero value indicates that the global RR startup parameter is applied. Changing the value to zero will cause services currently in slow start to take the full traffic as determined by the LB method. Subsequently, any new services added will use the global RR factor. Default value: 0
newservicerequestunit	<String>	Read-write	Units in which to increment load at each interval in slow-start mode. Default value: PER_SECOND

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = PER_SECOND, PERCENT
newservicerequestincrementinterval	<Double>	Read-write	Interval, in seconds, between successive increments in the load on a new service or a service whose state has just changed from DOWN to UP. A value of 0 (zero) specifies manual slow start. Default value: 0 Minimum value = 0 Maximum value = 3600
minautoscalemembers	<Double>	Read-write	Minimum number of members expected to be present when vserver is used in Autoscale. Default value: 0 Minimum value = 0 Maximum value = 5000
maxautoscalemembers	<Double>	Read-write	Maximum number of members expected to be present when vserver is used in Autoscale. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 5000
persistavpno	<Double[]>	Read-write	Persist AVP number for Diameter Persistency. In case this AVP is not defined in Base RFC 3588 and it is nested inside a Grouped AVP, define a sequence of AVP numbers (max 3) in order of parent to child. So say persist AVP number X is nested inside AVP Y which is nested in Z, then define the list as Z Y X. Minimum value = 1
skippersistency	<String>	Read-write	This argument decides the behavior incase the service which is selected from an existing persistence session has reached threshold. Default value: None

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Bypass, ReLb, None
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
authnprofile	<String>	Read-write	Name of the authentication profile to be used when authentication is turned on.
macmoderetainvlan	<String>	Read-write	This option is used to retain vlan information of incoming packet when macmode is enabled. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dbslb	<String>	Read-write	Enable database specific load balancing for MySQL and MSSQL service types. Default value: DISABLED Possible values = ENABLED, DISABLED
dns64	<String>	Read-write	This argument is for enabling/disabling the dns64 on lbvserver. Possible values = ENABLED, DISABLED
bypassaaaa	<String>	Read-write	If this option is enabled while resolving DNS64 query AAAA queries are not sent to back end dns server. Default value: NO Possible values = YES, NO
recursionavailable	<String>	Read-write	When set to YES, this option causes the DNS replies from this vserver to have the RA bit turned on. Typically one would set this option to YES, when the vserver is load

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			balancing a set of DNS servers thatsupport recursive queries. Default value: NO Possible values = YES, NO
processlocal	<String>	Read-write	By turning on this option packets destined to a vserver in a cluster will not under go any steering. Turn this option for single packet request response mode or when the upstream device is performing a proper RSS for connection based distribution. Default value: DISABLED Possible values = ENABLED, DISABLED
dnsprofilename	<String>	Read-write	Name of the DNS profile to be associated with the VServer. DNS profile properties will be applied to the transactions processed by a VServer. This parameter is valid

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only for DNS and DNS-TCP VServers. Minimum length = 1 Maximum length = 127
lbprofilename	<String>	Read-write	Name of the LB profile which is associated to the vserver.
redirectfromport	<Integer>	Read-write	Port number for the virtual server, from which we absorb the traffic for http redirect. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
httpsredirecturl	<String>	Read-write	URL to which to redirect traffic if the traffic is recieved from redirect port.
retainconnectionsoncluster	<String>	Read-write	This option enables you to retain existing connections on a node joining a Cluster system or when a node is being configured for passive timeout. By default, this option is disabled.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
adfsproxyprofile	<String>	Read-write	Name of the adfsProxy profile to be used to support ADFSPIP protocol for ADFS servers.
weight	<Double>	Read-write	Weight to assign to the specified service. Minimum value = 1 Maximum value = 100
servicename	<String>	Read-write	Service to bind to the virtual server. Minimum length = 1
redirurlflags	<Boolean>	Read-write	The redirect URL to be unset.
newname	<String>	Read-write	New name for the virtual server. Minimum length = 1
value	<String>	Read-only	SSL status. Possible values = Certkey not bound, SSL feature disabled
ipmapping	<String>	Read-only	The permanent mapping for the V6 Address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ngname	<String>	Read-only	Nodegroup name to which this lbvsever belongs to.
type	<String>	Read-only	Type of LB vserver. Possible values = CONTENT, ADDRESS
curstate	<String>	Read-only	Current LB vserver state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
effectivestate	<String>	Read-only	Effective state of the LB vserver , based on the state of backup vservers. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Unknown, DISABLED
status	<Integer>	Read-only	Current status of the lb vserver. During the initial phase if the configured lb method is not round robin , the vserver will adopt round robin to distribute traffic for a predefined number of requests.
lbrrreason	<Integer>	Read-only	Reason why a vserver is in RR. The following are the reasons: 1 - MEP is DOWN (GSLB) 2 - LB method has changed 3 - Bound service's state changed to UP 4 - A new service is bound 5 - Startup RR factor has changed 6 - LB feature is enabled 7 - Load monitor is not active on a service

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			8 - Vserver is Enabled 9 - SSL feature is Enabled 10 - All bound services have reached threshold. Using effective state to load balance (GSLB) 11 - Primary state of bound services are not UP. Using effective state to load balance (GSLB) 12 - No LB decision can be made as all bound services have either reached threshold or are not UP (GSLB) 13 - All load monitors are active .
redirect	<String>	Read-only	Cache redirect type. Possible values = CACHE, POLICY, ORIGIN
precedence	<String>	Read-only	Precedence.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = RULE, URL
homepage	<String>	Read-only	Home page.
dnsvservername	<String>	Read-only	DNS vserver name.
domain	<String>	Read-only	Domain.
policyname	<String>	Read-only	Name of the policy bound to the LB vserver.
cachevserver	<String>	Read-only	Cache virtual server.
health	<Double>	Read-only	Health of vserver based on percentage of weights of active svcs/all svcs. This does not consider administratively disabled svcs.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
ruletype	<Double>	Read-only	Rule type.
groupname	<String>	Read-only	LB group to which the lb vserver is to be bound.
cookiedomain	<String>	Read-only	Domain name to be used in the set cookie header in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			case of cookie persistence.
map	<String>	Read-only	Map. Possible values = ON, OFF
gt2gb	<String>	Read-only	Allow for greater than 2 GB transactions on this vserver. Default value: DISABLED Possible values = ENABLED, DISABLED
consolidatedlconn	<String>	Read-only	Use consolidated stats for LeastConnection. Default value: GLOBAL Possible values = GLOBAL, NO, YES
consolidatedlconngbl	<String>	Read-only	Fetches Global setting. Possible values = YES, NO
thresholdvalue	<Integer>	Read-only	Tells whether threshold exceeded for this service participating in CUSTOMLB.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bindpoint	<String>	Read-only	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE
invoke	<Boolean>	Read-only	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-only	The invocation type. Possible values = reqvserver, resvserver, policylabel
labelname	<String>	Read-only	Name of the label invoked.
version	<Integer>	Read-only	Cookie version.
totalservices	<Double>	Read-only	Total number of services bound to the vserver.
activeservices	<Double>	Read-only	Total number of active services bound to the vserver.
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
statechangetimeseconds	<Double>	Read-only	Time when last state change happened. Seconds part.
statechangetimemsec	<Double>	Read-only	Time at which last state change

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			happened. Milliseconds part.
tickssincelaststatechange	<Double>	Read-only	Time in 10 millisecond ticks since the last state change.
isgslb	<Boolean>	Read-only	This field is set to true if it is a GSLBVserver.
vsvrdynconnsothreshold	<Double>	Read-only	Spillover threshold for dynamic connection.
backupvserverstatus	<String>	Read-only	Staus of BackUp Vserver .
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

lbvserver_analyticsprofile_binding

Binding object showing the analyticsprofile that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
analyticsprofile	<String>	Read-write	Name of the analytics profile bound to the LB vserver.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lbvserver_analyticsprofile_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"lbvserver_analyticsprofile_binding":{

<b>"name":<String_value>,

</b>"analyticsprofile":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_analyticsprofile_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_analyticsprofile_binding/name_value<String>?**args=analyticsprofile:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_analyticsprofile_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_analyticsprofile_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbvserver_analyticsprofile_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_analyticsprofile_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lbvserver_analyticsprofile_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

lbvserver_appfwpolicy_binding

Binding object showing the appfwpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the label invoked.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver, resvserver, policylabel
sc	<String>	Read-only	Use SureConnect on the virtual server. Default value: OFF Possible values = ON, OFF
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

lbvserver_appqoepolicy_binding

Binding object showing the appqoepolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labeltype	<String>	Read-write	Type of policy label to invoke. Applicable only to rewrite, videooptimization and cache policies. Available settings function as follows: * reqvserver - Evaluate the request against the request-based policies bound to the specified virtual server. * resvserver - Evaluate the response against the response-based policies bound to the specified virtual server. * policylabel - invoke the request or response against the specified user-defined policy label. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

lbvserver_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applicable only to compression, rewrite, videooptimization and cache policies. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labeltype	<String>	Read-write	Type of policy label to invoke. Applicable only to rewrite, videooptimization and cache policies. Available settings function as follows: * reqvserver - Evaluate the request against the request-based policies bound to the specified virtual server. * resvserver - Evaluate the response against the response-based policies bound to the specified virtual server. * policylabel - invoke the request or response against the specified user-defined policy label. Possible values = reqvserver, resvserver, policylabel
sc	<String>	Read-only	Use SureConnect on the virtual server. Default value: OFF Possible values = ON, OFF
__count	<Double>	Read-only	count parameter

Response Payload:

```
{"lbvserver_auditnslogpolicy_binding": [ { "__count": "#no"} ] }
```

lbvserver_auditsyslogpolicy_binding

Binding object showing the auditsyslogpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applicable only to compression, rewrite, videooptimization and cache policies. Possible values = REQUEST, RESPONSE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	Type of policy label to invoke. Applicable only to rewrite, videooptimization and cache policies. Available settings function as follows: * reqvserver - Evaluate the request against the request-based policies bound to the specified virtual server. * resvserver - Evaluate the response against the response-based policies bound to the specified virtual server. * policylabel - invoke the request or response against the specified user-defined policy label. Possible values = reqvserver, resvserver, policylabel
sc	<String>	Read-only	Use SureConnect on the virtual server. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lbvserver_auditsyslogpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"lbvserver_auditsyslogpolicy_binding":{

<b>"name":<String_value>,

</b>"policyname":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"bindpoint":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_auditsyslogpolicy_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_auditsyslogpolicy_binding/name_value<String>?**args=policyname:<String_value>,bindpoint:<String_value>,priority:<Double_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_auditsyslogpolicy_binding/name_value<String>

lbvserver_cachepolicy_binding

Binding object showing the cachepolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the label invoked.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lbvserver_cachepolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"lbvserver_cachepolicy_binding":{

<b>"name":<String_value>,

</b>"policyname":<String_value>,
```

```
"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"bindpoint":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_cachepolicy_binding/name_value<String>

lbvserver_dnspolicy64_binding

Binding object showing the dnspolicy64 that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applicable only to compression, rewrite, videooptimization and cache policies. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	Type of policy label to invoke. Applicable only to rewrite, videooptimization and cache policies. Available settings function as follows: * reqvserver - Evaluate the request against the request-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			based policies bound to the specified virtual server. * resvserver - Evaluate the response against the response-based policies bound to the specified virtual server. * policylabel - invoke the request or response against the specified user-defined policy label. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lbvserver_dnspolicy64_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"lbvserver_dnspolicy64_binding":{

<b>"name":<String_value>,

</b>"policyname":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

lbvserver_filterpolicy_binding

Binding object showing the filterpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applicable only to compression, rewrite, videooptimization and cache policies. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: *

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	Type of policy label to invoke. Applicable only to rewrite, videooptimization and cache policies. Available settings function as follows: * reqvserver - Evaluate the request against the request-based policies bound to the specified virtual server. * resvserver - Evaluate the response against the response-based policies bound to the specified virtual server. * policylabel - invoke the request or response against the specified user-defined policy label. Possible values = reqvserver, resvserver, policylabel
sc	<String>	Read-only	Use SureConnect on the virtual server. Default value: OFF Possible values = ON, OFF
__count	<Double>	Read-only	count parameter

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_filterpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbvserver_filterpolicy_binding": [ {

"priority":<Double_value>,

"bindpoint":<String_value>,

"policyname":<String_value>,

"labelname":<String_value>,

"name":<String_value>,

"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"sc":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_filterpolicy_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"lbvserver_filterpolicy_binding": [ { "__count": "#no"} ] }
```

lbvserver_pqpolicy_binding

Binding object showing the pqpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the policy's priority. The lower the priority number, the higher the policy's priority. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 2147483647
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applicable only to compression, rewrite, videooptimization and cache policies. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	Type of policy label to invoke. Applicable only to rewrite, videooptimization and cache policies. Available settings function as follows: * reqvserver - Evaluate the request against the request-based policies bound to the specified virtual server. * resvserver - Evaluate the response against the response-based policies bound to the specified virtual server. * policylabel - invoke the request or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			response against the specified user-defined policy label. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lbvserver_pqpolicy_binding

lbvserver_scpolicy_binding

Binding object showing the scpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applicable only to compression, rewrite, videooptimization and cache policies. Possible values = REQUEST, RESPONSE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	Type of policy label to invoke. Applicable only to rewrite, videooptimization and cache policies. Available settings function as follows: * reqvserver - Evaluate the request against the request-based policies bound to the specified virtual server. * resvserver - Evaluate the response against the response-based policies bound to the specified virtual server. * policylabel - invoke the request or response against the specified user-defined policy label. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lbvserver_scpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"lbvserver_scpolicy_binding":{

<b>"name":<String_value>,

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"lbvserver_scpolicy_binding": [ { "__count": "#no"} ] }
```

lbvserver_servicegroupmember_binding

Binding object showing the servicegroupmember that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The service group name bound to the selected load balancing virtual server.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
weight	<Double>	Read-write	Weight to assign to the specified service. Minimum value = 1 Maximum value = 100
cookieipport	<String>	Read-only	Encryped Ip address and port of the service that is inserted into the set-cookie http header.
port	<Integer>	Read-only	Port number for the virtual server. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
curstate	<String>	Read-only	Current LB vserver state. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
preferredlocation	<String>	Read-only	Used for displaying the location of bound services.
vserverid	<String>	Read-only	Vserver Id.
ipv46	<String>	Read-only	IPv4 or IPv6 address to assign to the virtual server.
cookiename	<String>	Read-only	Use this parameter to specify the cookie name for COOKIE peristence type. It specifies the name of cookie with a maximum of 32 characters. If not specified, cookie name is internally generated.
dynamicweight	<Double>	Read-only	Dynamic weight.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicetype	<String>	Read-only	Protocol used by the service (also called the service type). Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, DTLS, NNTP, DNS, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, RTSP, PUSH, SSL_PUSH, RADIUS, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, SMPP, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, PROXY, USER_TCP, USER_SSL_TCP, QUIC, IPFIX, LOGSTREAM
__count	<Double>	Read-only	count parameter

lbvserver_spilloverpolicy_binding

Binding object showing the spilloverpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	Type of policy label to invoke. Applicable only to rewrite, videooptimization and cache policies. Available settings function as follows: * reqvserver - Evaluate the request against the request-based policies bound to the specified virtual server. * resvserver - Evaluate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the response against the response-based policies bound to the specified virtual server. * policylabel - invoke the request or response against the specified user-defined policy label. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lbvserver_spilloverpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
"lbvserver_spilloverpolicy_binding":{
<b>"name":<String_value>,
</b>"policyname":<String_value>,
"priority":<Double_value>,
"gotopriorityexpression":<String_value>,
"bindpoint":<String_value>,
"invoke":<Boolean_value>,
"labeltype":<String_value>,
"labelname":<String_value>
}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_spilloverpolicy_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_spilloverpolicy_binding/name_value<String>?**args=policyname:<String_value>,bindpoint:<String_value>,priority:<Double_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_spilloverpolicy_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_spilloverpolicy_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbvserver_spilloverpolicy_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_spilloverpolicy_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lbvserver_spilloverpolicy_binding resources in chunks.

HTTP Method:GET

Request Headers:

lbvserver_tmtrafficpolicy_binding

Binding object showing the tmtrafficpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applicable only to compression, rewrite, videooptimization and cache policies. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	Type of policy label to invoke. Applicable only to rewrite, videooptimization and cache policies. Available settings function as follows: * reqvserver - Evaluate the request against the request-based policies bound to the specified virtual server. * resvserver - Evaluate the response against the response-based policies bound to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified virtual server. * policylabel - invoke the request or response against the specified user-defined policy label. Possible values = reqvserver, resvserver, policylabel
__count	<Double>	Read-write	count parameter

lbwlm

Configuration for web log manager resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wlmname	<String>	Read-write	The name of the Work Load Manager. Minimum length = 1
ipaddress	<String>	Read-write	The IP address of the WLM.
port	<Integer>	Read-write	The port of the WLM. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
lbuid	<String>	Read-write	The LBUID for the Load Balancer to communicate to the Work Load Manager.
katimeout	<Double>	Read-write	The idle time period after which Citrix ADC would probe the WLM. The value ranges from 1 to 1440 minutes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 2 Minimum value = 0 Maximum value = 1440
secure	<String>	Read-only	Use this parameter to enable secure mode of communication with WLM. Possible values = YES, NO
state	<String>	Read-only	State of the WLM. Possible values = ACTIVE, INACTIVE, UNKNOWN
__count	<Double>	Read-only	count parameter

lbwlm_binding

Binding object which returns the resources bound to lbwlm.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wlmname	<String>	Read-write	The name of the work load manager. Minimum length = 1
lbwlm_lbvserver_binding	<lbwlm_lbvserver_binding[]>	Read-only	lbvserver that can be bound to lbwlm.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbwlm_binding/wlmname_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbwlm_binding": [ {

"wlmname":<String_value>,

"lbwlm_lbvserver_binding":<lbwlm_lbvserver_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbwlm_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbwlm_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lbwlm_binding": [ {

"wlmname":<String_value>,
```

```
"lbwlm_lbvserver_binding":<lbwlm_lbvserver_binding[]_value>

}]}
```

lbwlm_lbvserver_binding

Binding object showing the lbvserver that can be bound to lbwlm.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wlmname	<String>	Read-write	The name of the Work Load Manager. Minimum length = 1
vservername	<String>	Read-write	Name of the virtual server which is to be bound to the WLM.
__count	<Double>	Read-write	count parameter

Operations

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lbvserver_videooptimizationdetectionpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"lbvserver_videooptimizationdetectionpolicy_binding":{

<b>"name":<String_value>,
```

```
</b>"policyname":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"bindpoint":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_videooptimizationdetectionpolicy_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_videooptimizationdetectionpolicy_binding/name_value<String>?**args=policyname:<String_value>,bindpoint:<String_value>,priority:<Double_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_videooptimizationdetectionpolicy_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_videooptimizationdetectionpolicy_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lbvserver_videooptimizationdetectionpolicy_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lbvserver_videooptimizationdetectionpolicy_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lbvserver_videooptimizationdetectionpolicy_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

```

lbvserver_videooptimizationpacingpolicy_binding

Binding object showing the videooptimizationpacingpolicy that can be bound to lbvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority.
bindpoint	<String>	Read-write	The bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE
policyname	<String>	Read-write	Name of the policy bound to the LB vserver.
labelname	<String>	Read-write	Name of the label invoked.
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Can be changed after the virtual server is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server or policy label.
labeltype	<String>	Read-write	The invocation type. Possible values = reqvserver,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resvserver, policylabel
__count	<Double>	Read-write	count parameter

LSN

Lsn

Large Scale NAT commands

NAME	DESCRIPTION
lsnappsattributes	Configuration for LSN Application Attributes
lsnappsprofile	Configuration for LSN Application Profile
lsnappsprofile_binding	Binding object showing the resources that can be bound to lsnappsprofile
lsnappsprofile_lsnappsattributes_binding	Binding object showing the lsnappsattributes that can be bound to lsnappsprofile
lsnappsprofile_port_binding	Binding object showing the port that can be bound to lsnappsprofile
lsnclient	Configuration for lsn client
lsnclient_binding	Binding object showing the resources that can be bound to lsnclient
lsnclient_network6_binding	Binding object showing the network6 that can be bound to lsnclient
lsnclient_network_binding	Binding object showing the network that can be bound to lsnclient
lsnclient_nsacl6_binding	Binding object showing the nsacl6 that can be bound to lsnclient
lsnclient_nsacl_binding	Binding object showing the nsacl that can be bound to lsnclient
lsndeterministicnat	Configuration for deterministic NAT
lsngroup	Configuration for LSN group
lsngroup_binding	Binding object showing the resources that can be bound to lsngroup
lsngroup_ipsecalgprofile_binding	Binding object showing the ipsecalgprofile that can be bound to lsngroup
lsngroup_lsnappsprofile_binding	Binding object showing the lsnappsprofile that can be bound to lsngroup

NAME	DESCRIPTION
lsngroup_lsnhttphdrlogprofile_binding	Binding object showing the lsnhttphdrlogprofile that can be bound to lsngroup
lsngroup_lsnlogprofile_binding	Binding object showing the lsnlogprofile that can be bound to lsngroup
lsngroup_lsnpool_binding	Binding object showing the lsnpool that can be bound to lsngroup
lsngroup_lsnrtspalgprofile_binding	Binding object showing the lsnrtspalgprofile that can be bound to lsngroup
lsngroup_lsnsipalgprofile_binding	Binding object showing the lsnsipalgprofile that can be bound to lsngroup
lsngroup_lsntransportprofile_binding	Binding object showing the lsntransportprofile that can be bound to lsngroup
lsngroup_pcpserver_binding	Binding object showing the pcpserver that can be bound to lsngroup
lsnhttphdrlogprofile	Configuration for LSN HTTP header logging Profile
lsnip6profile	Configuration for LSN ip6 Profile
lsnlogprofile	Configuration for LSN logging Profile
lsnparameter	Configuration for LSN parameter
lsnpool	Configuration for LSN pool
lsnpool_binding	Binding object showing the resources that can be bound to lsnpool
lsnpool_lsnip_binding	Binding object showing the lsnip that can be bound to lsnpool
lsnrtspalgprofile	Configuration for LSN RTSPALG Profile
lsnrtspalgsession	Configuration for LSN RTSPALG session

NAME	DESCRIPTION
lsnrtspalgsession_binding	Binding object showing the resources that can be bound to lsnrtspalgsession
lsnrtspalgsession_datachannel_binding	Binding object showing the datachannel that can be bound to lsnrtspalgsession
lsnsession	Configuration for lsn session
lsnsipalgcall	Configuration for LSN SIPALG call
lsnsipalgcall_binding	Binding object showing the resources that can be bound to lsnsipalgcall
lsnsipalgcall_controlchannel_binding	Binding object showing the controlchannel that can be bound to lsnsipalgcall
lsnsipalgcall_datachannel_binding	Binding object showing the datachannel that can be bound to lsnsipalgcall
lsnsipalgprofile	Configuration for LSN SIPALG Profile
lsnstatic	Configuration for static mapping
lsntransportprofile	Configuration for LSN Transport Profile

lsnappsprofile

Configuration for LSN Application Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appsprofilename	<String>	Read-write	Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1'). Minimum length = 1 Maximum length = 127
transportprotocol	<String>	Read-write	Name of the protocol for which the parameters of this LSN application profile applies. Possible values = TCP, UDP, ICMP
ippooling	<String>	Read-write	NAT IP address allocation options for sessions associated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			with the same subscriber. Available options function as follows: * Paired - The Citrix ADC allocates the same NAT IP address for all sessions associated with the same subscriber. When all the ports of a NAT IP address are used in LSN sessions (for same or multiple subscribers), the Citrix ADC ADC drops any new connection from the subscriber. * Random - The Citrix ADC allocates random NAT IP addresses, from the pool, for different sessions associated with the same subscriber. This parameter is applicable to dynamic NAT allocation only.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: RANDOM Possible values = PAIRED, RANDOM
mapping	<String>	Read-write	Type of LSN mapping to apply to subsequent packets originating from the same subscriber IP address and port. Consider an example of an LSN mapping that includes the mapping of the subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y). Available options function as follows: * ENDPOINT-INDEPENDENT - Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to any external IP address and port.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ADDRESS-DEPENDENT - Reuse the LSN mapping for subsequent packets sent from the same subscriber IP address and port (X:x) to the same external IP address (Y), regardless of the external port. * ADDRESS-PORT-DEPENDENT - Reuse the LSN mapping for subsequent packets sent from the same internal IP address and port (X:x) to the same external IP address and port (Y:y) while the mapping is still active. Default value: ADDRESS-PORT-DEPENDENT Possible values = ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADDRESS-PORT-DEPENDENT
filtering	<String>	Read-write	Type of filter to apply to packets originating from external hosts. Consider an example of an LSN mapping that includes the mapping of subscriber IP:port (X:x), NAT IP:port (N:n), and external host IP:port (Y:y). Available options function as follows: * ENDPOINT INDEPENDENT - Filters out only packets not destined to the subscriber IP address and port X:x, regardless of the external host IP address and port source (Z:z). The Citrix ADC forwards any packets destined to X:x. In other words, sending packets from the subscriber to any external IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address is sufficient to allow packets from any external hosts to the subscriber. * ADDRESS DEPENDENT - Filters out packets not destined to subscriber IP address and port X:x. In addition, the ADC filters out packets from Y:y destined for the subscriber (X:x) if the client has not previously sent packets to Y:anyport (external port independent). In other words, receiving packets from a specific external host requires that the subscriber first send packets to that specific external host's IP address. * ADDRESS PORT DEPENDENT (the default) - Filters out packets not destined to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			subscriber IP address and port (X:x). In addition, the Citrix ADC filters out packets from Y:y destined for the subscriber (X:x) if the subscriber has not previously sent packets to Y:y. In other words, receiving packets from a specific external host requires that the subscriber first send packets first to that external IP address and port. Default value: ADDRESS-PORT-DEPENDENT Possible values = ENDPOINT-INDEPENDENT, ADDRESS-DEPENDENT, ADDRESS-PORT-DEPENDENT
tcpproxy	<String>	Read-write	Enable TCP proxy, which enables the Citrix ADC to optimize the TCP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			traffic by using Layer 4 features. Default value: DISABLED Possible values = ENABLED, DISABLED
td	<Double>	Read-write	ID of the traffic domain through which the Citrix ADC sends the outbound traffic after performing LSN. If you do not specify an ID, the ADC sends the outbound traffic through the default traffic domain, which has an ID of 0. Default value: 4095
l2info	<String>	Read-write	Enable l2info by creating natpcbs for LSN, which enables the Citrix ADC to use L2CONN/MBF with LSN. Default value: DISABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

lsnappsprofile_binding

Binding object which returns the resources bound to lsnappsprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appsprofilename	<String>	Read-write	Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be changed after the LSN application profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1'). Minimum length = 1 Maximum length = 127
lsnappsprofile_lsnappsattributes_binding	<lsnappsprofile_lsnappsattributes_binding[]>	Read-only	lsnappsattributes that can be bound to lsnappsprofile.
lsnappsprofile_port_binding	<lsnappsprofile_port_binding[]>	Read-only	port that can be bound to lsnappsprofile.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnappsprofile_binding/appsprofilename_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnappsprofile_binding": [ {

"appsprofilename":<String_value>,

"lsnappsprofile_port_binding":<lsnappsprofile_port_binding[]_value>,

"lsnappsprofile_lsnappsattributes_binding":<lsnappsprofile_lsnappsattributes_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnappsprofile_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnappsprofile_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnappsprofile_binding": [ {

"appsprofilename":<String_value>,

"lsnappsprofile_port_binding":<lsnappsprofile_port_binding[]_value>,

"lsnappsprofile_lsnappsattributes_binding":<lsnappsprofile_lsnappsattributes_binding[]_value>

}]}
```

lsnappsprofile_port_binding

Binding object showing the port that can be bound to lsnappsprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appsprofilename	<String>	Read-write	Name for the LSN application profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN application profile is created. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn application profile1" or 'lsn application profile1'). Minimum length = 1 Maximum length = 127
lsnport	<String>	Read-write	Port numbers or range of port numbers to match against the destination port of the incoming packet from a subscriber. When the destination port is matched, the LSN application profile is applied for the LSN session. Separate a range of ports with a hyphen. For example, 40-90. Minimum length = 1
__count	<Double>	Read-write	count parameter

lsnclient_network_binding

Binding object showing the network that can be bound to lsnclient.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	IPv4 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you want the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix ADC to perform Large Scale NAT. Minimum length = 1
clientname	<String>	Read-write	Name for the LSN client entity. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN client is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn client1" or 'lsn client1'). . Minimum length = 1 Maximum length = 127
td	<Double>	Read-write	ID of the traffic domain on which this subscriber or the subscriber network

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(as specified by the network parameter) belongs. If you do not specify an ID, the subscriber or the subscriber network becomes part of the default traffic domain. Default value: 0 Minimum value = 0 Maximum value = 4094
netmask	<String>	Read-write	Subnet mask for the IPv4 address specified in the Network parameter.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lsnclient_network_binding

lsngroup

Configuration for LSN group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupname	<String>	Read-write	Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1'). Minimum length = 1 Maximum length = 127
clientname	<String>	Read-write	Name of the LSN client entity to be associated with the LSN group. You can associate only one LSN client entity with an LSN group.You

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cannot remove this association or replace with another LSN client entity once the LSN group is created.
nattype	<String>	Read-write	Type of NAT IP address and port allocation (from the bound LSN pools) for subscribers: Available options function as follows: * Deterministic - Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The Citrix ADC sequentially allocates NAT resources to these subscribers. The Citrix ADC ADC assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port. The maximum number of LSN subscribers

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			allowed, globally, is 1 million. * Dynamic - Allocate a random NAT IP address and a port from the LSN NAT pool for a subscriber's connection. If port block allocation is enabled (in LSN pool) and a port block size is specified (in the LSN group), the Citrix ADC allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The ADC allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscriber's connections) from

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the subscriber's allocated port block, the ADC allocates a new random port block for the subscriber. Default value: DYNAMIC Possible values = DYNAMIC, DETERMINISTIC
allocpolicy	<String>	Read-write	NAT IP and PORT block allocation policy for Deterministic NAT. Supported Policies are, 1: PORTS: Port blocks from single NATIP will be allocated to LSN subscribers sequentially. After all blocks are exhausted, port blocks from next NATIP will be allocated and so on. 2: IPADDRS(Default): One port block from each NATIP will be allocated and once all the NATIPs are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			over second port block from each NATIP will be allocated and so on. To understand better if we assume port blocks of all NAT IPs as two dimensional array, PORTS policy follows "row major order" and IPADDRS policy follows "column major order" while allocating port blocks. Example: Client IPs: 2.2.2.1, 2.2.2.2 and 2.2.2.3 NAT IPs and PORT Blocks: 4.4.4.1:PB1, PB2, PB3,., PBn 4.4.4.2: PB1, PB2, PB3,., PBn PORTS Policy: 2.2.2.1 => 4.4.4.1:PB1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			2.2.2.2 => 4.4.4.1:PB2 2.2.2.3 => 4.4.4.1:PB3 IPADDRS Policy: 2.2.2.1 => 4.4.4.1:PB1 2.2.2.2 => 4.4.4.2:PB1 2.2.2.3 => 4.4.4.1:PB2. Default value: IPADDRS Possible values = PORTS, IPADDRS
portblocksize	<Double>	Read-write	Size of the NAT port block to be allocated for each subscriber. To set this parameter for Dynamic NAT, you must enable the port block allocation parameter in the bound LSN pool. For Deterministic NAT, the port block allocation parameter is always

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enabled, and you cannot disable it. In Dynamic NAT, the Citrix ADC allocates a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber. For a subscriber, if all the ports are allocated from the subscriber's allocated port block, the ADC allocates a new random port block for the subscriber. The default port block size is 256 for Deterministic NAT, and 0 for Dynamic NAT. Default value: 0 Minimum value = 256 Maximum value = 65536
logging	<String>	Read-write	Log mapping entries and sessions created or deleted for this LSN group. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix ADC logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled. The ADC uses its existing syslog and audit log framework to log LSN information. You must enable global level LSN logging by enabling the LSN parameter in the related NSLOG action and SYLOG action entities. When the Logging parameter is enabled, the Citrix ADC generates log messages related to LSN mappings and LSN sessions of this LSN group. The ADC then sends these log messages to servers associated with the NSLOG action and SYSLOG actions entities.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			A log message for an LSN mapping entry consists of the following information: * NSIP address of the Citrix ADC * Time stamp * Entry type (MAPPING or SESSION) * Whether the LSN mapping entry is created or deleted * Subscriber's IP address, port, and traffic domain ID * NAT IP address and port * Protocol name * Destination IP address, port, and traffic domain ID might be present, depending on the following conditions: ` Destination IP address and port are not logged for Endpoint-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Independent mapping ` Only Destination IP address (and not port) is logged for Address-Dependent mapping  ` Destination IP address and port are logged for Address-Port-Dependent mapping. Default value: DISABLED Possible values = ENABLED, DISABLED
sessionlogging	<String>	Read-write	Log sessions created or deleted for the LSN group. The Citrix ADC logs LSN sessions for this LSN group only when both logging and session logging parameters are enabled. A log message for an LSN session consists of the following information:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* NSIP address of the Citrix ADC * Time stamp * Entry type (MAPPING or SESSION) * Whether the LSN session is created or removed * Subscriber's IP address, port, and traffic domain ID * NAT IP address and port * Protocol name * Destination IP address, port, and traffic domain ID. Default value: DISABLED Possible values = ENABLED, DISABLED
sessionsync	<String>	Read-write	In a high availability (HA) deployment, synchronize information of all LSN sessions related to this LSN group with the secondary node. After a failover,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			established TCP connections and UDP packet flows are kept active and resumed on the secondary node (new primary). For this setting to work, you must enable the global session synchronization parameter. Default value: ENABLED Possible values = ENABLED, DISABLED
snmptraplimit	<Double>	Read-write	Maximum number of SNMP Trap messages that can be generated for the LSN group in one minute. Default value: 100 Minimum value = 0 Maximum value = 10000
ftp	<String>	Read-write	Enable Application Layer Gateway (ALG) for the FTP protocol. For some application-layer protocols, the IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			addresses and protocol port numbers are usually communicated in the packet's payload. When acting as an ALG, the Citrix ADC changes the packet's payload to ensure that the protocol continues to work over LSN. Note: The Citrix ADC also includes ALG for ICMP and TFTP protocols. ALG for the ICMP protocol is enabled by default, and there is no provision to disable it. ALG for the TFTP protocol is disabled by default. ALG is enabled automatically for an LSN group when you bind a UDP LSN application profile, with endpoint-independent-mapping, endpoint-independent filtering, and destination port as 69 (well-known port

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for TFTP), to the LSN group. Default value: ENABLED Possible values = ENABLED, DISABLED
pptp	<String>	Read-write	Enable the PPTP Application Layer Gateway. Default value: DISABLED Possible values = ENABLED, DISABLED
sipalg	<String>	Read-write	Enable the SIP ALG. Default value: DISABLED Possible values = ENABLED, DISABLED
rtspalg	<String>	Read-write	Enable the RTSP ALG. Default value: DISABLED Possible values = ENABLED, DISABLED
ip6profile	<String>	Read-write	Name of the LSN ip6 profile to associate with the specified

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LSN group. An ip6 profile can be associated with a group only during group creation. By default, no LSN ip6 profile is associated with an LSN group during its creation. Only one ip6profile can be associated with a group. Minimum length = 1 Maximum length = 127
ftpcm	<String>	Read-write	Enable the FTP connection mirroring for specified LSN group. Connection mirroring (CM or connection failover) refers to keeping active an established TCP or UDP connection when a failover occurs. Default value: DISABLED Possible values = ENABLED, DISABLED
groupid	<Double>	Read-only	. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

lsngroup_binding

Binding object which returns the resources bound to lsngroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupname	<String>	Read-write	Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1'). Minimum length = 1 Maximum length = 127
lsngroup_lsnsipalgprofile_binding	<lsngroup_lsnsipalgprofile_binding[]>	Read-only	lsnsipalgprofile that can be bound to lsngroup.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lsngroup_ipsecalgprofile_binding	<lsngroup_ipsecalgprofile_binding[]>	Read-only	ipsecalgprofile that can be bound to lsngroup.
lsngroup_pcpserver_binding	<lsngroup_pcpserver_binding[]>	Read-only	pcpserver that can be bound to lsngroup.
lsngroup_lsnhttphdrlogprofile_binding	<lsngroup_lsnhttphdrlogprofile_binding[]>	Read-only	lsnhttphdrlogprofile that can be bound to lsngroup.
lsngroup_lsnpool_binding	<lsngroup_lsnpool_binding[]>	Read-only	lsnpool that can be bound to lsngroup.
lsngroup_lsntransportprofile_binding	<lsngroup_lsntransportprofile_binding[]>	Read-only	lsntransportprofile that can be bound to lsngroup.
lsngroup_lsnlogprofile_binding	<lsngroup_lsnlogprofile_binding[]>	Read-only	lsnlogprofile that can be bound to lsngroup.
lsngroup_lsnrtspalgprofile_binding	<lsngroup_lsnrtspalgprofile_binding[]>	Read-only	lsnrtspalgprofile that can be bound to lsngroup.
lsngroup_lsnappsprofile_binding	<lsngroup_lsnappsprofile_binding[]>	Read-only	lsnappsprofile that can be bound to lsngroup.

Operations

{"lsngroup_ipsecalgprofile_binding": [ { "__count": "#no"} ] }
```

lsngroup_lsnappsprofile_binding

Binding object showing the lsnappsprofile that can be bound to lsngroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
appsprofilename	<String>	Read-write	Name of the LSN application profile to bind to the specified LSN group. For each set of destination ports, bind a profile for each protocol for which you want to specify settings. By default, one LSN application profile with default settings for TCP, UDP, and ICMP protocols for all destination ports is bound to an LSN group during its creation. This profile is called a default application profile. When you bind an LSN application profile, with a specified set of destination ports, to an LSN group, the bound profile overrides the default LSN application profile for that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			protocol at that set of destination ports.
groupname	<String>	Read-write	Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1'). Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/lsngroup_lsnappsprofile_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"lsngroup_lsnappsprofile_binding":{

<b>"groupname":<String_value>,

</b>"appsprofilename":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsngroup_lsnappsprofile_binding/groupname_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsngroup_lsnappsprofile_binding/groupname_value<String>?**args=appsprofilename:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

```

lsngroup_lsnsipalgprofile_binding

Binding object showing the lsnsipalgprofile that can be bound to lsngroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sipalgprofilename	<String>	Read-write	The name of the LSN SIP ALG Profile.
groupname	<String>	Read-write	Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1'). Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

lsngroup_lsntransportprofile_binding

Binding object showing the lsntransportprofile that can be bound to lsngroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
transportprofilename	<String>	Read-write	Name of the LSN transport profile to bind to the specified LSN group. Bind a profile for each protocol for which

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			you want to specify settings. By default, one LSN transport profile with default settings for TCP, UDP, and ICMP protocols is bound to an LSN group during its creation. This profile is called a default transport. An LSN transport profile that you bind to an LSN group overrides the default LSN transport profile for that protocol.
groupname	<String>	Read-write	Name for the LSN group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclose the name in double or single quotation marks (for example, "lsn group1" or 'lsn group1'). Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

```

lsnip6profile

Configuration for LSN ip6 Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LSN ip6 profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN ip6 profile is created. The following

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn ip6 profile1" or 'lsn ip6 profile1'). Minimum length = 1 Maximum length = 127
type	<String>	Read-write	IPv6 translation type for which to set the LSN IP6 profile parameters. Possible values = DS-Lite, NAT64
natprefix	<String>	Read-write	IPv6 address(es) of the LSN subscriber(s) or subscriber network(s) on whose traffic you want the Citrix ADC to perform Large Scale NAT.
network6	<String>	Read-write	IPv6 address of the Citrix ADC AFTR device.
__count	<Double>	Read-only	count parameter

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnip6profile

lsnparameter

Configuration for LSN parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
memlimit	<Double>	Read-write	Amount of Citrix ADC memory to reserve

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for the LSN feature, in multiples of 2MB. Note: If you later reduce the value of this parameter, the amount of active memory is not reduced. Changing the configured memory limit can only increase the amount of active memory. This command is deprecated, use 'set extendedmemoryparam -memlimit' instead.
sessionsync	<String>	Read-write	Synchronize all LSN sessions with the secondary node in a high availability (HA) deployment (global synchronization). After a failover, established TCP connections and UDP packet flows are kept active and resumed on the secondary node (new primary). The global session synchronization parameter and session

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			synchronization parameters (group level) of all LSN groups are enabled by default. For a group, when both the global level and the group level LSN session synchronization parameters are enabled, the primary node synchronizes information of all LSN sessions related to this LSN group with the secondary node. Default value: ENABLED Possible values = ENABLED, DISABLED
subscrsessionremoval	<String>	Read-write	LSN global setting for controlling subscriber aware session removal, when this is enabled, when ever the subscriber info is deleted from subscriber database, sessions corresponding to that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			subscriber will be removed. if this setting is disabled, subscriber sessions will be timed out as per the idle time out settings. Default value: DISABLED Possible values = ENABLED, DISABLED
memlimitactive	<Double>	Read-only	Amount of actual memory reserved for the LSN feature. The amount of active memory for the LSN feature might be less than the configured memory, because the available memory is shared across features.
maxmemlimit	<Double>	Read-only	Maximum amount of Citrix ADC memory that can be reserved for the LSN feature.

Operations

"subscrsessionremoval":<String_value>

}]}
```

lsnpool

Configuration for LSN pool resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
poolname	<String>	Read-write	Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1'). Minimum length = 1 Maximum length = 127
nattype	<String>	Read-write	Type of NAT IP address and port allocation (from the LSN pools bound to an LSN group) for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			subscribers (of the LSN client entity bound to the LSN group): Available options function as follows: * Deterministic - Allocate a NAT IP address and a block of ports to each subscriber (of the LSN client bound to the LSN group). The Citrix ADC sequentially allocates NAT resources to these subscribers. The Citrix ADC ADC assigns the first block of ports (block size determined by the port block size parameter of the LSN group) on the beginning NAT IP address to the beginning subscriber IP address. The next range of ports is assigned to the next subscriber, and so on, until the NAT address does not have enough ports

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for the next subscriber. In this case, the first port block on the next NAT address is used for the subscriber, and so on. Because each subscriber now receives a deterministic NAT IP address and a block of ports, a subscriber can be identified without any need for logging. For a connection, a subscriber can be identified based only on the NAT IP address and port, and the destination IP address and port. * Dynamic - Allocate a random NAT IP address and a port from the LSN NAT pool for a subscriber's connection. If port block allocation is enabled (in LSN pool) and a port block size is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified (in the LSN group), the Citrix ADC allocates a random NAT IP address and a block of ports for a subscriber when it initiates a connection for the first time. The ADC allocates this NAT IP address and a port (from the allocated block of ports) for different connections from this subscriber. If all the ports are allocated (for different subscriber's connections) from the subscriber's allocated port block, the ADC allocates a new random port block for the subscriber. Only LSN Pools and LSN groups with the same NAT type settings can be bound together. Multiples LSN pools can be bound to an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LSN group. A maximum of 16 LSN pools can be bound to an LSN group. . Default value: DYNAMIC Possible values = DYNAMIC, DETERMINISTIC
portblockallocation	<String>	Read-write	Allocate a random NAT port block, from the available NAT port pool of an NAT IP address, for each subscriber when the NAT allocation is set as Dynamic NAT. For any connection initiated from a subscriber, the Citrix ADC allocates a NAT port from the subscriber's allocated NAT port block to create the LSN session. You must set the port block size in the bound LSN group. For a subscriber, if all the ports are allocated from the subscriber's allocated port block,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the Citrix ADC allocates a new random port block for the subscriber. For Deterministic NAT, this parameter is enabled by default, and you cannot disable it. Default value: DISABLED Possible values = ENABLED, DISABLED
portrealloctimeout	<Double>	Read-write	The waiting time, in seconds, between deallocating LSN NAT ports (when an LSN mapping is removed) and reallocating them for a new LSN session. This parameter is necessary in order to prevent collisions between old and new mappings and sessions. It ensures that all established sessions are broken instead of redirected to a different subscriber. This is not applicable for ports used in:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Deterministic NAT * Address-Dependent filtering and Address-Port-Dependent filtering * Dynamic NAT with port block allocation In these cases, ports are immediately reallocated. Default value: 0 Minimum value = 0 Maximum value = 600
maxportrealloctmq	<Double>	Read-write	Maximum number of ports for which the port reallocation timeout applies for each NAT IP address. In other words, the maximum deallocated-port queue size for which the reallocation timeout applies for each NAT IP address. When the queue size is full, the next port deallocated is reallocated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			immediately for a new LSN session. Default value: 65536 Minimum value = 0 Maximum value = 65536
__count	<Double>	Read-only	count parameter

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"lsnpool":{

<b>"poolname":<String_value>,

</b>"nattype":<String_value>,

"portblockallocation":<String_value>,

"portrealloctimeout":<Double_value>,

"maxportrealloctmq":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool/poolname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"lsnpool":{

<b>"poolname":<String_value>,

</b>"portrealloctimeout":<Double_value>,

"maxportrealloctmq":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"lsnpool":{

<b>"poolname":<String_value>,

</b>"portrealloctimeout":true,

"maxportrealloctmq":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lsnpool resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnpool resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnpool": [ {

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnpool": [ { "__count": "#no"} ] }
```

lsnpool_binding

Binding object which returns the resources bound to lsnpool.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
poolname	<String>	Read-write	Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN pool is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1'). Minimum length = 1 Maximum length = 127
lsnpool_lsnip_binding	<lsnpool_lsnip_binding[]>	Read-only	lsnip that can be bound to lsnpool.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool_binding/poolname_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnpool_binding": [ {

"poolname":<String_value>,

"lsnpool_lsnip_binding":<lsnpool_lsnip_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnpool_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnpool_binding": [ {

"poolname":<String_value>,

"lsnpool_lsnip_binding":<lsnpool_lsnip_binding[]_value>

}]}
```

lsnpool_lsnip_binding

Binding object showing the lsnip that can be bound to lsnpool.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
poolname	<String>	Read-write	Name for the LSN pool. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be changed after the LSN pool is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn pool1" or 'lsn pool1'). Minimum length = 1 Maximum length = 127
ownernode	<Double>	Read-write	ID(s) of cluster node(s) on which command is to be executed. Minimum value = 0 Maximum value = 31
lsnip	<String>	Read-write	IPv4 address or a range of IPv4 addresses to be used as NAT IP address(es) for LSN. After the pool is created, these IPv4 addresses are added to the Citrix ADC as Citrix ADC owned IP address of type LSN. A maximum of 4096 IP addresses can be bound to an LSN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			pool. An LSN IP address associated with an LSN pool cannot be shared with other LSN pools. IP addresses specified for this parameter must not already exist on the Citrix ADC as any Citrix ADC owned IP addresses. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189. You can later remove some or all the LSN IP addresses from the pool, and add IP addresses to the LSN pool. By default , arp is enabled on LSN IP address but, you can disable it using command - "set ns ip" . Minimum length = 1
__count	<Double>	Read-write	count parameter

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession?**args=sessionid:<String_value>,nodeid:<Double_value>**

Use this query-parameter to get lsnrtspalgsession resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lsnrtspalgsession resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnrtspalgsession resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnrtspalgsession": [ {

sessionid:<String_value>,nodeid:<Double_value>"callflags":<Double_value>,

"xlatip":<String_value>,

"callrefcount":<Double_value>,

"calltimer":<Double_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession/sessionid_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession/sessionid_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession/sessionid_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnrtspalgsession": [ {

sessionid:<String_value>,nodeid:<Double_value>"callflags":<Double_value>,

```

```
"callrefcount":<Double_value>,

"calltimer":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnrtspalgsession": [ { "__count": "#no"} ] }
```

lsnrtspalgsession_binding

Binding object which returns the resources bound to lsnrtspalgsession.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessionid	<String>	Read-write	Session ID for the RTSP call.
lsnrtspalgsession_datachannel_binding	<lsnrtspalgsession_datachannel_binding[]>	Read-only	datachannel that can be bound to lsnrtspalgsession.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession_binding/sessionid_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnrtspalgsession_binding": [ {

"sessionid":<String_value>,

"lsnrtspalgsession_datachannel_binding":<lsnrtspalgsession_datachannel_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnrtspalgsession_binding": [ {

"sessionid":<String_value>,

"lsnrtspalgsession_datachannel_binding":<lsnrtspalgsession_datachannel_binding[]_value>

}]}
```

lsnrtspalgsession_datachannel_binding

Binding object showing the datachannel that can be bound to lsnrtspalgsession.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
channelip	<String>	Read-write	IP address of the channel.
sessionid	<String>	Read-write	Session ID for the RTSP call.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
channelnatip	<String>	Read-only	Natted IP address of the channel.
channelport	<Integer>	Read-only	port for the channel.
channelflags	<Double>	Read-only	Flags for the call entry.
channeltimeout	<Double>	Read-only	Timeout for the channel.
channelnatport	<Integer>	Read-only	Natted port for the channel.
channelprotocol	<String>	Read-only	Channel transport protocol. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, HTTPSVR, HTTPCLIENT, NAT, HA, AAA, SINCTCP, VPN AFTP, MONITORS, SSLVPN UDP, SINCUDP, RIP, UDP CLNT, SASP, RPCCLNTS, ROUTE, AUDIT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			STA HTTP, STA SSL, DNS RESOLVE, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, ICA, RADIUS, RADIUSListener, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, QUIC, TFTP_DATA, USER_TCP, USER_SSL_TCP
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession_datachannel_binding/sessionid_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession_datachannel_binding/sessionid_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lsnrtspalgsession_datachannel_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnrtspalgsession_datachannel_binding/sessionid_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnrtspalgsession_datachannel_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

lsnsession

Configuration for lsn session resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nattype	<String>	Read-write	Type of sessions to be displayed. Default value: NAT44

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NAT44, DS-Lite, NAT64
clientname	<String>	Read-write	Name of the LSN Client entity.
network	<String>	Read-write	IP address or network address of subscriber(s).
netmask	<String>	Read-write	Subnet mask for the IP address specified by the network parameter.
network6	<String>	Read-write	IPv6 address of the LSN subscriber or B4 device.
td	<Double>	Read-write	Traffic domain ID of the LSN client entity. Default value: 0 Minimum value = 0 Maximum value = 4094
natip	<String>	Read-write	Mapped NAT IP address used in LSN sessions.
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
natport2	<Integer>	Read-write	Mapped NAT port used in the LSN sessions.
natprefix	<String>	Read-only	IPv6 address of the LSN subscriber(s) or subscriber network(B4-Device) on whose traffic the Citrix ADC perform Large Scale NAT.
subscrip	<String>	Read-only	The Source IP address.
subscrport	<Integer>	Read-only	The Source Port.
destip	<String>	Read-only	The Destination IP address.
destport	<Integer>	Read-only	The Destination Port.
natport	<Integer>	Read-only	The NAT Port.
transportprotocol	<String>	Read-only	The Transport Protocol for the session. Possible values = TCP, UDP, ICMP
sessionestdir	<String>	Read-only	The Session establishment direction, session was established for outbound or inbound packet. Possible values = OUT, IN
dsttd	<Double>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srctd	<Double>	Read-only	.
ipv6address	<String>	Read-only	IPv6 address of v6 vserver.
__count	<Double>	Read-only	count parameter

ng[]_value>,

"lsnsipalgcall_datachannel_binding":<lsnsipalgcall_datachannel_binding[]_v
alue>

}]}
```

lsnsipalgcall_controlchannel_binding

Binding object showing the controlchannel that can be bound to lsnsipalgcall.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
channelip	<String>	Read-write	IP address of the channel.
callid	<String>	Read-write	Call ID for the SIP call.
channelnatip	<String>	Read-only	Natted IP address of the channel.
channelport	<Integer>	Read-only	port for the channel.
channelflags	<Double>	Read-only	Flags for the call entry.
channeltimeout	<Double>	Read-only	Timeout for the channel.
channelnatport	<Integer>	Read-only	Natted port for the channel.
channelprotocol	<String>	Read-only	Channel transport protocol.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, HTTPSVR, HTTPCLIENT, NAT, HA, AAA, SINCTCP, VPN AFTP, MONITORS, SSLVPN UDP, SINCUDP, RIP, UDP CLNT, SASP, RPCCLNTS, ROUTE, AUDIT, STA HTTP, STA SSL, DNS RESOLVE, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, ICA, RADIUS, RADIUSListener, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, QUIC, TFTP_DATA,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			USER_TCP, USER_SSL_TCP
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnsipalgcall_controlchannel_binding/callid_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnsipalgcall_controlchannel_binding/callid_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of lsnsipalgcall_controlchannel_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnsipalgcall_controlchannel_binding/callid_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnsipalgcall_controlchannel_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

lsnsipalgprofile

Configuration for LSN SIPALG Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sipalgprofilename	<String>	Read-write	The name of the SIPALG Profile. Minimum length = 1 Maximum length = 127
datasessionidletimeout	<Double>	Read-write	Idle timeout for the data channel sessions in seconds. Default value: 120
sipsessiontimeout	<Double>	Read-write	SIP control channel session timeout in seconds. Default value: 600
registrationtimeout	<Double>	Read-write	SIP registration timeout in seconds. Default value: 60
sipsrcportrange	<String>	Read-write	Source port range for SIP_UDP and SIP_TCP.
sipdstportrange	<String>	Read-write	Destination port range for SIP_UDP and SIP_TCP.
openregisterpinhole	<String>	Read-write	ENABLE/DISABLE RegisterPinhole creation.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
opencontactpinhole	<String>	Read-write	ENABLE/DISABLE ContactPinhole creation. Default value: ENABLED Possible values = ENABLED, DISABLED
openviapinhole	<String>	Read-write	ENABLE/DISABLE ViaPinhole creation. Default value: ENABLED Possible values = ENABLED, DISABLED
openrecordroutepinhole	<String>	Read-write	ENABLE/DISABLE RecordRoutePinhole creation. Default value: ENABLED Possible values = ENABLED, DISABLED
siptransportprotocol	<String>	Read-write	SIP ALG Profile transport protocol type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = TCP, UDP
openroutepinhole	<String>	Read-write	ENABLE/DISABLE RoutePinhole creation. Default value: ENABLED Possible values = ENABLED, DISABLED
rport	<String>	Read-write	ENABLE/DISABLE rport. Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

lsnstatic

Configuration for static mapping resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the LSN static mapping entry. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN group is created. The following requirement applies only to the Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn static1" or 'lsn static1'). Minimum length = 1 Maximum length = 127
transportprotocol	<String>	Read-write	Protocol for the LSN mapping entry. Possible values = TCP, UDP, ICMP, ALL
subscrip	<String>	Read-write	IPv4(NAT44 ; DS-Lite)/IPv6(NAT64) address of an LSN subscriber for the LSN static mapping entry.
subscrport	<Integer>	Read-write	Port of the LSN subscriber for the LSN mapping entry. * represents all ports being used. Used in case of static wildcard. Minimum value = 0 Maximum value = 65535 Range 1 - 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* in CLI is represented as 65535 in NITRO API
network6	<String>	Read-write	B4 address in DS-Lite setup. Minimum length = 1
td	<Double>	Read-write	ID of the traffic domain to which the subscriber belongs. If you do not specify an ID, the subscriber is assumed to be a part of the default traffic domain. Default value: 0 Minimum value = 0 Maximum value = 4094
natip	<String>	Read-write	IPv4 address, already existing on the Citrix ADC as type LSN, to be used as NAT IP address for this mapping entry.
natport	<Integer>	Read-write	NAT port for this LSN mapping entry. * represents all ports being used. Used in case of static wildcard.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 65535 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
destip	<String>	Read-write	Destination IP address for the LSN mapping entry.
dsttd	<Double>	Read-write	ID of the traffic domain through which the destination IP address for this LSN mapping entry is reachable from the Citrix ADC. If you do not specify an ID, the destination IP address is assumed to be reachable through the default traffic domain, which has an ID of 0. Default value: 0 Minimum value = 0 Maximum value = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nattype	<String>	Read-write	Type of sessions to be displayed. Possible values = NAT44, DS-Lite, NAT64
status	<String>	Read-only	The status of the Mapping. Status could be Inactive, if mapping addition failed due to already existing dynamic/ static mapping, port allocation failure. Possible values = ACTIVE, INACTIVE
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnstatic

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"lsnstatic":{

<b>"name":<String_value>,

</b><b>"transportprotocol":<String_value>,

</b><b>"subscrip":<String_value>,

</b><b>"subscrport":<Integer_value>,

</b>"network6":<String_value>,

"td":<Double_value>,

"natip":<String_value>,
```

```
"natport":<Integer_value>,

"destip":<String_value>,

"dsttd":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnstatic/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnstatic

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnstatic?
args=name:<String_value>,nattype:<String_value>

Use this query-parameter to get lsnstatic resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnstatic?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnstatic?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of lsnstatic resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnstatic?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsnstatic?**pagesize=#no;pageno=#no**

Use this query-parameter to get the lsnstatic resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "lsnstatic": [ {
```

```
name:<String_value>,nattype:<String_value>"transportprotocol":<String_valu
e>,

```

lsntransportprofile

Configuration for LSN Transport Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
transportprofilename	<String>	Read-write	Name for the LSN transport profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the LSN transport profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "lsn transport profile1" or 'lsn transport profile1'). Minimum length = 1 Maximum length = 127
transportprotocol	<String>	Read-write	Protocol for which to set the LSN transport profile parameters. Possible values = TCP, UDP, ICMP
sessiontimeout	<Double>	Read-write	Timeout, in seconds, for an idle LSN session. If an LSN session is idle for a time that exceeds this value, the Citrix ADC removes the session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This timeout does not apply for a TCP LSN session when a FIN or RST message is received from either of the endpoints. . Default value: 120 Minimum value = 60
finrsttimeout	<Double>	Read-write	Timeout, in seconds, for a TCP LSN session after a FIN or RST message is received from one of the endpoints. If a TCP LSN session is idle (after the Citrix ADC receives a FIN or RST message) for a time that exceeds this value, the Citrix ADC ADC removes the session. Since the LSN feature of the Citrix ADC does not maintain state information of any TCP LSN sessions, this timeout accommodates the transmission of the FIN or RST, and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ACK messages from the other endpoint so that both endpoints can properly close the connection. Default value: 30
stuntimeout	<Double>	Read-write	STUN protocol timeout. Default value: 600 Minimum value = 120 Maximum value = 1200
synidletimeout	<Double>	Read-write	SYN Idle timeout. Default value: 60 Minimum value = 30 Maximum value = 120
portquota	<Double>	Read-write	Maximum number of LSN NAT ports to be used at a time by each subscriber for the specified protocol. For example, each subscriber can be limited to a maximum of 500 TCP NAT ports. When the LSN NAT mappings for a subscriber reach the limit, the Citrix ADC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			does not allocate additional NAT ports for that subscriber. Default value: 0 Minimum value = 0 Maximum value = 65535
sessionquota	<Double>	Read-write	Maximum number of concurrent LSN sessions allowed for each subscriber for the specified protocol. When the number of LSN sessions reaches the limit for a subscriber, the Citrix ADC does not allow the subscriber to open additional sessions. Default value: 0 Minimum value = 0 Maximum value = 65535
groupsessionlimit	<Double>	Read-write	Maximum number of concurrent LSN sessions(for the specified protocol) allowed for all subscriber of a group to which this profile has bound. This limit will get split across

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the Citrix ADCs packet engines and rounded down. When the number of LSN sessions reaches the limit for a group in packet engine, the Citrix ADC does not allow the subscriber of that group to open additional sessions through that packet engine. Default value: 0
portpreserveparity	<String>	Read-write	Enable port parity between a subscriber port and its mapped LSN NAT port. For example, if a subscriber initiates a connection from an odd numbered port, the Citrix ADC allocates an odd numbered LSN NAT port for this connection. You must set this parameter for proper functioning of protocols that require the source port to be even or odd numbered, for example, in peer-to-peer applications

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that use RTP or RTCP protocol. Default value: DISABLED Possible values = ENABLED, DISABLED
portpreserverange	<String>	Read-write	If a subscriber initiates a connection from a well-known port (0-1023), allocate a NAT port from the well-known port range (0-1023) for this connection. For example, if a subscriber initiates a connection from port 80, the Citrix ADC can allocate port 100 as the NAT port for this connection. This parameter applies to dynamic NAT without port block allocation. It also applies to Deterministic NAT if the range of ports allocated includes well-known ports. When all the well-known ports of all the available NAT IP addresses are used

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			in different subscriber's connections (LSN sessions), and a subscriber initiates a connection from a well-known port, the Citrix ADC drops this connection. Default value: DISABLED Possible values = ENABLED, DISABLED
syncheck	<String>	Read-write	Silently drop any non-SYN packets for connections for which there is no LSN-NAT session present on the Citrix ADC. If you disable this parameter, the Citrix ADC accepts any non-SYN packets and creates a new LSN session entry for this connection. Following are some reasons for the Citrix ADC to receive such packets:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* LSN session for a connection existed but the Citrix ADC removed this session because the LSN session was idle for a time that exceeded the configured session timeout. * Such packets can be a part of a DoS attack. Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/lsntransportprofile

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"lsntransportprofile":{

<b>"transportprofilename":<String_value>,

</b><b>"transportprotocol":<String_value>,

```
{ "appalgparam": [ {

"pptpgreidletimeout":<Double_value>

}]}
```

arp

Configuration for arp resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the network device that you want to add to the ARP table. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
mac	<String>	Read-write	MAC address of the network device.
ifnum	<String>	Read-write	Interface through which the network device is accessible. Specify the interface in (slot/port) notation. For example, 1/3.
vxlan	<Double>	Read-write	ID of the VXLAN on which the IP address of this ARP entry is reachable.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 16777215
vtep	<String>	Read-write	IP address of the VXLAN tunnel endpoint (VTEP) through which the IP address of this ARP entry is reachable. Minimum length = 1
vlan	<Double>	Read-write	The VLAN ID through which packets are to be sent after matching the ARP entry. This is a numeric value.
ownernode	<Double>	Read-write	The owner node for the Arp entry. Minimum value = 0 Maximum value = 31
all	<Boolean>	Read-write	Remove all ARP entries from the ARP table of the Citrix ADC.
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeout	<Double>	Read-only	The time, in seconds, after which the entry times out.
state	<Double>	Read-only	The state of the ARP entry.
flags	<Double>	Read-only	The flags for the entry.
type	<String>	Read-only	Indicates whether this ARP entry was added manually or dynamically. When you manually add an ARP entry, the value for this parameter is STATIC. Otherwise, it is DYNAMIC. For the NSIP and loopback IP addresses, the value is PERMANENT. Possible values = STATIC, PERMANENT, DYNAMIC
channel	<Double>	Read-only	The tunnel, channel, or physical interface through which the ARP entry is identified.
controlplane	<Boolean>	Read-only	This arp entry is populated by a control plane protocol.
__count	<Double>	Read-only	count parameter

ADD| DELETE| SEND| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/arp

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

bridgegroup_binding

Binding object which returns the resources bound to bridgegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	The name of the bridge group. Minimum value = 1 Maximum value = 1000
bridgegroup_nsip_binding	<bridgegroup_nsip_binding[]>	Read-only	nsip that can be bound to bridgegroup.
bridgegroup_vlan_binding	<bridgegroup_vlan_binding[]>	Read-only	vlan that can be bound to bridgegroup.
bridgegroup_nsip6_binding	<bridgegroup_nsip6_binding[]>	Read-only	nsip6 that can be bound to bridgegroup.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/bridgegroup_binding/id_value<Double>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "bridgegroup_binding": [ {

"id":<Double_value>,

"bridgegroup_nsip_binding":<bridgegroup_nsip_binding[]_value>,

"bridgegroup_vlan_binding":<bridgegroup_vlan_binding[]_value>,

"bridgegroup_nsip6_binding":<bridgegroup_nsip6_binding[]_value>
```

```
}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/bridgegroup_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/bridgegroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "bridgegroup_binding": [ {

"id":<Double_value>,

"bridgegroup_nsip_binding":<bridgegroup_nsip_binding[]_value>,

"bridgegroup_vlan_binding":<bridgegroup_vlan_binding[]_value>,

"bridgegroup_nsip6_binding":<bridgegroup_nsip6_binding[]_value>

}]}
```

bridgegroup_nsip6_binding

Binding object showing the nsip6 that can be bound to bridgegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION

```

bridgegroup_nsip_binding

Binding object showing the nsip that can be bound to bridgegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ownergroup	<String>	Read-write	The owner node group in a Cluster for this vlan. Default value: DEFAULT_NG Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	The integer that uniquely identifies the bridge group. Minimum value = 1 Maximum value = 1000
netmask	<String>	Read-write	The network mask for the subnet defined for the bridge group.
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
ipaddress	<String>	Read-write	The IP address assigned to the bridge group.
rnat	<Boolean>	Read-only	Temporary flag used for internal purpose.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/bridgegroup_nsip_binding

bridgetable

Configuration for bridge table entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mac	<String>	Read-write	The MAC address of the target.
vxlan	<Double>	Read-write	The VXLAN to which this address is associated. Minimum value = 1 Maximum value = 16777215
vtep	<String>	Read-write	The IP address of the destination VXLAN tunnel endpoint where the Ethernet MAC ADDRESS resides. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vni	<Double>	Read-write	The VXLAN VNI Network Identifier (or VXLAN Segment ID) to use to connect to the remote VXLAN tunnel endpoint. If omitted the value specified as vxlan will be used. Minimum value = 1 Maximum value = 16777215
devicevlan	<Double>	Read-write	The vlan on which to send multicast packets when the VXLAN tunnel endpoint is a muticast group address. Minimum value = 1 Maximum value = 4094
bridgeage	<Double>	Read-write	Time-out value for the bridge table entries, in seconds. The new value applies only to the entries that are dynamically learned after the new value is set. Previously existing bridge table entries expire after the previously configured time-out value.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 300 Minimum value = 60 Maximum value = 300
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
vlan	<Double>	Read-write	VLAN whose entries are to be removed. Minimum value = 1 Maximum value = 4094
ifnum	<String>	Read-write	INTERFACE whose entries are to be removed.
flags	<Double>	Read-only	Display flags,.
type	<String>	Read-only	Whether static or dynamic. Possible values = STATIC, PERMANENT, DYNAMIC
channel	<Double>	Read-only	The Tunnel through which bridge entry is learned.
controlplane	<Boolean>	Read-only	This bridge table entry is populated by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a control plane protocol.
__count	<Double>	Read-only	count parameter

channel

Configuration for channel resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	ID for the LA channel or cluster LA channel or LR channel to be created. Specify an LA channel in LA/x notation, where x can range from 1 to 8 or cluster LA channel in CLA/x

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			notation or Link redundant channel in LR/x notation, where x can range from 1 to 4. Cannot be changed after the LA channel is created.
ifnum	<String[]>	Read-write	Interfaces to be bound to the LA channel of a Citrix ADC or to the LA channel of a cluster configuration. For an LA channel of a Citrix ADC, specify an interface in C/U notation (for example, 1/3). For an LA channel of a cluster configuration, specify an interface in N/C/U notation (for example, 2/1/3). where C can take one of the following values: * 0 - Indicates a management interface. * 1 - Indicates a 1 Gbps port.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* 10 - Indicates a 10 Gbps port. U is a unique integer for representing an interface in a particular port group. N is the ID of the node to which an interface belongs in a cluster configuration. Use spaces to separate multiple entries.
state	<String>	Read-write	Enable or disable the LA channel. Default value: ENABLED Possible values = ENABLED, DISABLED
mode	<String>	Read-write	The initital mode for the LA channel. Possible values = MANUAL, AUTO
conndistr	<String>	Read-write	The 'connection' distribution mode for the LA channel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DISABLED, ENABLED
macdistr	<String>	Read-write	The 'MAC' distribution mode for the LA channel. Possible values = SOURCE, DESTINATION, BOTH
lamac	<String>	Read-write	Specifies a MAC address for the LA channels configured in Citrix ADC virtual appliances (VPX). This MAC address is persistent after each reboot. If you don't specify this parameter, a MAC address is generated randomly for each LA channel. These MAC addresses change after each reboot.
speed	<String>	Read-write	Ethernet speed of the channel, in Mbps. If the speed of any bound interface is greater than or equal to the value set for this parameter, the state of the interface is UP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Otherwise, the state is INACTIVE. Bound Interfaces whose state is INACTIVE do not process any traffic. Default value: AUTO Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000
flowctl	<String>	Read-write	Specifies the flow control type for this LA channel to manage the flow of frames. Flow control is a function as mentioned in clause 31 of the IEEE 802.3 standard. Flow control allows congested ports to pause traffic from the peer device. Flow control is achieved by sending PAUSE frames. Default value: OFF Possible values = OFF, RX, TX, RXTX, ON
hamonitor	<String>	Read-write	In a High Availability (HA) configuration, monitor the LA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			channel for failure events. Failure of any LA channel that has HA MON enabled triggers HA failover. Default value: ON Possible values = ON, OFF
haheartbeat	<String>	Read-write	In a High Availability (HA) configuration, configure the LA channel for sending heartbeats. LA channel that has HA Heartbeat disabled should not send the heartbeats. Default value: ON Possible values = OFF, ON
tagall	<String>	Read-write	Adds a four-byte 802.1q tag to every packet sent on this channel. The ON setting applies tags for all VLANs that are bound to this channel. OFF applies the tag for all VLANs other than the native VLAN. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trunk	<String>	Read-write	This is deprecated by tagall. Default value: OFF Possible values = ON, OFF
ifalias	<String>	Read-write	Alias name for the LA channel. Used only to enhance readability. To perform any operations, you have to specify the LA channel ID. Default value: " " Maximum length = 31
throughput	<Double>	Read-write	Low threshold value for the throughput of the LA channel, in Mbps. In an high availability (HA) configuration, failover is triggered when the LA channel has HA MON enabled and the throughput is below the specified threshold. Minimum value = 0 Maximum value = 160000
bandwidthhigh	<Double>	Read-write	High threshold value for the bandwidth usage of the LA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			channel, in Mbps. The Citrix ADC generates an SNMP trap message when the bandwidth usage of the LA channel is greater than or equal to the specified high threshold value. Minimum value = 0 Maximum value = 160000
bandwidthnormal	<Double>	Read-write	Normal threshold value for the bandwidth usage of the LA channel, in Mbps. When the bandwidth usage of the LA channel returns to less than or equal to the specified normal threshold after exceeding the high threshold, the Citrix ADC generates an SNMP trap message to indicate that the bandwidth usage has returned to normal. Minimum value = 0 Maximum value = 160000
mtu	<Double>	Read-write	The maximum transmission unit (MTU) is the largest packet size,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			measured in bytes excluding 14 bytes ethernet header and 4 bytes crc, that can be transmitted and received by this interface. Default value of MTU is 1500 on all the interface of Citrix ADC any value configured more than 1500 on the interface will make the interface as jumbo enabled. In case of cluster backplane interface MTU value will be changed to 1514 by default, user has to change the backplane interface value to maximum mtu configured on any of the interface in cluster system plus 14 bytes more for backplane interface if Jumbo is enabled on any of the interface in a cluster system. Changing the backplane will bring back the MTU of backplane interface to default value of 1500. If a channel is configured as backplane then the same holds true for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			channel as well as member interfaces. Default value: 1500 Minimum value = 1500 Maximum value = 9216
lrminthroughput	<Double>	Read-write	Specifies the minimum throughput threshold (in Mbps) to be met by the active subchannel. Setting this parameter automatically divides an LACP channel into logical subchannels, with one subchannel active and the others in standby mode. When the maximum supported throughput of the active channel falls below the lrMinThroughput value, link failover occurs and a standby subchannel becomes active. Minimum value = 0 Maximum value = 80000
linkredundancy	<String>	Read-write	Link Redundancy for Cluster LAG.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: OFF Possible values = ON, OFF
devicename	<String>	Read-only	LA channel name in form LA/x, where x is channel ID, which ranges from 1 to 8 or LR channel name in form LR/x, where x is channel ID, which ranges from 1 to 4.
unit	<Double>	Read-only	Unit number of the channel. This is an internal reference number that the Citrix ADC uses to identify the channel.
description	<String>	Read-only	The IEEE standard that the channel is based on.
flags	<Double>	Read-only	Flags of this channel.
actualmtu	<Double>	Read-only	MTU of the channel. This is the maximum frame size that the channel can process.
vlan	<Double>	Read-only	Native VLAN of the channel.
mac	<String>	Read-only	MAC address of the channel.
uptime	<Double>	Read-only	Duration for which the channel is UP. (Example: 3 hours 1 minute 1 second).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This value is reset when the channel state changes to DOWN.
downtime	<Double>	Read-only	Duration for which the channel is DOWN. (Example: 3 hours 1 minute 1 second). This value is reset when the channel state changes to UP.
reqmedia	<String>	Read-only	Requested media setting for this channel. Since there is no media associated with LA, the displayed values carry no significance. Possible values = AUTO, UTP, FIBER
reqspeed	<String>	Read-only	Requested speed setting for this channel. Since no media are associated with LA, this speed is used to determine the threshold for the slave interfaces. If the speed of the member interface is less than the requested speed, that interface is considered inactive.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000
reqduplex	<String>	Read-only	Requested duplex setting for this channel. Since no media are associated with LA, the displayed values carry no significance. Possible values = AUTO, HALF, FULL
reqflowcontrol	<String>	Read-only	Requested flow control setting for this channel. Since no media are associated with LA, the displayed values carry no significance. Possible values = OFF, RX, TX, RXTX, ON
media	<String>	Read-only	Requested media setting for this interface. Possible values = AUTO, UTP, FIBER
actspeed	<String>	Read-only	Actual speed setting for this channel. Possible values = AUTO, 10, 100, 1000, 10000,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			25000, 40000, 50000, 100000
duplex	<String>	Read-only	Actualduplex setting for this interface. Possible values = AUTO, HALF, FULL
actflowctl	<String>	Read-only	Actual flow control setting for this channel. Possible values = OFF, RX, TX, RXTX, ON
lamode	<String>	Read-only	The mode(AUTO/MANNUAL) for the LA channel. Possible values = MANUAL, AUTO
autoneg	<Double>	Read-only	Requested auto negotiation setting for this channel. Since no media are associated with LA, this setting has no effect.
autonegresult	<Double>	Read-only	Actual auto negotiation setting for this channel.
tagged	<Double>	Read-only	VLAN tags setting on this channel.
taggedany	<Double>	Read-only	Channel setting to accept/drop all tagged packets.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
taggedautolearn	<Double>	Read-only	Dynaminc vlan membership on this channel.
hangdetect	<Double>	Read-only	Hang detect for this channel.
hangreset	<Double>	Read-only	Hang reset for this channel.
linkstate	<Double>	Read-only	The current state of the link associated with the interface. For logical interfaces (LA), the state of the link is dependent on the state of the slave interfaces. For the link to be UP at least one of the slave interfaces needs to be UP.
intfstate	<Double>	Read-only	Current state of the specified interface. The interface state set to UP only if the link state is UP and administrative state is ENABLED.
rxpackets	<Double>	Read-only	Number of bytes received by all the slave interfaces of the channel since the Citrix ADC was started or the interface statistics were cleared.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rxbytes	<Double>	Read-only	Number of packets received by all member interfaces since the Citrix ADC was started or the interface statistics were cleared.
rxerrors	<Double>	Read-only	Number of inbound packets dropped by the hardware of the slave interfaces since the Citrix ADC was started or the interface statistics were cleared. Possible causes of dropped packets are CRC, length (undersize or oversize), and alignment errors.
rxdrops	<Double>	Read-only	Number of inbound packets dropped by the channel's slave interfaces. Commonly dropped packets are multicast frames, spanning tree BPDUs, packets destined to a MAC not owned by the Citrix ADC when L2 mode is disabled, or packets tagged for a VLAN that is not bound to the interface. In most healthy networks, this statistic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			increments at a steady rate regardless of traffic load. A sharp spike in dropped packets generally indicates an issue with connected L2 switches, such as a forwarding database overflow resulting in packets being broadcast on all ports.
txpackets	<Double>	Read-only	Number of packets transmitted by slave interfaces of a channel since the Citrix ADC was started or the interface statistics were cleared.
txbytes	<Double>	Read-only	Number of bytes transmitted by slave interfaces of a channel since the Citrix ADC was started or the interface statistics were cleared.
txerrors	<Double>	Read-only	Number of outbound packets dropped by the hardware of a channel's slave interfaces since the Citrix ADC was started or the interface statistics

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			were cleared. Possible causes of dropped packets are length (undersize or oversize) errors and lack of resources.
txdrops	<Double>	Read-only	Number of packets dropped in transmission by a channel's slave interfaces for one of the following reasons: (1) VLAN mismatch. (2) Oversized packets. (3) Interface congestion. (4) Loopback packets sent on non-loopback interface.
indisc	<Double>	Read-only	Number of error-free inbound packets discarded by a channel's slave interfaces because of a lack of resources (for example, insufficient receive buffers).
outdisc	<Double>	Read-only	Number of error-free outbound packets discarded by a channel's slave

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interfaces because of a lack of resources. This statistic is not available on: (1) 10G ports of Citrix ADC MPX 12500/12500/15500 -10G platforms. (2) 10G data ports on Citrix ADC MPX 17500/19500/21500 platforms.
fctls	<Double>	Read-only	Number of times flow control is performed on a channel's slave interfaces because of pause frames.
hangs	<Double>	Read-only	Number of hangs that occurred on the channel's slave interfaces.
stsstalls	<Double>	Read-only	Number of status stalls that occurred on the channel's slave interfaces.
txstalls	<Double>	Read-only	Number of Tx stalls happened that occurred on the channel's slave interfaces.
rxstalls	<Double>	Read-only	Number of Rx stalls that occurred on the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			channel's slave interfaces.
bdgmuted	<Double>	Read-only	Number of times a channel's slave interfaces stopped transmitting and receiving packets because of MAC moves between ports.
vmac	<String>	Read-only	Virtual MAC of this channel.
vmac6	<String>	Read-only	Virtual MAC for IPv6 on this interface.
reqthroughput	<Double>	Read-only	Minimum required throughput for an interface. Failover is triggered if the operating throughput of a Link Aggregation (LA) channel for which HAMON is ON falls below this value. Minimum value = 0 Maximum value = 160000
actthroughput	<Double>	Read-only	Actual throughput for the interface.
backplane	<String>	Read-only	The cluster backplane status of the LA. If the status is enabled, the LA is part of the cluster backplane. By default, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			backplane status is disabled. Possible values = ENABLED, DISABLED
cleartime	<Double>	Read-only	Time since the interface stats are cleared last time.
lacpmode	<String>	Read-only	The LACP mode of the specified interface. The possible values are: 1. Active: A port in active mode generates LACP protocol messages on a regular basis, regardless of any need expressed by its partner to receive them. 2. Passive: A port in passive mode generally does not transmit LACP messages unless its partner is in the active mode; that is, it does not speak unless spoken to. 3. Disabled: Removes the interface from the LA channel. If this is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only interface in the LA channel, the LA channel is also deleted. . Possible values = DISABLED, ACTIVE, PASSIVE
lacptimeout	<String>	Read-only	Time to wait for the LACPDU. If a LACPDU is not received within this interval, the Citrix ADC markes the link partner port as DOWN. Possible values: Long and Short. Long lacptimeout is 90 sec and Short LACP timeout is 3 sec. Possible values = LONG, SHORT
lacpactorpriority	<Double>	Read-only	LACP Actor Priority. A LACP port priority is configured on each port using LACP. LACP uses the port priority with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a hardware limitation that prevents all compatible ports from aggregating.
lacpactorportno	<Double>	Read-only	LACP Actor port number. LACP uses the port priority with the port number to form the port identifier.
lacppartnerstate	<String>	Read-only	LACP Partner State. Whether the port is in Active or Passive negotiating state. Possible values = MANUAL, AUTO
lacppartnertimeout	<String>	Read-only	The timeout value for the information revieved in LACPDUs. It can have values as SHORT or LONG. The SHORT timeout is 3s and the LONG timeout is 90s. Possible values = LONG, SHORT
lacppartneraggregation	<String>	Read-only	The Aggregation flag indicates that the participant will allow the link to be used as part of an aggregate. Otherwise the link is to be used as an individual link, i.e.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			not aggregated with any other. Possible values = NS_EMPTY_STR, AGG
lacppartnerinsync	<String>	Read-only	The Synchronization flag indicates that the transmitting participant.s mux component is in sync with the system id and key information transmitted. Possible values = NS_EMPTY_STR, SYNC
lacppartnercollecting	<String>	Read-only	The Collecting flag indicates that the participant.s collector, i.e. the reception component of the mux, is definitely on. If set the flag communicates collecting. Possible values = NS_EMPTY_STR, COLLECTING
lacppartnerdistributing	<String>	Read-only	The Distributing flag indicates that the participant.s distributor is not definitely off. If reset the flag indicates not distributing.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NS_EMPTY_STR, DISTRIBUTING
lacppartnerdefaulted	<String>	Read-only	If the timer expires in the Expired state, the Receive Machine enters the Defaulted state. Possible values = NS_EMPTY_STR, DEFAULTED
lacppartnerexpired	<String>	Read-only	If the LACPDUs are received for timeout period, the Receive Machine enters the Expired state and the timer is restarted with the timeout value of SHORT timeout. Possible values = NS_EMPTY_STR, EXPIRED
lacppartnerpriority	<Double>	Read-only	LACP Partner Priority. A LACP port priority is configured on each port using LACP. LACP uses the port priority with the port number to form the port identifier. The port priority determines which ports should be put in standby mode

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			when there is a hardware limitation that prevents all compatible ports from aggregating.
lacppartnersystemmac	<String>	Read-only	LACP Partner System MAC.
lacppartnersystempriority	<Double>	Read-only	LACP Partner System Priority. The LACP partner's system priority. The values for the priority range from 0 to 65535. The lower the value, the higher the system priority. The switch with the lower system priority value determines which links between LACP partner are active and which are in the standby for each LACP Channel.
lacppartnerportno	<Double>	Read-only	LACP Partner Port number. LACP uses the port priority with the port number to form the port identifier.
lacppartnerkey	<Double>	Read-only	LACP Partner Key. The LACP key used by the partner port.
lacpactoraggregation	<String>	Read-only	The Aggregation flag indicates that the participant will allow

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the link to be used as part of an aggregate. Otherwise the link is to be used as an individual link, i.e. not aggregated with any other. Possible values = NS_EMPTY_STR, AGG
lacpactorinsync	<String>	Read-only	The Synchronization flag indicates that the transmitting participant.s mux component is in sync with the system id and key information transmitted. Possible values = NS_EMPTY_STR, SYNC
lacpactorcollecting	<String>	Read-only	The Collecting flag indicates that the participant.s collector, i.e. the reception component of the mux, is definitely on. If set the flag communicates collecting. Possible values = NS_EMPTY_STR, COLLECTING
lacpactordistributing	<String>	Read-only	The Distributing flag indicates that the participant.s

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			distributor is not definitely off. If reset the flag indicates not distributing. Possible values = NS_EMPTY_STR, DISTRIBUTING
lacpportmuxstate	<String>	Read-only	LACP Port MUX state. The state of the MUX control machine. The Mux Control Machine attaches the physical port to an aggregate port, using the Selection Logic to choose an appropriate port, and turns the distributor and collector for the physical port on or off as required by protocol information. Possible values = DETACHED, WAITING, ATTACHED, COLLECTING, DISTRIBUTING
lacpportrxstat	<String>	Read-only	LACP Port RX state. The state of the Receive machine. The Receive Machine maintains partner information, recording protocol information from LACPDUs sent by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			remote partner(s). Received information is subject to a timeout, and if sufficient time elapses the receive machine will revert to using default partner information. Possible values = INIT, PORT_DISABLED, LACP_DISABLED, EXPIRED, DEFAULTED, CURRENT
lacpportselectstate	<String>	Read-only	LACP Port SELECT state. The state of the SELECT state machine, It could be SELECTED or UNSELECTED. Possible values = UNSELECTED, SELECTED, STANDBY
lldpmode	<String>	Read-only	Link Layer Discovery Protocol (LLDP) mode for an interface. The resultant LLDP mode of an interface depends on the LLDP mode configured at the global and the interface levels.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NONE, TRANSMITTER, RECEIVER, TRANSCEIVER
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of channel resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel?**pagesize=#no;pageno=#no**

Use this query-parameter to get the channel resources in chunks.

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "channel": [ { "__count": "#no"} ] }
```

channel_binding

Binding object which returns the resources bound to channel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	ID of an LA channel or LA channel in cluster configuration whose details you want the Citrix ADC to display. Specify an LA channel in LA/x notation, where x can range from 1 to 8 or a cluster LA channel in CLA/x

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			notation or Link redundant channel in LR/x notation , where x can range from 1 to 4. Minimum length = 1
channel_interface_binding	<channel_interface_binding[]>	Read-only	interface that can be bound to channel.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel_binding/id_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "channel_binding": [ {

"id":<String_value>,

"channel_interface_binding":<channel_interface_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/channel_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "channel_binding": [ {

"id":<String_value>,

"channel_interface_binding":<channel_interface_binding[]_value>

}]}
```

channel_interface_binding

Binding object showing the interface that can be bound to channel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svmcmd	<Double>	Read-write	New attribute added to identify the source of cmd, when SVM fires the nitro cmd, it

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			will set the value of SVMCMD to be 1. . Default value: 0
ifnum	<String[]>	Read-write	Interfaces to be bound to the LA channel of a Citrix ADC or to the LA channel of a cluster configuration. For an LA channel of a Citrix ADC, specify an interface in C/U notation (for example, 1/3). For an LA channel of a cluster configuration, specify an interface in N/C/U notation (for example, 2/1/3). where C can take one of the following values: * 0 - Indicates a management interface. * 1 - Indicates a 1 Gbps port. * 10 - Indicates a 10 Gbps port. U is a unique integer for representing an interface in a particular port group. N is the ID of the node to which an interface belongs in a cluster configuration. Use spaces to separate multiple entries.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	ID of the LA channel or the cluster LA channel to which you want to bind interfaces. Specify an LA channel in LA/x notation, where x can range from 1 to 8 or a cluster LA channel in CLA/x notation or Link redundant channel in LR/x notation , where x can range from 1 to 4.
lamode	<String>	Read-only	The mode(AUTO/MANNUAL) for the LA channel. Possible values = MANUAL, AUTO
slavespeed	<Double>	Read-only	Speed of the member interfaces.
slavemedia	<Double>	Read-only	Media type of the member interfaces.
slaveduplex	<Double>	Read-only	Duplex of the member interfaces.
lractiveintf	<Boolean>	Read-only	LR set member interface state(active/inactive).
slaveflowctl	<Double>	Read-only	Flowcontrol of the member interfaces.
slavetime	<Double>	Read-only	UP time of the member interfaces.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
slavestate	<Double>	Read-only	State of the member interfaces.
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"fis_channel_binding": [ { "__count": "#no"} ] }
```

fis_interface_binding

Binding object showing the interface that can be bound to fis.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ownernode	<Double>	Read-write	ID of the cluster node for which you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are creating the FIS. Can be configured only through the cluster IP address. Minimum value = 0 Maximum value = 31
name	<String>	Read-write	The name of the FIS to which you want to bind interfaces. Minimum length = 1
ifnum	<String>	Read-write	Interface to be bound to the FIS, specified in slot/port notation (for example, 1/3).

Operations

(click to see Properties)

ADD:| DELETE:

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/fis_interface_binding

HTTP Method:PUT

Request Headers:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/fis_interface_binding/name_value<String>?**args=ifnum:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

forwardingsession

Configuration for session forward resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the forwarding session rule. Can begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			colon (:), and underscore characters. Cannot be changed after the rule is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rule" or 'my rule'). Minimum length = 1
network	<String>	Read-write	An IPv4 network address or IPv6 prefix of a network from which the forwarded traffic originates or to which it is destined. Minimum length = 1
netmask	<String>	Read-write	Subnet mask associated with the network. Minimum length = 1
acl6name	<String>	Read-write	Name of any configured ACL6 whose action is ALLOW. The rule of the ACL6 is used as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a forwarding session rule. Minimum length = 1
aclname	<String>	Read-write	Name of any configured ACL whose action is ALLOW. The rule of the ACL is used as a forwarding session rule. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
connfailover	<String>	Read-write	Synchronize connection information with the secondary appliance in a high availability (HA) pair. That is, synchronize all connection-related information for the forwarding session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
sourceroutecache	<String>	Read-write	Cache the source ip address and mac address of the DA servers. Default value: DISABLED Possible values = ENABLED, DISABLED
processlocal	<String>	Read-write	Enabling this option on forwarding session will not steer the packet to flow processor. Instead, packet will be routed. Default value: DISABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

inat

Configuration for inbound nat resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Inbound NAT (INAT) entry. Leading character must be a number or letter. Other characters allowed, after the first character, are @ _ - . (period) : (colon) # and space ( ). Minimum length = 1
publicip	<String>	Read-write	Public IP address of packets received on the Citrix ADC. Can be aNetScaler-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			owned VIP or VIP6 address. Minimum length = 1
privateip	<String>	Read-write	IP address of the server to which the packet is sent by the Citrix ADC. Can be an IPv4 or IPv6 address. Minimum length = 1
mode	<String>	Read-write	Stateless translation. Possible values = STATELESS
tcpproxy	<String>	Read-write	Enable TCP proxy, which enables the Citrix ADC to optimize the RNAT TCP traffic by using Layer 4 features. Default value: DISABLED Possible values = ENABLED, DISABLED
ftp	<String>	Read-write	Enable the FTP protocol on the server for transferring files between the client and the server. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tftp	<String>	Read-write	To enable/disable TFTP (Default DISABLED). Default value: DISABLED Possible values = ENABLED, DISABLED
usip	<String>	Read-write	Enable the Citrix ADC to retain the source IP address of packets before sending the packets to the server. Possible values = ON, OFF
usnip	<String>	Read-write	Enable the Citrix ADC to use a SNIP address as the source IP address of packets before sending the packets to the server. Possible values = ON, OFF
proxyip	<String>	Read-write	Unique IP address used as the source IP address in packets sent to the server. Must be a MIP or SNIP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
useproxyport	<String>	Read-write	Enable the Citrix ADC to proxy the source port of packets before sending the packets to the server. Default value: ENABLED Possible values = ENABLED, DISABLED
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
flags	<Double>	Read-only	Flags for different modes.
__count	<Double>	Read-only	count parameter

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/inatparam

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"inatparam":{

"nat46v6prefix":<String_value>,

"td":<Double_value>,

"nat46ignoretos":<String_value>,
```

```
"nat46zerochecksum":<String_value>,

"nat46v6mtu":<Double_value>,

"nat46fragheader":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/inatparam?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"inatparam":{

"nat46v6prefix":true,

"td":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/inatparam

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/inatparam?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/inatparam?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of inatparam resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/inatparam?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/inatparam?**pagesize=#no;pageno=#no**

Use this query-parameter to get the inatparam resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Interface

Configuration for interface resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	Interface number, in C/U format, where C can take one of the following values: * 0 - Indicates a management interface. * 1 - Indicates a 1 Gbps port. * 10 - Indicates a 10 Gbps port. * LA - Indicates a link aggregation port.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* LO - Indicates a loop back port. U is a unique integer for representing an interface in a particular port group.
speed	<String>	Read-write	Ethernet speed of the interface, in Mbps. Notes: * If you set the speed as AUTO, the Citrix ADC attempts to auto-negotiate or auto-sense the link speed of the interface when it is UP. You must enable auto negotiation on the interface. * If you set a speed other than AUTO, you must specify the same speed for the peer network device. Mismatched speed and duplex settings between the peer devices of a link lead to link

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			errors, packet loss, and other errors. Some interfaces do not support certain speeds. If you specify an unsupported speed, an error message appears. Default value: AUTO Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000
duplex	<String>	Read-write	The duplex mode for the interface. Notes:* If you set the duplex mode to AUTO, the Citrix ADC attempts to auto-negotiate the duplex mode of the interface when it is UP. You must enable auto negotiation on the interface. If you set a duplex mode other than AUTO, you must specify the same duplex mode for the peer network device. Mismatched speed and duplex settings between the peer devices of a link

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			lead to link errors, packet loss, and other errors. Default value: AUTO Possible values = AUTO, HALF, FULL
flowctl	<String>	Read-write	802.3x flow control setting for the interface. The 802.3x specification does not define flow control for 10 Mbps and 100 Mbps speeds, but if a Gigabit Ethernet interface operates at those speeds, the flow control settings can be applied. The flow control setting that is finally applied to an interface depends on auto-negotiation. With the ON option, the peer negotiates the flow control, but the appliance then forces two-way flow control for the interface. Default value: OFF Possible values = OFF, RX, TX, RXTX, ON

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
autoneg	<String>	Read-write	Auto-negotiation state of the interface. With the ENABLED setting, the Citrix ADC auto-negotiates the speed and duplex settings with the peer network device on the link. The Citrix ADC appliance auto-negotiates the settings of only those parameters (speed or duplex mode) for which the value is set as AUTO. Default value: NSA_DVC_AUTONEG_ON Possible values = DISABLED, ENABLED
hamonitor	<String>	Read-write	In a High Availability (HA) configuration, monitor the interface for failure events. In an HA configuration, an interface that has HA MON enabled and is not bound to any Failover Interface Set (FIS), is a critical interface. Failure or disabling of any critical interface triggers HA failover.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ON Possible values = ON, OFF
haheartbeat	<String>	Read-write	In a High Availability (HA) or Cluster configuration, configure the interface for sending heartbeats. In an HA or Cluster configuration, an interface that has HA Heartbeat disabled should not send the heartbeats. Default value: ON Possible values = OFF, ON
mtu	<Double>	Read-write	The maximum transmission unit (MTU) is the largest packet size, measured in bytes excluding 14 bytes ethernet header and 4 bytes crc, that can be transmitted and received by this interface. Default value of MTU is 1500 on all the interface of Citrix ADC any value configured more than 1500 on the interface will make the interface as jumbo enabled. In case of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cluster backplane interface MTU value will be changed to 1514 by default, user has to change the backplane interface value to maximum mtu configured on any of the interface in cluster system plus 14 bytes more for backplane interface if Jumbo is enabled on any of the interface in a cluster system. Changing the backplane will bring back the MTU of backplane interface to default value of 1500. If a channel is configured as backplane then the same holds true for channel as well as member interfaces. Default value: 1500 Minimum value = 1500 Maximum value = 9216
tagall	<String>	Read-write	Add a four-byte 802.1q tag to every packet sent on this interface. The ON setting applies the tag for this

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interface's native VLAN. OFF applies the tag for all VLANs other than the native VLAN. Default value: OFF Possible values = ON, OFF
trunk	<String>	Read-write	This argument is deprecated by tagall. Default value: OFF Possible values = ON, OFF
trunkmode	<String>	Read-write	Accept and send 802.1q VLAN tagged packets, based on Allowed Vlan List of this interface. Default value: OFF Possible values = ON, OFF
trunkallowedvlan	<String[]>	Read-write	VLAN ID or range of VLAN IDs will be allowed on this trunk interface. In the command line interface, separate the range with a hyphen. For example: 40-90. Minimum length = 1 Maximum length = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lacpmode	<String>	Read-write	Bind the interface to a LA channel created by the Link Aggregation control protocol (LACP). Available settings function as follows: * Active - The LA channel port of the Citrix ADC generates LACPDU messages on a regular basis, regardless of any need expressed by its peer device to receive them. * Passive - The LA channel port of the Citrix ADC does not transmit LACPDU messages unless the peer device port is in the active mode. That is, the port does not speak unless spoken to. * Disabled - Unbinds the interface from the LA channel. If this is the only interface in the LA channel, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LA channel is removed. Default value: DISABLED Possible values = DISABLED, ACTIVE, PASSIVE
lacpkey	<Double>	Read-write	Integer identifying the LACP LA channel to which the interface is to be bound. For an LA channel of the Citrix ADC, this digit specifies the variable x of an LA channel in LA/x notation, where x can range from 1 to 8. For example, if you specify 3 as the LACP key for an LA channel, the interface is bound to the LA channel LA/3. For an LA channel of a cluster configuration, this digit specifies the variable y of a cluster LA channel in CLA/(y-4) notation, where y

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			can range from 5 to 8. For example, if you specify 6 as the LACP key for a cluster LA channel, the interface is bound to the cluster LA channel CLA/2. Minimum value = 1 Maximum value = 8
lagtype	<String>	Read-write	Type of entity (Citrix ADC or cluster configuration) for which to create the channel. Default value: NODE Possible values = NODE, CLUSTER
lacppriority	<Double>	Read-write	LACP port priority, expressed as an integer. The lower the number, the higher the priority. The Citrix ADC limits the number of interfaces in an LA channel to sixteen. Default value: 32768 Minimum value = 1 Maximum value = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lacptimeout	<String>	Read-write	Interval at which the Citrix ADC sends LACPDU messages to the peer device on the LA channel. Available settings function as follows: LONG - 30 seconds. SHORT - 1 second. Default value: NSA_LACP_TIMEOUT_LONG Possible values = LONG, SHORT
ifalias	<String>	Read-write	Alias name for the interface. Used only to enhance readability. To perform any operations, you have to specify the interface ID. Default value: " " Maximum length = 31
throughput	<Double>	Read-write	Low threshold value for the throughput of the interface, in Mbps. In an HA configuration, failover is triggered if the interface has HA MON enabled and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the throughput is below the specified the threshold. Minimum value = 0 Maximum value = 160000
linkredundancy	<String>	Read-write	Link Redundancy for Cluster LAG. Default value: OFF Possible values = ON, OFF
bandwidthhigh	<Double>	Read-write	High threshold value for the bandwidth usage of the interface, in Mbps. The Citrix ADC generates an SNMP trap message when the bandwidth usage of the interface is greater than or equal to the specified high threshold value. Minimum value = 0 Maximum value = 160000
bandwidthnormal	<Double>	Read-write	Normal threshold value for the bandwidth usage of the interface, in Mbps. When the bandwidth usage of the interface becomes less than or equal to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified normal threshold after exceeding the high threshold, the Citrix ADC generates an SNMP trap message to indicate that the bandwidth usage has returned to normal. Minimum value = 0 Maximum value = 160000
lldpmode	<String>	Read-write	Link Layer Discovery Protocol (LLDP) mode for an interface. The resultant LLDP mode of an interface depends on the LLDP mode configured at the global and the interface levels. Possible values = NONE, TRANSMITTER, RECEIVER, TRANSCEIVER
lrsetpriority	<Double>	Read-write	LRSET port priority, expressed as an integer ranging from 1 to 1024. The highest priority is 1. The Citrix ADC limits the number of interfaces in an LRSET to 8. Within a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LRSET the highest LR Priority Interface is considered as the first candidate for the Active interface, if the interface is UP. Default value: 1024 Minimum value = 1 Maximum value = 1024
devicename	<String>	Read-only	Name of the interface.
unit	<Double>	Read-only	Unit number for this interface, signifying the sequence number in which this interface is discovered on this Citrix ADC.
description	<String>	Read-only	Display the type of interface, the speeds at which this interface can operate, and, if applicable, the type of SFP,.
flags	<Double>	Read-only	Flags for this interface. Used for communicating the device states.
actualmtu	<Double>	Read-only	MTU for this interface (the largest frame that can transit this interface).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Double>	Read-only	Native VLAN for this interface.
mac	<String>	Read-only	MAC address for this interface.
uptime	<Double>	Read-only	Duration for which the interface has been UP (Example: 3 hours 1 minute 1 second). This value is reset when the interface state changes to DOWN..
downtime	<Double>	Read-only	Duration for which the interface has been DOWN. This value is reset when the interface state changes to UP. (Example: 3 hours 1 minute 1 second).
reqmedia	<String>	Read-only	Requested media setting for this interface. Possible values = AUTO, UTP, FIBER
reqspeed	<String>	Read-only	Requested speed setting for this interface. Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqduplex	<String>	Read-only	Requested duplex setting for this interface. Possible values = AUTO, HALF, FULL
reqflowcontrol	<String>	Read-only	Requested flow control setting for this interface. Possible values = OFF, RX, TX, RXTX, ON
actmedia	<String>	Read-only	Actual media setting for this interface. Possible values = AUTO, UTP, FIBER
actspeed	<String>	Read-only	Actual speed setting for this interface. Possible values = AUTO, 10, 100, 1000, 10000, 25000, 40000, 50000, 100000
actduplex	<String>	Read-only	Actual duplex setting for this interface. Possible values = AUTO, HALF, FULL
actflowctl	<String>	Read-only	Actual flow control setting for this interface. Possible values = OFF, RX, TX, RXTX, ON

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mode	<String>	Read-only	Interface Link Aggregation mode (Auto/Manual) setting. Possible values = MANUAL, AUTO
state	<String>	Read-only	Link state of the interface (UP/DOWN). Default value: ENABLED Possible values = ENABLED, DISABLED
autonegresult	<Double>	Read-only	Actual auto-negotiation setting for this interface.
tagged	<Double>	Read-only	VLAN tags setting on this channel.
taggedany	<Double>	Read-only	Interface setting to accept/drop all tagged packets.
taggedautolearn	<Double>	Read-only	Dynamic VLAN membership autolearning enabled or disabled on this interface.
hangdetect	<Double>	Read-only	Hang detection enabled or disabled for this interface.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hangreset	<Double>	Read-only	Hang reset enabled or disabled for this interface.
linkstate	<Double>	Read-only	The current state of the link associated with the interface. For logical interfaces (LA), the state of the link is dependent on the state of the slave interfaces. For the link to be UP at least one of the slave interfaces needs to be UP.
intfstate	<Double>	Read-only	Current state of the specified interface. The interface state set to UP only if the link state is UP and administrative state is ENABLED.
rxpackets	<Double>	Read-only	Number of packets received by an interface since the Citrix ADC was started or the interface statistics were cleared.
rxbytes	<Double>	Read-only	Number of bytes received by an interface since the Citrix ADC was started or the interface statistics were cleared.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rxerrors	<Double>	Read-only	Number of inbound packets dropped by the hardware on a specified interface since the Citrix ADC was started or the interface statistics were cleared. Packets can be dropped because of CRC, length (undersize or oversize), or alignment errors.
rxdrops	<Double>	Read-only	Number of inbound packets dropped by the specified interface. Commonly dropped packets are multicast frames, spanning tree BPDUs, packets destined to a MAC not owned by the Citrix ADC when L2 mode is disabled, or packets tagged for a VLAN that is not bound to the interface. In most healthy networks, this statistic increments at a steady rate regardless of traffic load. A sharp spike in dropped packets generally indicates an issue with connected L2

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			switches, such as a forwarding database overflow resulting in packets being broadcast on all ports.
txpackets	<Double>	Read-only	Number of packets transmitted by an interface since the Citrix ADC was started or the interface statistics were cleared.
txbytes	<Double>	Read-only	Number of bytes transmitted by an interface since the Citrix ADC was started or the interface statistics were cleared.
txerrors	<Double>	Read-only	Number of outbound packets dropped by the hardware on a specified interface since the Citrix ADC was started or the interface statistics were cleared. Packets can be dropped because of length (undersize or oversize) errors or a lack of resources. This statistic is available only for:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(1) Loop back interface (LO) of all platforms. (2) All data ports on the Citrix ADC 12000 platform. (3) Management ports on the Citrix ADC MPX 15000 and 17000 platforms. .
txdrops	<Double>	Read-only	Number of packets dropped in transmission by the specified interface for one of the following reasons. (1) VLAN mismatch. (2) Oversized packets. (3) Interface congestion. (4) Loopback packets sent on non loop back interface. .
indisc	<Double>	Read-only	Number of error-free inbound packets discarded by the specified interface because of a lack of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resources (for example, insufficient receive buffers).
outdisc	<Double>	Read-only	Number of error-free outbound packets discarded by the specified interface because of a lack of resources. This statistic is not available on: (1) 10G ports of Citrix ADC MPX 12500/12500/15500 -10G platforms. (2) 10G data ports on Citrix ADC MPX 17500/19500/21500 platforms. .
fctls	<Double>	Read-only	Number of times flow control is performed on the specified interface because of received pause frames.
hangs	<Double>	Read-only	Number of times the specified interface detected hangs in the transmit and receive paths since the Citrix ADC was started or the interface statistics were cleared.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
stsstalls	<Double>	Read-only	Number of times the status updates for a specified interface were stalled since the Citrix ADC was started or the interface statistics were cleared. A status stall is detected when the status of the interface is not updated by the NIC hardware within 0.8 seconds of the last update.
txstalls	<Double>	Read-only	Number of times the interface stalled, when transmitting packets, since the Citrix ADC was started or the interface statistics were cleared. Transmit (Tx) stalls are detected when a packet posted for transmission is not transmitted in 4 seconds.
rxstalls	<Double>	Read-only	Number of times the interface stalled, when receiving packets, since the Citrix ADC was started or the interface statistics were cleared. Receive (Rx) stalls

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are detected when the following conditions are met: (1)The link is up for more than 10 minutes. (2)Packets are transmitted, but no packets are received for 16 seconds. .
bdgmacmoved	<Double>	Read-only	Number of MAC moves between ports. A high rate of MAC moves typically indicates a bridge loop between two interfaces.
bdgmuted	<Double>	Read-only	Number of times the specified interface stopped transmitting and receiving packets because of MAC moves between ports.
vmac	<String>	Read-only	Virtual MAC of this interface.
vmac6	<String>	Read-only	Virtual MAC for IPv6 of this interface.
reqthroughput	<Double>	Read-only	Minimum required throughput for an interface. Failover is triggered if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			operating throughput of a Link Aggregation (LA) channel for which HAMON is ON falls below this value. The possible values are: 1. 1000Mbps for 1G interfaces. 2. 10000Mbps for 10G interfaces. 3. 160000Mbps for Link Aggregation channels. Minimum value = 0 Maximum value = 160000
actthroughput	<Double>	Read-only	Actual throughput for the interface.
backplane	<String>	Read-only	The cluster backplane status of the interface. If the status is enabled, the interface is part of the cluster backplane. By default, the backplane status is disabled. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ifnum	<String[]>	Read-only	Contains the LA Master, if the interface is part of LA channel.
cleartime	<Double>	Read-only	Time since the interface stats are cleared last time.
slavestate	<Double>	Read-only	State of the member interfaces.
slavemedia	<Double>	Read-only	Media type of the member interfaces.
slavespeed	<Double>	Read-only	Speed of the member interfaces.
slaveduplex	<Double>	Read-only	Duplex of the member interfaces.
slaveflowctl	<Double>	Read-only	Flowcontrol of the member interfaces.
slavetime	<Double>	Read-only	UP time of the member interfaces.
intftype	<String>	Read-only	Interface Type, this field will have the interface type either it is virtual, physical or loopback. . Possible values = BROADCOM 5700/5701, TIGON1/TIGON2, INTEL 82546, INTEL 8255X(PRO), Link Aggregate,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Loopback, Intel 82541/47, Broadcom 5704, Chelsio 1G, Intel 8247X, Intel 82576 VF, Xen Virtual, Intel 10G, Intel 82599 VF, Mellanox 100G, Mellanox 50G, Mellanox 25G, Intel FVL 40G, Intel FVL 25G, Intel FVL 10G, Intel FVL 40G VF, Mellanox VF, Hyper v, Cluster LAG, Intel 8247X SFP, XEN Interface, Chelsio 10G, KVM Virtio, VMXNET3
svmcmd	<Double>	Read-only	New attribute added to identify the source of cmd, when SVM fires the nitro cmd, it will set the value of SVMCMD to be 1. . Default value: 0
lacpactormode	<String>	Read-only	* Active - The LA channel port of the Citrix ADC generates LACPDU messages on a regular basis, regardless of any need expressed by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			its peer device to receive them. * Passive - The LA channel port of the Citrix ADC does not transmit LACPDU messages unless the peer device port is in the active mode. That is, the port does not speak unless spoken to. * Disabled - Unbinds the interface from the LA channel. If this is the only interface in the LA channel, the LA channel is removed. Possible values = DISABLED, ACTIVE, PASSIVE
lacpactortimeout	<String>	Read-only	Interval at which the Citrix ADC sends LACPDU messages to the peer device on the LA channel. Available settings function as follows: LONG - 30 seconds.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SHORT - 1 second. Possible values = LONG, SHORT
lacpactorpriority	<Double>	Read-only	LACP Actor Priority. A LACP port priority is configured on each port using LACP. LACP uses the port priority with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.
lacpactorportno	<Double>	Read-only	LACP Actor port number. LACP uses the port priority with the port number to form the port identifier.
lacppartnerstate	<String>	Read-only	LACP Partner State. Whether the port is in Active or Passive negotiating state. Possible values = MANUAL, AUTO
lacppartnertimeout	<String>	Read-only	The timeout value for the information revieved in LACPDUs. It can

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			have values as SHORT or LONG. The SHORT timeout is 3s and the LONG timeout is 90s. Possible values = LONG, SHORT
lacppartneraggregation	<String>	Read-only	The Aggregation flag indicates that the participant will allow the link to be used as part of an aggregate. Otherwise the link is to be used as an individual link, i.e. not aggregated with any other. Possible values = NS_EMPTY_STR, AGG
lacppartnerinsync	<String>	Read-only	The Synchronization flag indicates that the transmitting participant.s mux component is in sync with the system id and key information transmitted. Possible values = NS_EMPTY_STR, SYNC
lacppartnercollecting	<String>	Read-only	The Collecting flag indicates that the participant.s collector, i.e. the reception component of the mux, is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			definitely on. If set the flag communicates collecting. Possible values = NS_EMPTY_STR, COLLECTING
lacppartnerdistributing	<String>	Read-only	The Distributing flag indicates that the participant.s distributor is not definitely off. If reset the flag indicates not distributing. Possible values = NS_EMPTY_STR, DISTRIBUTING
lacppartnerdefaulted	<String>	Read-only	If the timer expires in the Expired state, the Receive Machine enters the Defaulted state. Possible values = NS_EMPTY_STR, DEFAULTED
lacppartnerexpired	<String>	Read-only	If the LACPDUs are received for timeout period, the Receive Machine enters the Expired state and the timer is restarted with the timeout value of SHORT timeout.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NS_EMPTY_STR, EXPIRED
lacppartnerpriority	<Double>	Read-only	LACP Partner Priority. A LACP port priority is configured on each port using LACP. LACP uses the port priority with the port number to form the port identifier. The port priority determines which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.
lacppartnersystemmac	<String>	Read-only	LACP Partner System MAC.
lacppartnersystempriority	<Double>	Read-only	LACP Partner System Priority. The LACP partner's system priority. The values for the priority range from 0 to 65535. The lower the value, the higher the system priority. The switch with the lower system priority value determines which links between LACP partner are active

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and which are in the standby for each LACP Channel.
lacppartnerportno	<Double>	Read-only	LACP Partner Port number. LACP uses the port priority with the port number to form the port identifier.
lacppartnerkey	<Double>	Read-only	LACP Partner Key. The LACP key used by the partner port.
lacpactoraggregation	<String>	Read-only	The Aggregation flag indicates that the participant will allow the link to be used as part of an aggregate. Otherwise the link is to be used as an individual link, i.e. not aggregated with any other. Possible values = NS_EMPTY_STR, AGG
lacpactorinsync	<String>	Read-only	The Synchronization flag indicates that the transmitting participant.s mux component is in sync with the system id and key information transmitted. Possible values = NS_EMPTY_STR, SYNC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lacpactorcollecting	<String>	Read-only	The Collecting flag indicates that the participant.s collector, i.e. the reception component of the mux, is definitely on. If set the flag communicates collecting. Possible values = NS_EMPTY_STR, COLLECTING
lacpactordistributing	<String>	Read-only	The Distributing flag indicates that the participant.s distributor is not definitely off. If reset the flag indicates not distributing. Possible values = NS_EMPTY_STR, DISTRIBUTING
lacpportmuxstate	<String>	Read-only	LACP Port MUX state. The state of the MUX control machine. The Mux Control Machine attaches the physical port to an aggregate port, using the Selection Logic to choose an appropriate port, and turns the distributor and collector for the physical port on or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			off as required by protocol information. Possible values = DETACHED, WAITING, ATTACHED, COLLECTING, DISTRIBUTING
lacpportrxstat	<String>	Read-only	LACP Port RX state. The state of the Receive machine. The Receive Machine maintains partner information, recording protocol information from LACPDUs sent by remote partner(s). Received information is subject to a timeout, and if sufficient time elapses the receive machine will revert to using default partner information. Possible values = INIT, PORT_DISABLED, LACP_DISABLED, EXPIRED, DEFAULTED, CURRENT
lacpportselectstate	<String>	Read-only	LACP Port SELECT state. The state of the SELECT state machine, It could be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SELECTED or UNSELECTED. Possible values = UNSELECTED, SELECTED, STANDBY
lractiveintf	<Boolean>	Read-only	LR set member interface state(active/inactive).
__count	<Double>	Read-only	count parameter

CLEAR| UPDATE| UNSET| ENABLE| DISABLE| RESET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

clear

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/Interface?**action=clear**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"Interface":{

<b>"id":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/Interface

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"Interface":{

<b>"id":<String_value>,

</b>"speed":<String_value>,

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ip6tunnel

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ip6tunnel?**args=name:<String_value>,remote:<String_value>**

Use this query-parameter to get ip6tunnel resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ip6tunnel?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ip6tunnel?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of ip6tunnel resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ip6tunnel?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ip6tunnel?**pagesize=#no;pageno=#no**

Use this query-parameter to get the ip6tunnel resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

Response Payload:

```
{ "ip6tunnel": [ { "__count": "#no"} ] }
```

ip6tunnelparam

Configuration for ip6 tunnel parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcip	<String>	Read-write	Common source IPv6 address for all IPv6 tunnels. Must be a SNIP6 or VIP6 address. Minimum length = 1
dropfrag	<String>	Read-write	Drop any packet that requires fragmentation. Default value: NO Possible values = YES, NO
dropfragcputhreshold	<Double>	Read-write	Threshold value, as a percentage of CPU usage, at which to drop packets that require

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			fragmentation. Applies only if dropFragparameter is set to NO. Minimum value = 1 Maximum value = 100
srciproundrobin	<String>	Read-write	Use a different source IPv6 address for each new session through a particular IPv6 tunnel, as determined by round robin selection of one of the SNIP6 addresses. This setting is ignored if a common global source IPv6 address has been specified for all the IPv6 tunnels. This setting does not apply to a tunnel for which a source IPv6 address has been specified. Default value: NO Possible values = YES, NO
useclientsourceipv6	<String>	Read-write	Use client source IPv6 address as source IPv6 address for outer tunnel IPv6 header. Default value: NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ip6tunnelparam

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"ip6tunnelparam":{

"srcip":<String_value>,

"dropfrag":<String_value>,

"dropfragcputhreshold":<Double_value>,

"srciproundrobin":<String_value>,

"useclientsourceipv6":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ip6tunnelparam?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"ip6tunnelparam":{

"srcip":true,

"dropfrag":true,

"dropfragcputhreshold":true,

"srciproundrobin":true,

"useclientsourceipv6":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ip6tunnelparam

HTTP Method:GET

Request Headers:

}]}
```

ipset

Configuration for network ipset resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the IP set. Must begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the IP set is created. Choose a name that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			helps identify the IP set. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

iptunnel

Configuration for ip Tunnel resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the IP tunnel. Leading character must be a number or letter. Other characters allowed, after the first character, are @

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			_ - . (period) : (colon) # and space ( ). Minimum length = 1
remote	<String>	Read-write	Public IPv4 address, of the remote device, used to set up the tunnel. For this parameter, you can alternatively specify a network address. Minimum length = 1
remotesubnetmask	<String>	Read-write	Subnet mask of the remote IP address of the tunnel.
local	<String>	Read-write	Type of Citrix ADC owned public IPv4 address, configured on the local Citrix ADC and used to set up the tunnel.
protocol	<String>	Read-write	Name of the protocol to be used on this tunnel. Default value: IPIP Possible values = IPIP, GRE, IPSEC, UDP
grepayload	<String>	Read-write	The payload GRE will carry. Default value: ETHERNETwithDOT1Q

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ETHERNETwithDOT1Q, ETHERNET, IP
ipsecprofilename	<String>	Read-write	Name of IPSec profile to be associated. Default value: "ns_ipsec_default_profile"
vlan	<Double>	Read-write	The vlan for mulicast packets. Minimum value = 1 Maximum value = 4094
ownergroup	<String>	Read-write	The owner node group in a Cluster for the iptunnel. Default value: DEFAULT_NG Minimum length = 1
sysname	<String>	Read-only	The name of the ip tunnel.
type	<Double>	Read-only	The type of this tunnel.
encapip	<String>	Read-only	The effective local IP address of the tunnel. Used as the source of the encapsulated packets.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
channel	<Double>	Read-only	The tunnel that is bound to a netbridge.
tunneltype	<String[]>	Read-only	Indicates that a tunnel is User-Configured, Internal or DELETE-IN-PROGRESS. Possible values = Configured, Delete-In-Progress
ipsectunnelstatus	<String>	Read-only	Whether the ipsec on this tunnel is up or down. Possible values = DOWN, UP, PARTIAL-UP, UNKNOWN
refcnt	<Double>	Read-only	Number of PBRs to bound to this iptunnel.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/iptunnel

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"iptunnel":{

<b>"name":<String_value>,

</b><b>"remote":<String_value>,

</b><b>"remotesubnetmask":<String_value>,
```

```
</b><b>"local":<String_value>,

</b>"protocol":<String_value>,

"grepayload":<String_value>,

"ipsecprofilename":<String_value>,

"vlan":<Double_value>,

"ownergroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/iptunnel/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/iptunnel

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/iptunnel?**args=remote:<String_value>,remotesubnetmask:<String_value>,name:<String_value>**

Use this query-parameter to get iptunnel resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/iptunnel?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/iptunnel?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of iptunnel resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/iptunnel?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/iptunnel?**pagesize=#no;pageno=#no**

Use this query-parameter to get the iptunnel resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

iptunnelparam

Configuration for ip tunnel parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcip	<String>	Read-write	Common source-IP address for all tunnels. For a specific tunnel, this global setting is overridden if you have specified another source IP address. Must be a MIP or SNIP address. Minimum length = 1
dropfrag	<String>	Read-write	Drop any IP packet that requires fragmentation before it is sent through the tunnel. Default value: NO Possible values = YES, NO
dropfragcputhreshold	<Double>	Read-write	Threshold value, as a percentage of CPU usage, at which to drop packets that require fragmentation to use the IP tunnel. Applies only if dropFragparameter is set to NO. The default value, 0,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specifies that this parameter is not set. Minimum value = 1 Maximum value = 100
srciproundrobin	<String>	Read-write	Use a different source IP address for each new session through a particular IP tunnel, as determined by round robin selection of one of the SNIP addresses. This setting is ignored if a common global source IP address has been specified for all the IP tunnels. This setting does not apply to a tunnel for which a source IP address has been specified. Default value: NO Possible values = YES, NO
enablestrictrx	<String>	Read-write	Strict PBR check for IPSec packets received through tunnel. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
enablestricttx	<String>	Read-write	Strict PBR check for packets to be sent IPSec protected. Default value: NO Possible values = YES, NO
mac	<String>	Read-write	The shared MAC used for shared IP between cluster nodes/HA peers.
useclientsourceip	<String>	Read-write	Use client source IP as source IP for outer tunnel IP header. Default value: NO Possible values = YES, NO

}]}
```

ipv6

Configuration for ip v6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ralearning	<String>	Read-write	Enable the Citrix ADC to learn about various routes from Router Advertisement (RA) and Router Solicitation (RS) messages sent by the routers. Default value: DISABLED Possible values = ENABLED, DISABLED
routerredirection	<String>	Read-write	Enable the Citrix ADC to do Router Redirection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
ndbasereachtime	<Double>	Read-write	Base reachable time of the Neighbor Discovery (ND6) protocol. The time, in milliseconds, that the Citrix ADC assumes an adjacent device is reachable after receiving a reachability confirmation. Default value: 30000 Minimum value = 1
ndretransmissiontime	<Double>	Read-write	Retransmission time of the Neighbor Discovery (ND6) protocol. The time, in milliseconds, between retransmitted Neighbor Solicitation (NS) messages, to an adjacent device. Default value: 1000 Minimum value = 1
natprefix	<String>	Read-write	Prefix used for translating packets from private IPv6 servers to IPv4

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packets. This prefix has a length of 96 bits (128-32 = 96). The IPv6 servers embed the destination IP address of the IPv4 servers or hosts in the last 32 bits of the destination IP address field of the IPv6 packets. The first 96 bits of the destination IP address field are set as the IPv6 NAT prefix. IPv6 packets addressed to this prefix have to be routed to the Citrix ADC to ensure that the IPv6-IPv4 translation is done by the appliance.
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Default value: 0 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 4094
dodad	<String>	Read-write	Enable the Citrix ADC to do Duplicate Address Detection (DAD) for all the Citrix ADC owned IPv6 addresses regardless of whether they are obtained through stateless auto configuration, DHCPv6, or manual configuration. Default value: DISABLED Possible values = ENABLED, DISABLED
usipnatprefix	<String>	Read-write	IPV6 NATPREFIX used in NAT46 scenario when USIP is turned on.
basereachtime	<Integer>	Read-only	ND6 base reachable time (ms).
reachtime	<Integer>	Read-only	ND6 computed reachable time (ms).
ndreachtime	<Double>	Read-only	ND6 computed reachable time (ms).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
retransmissiontime	<Integer>	Read-only	ND6 retransmission time (ms).
__count	<Double>	Read-only	count parameter

l2param

Configuration for Layer 2 related parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mbfpeermacupdate	<Double>	Read-write	When mbf_instant_learning is enabled, learn any

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			changes in peer's MAC after this time interval, which is in 10ms ticks. Default value: 10
maxbridgecollision	<Double>	Read-write	Maximum bridge collision for loop detection . Default value: 20
bdggrpproxyarp	<String>	Read-write	Set/reset proxy ARP in bridge group deployment. Default value: ENABLED Possible values = ENABLED, DISABLED
bdgsetting	<String>	Read-write	Bridging settings for C2C behavior. If enabled, each PE will learn MAC entries independently. Otherwise, when L2 mode is ON, learned MAC entries on a PE will be broadcasted to all other PEs. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
garponvridintf	<String>	Read-write	Send GARP messagess on VRID-configured interfaces upon failover . Default value: ENABLED Possible values = ENABLED, DISABLED
macmodefwdmypkt	<String>	Read-write	Allows MAC mode vserver to pick and forward the packets even if it is destined to Citrix ADC owned VIP. Default value: DISABLED Possible values = ENABLED, DISABLED
usemymac	<String>	Read-write	Use Citrix ADC MAC for all outgoing packets. Default value: DISABLED Possible values = ENABLED, DISABLED
proxyarp	<String>	Read-write	Proxies the ARP as Citrix ADC MAC for FreeBSD.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
garpreply	<String>	Read-write	Set/reset REPLY form of GARP . Default value: DISABLED Possible values = ENABLED, DISABLED
mbfinstlearning	<String>	Read-write	Enable instant learning of MAC changes in MBF mode. Default value: DISABLED Possible values = ENABLED, DISABLED
rstintfonhafo	<String>	Read-write	Enable the reset interface upon HA failover. Default value: DISABLED Possible values = ENABLED, DISABLED
skipproxyingbsdtraffic	<String>	Read-write	Control source parameters (IP and Port) for FreeBSD

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			initiated traffic. If Enabled, source parameters are retained. Else proxy the source parameters based on next hop. Default value: DISABLED Possible values = ENABLED, DISABLED
returntoethernetsender	<String>	Read-write	Return to ethernet sender. Default value: DISABLED Possible values = ENABLED, DISABLED
stopmacmoveupdate	<String>	Read-write	Stop Update of server mac change to NAT sessions. Default value: DISABLED Possible values = ENABLED, DISABLED
bridgeagetimeout	<Double>	Read-write	Time-out value for the bridge table entries, in seconds. The new value applies only to the entries that are dynamically learned

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			after the new value is set. Previously existing bridge table entries expire after the previously configured time-out value. Default value: 300 Minimum value = 60 Maximum value = 300

Operations

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

```

l3param

Configuration for Layer 3 related parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcnat	<String>	Read-write	Perform NAT if only the source is in the private network. Default value: ENABLED Possible values = ENABLED, DISABLED
icmpgenratethreshold	<Double>	Read-write	NS generated ICMP pkts per 10ms rate threshold. Default value: 100
overridernat	<String>	Read-write	USNIP/USIP settings override RNAT settings for configured service/virtual server traffic.. . Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dropdfflag	<String>	Read-write	Enable dropping the IP DF flag. Default value: DISABLED Possible values = ENABLED, DISABLED
miproundrobin	<String>	Read-write	Enable round robin usage of mapped IPs. Default value: ENABLED Possible values = ENABLED, DISABLED
externalloopback	<String>	Read-write	Enable external loopback. Default value: DISABLED Possible values = ENABLED, DISABLED
tnlpmtuwoconn	<String>	Read-write	Enable/Disable learning PMTU of IP tunnel when ICMP error does not contain connection information. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
usipserverstraypkt	<String>	Read-write	Enable detection of stray server side pkts in USIP mode. Default value: DISABLED Possible values = ENABLED, DISABLED
forwardicmpfragments	<String>	Read-write	Enable forwarding of ICMP fragments. Default value: DISABLED Possible values = ENABLED, DISABLED
dropipfragments	<String>	Read-write	Enable dropping of IP fragments. Default value: DISABLED Possible values = ENABLED, DISABLED
acllogtime	<Double>	Read-write	Parameter to tune acl logging time. Default value: 5000
implicitaclallow	<String>	Read-write	Do not apply ACLs for internal ports.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
dynamicrouting	<String>	Read-write	Enable/Disable Dynamic routing on partition. This configuration is not applicable to default partition. Default value: DISABLED Possible values = ENABLED, DISABLED
ipv6dynamicrouting	<String>	Read-write	Enable/Disable IPv6 Dynamic routing. Default value: DISABLED Possible values = ENABLED, DISABLED
allowclasseipv4	<String>	Read-write	Enable/Disable IPv4 Class E address clients. Default value: DISABLED Possible values = ENABLED, DISABLED

lacp

Configuration for Link aggregation control protocol resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
syspriority	<Double>	Read-write	Priority number that determines which peer device of an LACP LA channel can have control over the LA channel. This parameter is globally applied to all LACP channels on the Citrix ADC. The lower the number, the higher the priority. Default value: 32768 Minimum value = 1 Maximum value = 65535
ownernode	<Double>	Read-write	The owner node in a cluster for which we want to set the lacp priority. Owner node can vary from 0 to 31. Ownernode value of 254 is used for Cluster. Default value: 255
devicename	<String>	Read-only	Name of the channel.
mac	<String>	Read-only	LACP system MAC.
flags	<Double>	Read-only	Flags of this channel.
lacpkey	<Double>	Read-only	LACP key of this channel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clustersyspriority	<Double>	Read-only	LACP system (Cluster) priority.
clustermac	<String>	Read-only	LACP system (Cluster) mac.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

linkset_binding

Binding object which returns the resources bound to linkset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<String>	Read-write	ID of the linkset for which to display information. If an ID is not provided, the display includes information about all linksets that are available in the cluster.
linkset_channel_binding	<linkset_channel_binding[]>	Read-only	channel that can be bound to linkset.
linkset_interface_binding	<linkset_interface_binding[]>	Read-only	interface that can be bound to linkset.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/linkset_binding/id_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "linkset_binding": [ {

"id":<String_value>,

"linkset_interface_binding":<linkset_interface_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/linkset_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/linkset_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "linkset_binding": [ {

"id":<String_value>,

"linkset_channel_binding":<linkset_channel_binding[]_value>,

"linkset_interface_binding":<linkset_interface_binding[]_value>

}]}
```

linkset_channel_binding

Binding object showing the channel that can be bound to linkset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ifnum	<String>	Read-write	The interfaces to be bound to the linkset.
id	<String>	Read-write	ID of the linkset to which to bind the interfaces.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/linkset_channel_binding

mapbmr

Configuration for MAP-T Basic Mapping rule resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Basic Mapping Rule. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the MAP Basic Mapping Rule is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "add network MapBmr bmr1 -natprefix 2005::/64 -EAbitLength 16 -psidoffset 6 -portsharingratio 8"). The Basic Mapping Rule information allows a MAP BR to determine source IPv4 address from the IPv6 packet sent from MAP CE device. Also it allows to determine destination IPv6 address of MAP CE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			before sending packets to MAP CE. Minimum length = 1 Maximum length = 127
ruleipv6prefix	<String>	Read-write	IPv6 prefix of Customer Edge(CE) device.MAP-T CE will send ipv6 packets with this ipv6 prefix as source ipv6 address prefix.
psidoffset	<Double>	Read-write	Start bit position of Port Set Identifier(PSID) value in Embedded Address (EA) bits. Default value: 6 Minimum value = 1 Maximum value = 15
eabitlength	<Double>	Read-write	The Embedded Address (EA) bit field encodes the CE-specific IPv4 address and port information. The EA bit field, which is unique for a given Rule IPv6 prefix. Default value: 16

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 2 Maximum value = 47
psidlength	<Double>	Read-write	Length of Port Set IdentifierPort Set Identifier(PSID) in Embedded Address (EA) bits. Default value: 8 Minimum value = 1 Maximum value = 16
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"mapbmr_bmrv4network_binding": [ { "__count": "#no"} ] }
```

mapdmr

Configuration for MAP-T Default Mapping rule resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Default Mapping Rule. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the MAP Default Mapping Rule is created. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "add network MapDmr map1 -BRIpv6Prefix 2003::/96"). Default Mapping Rule (DMR) is defined in terms of the IPv6 prefix advertised by one or more BRs, which provide external connectivity. A typical MAP-T CE will install an IPv4 default route using this rule. A BR will use this rule when translating all outside IPv4 source addresses to the IPv6 MAP domain. Minimum length = 1 Maximum length = 127
bripv6prefix	<String>	Read-write	IPv6 prefix of Border Relay (Citrix ADC) device.MAP-T CE will send ipv6 packets to this ipv6

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			prefix.The DMR IPv6 prefix length SHOULD be 64 bits long by default and in any case MUST NOT exceed 96 bits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/mapdmr

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"mapdmr":{

<b>"name":<String_value>,

</b><b>"bripv6prefix":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/mapdmr/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/mapdmr

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/mapdmr?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/mapdmr?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of mapdmr resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/mapdmr?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/mapdmr?**pagesize=#no;pageno=#no**

Use this query-parameter to get the mapdmr resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

nat64

Configuration for nat64 config resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the NAT64 rule. Must begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the rule is created. Choose a name that helps identify the NAT64 rule. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
acl6name	<String>	Read-write	Name of any configured ACL6 whose action is ALLOW. IPv6 Packets matching the condition of this ACL6 rule and destination IP address of these packets matching the NAT64 IPv6 prefix are considered for NAT64 translation. Minimum length = 1
netprofile	<String>	Read-write	Name of the configured netprofile. The Citrix ADC selects one of the IP address in the netprofile as the source IP address of the translated IPv4 packet to be sent to the IPv4 server. Minimum length = 1 Maximum length = 127
__count	<Double>	Read-only	count parameter

Request Payload:

```
{"nat64":{

<b>"name":<String_value>,

</b>"acl6name":<String_value>,

"netprofile":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nat64?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nat64":{

<b>"name":<String_value>,

</b>"netprofile":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nat64/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nat64

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nat64?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nat64?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nat64 resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nat64?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nat64?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nat64 resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

```
{ "nat64": [ { "__count": "#no"} ] }
```

nat64param

Configuration for NAT64 parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Default value: 0 Minimum value = 0 Maximum value = 4094
nat64ignoretos	<String>	Read-write	Ignore TOS. Default value: NO Possible values = YES, NO
nat64zerochecksum	<String>	Read-write	Calculate checksum for UDP packets with zero checksum.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
nat64v6mtu	<Double>	Read-write	MTU setting for the IPv6 side. If the incoming IPv4 packet greater than this, either fragment or send icmp need fragmentation error. Default value: 1280 Minimum value = 1280 Maximum value = 9216
nat64fragheader	<String>	Read-write	When disabled, translator will not insert IPv6 fragmentation header for non fragmented IPv4 packets. Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nat64param

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nat64param":{

"td":<Double_value>,

"nat64ignoretos":<String_value>,

"nat64zerochecksum":<String_value>,

"nat64v6mtu":<Double_value>,

nd6

Configuration for nd6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
neighbor	<String>	Read-write	Link-local IPv6 address of the adjacent network device to add to the ND6 table.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mac	<String>	Read-write	MAC address of the adjacent network device.
ifnum	<String>	Read-write	Interface through which the adjacent network device is available, specified in slot/port notation (for example, 1/3). Use spaces to separate multiple entries.
vlan	<Integer>	Read-write	Integer value that uniquely identifies the VLAN on which the adjacent network device exists. Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN on which the IPv6 address of this ND6 entry is reachable. Minimum value = 1 Maximum value = 16777215
vtep	<String>	Read-write	IP address of the VXLAN tunnel endpoint (VTEP) through which the IPv6 address of this ND6 entry is reachable.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
state	<String>	Read-only	ND6 state. Default value: REACHABLE Possible values = INCOMPLETE, REACHABLE, STALE, DELAY, PROBE
timeout	<Double>	Read-only	Time elapsed.
flags	<Double>	Read-only	flag for static/ permanent entry.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
controlplane	<Boolean>	Read-only	This nd6 entry is populated by a control plane protocol.
channel	<Double>	Read-only	The tunnel that is bound to a netbridge.
__count	<Double>	Read-only	count parameter

Operations

nd6ravariables

Configuration for nd6 Router Advertisment configuration variables resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Double>	Read-write	The VLAN number. Minimum value = 1 Maximum value = 4094
ceaserouteradv	<String>	Read-write	Cease router advertisements on this vlan. Default value: NO Possible values = YES, NO
sendrouteradv	<String>	Read-write	whether the router sends periodic RAs and responds to Router Solicitations. Default value: NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
srclinklayeraddroption	<String>	Read-write	Include source link layer address option in RA messages. Default value: YES Possible values = YES, NO
onlyunicastrtadvresponse	<String>	Read-write	Send only Unicast Router Advertisements in respond to Router Solicitations. Default value: NO Possible values = YES, NO
managedaddrconfig	<String>	Read-write	Value to be placed in the Managed address configuration flag field. Default value: NO Possible values = YES, NO
otheraddrconfig	<String>	Read-write	Value to be placed in the Other configuration flag field. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
currhoplimit	<Double>	Read-write	Current Hop limit. Default value: 64 Minimum value = 0 Maximum value = 255
maxrtadvinterval	<Double>	Read-write	Maximum time allowed between unsolicited multicast RAs, in seconds. Default value: 600 Minimum value = 4 Maximum value = 1800
minrtadvinterval	<Double>	Read-write	Minimum time interval between RA messages, in seconds. Default value: 198 Minimum value = 3 Maximum value = 1350
linkmtu	<Double>	Read-write	The Link MTU. Default value: 0 Minimum value = 0 Maximum value = 1500
reachabletime	<Double>	Read-write	Reachable time, in milliseconds.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 3600000
retranstime	<Double>	Read-write	Retransmission time, in milliseconds. Default value: 0
defaultlifetime	<Integer>	Read-write	Default life time, in seconds. Default value: 1800 Minimum value = 0 Maximum value = 9000
lastrtadvtime	<Double>	Read-only	Last RA sent timestamp.
nextrtadvdelay	<Double>	Read-only	Next RA delay.
__count	<Double>	Read-only	count parameter

```

nd6ravariables_binding

Binding object which returns the resources bound to nd6ravariables.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Double>	Read-write	The VLAN number. Minimum value = 1 Maximum value = 4094
nd6ravariables_onlinkipv6prefix_binding	<nd6ravariables_onlinkipv6prefix_binding[]>	Read-only	onlinkipv6prefix that can be bound to nd6ravariables.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nd6ravariables_binding/vlan_value<Double>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nd6ravariables_binding": [ {

"vlan":<Double_value>,

"nd6ravariables_onlinkipv6prefix_binding":<nd6ravariables_onlinkipv6prefix
_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nd6ravariables_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nd6ravariables_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nd6ravariables_binding": [ {

"vlan":<Double_value>,

"nd6ravariables_onlinkipv6prefix_binding":<nd6ravariables_onlinkipv6prefix
_binding[]_value>

}]}
```

nd6ravariables_onlinkipv6prefix_binding

Binding object showing the onlinkipv6prefix that can be bound to nd6ravariables.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipv6prefix	<String>	Read-write	Onlink prefixes for RA messages.
vlan	<Double>	Read-write	The VLAN number. Minimum value = 1 Maximum value = 4094
__count	<Double>	Read-write	count parameter

Operations

netprofile

Configuration for Network profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the net profile. Must begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the profile is created. Choose a name that helps identify the net profile. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcip	<String>	Read-write	IP address or the name of an IP set.
srcippersistency	<String>	Read-write	When the net profile is associated with a virtual server or its bound services, this option enables the Citrix ADC to use the same address, specified in the net profile, to communicate to servers for all sessions initiated from a particular client to the virtual server. Default value: DISABLED Possible values = ENABLED, DISABLED
overridelsn	<String>	Read-write	USNIP/USIP settings override LSN settings for configured

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service/virtual server traffic.. . Default value: DISABLED Possible values = ENABLED, DISABLED
mbf	<String>	Read-write	Response will be sent using learnt info if enabled. When creating a netprofile, if you do not set this parameter, the netprofile inherits the global MBF setting (available in the enable ns mode and disable ns mode CLI commands, or in the System > Settings > Configure modes > Configure Modes dialog box). However, you can override this setting after you create the netprofile. Possible values = ENABLED, DISABLED
proxyprotocol	<String>	Read-write	Proxy Protocol Action (Enabled/ Disabled). Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
proxyprotocoltxversion	<String>	Read-write	Proxy Protocol Version (V1/V2). Default value: V1 Possible values = V1, V2
__count	<Double>	Read-only	count parameter

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "netprofile_binding": [ {

"name":<String_value>,

"netprofile_srcportset_binding":<netprofile_srcportset_binding[]_value>,

"netprofile_natrule_binding":<netprofile_natrule_binding[]_value>

}]}
```

netprofile_natrule_binding

Binding object showing the natrule that can be bound to netprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rewriteip	<String>	Read-write	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the netprofile to which to bind port ranges. Minimum length = 1
netmask	<String>	Read-write	.
natrule	<String>	Read-write	IPv4 network address on whose traffic you want the Citrix ADC to do rewrite ip prefix.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/netprofile_natrule_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
"netprofile_natrule_binding":{
<b>"name":<String_value>,
</b>"natrule":<String_value>,
"netmask":<String_value>,
"rewriteip":<String_value>
}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/netprofile_natrule_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/netprofile_natrule_binding/name_value<String>?**args=natrule:<String_value>,netmask:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/netprofile_natrule_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/netprofile_natrule_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of netprofile_natrule_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/netprofile_natrule_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the netprofile_natrule_binding resources in chunks.

HTTP Method:GET

Request Headers:

```

rnat

Configuration for RNAT configured route resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	The network address defined for the RNAT entry. Minimum length = 1
netmask	<String>	Read-write	The subnet mask for the network address. Minimum length = 1
aclname	<String>	Read-write	An extended ACL defined for the RNAT entry. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
ownergroup	<String>	Read-write	The owner node group in a Cluster for this rnat rule. Default value: DEFAULT_NG Minimum length = 1
name	<String>	Read-write	Name for the RNAT4 rule. Must begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the rule is created. Choose a name that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			helps identify the RNAT4 rule. Minimum length = 1
redirectport	<Integer>	Read-write	Port number to which the IPv4 packets are redirected. Applicable to TCP and UDP protocols. Minimum value = 1 Maximum value = 65535
natip	<String>	Read-write	Any Citrix ADC owned IPv4 address except the NSIP address. The Citrix ADC appliance replaces the source IP addresses of server-generated packets with the IP address specified. The IP address must be a public Citrix ADC owned IP address. If you specify multiple addresses for this field, NATIP selection uses the round robin algorithm for each session. By specifying a range of IP addresses, you can specify all Citrix ADC owned IP addresses, except the NSIP, that fall

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			within the specified range. Minimum length = 1
srcippersistency	<String>	Read-write	Enables the Citrix ADC to use the same NAT IP address for all RNAT sessions initiated from a particular server. Default value: DISABLED Possible values = ENABLED, DISABLED
useproxyport	<String>	Read-write	Enable source port proxying, which enables the Citrix ADC to use the RNAT ips using proxied source port. Default value: ENABLED Possible values = ENABLED, DISABLED
connfailover	<String>	Read-write	Synchronize connection information with the secondary appliance in a high availability (HA) pair. That is, synchronize all connection-related information for the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RNAT session. In order for this to work, tcpproxy should be DISABLED. To disable tcpproxy use "set rnatparam tcpproxy DISABLED". Default value: DISABLED Possible values = ENABLED, DISABLED
newname	<String>	Read-write	New name for the RNAT4 rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
__count	<Double>	Read-only	count parameter

Request Payload:

```
{"rnat":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of rnat resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat?**pagesize=#no;pageno=#no**

Use this query-parameter to get the rnat resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

"connfailover":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "rnat": [ { "__count": "#no"} ] }
```

rnatsession

Configuration for RNAT session resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	IPv4 network address on whose traffic you want the Citrix ADC to do RNAT processing. Minimum length = 1
netmask	<String>	Read-write	Subnet mask associated with the network address. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
natip	<String>	Read-write	The NAT IP address defined for the RNAT entry. Minimum length = 1
aclname	<String>	Read-write	Name of any configured extended ACL whose action is ALLOW. Minimum length = 1

Operations

(click to see Properties)

FLUSH

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

flush

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnatsession?**action=flush**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"rnatsession":{

"network":<String_value>,

"netmask":<String_value>,

"natip":<String_value>,

"aclname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rnat6

Configuration for IPv6 RNAT configured route resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the RNAT6 rule. Must begin with a letter, number, or the underscore character (_), and can consist of letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore characters. Cannot be changed after the rule is created. Choose a name that helps identify the RNAT6 rule. Minimum length = 1
network	<String>	Read-write	IPv6 address of the network on whose traffic you want the Citrix ADC to do RNAT processing. Minimum length = 1
acl6name	<String>	Read-write	Name of any configured ACL6 whose action is ALLOW. The rule of the ACL6 is used as an RNAT6 rule. Minimum length = 1
redirectport	<Integer>	Read-write	Port number to which the IPv6 packets are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			redirected. Applicable to TCP and UDP protocols. Minimum value = 1 Maximum value = 65535
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcippersistency	<String>	Read-write	Enable source ip persistency, which enables the Citrix ADC to use the RNAT ips using source ip. Default value: DISABLED Possible values = ENABLED, DISABLED
ownergroup	<String>	Read-write	The owner node group in a Cluster for this rnat rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DEFAULT_NG Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

```

rnat6_binding

Binding object which returns the resources bound to rnat6.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the RNAT6 rule whose details you want to display. Minimum length = 1
rnat6_nsip6_binding	<rnat6_nsip6_binding[]>	Read-only	nsip6 that can be bound to rnat6.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat6_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "rnat6_binding": [ {

"name":<String_value>,

"rnat6_nsip6_binding":<rnat6_nsip6_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat6_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnat6_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "rnat6_binding": [ {

"name":<String_value>,
```

```
"rnat6_nsip6_binding":<rnat6_nsip6_binding[]_value>

}]}
```

rnat6_nsip6_binding

Binding object showing the nsip6 that can be bound to rnat6.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
natip6	<String>	Read-write	Nat IP Address. Minimum length = 1
name	<String>	Read-write	Name of the RNAT6 rule to which to bind NAT IPs. Minimum length = 1
ownergroup	<String>	Read-write	The owner node group in a Cluster for this rnat rule. Default value: DEFAULT_NG Minimum length = 1
td	<Double>	Read-only	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4094
__count	<Double>	Read-only	count parameter

```

rnatglobal_auditsyslogpolicy_binding

Binding object showing the auditsyslogpolicy that can be bound to rnatglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policy.
all	<Boolean>	Read-write	Remove all RNAT global config.
policy	<String>	Read-write	The policy Name.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/rnatglobal_auditsyslogpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
"rnatglobal_auditsyslogpolicy_binding":{
"policy":<String_value>,
"priority":<Double_value>
}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnatglobal_auditsyslogpolicy_binding

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnatglobal_auditsyslogpolicy_binding?**args=policy:<String_value>,all:<Boolean_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnatglobal_auditsyslogpolicy_binding

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnatglobal_auditsyslogpolicy_binding?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of rnatglobal_auditsyslogpolicy_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rnatglobal_auditsyslogpolicy_binding?**pagesize=#no;pageno=#no**

Use this query-parameter to get the rnatglobal_auditsyslogpolicy_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

route

Configuration for route resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
network	<String>	Read-write	IPv4 network address for which to add a route entry in the routing table of the Citrix ADC.
netmask	<String>	Read-write	The subnet mask associated with the network address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gateway	<String>	Read-write	IP address of the gateway for this route. Can be either the IP address of the gateway, or can be null to specify a null interface route. Minimum length = 1
vlan	<Double>	Read-write	VLAN as the gateway for this route. Minimum value = 1 Maximum value = 4094
cost	<Double>	Read-write	Positive integer used by the routing algorithms to determine preference for using this route. The lower the cost, the higher the preference. Minimum value = 0 Maximum value = 65535
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
distance	<Double>	Read-write	Administrative distance of this route, which determines the preference of this route over other routes, with same destination, from different routing protocols. A lower value is preferred. Default value: 1 Minimum value = 0 Maximum value = 255
cost1	<Double>	Read-write	The cost of a route is used to compare routes of the same type. The route having the lowest cost is the most preferred route. Possible values: 0 through 65535. Default: 0. Minimum value = 0 Maximum value = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
weight	<Double>	Read-write	Positive integer used by the routing algorithms to determine preference for this route over others of equal cost. The lower the weight, the higher the preference. Default value: 1 Minimum value = 1 Maximum value = 65535
advertise	<String>	Read-write	Advertise this route. Possible values = DISABLED, ENABLED
protocol	<String[]>	Read-write	Routing protocol used for advertising this route. Default value: ADV_ROUTE_FLAGS Possible values = OSPF, ISIS, RIP, BGP
msr	<String>	Read-write	Monitor this route using a monitor of type ARP or PING. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	Name of the monitor, of type ARP or PING, configured on the Citrix ADC to monitor this route. Minimum length = 1
ownergroup	<String>	Read-write	The owner node group in a Cluster for this route. If owner node group is not specified then the route is treated as Striped route. Default value: DEFAULT_NG Minimum length = 1
routetype	<String>	Read-write	Protocol used by routes that you want to remove from the routing table of the Citrix ADC. Possible values = CONNECTED, STATIC, DYNAMIC, OSPF, ISIS, RIP, BGP
detail	<Boolean>	Read-write	Display a detailed view.
gatewayname	<String>	Read-only	The name of the gateway for this route. For a route

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			other than a link load balancing (LLB) route, this value is null.
type	<Boolean>	Read-only	State of the RNAT.
dynamic	<Boolean>	Read-only	State of the route.
Static	<Boolean>	Read-only	.
permanent	<Boolean>	Read-only	.
direct	<Boolean>	Read-only	.
nat	<Boolean>	Read-only	.
lbroute	<Boolean>	Read-only	.
adv	<Boolean>	Read-only	.
tunnel	<Boolean>	Read-only	Show whether it is a tunnel route or not.
data	<Boolean>	Read-only	Internal data of this route.
data0	<Boolean>	Read-only	Internal route type is stored, used for get.
flags	<Boolean>	Read-only	If this route is dynamic, the name of the routing protocol from which it was learned.
routeowners	<String[]>	Read-only	Use this option with -dynamic and in a cluster only to specify the set of nodes from which

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this dynamic route has been learnt. Possible values = 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31
retain	<Integer>	Read-only	.
ospf	<Boolean>	Read-only	OSPF protocol.
isis	<Boolean>	Read-only	ISIS protocol.
rip	<Boolean>	Read-only	RIP protocol.
bgp	<Boolean>	Read-only	BGP protocol.
dhcp	<Boolean>	Read-only	.
advospf	<Boolean>	Read-only	Advertised through OSPF protocol.
advisis	<Boolean>	Read-only	Advertised through ISIS protocol.
advrip	<Boolean>	Read-only	Advertised through RIP protocol.
advbgp	<Boolean>	Read-only	Advertised through BGP protocol.
state	<Double>	Read-only	The state of the static route. Possible values: UP, DOWN.
totalprobes	<Double>	Read-only	The total number of probes sent.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
totalfailedprobes	<Double>	Read-only	The total number of failed probes.
failedprobes	<Double>	Read-only	Number of the current failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter used with the message code.
monstatparam2	<Integer>	Read-only	Second parameter used with the message code.
monstatparam3	<Integer>	Read-only	Third parameter used with the message code.
__count	<Double>	Read-only	count parameter

weight	<Double>	Read-write	Positive integer used by the routing algorithms to determine preference for this route over others of equal cost. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			lower the weight, the higher the preference. Default value: 1 Minimum value = 1 Maximum value = 65535
distance	<Double>	Read-write	Administrative distance of this route from the appliance. Default value: 1 Minimum value = 1 Maximum value = 254
cost	<Double>	Read-write	Positive integer used by the routing algorithms to determine preference for this route. The lower the cost, the higher the preference. Default value: 1 Minimum value = 0 Maximum value = 65535
advertise	<String>	Read-write	Advertise this route. Possible values = DISABLED, ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
msr	<String>	Read-write	Monitor this route with a monitor of type ND6 or PING. Default value: DISABLED Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	Name of the monitor, of type ND6 or PING, configured on the Citrix ADC to monitor this route. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
ownergroup	<String>	Read-write	The owner node group in a Cluster for this route6. If owner node group is not specified then the route is treated as Striped route.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DEFAULT_NG Minimum length = 1
routetype	<String>	Read-write	Type of IPv6 routes to remove from the routing table of the Citrix ADC. Possible values = CONNECTED, STATIC, DYNAMIC, OSPF, ISIS, BGP, RIP, ND-RA-ROUTE, FIB6
detail	<Boolean>	Read-write	To get a detailed view.
gatewayname	<String>	Read-only	The name of the gateway for this route.
type	<Boolean>	Read-only	State of the RNAT.
dynamic	<Boolean>	Read-only	Whether this route is dynamically learned or not.
data	<Boolean>	Read-only	Internal data of this route.
flags	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
state	<Double>	Read-only	Whether this route is UP or DOWN.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
totalprobes	<Double>	Read-only	The total number of probes sent.
totalfailedprobes	<Double>	Read-only	The total number of failed probes.
failedprobes	<Double>	Read-only	Current number of failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
data1	<String>	Read-only	Internal data of this route. Possible values = ENABLED, DISABLED
routeowners	<String[]>	Read-only	Use this option with -dynamic and in a cluster only to specify the set of nodes from which this dynamic route has been learnt.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31
retain	<Integer>	Read-only	.
Static	<Boolean>	Read-only	Static route.
permanent	<Boolean>	Read-only	Permanent Route.
connected	<Boolean>	Read-only	Connected Route.
ospfv3	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
isis	<Boolean>	Read-only	If this route is dynamic then which routing protocol was it learnt from.
active	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
bgp	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
rip	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
raroute	<Boolean>	Read-only	For a dynamic route, the routing protocol from which the route was learned.
__count	<Double>	Read-only	count parameter

Operations

ADD| CLEAR| DELETE| UPDATE| UNSET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/route6

HTTP Method:POST

Request Headers:

vlan

Configuration for "VLAN" resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	A positive integer that uniquely identifies a VLAN. Minimum value = 1 Maximum value = 4094
aliasname	<String>	Read-write	A name for the VLAN. Must begin with a letter, a number, or the underscore symbol, and can consist of from 1 to 31 letters, numbers, and the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the VLAN. However, you cannot perform any VLAN operation by specifying this name instead of the VLAN ID. Maximum length = 31
dynamicrouting	<String>	Read-write	Enable dynamic routing on this VLAN. Default value: DISABLED Possible values = ENABLED, DISABLED
ipv6dynamicrouting	<String>	Read-write	Enable all IPv6 dynamic routing protocols on this VLAN. Note: For the ENABLED setting to work, you must configure IPv6 dynamic routing protocols from the VTYSH command line.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
mtu	<Double>	Read-write	Specifies the maximum transmission unit (MTU), in bytes. The MTU is the largest packet size, excluding 14 bytes of ethernet header and 4 bytes of crc, that can be transmitted and received over this VLAN. Default value: 0 Minimum value = 500 Maximum value = 9216
sharing	<String>	Read-write	If sharing is enabled, then this vlan can be shared across multiple partitions by binding it to all those partitions. If sharing is disabled, then this vlan can be bound to only one of the partitions. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
linklocalipv6addr	<String>	Read-only	The link-local IP address assigned to the VLAN.
rnat	<Boolean>	Read-only	Temporary flag used for internal purpose.
portbitmap	<Double>	Read-only	Member interfaces of this vlan.
lsbitmap	<Double>	Read-only	Member linksets of this vlan.
tagbitmap	<Double>	Read-only	Tagged members of this vlan.
lstagbitmap	<Double>	Read-only	Tagged linksets of this vlan.
ifaces	<String>	Read-only	Names of all member interfaces of this vlan.
tagifaces	<String>	Read-only	Names of all tagged member interfaces of this vlan.
ifnum	<String>	Read-only	The interface to be bound to the VLAN, specified in slot/port notation (for example, 1/3). Minimum length = 1
tagged	<Boolean>	Read-only	Make the interface an 802.1q tagged interface. Packets sent on this interface

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			on this VLAN have an additional 4-byte 802.1q tag, which identifies the VLAN. To use 802.1q tagging, you must also configure the switch connected to the appliance's interfaces.
vlantd	<Double>	Read-only	Traffic domain associated with vlan. Minimum value = 0 Maximum value = 4094
sdxvlan	<String>	Read-only	SDX vlan. Default value: NO Possible values = YES, NO
partitionname	<String>	Read-only	Name of the Partition to which this vlan bound to. Minimum length = 1
vxlan	<Double>	Read-only	The VXLAN that extends this vlan.
__count	<Double>	Read-only	count parameter

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_binding/id_value<Double>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vlan_binding": [ {

"id":<Double_value>,

"vlan_interface_binding":<vlan_interface_binding[]_value>,

"vlan_nsip6_binding":<vlan_nsip6_binding[]_value>,

"vlan_nsip_binding":<vlan_nsip_binding[]_value>,

"vlan_linkset_binding":<vlan_linkset_binding[]_value>,

"vlan_channel_binding":<vlan_channel_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vlan_binding": [ {

"id":<Double_value>,

"vlan_interface_binding":<vlan_interface_binding[]_value>,

"vlan_nsip6_binding":<vlan_nsip6_binding[]_value>,

"vlan_linkset_binding":<vlan_linkset_binding[]_value>,

"vlan_channel_binding":<vlan_channel_binding[]_value>

}]}
```

vlan_channel_binding

Binding object showing the channel that can be bound to vlan.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ownergroup	<String>	Read-write	The owner node group in a Cluster for this vlan.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DEFAULT_NG Minimum length = 1
id	<Double>	Read-write	Specifies the virtual LAN ID. Minimum value = 1 Maximum value = 4094
ifnum	<String>	Read-write	The interface to be bound to the VLAN, specified in slot/port notation (for example, 1/3). Minimum length = 1
tagged	<Boolean>	Read-write	Make the interface an 802.1q tagged interface. Packets sent on this interface on this VLAN have an additional 4-byte 802.1q tag, which identifies the VLAN. To use 802.1q tagging, you must also configure the switch connected to the appliance's interfaces.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vlan_channel_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"vlan_channel_binding":{

<b>"id":<Double_value>,

</b>"ifnum":<String_value>,

"tagged":<Boolean_value>,

"ownergroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_channel_binding/id_value<Double>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_channel_binding/id_value<Double>?**args=ifnum:<String_value>,tagged:<Boolean_value>,ownergroup:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_channel_binding/id_value<Double>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_channel_binding/id_value<Double>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vlan_channel_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_channel_binding/id_value<Double>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vlan_channel_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vlan_channel_binding": [ {
```

```

ownergroup	<String>	Read-write	The owner node group in a Cluster for this vlan. Default value: DEFAULT_NG Minimum length = 1
id	<Double>	Read-write	Specifies the virtual LAN ID. Minimum value = 1 Maximum value = 4094
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
netmask	<String>	Read-write	Subnet mask for the network address

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			defined for this VLAN.
ipaddress	<String>	Read-write	The IP address assigned to the VLAN.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vlan_nsip_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"vlan_nsip_binding":{

<b>"id":<Double_value>,

</b>"ipaddress":<String_value>,

"netmask":<String_value>,

"td":<Double_value>,

"ownergroup":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_nsip_binding/id_value<Double>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_nsip_binding/id_value<Double>?
args=ipaddress:<String_value>,netmask:<String_value>,td:<Double_value>,ownergroup:<String_value

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_nsip_binding/id_value<Double>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_nsip_binding/id_value<Double>?
filter=property-name1:property-value1,property-name2:property-value2

Use this query-parameter to get the filtered set of vlan_nsip_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vlan_nsip_binding/id_value<Double>?
pagesize=#no;pageno=#no

Use this query-parameter to get the vlan_nsip_binding resources in chunks.

HTTP Method:GET

Request Headers:

Response Payload:

```
{"vlan_nsip_binding": [ { "__count": "#no"} ] }
```

vrid

Configuration for Virtual Router ID resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer that uniquely identifies the VMAC address. The generic VMAC address is in the form of 00:00:5e:00:01:<VRID>. For example, if you add a VRID with a value of 60 and bind it to an interface, the resulting VMAC address is 00:00:5e:00:01:3c, where 3c is the hexadecimal representation of 60. Minimum value = 1 Maximum value = 255
priority	<Double>	Read-write	Base priority (BP), in an active-active mode configuration, which ordinarily

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			determines the master VIP address. Default value: 255 Minimum value = 0 Maximum value = 255
preemption	<String>	Read-write	In an active-active mode configuration, make a backup VIP address the master if its priority becomes higher than that of a master VIP address bound to this VMAC address. If you disable pre-emption while a backup VIP address is the master, the backup VIP address remains master until the original master VIP's priority becomes higher than that of the current master. Default value: ENABLED Possible values = ENABLED, DISABLED
sharing	<String>	Read-write	In an active-active mode configuration, enable the backup

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VIP address to process any traffic instead of dropping it. Default value: DISABLED Possible values = ENABLED, DISABLED
tracking	<String>	Read-write	The effective priority (EP) value, relative to the base priority (BP) value in an active-active mode configuration. When EP is set to a value other than None, it is EP, not BP, which determines the master VIP address. Available settings function as follows: * NONE - No tracking. EP = BP * ALL - If the status of all virtual servers is UP, EP = BP. Otherwise, EP = 0. * ONE - If the status of at least one virtual server is UP, EP = BP. Otherwise, EP = 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* PROGRESSIVE - If the status of all virtual servers is UP, EP = BP. If the status of all virtual servers is DOWN, EP = 0. Otherwise EP = BP (1 - K/N), where N is the total number of virtual servers associated with the VIP address and K is the number of virtual servers for which the status is DOWN. Default: NONE. Default value: NONE Possible values = NONE, ONE, ALL, PROGRESSIVE
ownernode	<Double>	Read-write	In a cluster setup, assign a cluster node as the owner of this VMAC address for IP based VRRP configuration. If no owner is configured, owner node is displayed as ALL and one node is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			dynamically elected as the owner. Minimum value = 0 Maximum value = 31
trackifnumpriority	<Double>	Read-write	Priority by which the Effective priority will be reduced if any of the tracked interfaces goes down in an active-active configuration. Default value: 0 Minimum value = 1 Maximum value = 255
preemptiondelaytimer	<Double>	Read-write	Preemption delay time, in seconds, in an active-active configuration. If any high priority node will come in network, it will wait for these many seconds before becoming master. Default value: 0 Minimum value = 1 Maximum value = 36000
all	<Boolean>	Read-write	Remove all the configured VMAC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			addresses from the Citrix ADC.
ifaces	<String>	Read-only	Interfaces bound to this VRID.
type	<String>	Read-only	Indicates whether this VRID entry was added manually or dynamically. When you manually add a VRID entry, the value for this parameter is STATIC. Otherwise, it is DYNAMIC. Possible values = STATIC, DYNAMIC
effectivepriority	<Double>	Read-only	The effective priority of this VRID.
flags	<Double>	Read-only	Flags.
ipaddress	<String>	Read-only	The IP address bound to the VRID.
state	<Double>	Read-only	State of this VRID.
operationalownernode	<Double>	Read-only	Run time owner node of the vrid. Minimum value = 0 Maximum value = 31
__count	<Double>	Read-only	count parameter

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid6?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vrid6": [ { "__count": "#no"} ] }
```

vrid6_binding

Binding object which returns the resources bound to vrid6.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer value that uniquely identifies a VMAC6 address. Minimum value = 1 Maximum value = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vrid6_interface_binding	<vrid6_interface_binding[]>	Read-only	interface that can be bound to vrid6.
vrid6_trackinterface_binding	<vrid6_trackinterface_binding[]>	Read-only	trackinterface that can be bound to vrid6.
vrid6_channel_binding	<vrid6_channel_binding[]>	Read-only	channel that can be bound to vrid6.
vrid6_nsip_binding	<vrid6_nsip_binding[]>	Read-only	nsip that can be bound to vrid6.
vrid6_nsip6_binding	<vrid6_nsip6_binding[]>	Read-only	nsip6 that can be bound to vrid6.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid6_binding/id_value<Double>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vrid6_binding": [ {

"id":<Double_value>,

"vrid6_nsip6_binding":<vrid6_nsip6_binding[]_value>,

"vrid6_nsip_binding":<vrid6_nsip_binding[]_value>,

"vrid6_channel_binding":<vrid6_channel_binding[]_value>,

"vrid6_interface_binding":<vrid6_interface_binding[]_value>,

"vrid6_trackinterface_binding":<vrid6_trackinterface_binding[]_value>
```

```
}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid6_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid6_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vrid6_binding": [ {

"id":<Double_value>,

"vrid6_nsip6_binding":<vrid6_nsip6_binding[]_value>,

"vrid6_nsip_binding":<vrid6_nsip_binding[]_value>,

"vrid6_channel_binding":<vrid6_channel_binding[]_value>,

"vrid6_interface_binding":<vrid6_interface_binding[]_value>,
```

```
"vrid6_trackinterface_binding":<vrid6_trackinterface_binding[]_value>

}]}
```

vrid6_channel_binding

Binding object showing the channel that can be bound to vrid6.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer value that uniquely identifies a VMAC6 address. Minimum value = 1 Maximum value = 255
ifnum	<String>	Read-write	Interfaces to bind to the VMAC6, specified in (slot/port) notation (for example, 1/2).Use spaces to separate multiple entries.
flags	<Double>	Read-only	Flags.
vlan	<Double>	Read-only	The VLAN in which this VRID resides.
__count	<Double>	Read-only	count parameter

Content-Type:application/json

Response Payload:

```
{"vrid6_trackinterface_binding": [ { "__count": "#no"} ] }
```

vridparam

Configuration for VR ID parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sendtomaster	<String>	Read-write	Forward packets to the master node, in an active-active mode configuration,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			if the virtual server is in the backup state and sharing is disabled. Default value: DISABLED Possible values = ENABLED, DISABLED
hellointerval	<Double>	Read-write	Interval, in milliseconds, between vrrp advertisement messages sent to the peer node in active-active mode. Default value: 1000 Minimum value = 200 Maximum value = 1000
deadinterval	<Double>	Read-write	Number of seconds after which a peer node in active-active mode is marked down if vrrp advertisements are not received from the peer node. Default value: 3 Minimum value = 1 Maximum value = 60

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vridparam

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"vridparam":{

"sendtomaster":<String_value>,

"hellointerval":<Double_value>,

"deadinterval":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vridparam?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"vridparam":{

"sendtomaster":true,

"hellointerval":true,

"deadinterval":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vridparam

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vridparam": [ {

"sendtomaster":<String_value>,

"hellointerval":<Double_value>,

"deadinterval":<Double_value>

}]}
```

vrid_binding

Binding object which returns the resources bound to vrid.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer value that uniquely identifies the VMAC address. Minimum value = 1 Maximum value = 255
vrid_trackinterface_binding	<vrid_trackinterface_binding[]>	Read-only	trackinterface that can be bound to vrid.
vrid_nsip6_binding	<vrid_nsip6_binding[]>	Read-only	nsip6 that can be bound to vrid.
vrid_interface_binding	<vrid_interface_binding[]>	Read-only	interface that can be bound to vrid.
vrid_channel_binding	<vrid_channel_binding[]>	Read-only	channel that can be bound to vrid.
vrid_nsip_binding	<vrid_nsip_binding[]>	Read-only	nsip that can be bound to vrid.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vrid_nsip6_binding": [ {

"id":<Double_value>,

"ipaddress":<String_value>,

"flags":<Double_value>
```

```
}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid_nsip6_binding/id_value<Double>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"vrid_nsip6_binding": [ { "__count": "#no"} ] }
```

vrid_nsip_binding

Binding object showing the nsip that can be bound to vrid.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer that uniquely identifies the VMAC address. The generic VMAC address is in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the form of 00:00:5e:00:01:<VRID>. For example, if you add a VRID with a value of 60 and bind it to an interface, the resulting VMAC address is 00:00:5e:00:01:3c, where 3c is the hexadecimal representation of 60. Minimum value = 1 Maximum value = 255
ipaddress	<String>	Read-write	The IP address bound to the VRID.
flags	<Double>	Read-only	Flags.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid_nsip_binding/id_value<Double>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid_nsip_binding/id_value<Double>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vrid_nsip_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid_nsip_binding/id_value<Double>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vrid_nsip_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vrid_nsip_binding": [ {

"id":<Double_value>,

"ipaddress":<String_value>,

"flags":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid_nsip_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid_nsip_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vrid_nsip_binding": [ {

"id":<Double_value>,

"ipaddress":<String_value>,

"flags":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vrid_nsip_binding/id_value<Double>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"vrid_nsip_binding": [ { "__count": "#no"} ] }
```

vrid_trackinterface_binding

Binding object showing the trackinterface that can be bound to vrid.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer that uniquely identifies the VMAC address. The generic VMAC address is in the form of 00:00:5e:00:01:<VRID>. For example, if you add a VRID with a value of 60 and bind it to an interface, the resulting VMAC address is 00:00:5e:00:01:3c, where 3c is the hexadecimal representation of 60. Minimum value = 1 Maximum value = 255
trackifnum	<String>	Read-write	Interfaces which need to be tracked for this vrID.
flags	<Double>	Read-only	Flags.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION

```

vxlan

Configuration for "VXLAN" resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	A positive integer, which is also called VXLAN Network Identifier (VNI), that uniquely identifies a VXLAN. Minimum value = 1 Maximum value = 16777215
vlan	<Double>	Read-write	ID of VLANs whose traffic is allowed over this VXLAN. If you do not specify any VLAN IDs, the Citrix ADC allows traffic of all VLANs that are not part of any other VXLANs. Minimum value = 2 Maximum value = 4094
port	<Integer>	Read-write	Specifies UDP destination port for VXLAN packets. Default value: 4789 Minimum value = 1 Maximum value = 65534
dynamicrouting	<String>	Read-write	Enable dynamic routing on this VXLAN.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
ipv6dynamicrouting	<String>	Read-write	Enable all IPv6 dynamic routing protocols on this VXLAN. Note: For the ENABLED setting to work, you must configure IPv6 dynamic routing protocols from the VTYSH command line. Default value: DISABLED Possible values = ENABLED, DISABLED
type	<String>	Read-write	VXLAN encapsulation type. VXLAN, VXLANGPE. Default value: VXLAN Possible values = VXLAN, VXLANGPE
protocol	<String>	Read-write	VXLAN-GPE next protocol. RESERVED, IPv4,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IPv6, ETHERNET, NSH. Default value: ETHERNET Possible values = IPv4, IPv6, ETHERNET, NSH
innervlantagging	<String>	Read-write	Specifies whether Citrix ADC should generate VXLAN packets with inner VLAN tag. Default value: DISABLED Possible values = ENABLED, DISABLED
td	<Double>	Read-only	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.
partitionname	<String>	Read-only	The Partition to which this vxlan is bound. Minimum length = 1
__count	<Double>	Read-only	count parameter

vxlanvlanmap_binding

Binding object which returns the resources bound to vxlanvlanmap.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the mapping table. Minimum length = 1
vxlanvlanmap_vxlan_binding	<vxlanvlanmap_vxlan_binding[]>	Read-only	vxlan that can be bound to vxlanvlanmap.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"vxlan_nsip_binding": [ { "__count": "#no"} ] }
```

vxlan_srcip_binding

Binding object showing the srcip that can be bound to vxlan.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	A positive integer, which is also called VXLAN Network Identifier (VNI), that uniquely identifies a VXLAN.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 16777215
srcip	<String>	Read-write	The source IP address to use in outgoing vxlan packets. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vxlan_srcip_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"vxlan_srcip_binding":{

<b>"id":<Double_value>,

</b>"srcip":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vxlan_srcip_binding/id_value<Double>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vxlan_srcip_binding/id_value<Double>?**args=srcip:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vxlan_srcip_binding/id_value<Double>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vxlan_srcip_binding/id_value<Double>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vxlan_srcip_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vxlan_srcip_binding/id_value<Double>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vxlan_srcip_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vxlan_srcip_binding": [ {

"id":<Double_value>,

"srcip":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vxlan_srcip_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vxlan_srcip_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

Configuration for ACL entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclname	<String>	Read-write	Name for the extended ACL rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
aclaction	<String>	Read-write	Action to perform on incoming IPv4 packets that match the extended ACL rule. Available settings function as follows: * ALLOW - The Citrix ADC processes the packet. * BRIDGE - The Citrix ADC bridges the packet to the destination without processing it. * DENY - The Citrix ADC drops the packet.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = BRIDGE, DENY, ALLOW
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcip	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcipval	<String>	Read-write	IP address or range of IP addresses to match against the source IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example:10.102.29.30-10.102.29.189.
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Port number or range of port numbers to match against the source port number of an incoming IPv4 packet. In the command line interface, separate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the range with a hyphen. For example: 40-90. Maximum length = 65535
destip	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipval	<String>	Read-write	IP address or range of IP addresses to match against the destination IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			10.102.29.30-10.102.29.189.
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Port number or range of port numbers to match against the destination port number of an incoming IPv4 packet. In the command line interface, separate the range with a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols. Maximum length = 65535
ttl	<Double>	Read-write	Number of seconds, in multiples of four, after which the extended ACL rule expires. If you do not want the extended ACL rule to expire, do not specify a TTL value. Minimum value = 1 Maximum value = 2147483647
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an incoming IPv4 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			srcMacMask value "000000111111". . Default value: "000000000000"
protocol	<String>	Read-write	Protocol to match against the protocol of an incoming IPv4 packet. Possible values = ICMP, IGMP, TCP, EGP, IGP, ARGUS, UDP, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, ICMPV6,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IPv6-NoNx, IPv6-Opts, Any-Host-Internal-Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-IGNORE, Mobility-Header, UDPLite
protocolnumber	<Double>	Read-write	Protocol to match against the protocol of an incoming IPv4 packet. Minimum value = 1 Maximum value = 255
vlan	<Double>	Read-write	ID of the VLAN. The Citrix ADC applies the ACL rule only to the incoming packets of the specified VLAN. If you do not specify a VLAN ID, the appliance applies the ACL rule to the incoming packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN. The Citrix ADC applies the ACL rule only to the incoming packets of the specified VXLAN. If you do not specify a VXLAN ID, the appliance applies the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ACL rule to the incoming packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC applies the ACL rule only to the incoming packets from the specified interface. If you do not specify any value, the appliance applies the ACL rule to the incoming packets of all interfaces.
established	<Boolean>	Read-write	Allow only incoming TCP packets that have the ACK or RST bit set, if the action set for the ACL rule is ALLOW and these packets match the other conditions in the ACL rule.
icmptype	<Double>	Read-write	ICMP Message type to match against the message type of an incoming ICMP packet. For example, to block DESTINATION UNREACHABLE messages, you must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specify 3 as the ICMP type. Note: This parameter can be specified only for the ICMP protocol. Minimum value = 0 Maximum value = 65536
icmpcode	<Double>	Read-write	Code of a particular ICMP message type to match against the ICMP code of an incoming ICMP packet. For example, to block DESTINATION HOST UNREACHABLE messages, specify 3 as the ICMP type and 1 as the ICMP code. If you set this parameter, you must set the ICMP Type parameter. Minimum value = 0 Maximum value = 65536
priority	<Double>	Read-write	Priority for the extended ACL rule that determines the order in which it is evaluated relative to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the other extended ACL rules. If you do not specify priorities while creating extended ACL rules, the ACL rules are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 100000
state	<String>	Read-write	Enable or disable the extended ACL rule. After you apply the extended ACL rules, the Citrix ADC compares incoming packets against the enabled extended ACL rules. Default value: ENABLED Possible values = ENABLED, DISABLED
logstate	<String>	Read-write	Enable or disable logging of events related to the extended ACL rule. The log messages are stored in the configured syslog or auditlog server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
ratelimit	<Double>	Read-write	Maximum number of log messages to be generated per second. If you set this parameter, you must enable the Log State parameter. Default value: 100 Minimum value = 1 Maximum value = 10000
type	<String>	Read-write	Type of the acl ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: CLASSIC Possible values = CLASSIC, DFD
dfdhash	<String>	Read-write	Specifies the type hashmethod to be applied, to steer the packet to the FP of the packet. Possible values = SIP-SPORT-DIP-DPORT, SIP, DIP, SIP-DIP, SIP-SPORT, DIP-DPORT
stateful	<String>	Read-write	If stateful option is enabled, transparent sessions are created for the traffic hitting this ACL and not hitting any other features like LB, INAT etc. . Default value: NO Possible values = YES, NO
newname	<String>	Read-write	New name for the extended ACL rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
hits	<Double>	Read-only	The hits of this ACL.
kernelstate	<String>	Read-only	The commit status of the ACL. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED, SFAPPLIED61, SFNOTAPPLIED61
aclassociate	<String[]>	Read-only	ACL linked. Possible values = NAT, FORWARDINGSESSION, NAT64, LSN
__count	<Double>	Read-only	count parameter

nsacl6

Configuration for ACL6 entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
acl6name	<String>	Read-write	Name for the ACL6 rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
acl6action	<String>	Read-write	Action to perform on the incoming IPv6 packets that match the ACL6 rule. Available settings function as follows: * ALLOW - The Citrix ADC processes the packet. * BRIDGE - The Citrix ADC bridges the packet to the destination without processing it.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DENY - The Citrix ADC drops the packet. Possible values = BRIDGE, DENY, ALLOW
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an incoming IPv6 packet. In the command line interface, separate the range with a hyphen.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcipv6val	<String>	Read-write	Source IPv6 address (range).
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an incoming IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Source port (range). Maximum length = 65535
destipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an incoming IPv6 packet. In the command line interface, separate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the range with a hyphen.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipv6val	<String>	Read-write	Destination IPv6 address (range).
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an incoming IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Destination port (range).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 65535
ttl	<Double>	Read-write	Time to expire this ACL6 (in seconds). Minimum value = 1 Maximum value = 2147483647
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an incoming IPv6 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"
protocol	<String>	Read-write	Protocol, identified by protocol name, to match against the protocol of an incoming IPv6 packet. Possible values = ICMPV6, TCP, UDP, ICMP, IGMP, EGP, IGP, ARGUS, RDP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-IGNORE, Mobility-Header, UDPLite
protocolnumber	<Double>	Read-write	Protocol, identified by protocol number, to match against the protocol of an incoming IPv6 packet. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 255
vlan	<Double>	Read-write	ID of the VLAN. The Citrix ADC applies the ACL6 rule only to the incoming packets on the specified VLAN. If you do not specify a VLAN ID, the appliance applies the ACL6 rule to the incoming packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN. The Citrix ADC applies the ACL6 rule only to the incoming packets on the specified VXLAN. If you do not specify a VXLAN ID, the appliance applies the ACL6 rule to the incoming packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC applies the ACL6 rule only to the incoming packets

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from the specified interface. If you do not specify any value, the appliance applies the ACL6 rule to the incoming packets from all interfaces.
established	<Boolean>	Read-write	Allow only incoming TCP packets that have the ACK or RST bit set if the action set for the ACL6 rule is ALLOW and these packets match the other conditions in the ACL6 rule.
icmptype	<Double>	Read-write	ICMP Message type to match against the message type of an incoming IPv6 ICMP packet. For example, to block DESTINATION UNREACHABLE messages, you must specify 3 as the ICMP type. Note: This parameter can be specified only for the ICMP protocol. Minimum value = 0 Maximum value = 65536

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
icmpcode	<Double>	Read-write	Code of a particular ICMP message type to match against the ICMP code of an incoming IPv6 ICMP packet. For example, to block DESTINATION HOST UNREACHABLE messages, specify 3 as the ICMP type and 1 as the ICMP code. If you set this parameter, you must set the ICMP Type parameter. Minimum value = 0 Maximum value = 65536
priority	<Double>	Read-write	Priority for the ACL6 rule, which determines the order in which it is evaluated relative to the other ACL6 rules. If you do not specify priorities while creating ACL6 rules, the ACL6 rules are evaluated in the order in which they are created. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 81920
state	<String>	Read-write	State of the ACL6. Default value: ENABLED Possible values = ENABLED, DISABLED
type	<String>	Read-write	Type of the acl6 ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster . Default value: CLASSIC Possible values = CLASSIC, DFD
dfdhash	<String>	Read-write	Specifies the type of hashmethod to be applied, to steer the packet to the FP of the packet.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = SIP-SPORT-DIP-DPORT, SIP, DIP, SIP-DIP, SIP-SPORT, DIP-DPORT
dfdprefix	<Double>	Read-write	hashprefix to be applied to SIP/DIP to generate rsshash FP.eg 128 => hash calculated on the complete IP. Default value: 128 Minimum value = 1 Maximum value = 128
stateful	<String>	Read-write	If stateful option is enabled, transparent sessions are created for the traffic hitting this ACL6 and not hitting any other features like LB, INAT etc. . Default value: NO Possible values = YES, NO
logstate	<String>	Read-write	Enable or disable logging of events related to the ACL6 rule. The log messages are stored in the configured

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			syslog or auditlog server. Default value: DISABLED Possible values = ENABLED, DISABLED
ratelimit	<Double>	Read-write	Maximum number of log messages to be generated per second. If you set this parameter, you must enable the Log State parameter. Default value: 100 Minimum value = 1 Maximum value = 10000
aclaction	<String>	Read-write	Action associated with the ACL6. Possible values = BRIDGE, DENY, ALLOW
newname	<String>	Read-write	New name for the ACL6 rule. Must begin with an ASCII alphabetic or underscore \(_\) character, and must contain only ASCII alphanumeric, underscore, hash \(#\), period \(.\), space, colon \(:\), at \(@\), equals \(=\),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and hyphen \(-\) characters. Minimum length = 1
kernelstate	<String>	Read-only	Commit status of the ACL6. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED
hits	<Double>	Read-only	Number of hits of this ACL6.
aclassociate	<String[]>	Read-only	ACL6 linked. Possible values = NAT, FORWARDINGSESSION, NAT64, LSN
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsacl6?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nsacl6": [ { "__count": "#no"} ] }
```

nsacls

Configuration for ACL entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the acl ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster . Default value: CLASSIC Possible values = CLASSIC, DFD

Operations

(click to see Properties)

RENUMBER| CLEAR| APPLY

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

renumber

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsacls?**action=renumber**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nsacls":{

"type":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

clear

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsacls?**action=clear**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nsacls":{

"type":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

apply

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsacls?**action=apply**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nsacls":{

"type":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

nsacls6

Configuration for ACL6 entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the acl ,default will be CLASSIC. Available options as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster . Default value: CLASSIC Possible values = CLASSIC, DFD

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nsappflowcollector":{

<b>"name":<String_value>,

</b><b>"ipaddress":<String_value>,

</b>"port":<Integer_value>
```

```
}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsappflowcollector resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nsappflowcollector resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nsappflowcollector": [ {

"name":<String_value>,

"ipaddress":<String_value>,

"port":<Integer_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nsappflowcollector": [ {

"name":<String_value>,

"ipaddress":<String_value>,

"port":<Integer_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsappflowcollector?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nsappflowcollector": [ { "__count": "#no"} ] }
```

nsappflowparam

Configuration for appflowParam resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
templaterefresh	<Double>	Read-write	IPFIX template refresh interval (in seconds). Default value: 600 Minimum value = 60

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 3600
udppmtu	<Double>	Read-write	MTU to be used for IPFIX UDP packets. Default value: 1472 Minimum value = 128 Maximum value = 1472
httpurl	<String>	Read-write	Enable AppFlow HTTP URL logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpcookie	<String>	Read-write	Enable AppFlow HTTP cookie logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpreferer	<String>	Read-write	Enable AppFlow HTTP referer logging. Default value: DISABLED

nsassignment

Configuration for assignment resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the assignment. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the assignment is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my assignment" or my assignment).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
variable	<String>	Read-write	Left hand side of the assigment, of the form $variable-name (for a singleton variabled) or $variable-name[key-expression], where key-expression is an expression that evaluates to a text string and provides the key to select a map entry.
set	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and assigned to the left hand variable.
Add	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and added to the left hand variable.
sub	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and subtracted from the left hand variable.
append	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and appended to the left hand variable.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clear	<Boolean>	Read-write	Clear the variable value. Deallocates a text value, and for a map, the text key.
comment	<String>	Read-write	Comment. Can be used to preserve information about this rewrite action.
newname	<String>	Read-write	New name for the assignment. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks (for example, "my assignment" or my assignment). Minimum length = 1
hits	<Double>	Read-only	The number of times the action has been taken.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Double>	Read-only	The number of references to the action.
__count	<Double>	Read-only	count parameter

nscapacity

Configuration for capacity resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bandwidth	<Double>	Read-write	System bandwidth limit.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
platform	<String>	Read-write	appliance platform type. Possible values = VS10, VE10, VP10, VS25, VE25, VP25, VS200, VE200, VP200, VS1000, VE1000, VP1000, VS3000, VE3000, VP3000, VS5000, VE5000, VP5000, VS8000, VE8000, VP8000, VS10000, VE10000, VP10000, VS15000, VE15000, VP15000, VS25000, VE25000, VP25000, VS40000, VE40000, VP40000, VS100000, VE100000, VP100000, CP1000
vcpu	<Boolean>	Read-write	licensed using vcpu pool.
edition	<String>	Read-write	Product edition. Possible values = Standard, Enterprise, Platinum

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
unit	<String>	Read-write	Bandwidth unit. Possible values = Gbps, Mbps
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
actualbandwidth	<Double>	Read-only	Bandwith in MBPS.
vcpucount	<Double>	Read-only	number of vCPUs licensed. Minimum value = 1 Maximum value = 20
maxvcpucount	<Double>	Read-only	number of max vCPUs. Minimum value = 1 Maximum value = 20
maxbandwidth	<Double>	Read-only	Maximum Bandwidth.
minbandwidth	<Double>	Read-only	Minimum Bandwidth.
instancecount	<Double>	Read-only	VPX will consume one instance and MPX will consume zero instance.

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nscapacity

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nscapacity":{

"bandwidth":<Double_value>,

"platform":<String_value>,

"vcpu":<Boolean_value>,

"edition":<String_value>,

"unit":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nscapacity?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nscapacity":{

"bandwidth":true,

"platform":true,
```

```
"vcpu":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nscapacity

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nscapacity?**args=nodeid:<Double_value>**

Use this query-parameter to get nscapacity resources based on additional properties.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

```

nscentralmanagementserver

Configuration for centralmanagementserver resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the central management server. Must be either CLOUD or ONPREM depending on whether the server is on the cloud or on premise. Possible values = CLOUD, ONPREM

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Username for access to central management server. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ns centralmgmtserver" or "my ns centralmgmtserver"). Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
password	<String>	Read-write	Password for access to central management server. Required for any user account. Minimum length = 1 Maximum length = 127
ipaddress	<String>	Read-write	Ip Address of central management server. Minimum length = 1
servername	<String>	Read-write	Fully qualified domain name of the central management server.
__count	<Double>	Read-only	count parameter

nsconfig

Configuration for system config resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
force	<Boolean>	Read-write	Configurations will be cleared without prompting for confirmation.
level	<String>	Read-write	Types of configurations to be cleared. * basic: Clears all configurations except the following: - NSIP, default route (gateway), MIPs, and SNIPs - Network settings (DG, VLAN, RHI and DNS settings) - Cluster settings - HA node definitions - Feature and mode settings - nsroot password * extended: Clears the same configurations as the 'basic' option. In addition, it clears

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the feature and mode settings. * full: Clears all configurations except NSIP, default route, and interface settings. Note: When you clear the configurations through the cluster IP address, by specifying the level as 'full', the cluster is deleted and all cluster nodes become standalone appliances. The 'basic' and 'extended' levels are propagated to the cluster nodes. Possible values = basic, extended, full
rbaconfig	<String>	Read-write	RBA configurations and TACACS policies bound to system global will not be cleared if RBA is set to NO.This option is applicable only for BASIC level of clear configuration.Default is YES, which will

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			clear rba configurations. Default value: YES Possible values = YES, NO
ipaddress	<String>	Read-write	IP address of the Citrix ADC. Commonly referred to as NSIP address. This parameter is mandatory to bring up the appliance. Minimum length = 1
netmask	<String>	Read-write	Netmask corresponding to the IP address. This parameter is mandatory to bring up the appliance.
nsvlan	<Double>	Read-write	VLAN (NSVLAN) for the subnet on which the IP address resides. Minimum value = 2 Maximum value = 4094
ifnum	<String[]>	Read-write	Interfaces of the appliances that must be bound to the NSVLAN. Minimum length = 1
tagged	<String>	Read-write	Specifies that the interfaces will be added as 802.1q

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			tagged interfaces. Packets sent on these interface on this VLAN will have an additional 4-byte 802.1q tag which identifies the VLAN. To use 802.1q tagging, the switch connected to the appliance's interfaces must also be configured for tagging. Default value: YES Possible values = YES, NO
httpport	<Integer[]>	Read-write	The HTTP ports on the Web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1
maxconn	<Double>	Read-write	The maximum number of connections that will be made from the system to the web server(s) attached to it. The value entered here is applied

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			globally to all attached servers. Minimum value = 0 Maximum value = 4294967294
maxreq	<Double>	Read-write	The maximum number of requests that the system can pass on a particular connection between the system and a server attached to it. Setting this value to 0 allows an unlimited number of requests to be passed. Minimum value = 0 Maximum value = 65535
cip	<String>	Read-write	The option to control (enable or disable) the insertion of the actual client IP address into the HTTP header request passed from the client to one, some, or all servers attached to the system. The passed address can then be accessed through a minor

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			modification to the server. l If cipHeader is specified, it will be used as the client IP header. l If it is not specified, then the value that has been set by the set ns config CLI command will be used as the client IP header. Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	The text that will be used as the client IP header. Minimum length = 1
cookieversion	<String>	Read-write	The version of the cookie inserted by system. Possible values = 0, 1
securecookie	<String>	Read-write	enable/disable secure flag for persistence cookie. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
pmtumin	<Double>	Read-write	The minimum Path MTU. Default value: 576 Minimum value = 168 Maximum value = 1500
pmtutimeout	<Double>	Read-write	The timeout value in minutes. Default value: 10 Minimum value = 1 Maximum value = 1440
ftpportrange	<String>	Read-write	Port range configured for FTP services. Minimum length = 1024 Maximum length = 64000
crportrange	<String>	Read-write	Port range for cache redirection services. Minimum length = 1 Maximum length = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timezone	<String>	Read-write	Name of the timezone. Default value: CoordinatedUniversalTime Minimum length = 1 Maximum length = 64
grantquotamaxclient	<Double>	Read-write	The percentage of shared quota to be granted at a time for maxClient. Default value: 10 Minimum value = 0 Maximum value = 100
exclusivequotamaxclient	<Double>	Read-write	The percentage of maxClient to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
grantquotaspillover	<Double>	Read-write	The percentage of shared quota to be granted at a time for spillover. Default value: 10 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 100
exclusivequotaspillover	<Double>	Read-write	The percentage of max limit to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
all	<Boolean>	Read-write	Use this option to do saveconfig for all partitions.
config1	<String>	Read-write	Location of the configurations.
config2	<String>	Read-write	Location of the configurations.
outtype	<String>	Read-write	Format to display the difference in configurations. Possible values = cli, xml
template	<Boolean>	Read-write	File that contains the commands to be compared.
ignoredevicespecific	<Boolean>	Read-write	Suppress device specific differences.
weakpassword	<Boolean>	Read-write	Option to list all weak passwords (not adhering to strong password requirements). Takes

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			config file as input, if no input specified, running configuration is considered. Command => query ns config -weakpassword / query ns config -weakpassword / nsconfig/ns.conf.
config	<String>	Read-write	configuration File to be used to find weak passwords, if not specified, running config is taken as input.
message	<String>	Read-only	.
mappedip	<String>	Read-only	Mapped IP Address of the System. Minimum length = 1
range	<Double>	Read-only	The range of Mapped IP addresses to be configured. Minimum value = 1
systemtype	<String>	Read-only	The type of the System. Possible Values: Standalone, HA, Cluster. Possible values = Stand-alone, HA, Cluster
primaryip	<String>	Read-only	HA Master Node IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
primaryip6	<String>	Read-only	.
flags	<Double>	Read-only	The flags for this entry.
lastconfigchangedtime	<String>	Read-only	Time when the configuration was last modified.
lastconfigsavetime	<String>	Read-only	Time when the configuration was last saved through savensconfig.
currentsytemtime	<String>	Read-only	current system time in date format.
systemtime	<Double>	Read-only	current system time.
configchanged	<Boolean>	Read-only	returns True if configuration has changed since last saved config.
response	<String>	Read-only	.

Operations

(click to see Properties)

CLEAR| UPDATE| UNSET| SAVE| DIFF| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

clear

nsconnectiontable

Configuration for TCP/IP connection table resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
filterexpression	<String>	Read-write	The maximum length of filter expression is 255 and it can be of following format: <expression> [<relop> <expression>] <relop> = (;; | ||) <expression> =: CONNECTION.<qualifier>.<qualifier-method>.(<qualifier-value>) <qualifier> = SRCIP <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv4 address example = CONNECTION.SRCIP.EQ(127.0.0.1)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier> = DSTIP <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv4 address. example = CONNECTION.DSTIP.EQ(127.0.0.1) <qualifier> = IP <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv4 address. example = CONNECTION.IP.EQ(127.0.0.1) <qualifier> = SRCIPv6 <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv6 address. example = CONNECTION.SR

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CIPv6.EQ(2001:db8:0:0:1::1) <qualifier> = DSTIPv6 <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv6 address. example = CONNECTION.DSTIPv6.EQ(2001:db8:0:0:1::1) <qualifier> = IPv6 <qualifier-method> = [EQ | NE] <qualifier-value> = A valid IPv6 address. example = CONNECTION.IPv6.EQ(2001:db8:0:0:1::1) <qualifier> = SRCPORT <qualifier-method> = [EQ | NE | GT | GE | LT | LE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			| BETWEEN] <qualifier-value> = A valid port number. example = CONNECTION.SRCPORT.EQ(80) <qualifier> = DSTPORT <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid port number. example = CONNECTION.DSTPORT.EQ(80) <qualifier> = PORT <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid port number. example = CONNECTION.PORT.EQ(80)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier> = SVCNAME <qualifier-method> = [EQ | NE | CONTAINS | STARTSWITH | ENDSWITH] <qualifier-value> = service name. example = CONNECTION.SVCNAME.EQ("name") <qualifier> = LB_VSERVER.NAME <qualifier-method> = [EQ | NE | CONTAINS | STARTSWITH | ENDSWITH] <qualifier-value> = LB vserver name. example = CONNECTION.LB_VSERVER.NAME.EQ("name")

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier> = CS_VSERVER.NAME <qualifier-method> = [EQ | NE | CONTAINS | STARTSWITH | ENDSWITH] <qualifier-value> = CS vserver name. example = CONNECTION.CS_VSERVER.NAME.EQ("name") <qualifier> = INTF <qualifier-method> = [EQ | NE] <qualifier-value> = A valid interface id in the form of x/y (n/x/y in case of cluster interface). examle = CONNECTION.INTF.EQ("0/1/1") <qualifier> = VLANID

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid VLAN ID. example = CONNECTION.VLANID.EQ(0) <qualifier> = CONNID <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid PCB dev number. example = CONNECTION.CONNID.EQ(0) <qualifier> = PPEID <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid core ID.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example = CONNECTION.PPEID.EQ(0) <qualifier> = IDLETIME <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A positive integer indicating the idletime. example = CONNECTION.IDLETIME.LT(100) <qualifier> = TCPSTATE <qualifier-method> = [EQ | NE] <qualifier-value> = (CLOSE_WAIT | CLOSED | CLOSING | ESTABLISHED | FIN_WAIT_1 | FIN_WAIT_2 | LAST_ACK |

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LISTEN | SYN_RECEIVED | SYN_SENT | TIME_WAIT | NOT_APPLICABLE) example = CONNECTION.TCPSTATE.EQ(LISTEN) <qualifier> = SERVICE_TYPE <qualifier-method> = [EQ | NE] <qualifier-value> = (SVC_HTTP | FTP | TCP | UDP | SSL | SSL_BRIDGE | SSL_TCP | NNTP | RPCSVR | RPCSVRS | RPCCLNT | SVC_DNS | ADNS | SNMP | RTSP | DHCPRA | NAT | ANY | MONITOR | MONITOR_UDP | MONITOR_PING | SIP_UDP |

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SVC_MYSQL | SVC_MSSQL | SERVICE_UNKNOWN) example = CONNECTION.SERVICE_TYPE.EQ(ANY) <qualifier> = TRAFFIC_DOMAIN_ID <qualifier-method> = [EQ | NE | GT | GE | LT | LE | BETWEEN] <qualifier-value> = A valid traffic domain ID. example = CONNECTION.TRAFFIC_DOMAIN_ID.EQ(0) common usecases: Filtering out loopback connections and view present connections through netsclaer

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			show connectiontable "CONNECTION.IP.NEQ(127.0.0.1) ;; CONNECTION.TCPSTATE.EQ(ESTABLISHED)" -detail full show connections from a particular sourceip and targeted to port 80 show connectiontable "CONNECTION.SRCIP.EQ(10.102.1.91) ;; CONNECTION.DSTPORT.EQ(80)" show connection particular to a service and its linked client connections show connectiontable "CONNECTION.SVCNAME.EQ("S1")" -detail link

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			show connections for a particular servicetype(e.g.http) show connectiontable "CONNECTION.SERVICE_TYPE.EQ(TCP)" viewing connections that have been idle for a long time show connectiontable "CONNECTION.IDLETIME.GT(100)" show connections for a particular interface and vlan show connectiontable "CONNECTION.INTF.EQ("1/1") ;; CONNECTION.VLANID.EQ(1)" .
link	<Boolean>	Read-write	Display link information if available.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
filtername	<Boolean>	Read-write	Display name instead of IP for local entities.
detail	<String[]>	Read-write	Specify display options for the connection table. * LINK - Displays the linked PCB (Protocol Control Block). * NAME - Displays along with the service name. * CONNFAILOVER - Displays PCB with connection failover. * FULL - Displays all available details. Possible values = LINK, NAME, CONNFAILOVER, FULL, NNM, FULL+
listen	<Boolean>	Read-write	Display listening services only.
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sourceip	<String>	Read-only	Source IP of the connection.
sourceport	<Integer>	Read-only	Source port of the connection. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
destip	<String>	Read-only	Destination IP of the connection.
destport	<Integer>	Read-only	Destination port of the connection. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
svctype	<String>	Read-only	Protocol supported by the connection. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			HTTPSVR, HTTPCLIENT, NAT, HA, AAA, SINCTCP, VPN AFTP, MONITORS, SSLVPN UDP, SINCUDP, RIP, UDP CLNT, SASP, RPCCLNTS, ROUTE, AUDIT, STA HTTP, STA SSL, DNS RESOLVE, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, ICA, RADIUS, RADIUSListener, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, QUIC, TFTP_DATA, USER_TCP, USER_SSL_TCP
idletime	<Integer>	Read-only	Time since last activity was detected on the connection.
state	<String>	Read-only	Current TCP/IP state of the connection. Possible values = CLOSED, LISTEN, SYN_SENT, SYN_RECEIVED,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ESTABLISHED, CLOSE_WAIT, FIN_WAIT_1, CLOSING, LAST_ACK, FIN_WAIT_2, TIME_WAIT, NA
linksourceip	<String>	Read-only	Source IP of the link connection.
linksourceport	<Integer>	Read-only	Source port of the link connection. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
linkdestip	<String>	Read-only	Destination IP of the link connection.
linkdestport	<Integer>	Read-only	Destination port of the link connection. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
linkservicetype	<String>	Read-only	Protocol supported by the link connection. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL_TCP, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, HTTPSVR, HTTPCLIENT, NAT, HA, AAA, SINCTCP, VPN AFTP, MONITORS, SSLVPN UDP, SINCUDP, RIP, UDP CLNT, SASP, RPCCLNTS, ROUTE, AUDIT, STA HTTP, STA SSL, DNS RESOLVE, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, ICA, RADIUS, RADIUSListener, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, QUIC, TFTP_DATA, USER_TCP, USER_SSL_TCP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linkidletime	<Integer>	Read-only	Time since last activity was detected on link connection.
linkstate	<String>	Read-only	TCP/IP current state of link connection. Possible values = CLOSED, LISTEN, SYN_SENT, SYN_RECEIVED, ESTABLISHED, CLOSE_WAIT, FIN_WAIT_1, CLOSING, LAST_ACK, FIN_WAIT_2, TIME_WAIT, NA
entityname	<String>	Read-only	Citrix ADC entity name for the connection.
linkentityname	<String>	Read-only	Citrix ADC entity name for link connection.
connid	<Double>	Read-only	Unique transaction number for the connection.
linkconnid	<Double>	Read-only	Unique transaction number for the peer connection.
connproperties	<String[]>	Read-only	flags used to store connection properties like client, server etc.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = LINK, HASLINK, CLIENT, SERVER, NNM, MPTCP, SUBFLOW
optionflags	<String[]>	Read-only	flags used to store TCP options like Sack, WS. Possible values = sack, timstmp, ws
nswsvalue	<Double>	Read-only	Citrix ADC window scaling value.
peerwsvalue	<Double>	Read-only	peer window scaling value.
mss	<Integer>	Read-only	Client side MSS for the connection - used in server SYN.
retxretrycnt	<Integer>	Read-only	Retransmission retry count for the connection.
rcvwnd	<Integer>	Read-only	Received Advertised Window for the connection.
advwnd	<Integer>	Read-only	Sent advertised window for the connection.
sndcwnd	<Integer>	Read-only	sent congestion window for the connection.
iss	<Double>	Read-only	Initial send sequence number for the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
irs	<Double>	Read-only	Initial receive sequence number for the connection.
rcvnxt	<Integer>	Read-only	next expecting seq number for the connection.
maxack	<Integer>	Read-only	current running max ack sent for the connection.
sndnxt	<Integer>	Read-only	next bytes seq number for the connection.
sndunack	<Integer>	Read-only	Most recently received ACK for the connection.
httpendseq	<Integer>	Read-only	HTTP parsing tracking seq number for the connection.
httpstate	<String>	Read-only	HTTP Protocol state for the connection. Possible values = INITIALIZED, CONTENT_LENGTH, CHUNKED, WAIT_FINAL_ACK, UNKNOWN, DONE, WAIT_FIN
trcount	<Integer>	Read-only	Max reuests allowed per connection.
priority	<String>	Read-only	priority of the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = SC Priority, Priority queue1, priority queue2, priority queue3, DoS Priority, Surge Priority
httpreqver	<String>	Read-only	current HTTP request version on the connection. Possible values = HTTP_1_0, HTTP_1_1, HTTP_0_9, RTSP_1_0, SIP_2_0, VPN_ICA_SOCKS, VPN_ICA_CGP, HTTP_2_0
httprequest	<String>	Read-only	current HTTP request type on the connection. Possible values = OPTIONS, GET, HEAD, POST, PUT, DELETE, TRACE, TRACK, CONNECT, RPCCONNECT
httprspcode	<Integer>	Read-only	current response type on the connection.
rttsmoothed	<Integer>	Read-only	smoothed RTT value of the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rttvariance	<Integer>	Read-only	RTT variance for the connection.
outoforderpkts	<Integer>	Read-only	held packets on the connection.
linkoptionflag	<String[]>	Read-only	Link connection's TCP option flag for Sack and WS. Possible values = sack, timstmp, ws
linknswsvalue	<Double>	Read-only	Link connection-s Citrix ADC window scaling value.
linkpeerwsvalue	<Double>	Read-only	Link connection-s peer Citrix ADC window scaling value.
targetnodeidnnm	<Integer>	Read-only	NNM connection target node ID.
sourcenodeidnnm	<Integer>	Read-only	NNM connection source node ID.
channelidnnm	<Double>	Read-only	NNM connection channel ID.
msgversionnnm	<Double>	Read-only	nnm message version.
td	<Double>	Read-only	Traffic Domain Id.
maxrcvbuf	<Integer>	Read-only	Maximum receive window that application advertizes to peer.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linkmaxrcvbuf	<Integer>	Read-only	Maximum receive window that application advertizes to peer in linked connection.
rxqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC receive buffer. This includes bytes being processed / policy related data / stored in application buffer.
linkrxqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC receive buffer for linked connection. This includes bytes being processed / policy related data / stored in application buffer.
maxsndbuf	<Integer>	Read-only	Maximum send window that application can process and send.
linkmaxsndbuf	<Integer>	Read-only	Maximum send window that application can process and send in linked connection.
txqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC send buffer. This includes both inflight and queued bytes in Citrix ADC.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linktxqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC send buffer for linked connection. This includes both inflight and queued bytes in Citrix ADC.
flavor	<String>	Read-only	TCP congestion control algorithm. Possible values = Default, Westwood, BIC, CUBIC, Nile
linkflavor	<String>	Read-only	TCP congestion control algorithm for a linked connection. Possible values = Default, Westwood, BIC, CUBIC, Nile
bwestimate	<Integer>	Read-only	TCP Bandwidth Estimate.
linkbwestimate	<Integer>	Read-only	TCP Bandwidth Estimate for a linked connection.
rttmin	<Integer>	Read-only	Minimum Round Trip Time for the connection.
linkrttmin	<Integer>	Read-only	Minimum Round Trip Time for linked connection.
name	<String>	Read-only	Name of TCP profile attached to the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
linkname	<String>	Read-only	Name of TCP profile attached to the connection. Minimum length = 1 Maximum length = 127
tcpmode	<String>	Read-only	TCP Optimization modes TRANSPARENT / ENDPOINT. Possible values = TRANSPARENT, ENDPOINT
linktcpmode	<String>	Read-only	TCP Optimization modes TRANSPARENT / ENDPOINT for linked connection. Possible values = TRANSPARENT, ENDPOINT
realtimertt	<Integer>	Read-only	Real Time / Instantaneous round trip time.
linkrealtimertt	<Integer>	Read-only	Real Time / Instantaneous round trip time for linked connection.
sndbuf	<Integer>	Read-only	send buffer size.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linksndbuf	<Integer>	Read-only	Send buffer size for linked connection.
nsbtcpwaitq	<Integer>	Read-only	Number of packets in TCP wait queue.
linknsbtcpwaitq	<Integer>	Read-only	Number of packets in wait queue for linked connection.
nsbretxq	<Integer>	Read-only	Number of packets in retransmission queue.
linknsbretxq	<Integer>	Read-only	Number of packets in retransmission queue for linked connection.
sackblocks	<Integer>	Read-only	Number of sack blocks attached to the connection.
linksackblocks	<Integer>	Read-only	Number of sack blocks attached in linked connection.
congstate	<String>	Read-only	TCP congestion state. Possible values = open, recovery, loss, reneg, partial_ACK, retx_lost
linkcongstate	<String>	Read-only	TCP congestion state for a linked connection. Possible values = open, recovery,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			loss, reneg, partial_ACK, retx_lost
sndrecoverle	<Double>	Read-only	Sequence Number denoting end of fast recovery.
linksndrecoverle	<Double>	Read-only	Sequence Number denoting end of fast recovery for linked connection.
creditsinbytes	<Integer>	Read-only	Connections current credits in Bytes/ms.
linkcredits	<Integer>	Read-only	Link connections current credits in Bytes/ms.
rateinbytes	<Double>	Read-only	Connections current rate in Bytes/ms.
linkrateinbytes	<Double>	Read-only	Link connections current rate in Bytes/ms.
rateschedulerqueue	<Double>	Read-only	Bytes that are queued in the rate scheduler for this connection.
linkrateschedulerqueue	<Double>	Read-only	Bytes that are queued in the rate scheduler for link connection.
burstratecontrol	<String>	Read-only	TCP Burst Rate Control DISABLED/FIXED/DYNAMIC.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DISABLED, FIXED, DYNAMIC
linkburstratecontrol	<String>	Read-only	TCP Burst Rate Control DISABLED/ FIXED/DYNAMIC. Possible values = DISABLED, FIXED, DYNAMIC
cqabifavg	<Double>	Read-only	Average bytes in flight over maxburst.
cqathruputavg	<Double>	Read-only	Average instantaneous throughput over maxburst.
cqarcvwndavg	<Double>	Read-only	Average receive window over maxburst.
cqaiai1mspct	<Double>	Read-only	Percentage of inter arriaval samples for 1ms over maxburst.
cqaiai2mspct	<Double>	Read-only	Percentage of inter arriaval samples for 2ms over maxburst.
cqasamples	<Double>	Read-only	Number of ACK samples over maxburst.
cqaiaisamples	<Double>	Read-only	Number of samples considered for calculating inter arrival interval over maxburst.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cqanetclass	<String>	Read-only	Network type name. Maximum length = 49
cqaccl	<Double>	Read-only	Connection congestion level. Minimum value = 0 Maximum value = 100
cqacsq	<Double>	Read-only	Connectiontion signal quality level. Minimum value = 0 Maximum value = 100
cqaiaiavg	<Double>	Read-only	Average inter arriaval interval over maxburst.
cqaisiavg	<Double>	Read-only	Average inter send interval over maxburst.
cqarcvwndmin	<Double>	Read-only	Minimum receive window over maxburst.
cqaretxcorr	<Double>	Read-only	Number of retransmission due to noise over maxburst.
cqaretxcong	<Double>	Read-only	Number of retransmission due to congestion over maxburst.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cqaretxpackets	<Double>	Read-only	Number of retransmission over maxburst.
cqaloaddelayavg	<Double>	Read-only	Average load delay over maxburst.
cqanoisedelayavg	<Double>	Read-only	Average noise delay over maxburst.
cqarttmax	<Double>	Read-only	Maximum RTT sample over maxburst in ms.
cqarttmin	<Double>	Read-only	Minimum RTT sample over maxburst in ms.
cqarttavg	<Double>	Read-only	Minimum RTT sample over maxburst in ms.
adaptivetcpprofname	<String>	Read-only	Name of the Adaptive-TCP profile currently assigned to the connection. Minimum length = 1 Maximum length = 127
outoforderblocks	<Integer>	Read-only	held packets on the connection.
outoforderflushedcount	<Integer>	Read-only	held packets on the connection.
outoforderbytes	<Integer>	Read-only	held packets on the connection.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconnectiontable

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconnectiontable?**args=filterexpression:<String_value>,link:<Boolean_value>,filtername:<Boolean_value>,detail:<String_value>,listen:<Boolean_value>,nodeid:<Double_value>**

Use this query-parameter to get nsconnectiontable resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconnectiontable?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconnectiontable?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsconnectiontable resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconnectiontable?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconnectiontable?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nsconnectiontable resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconnectiontable?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nsconnectiontable": [ { "__count": "#no"} ] }
```

nsconsoleloginprompt

Configuration for console prompt resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
promptstring	<String>	Read-write	Console login prompt string.

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsconsoleloginprompt

nsdiameter

Configuration for Diameter Parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
identity	<String>	Read-write	DiameterIdentity to be used by NS. DiameterIdentity is used to identify a Diameter node uniquely. Before

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			setting up diameter configuration, Citrix ADC (as a Diameter node) MUST be assigned a unique DiameterIdentity. example => set ns diameter -identity netscaler.com Now whenever Citrix ADC needs to use identity in diameter messages. It will use 'netscaler.com' as Origin-Host AVP as defined in RFC3588 . Minimum length = 1
realm	<String>	Read-write	Diameter Realm to be used by NS. example => set ns diameter -realm com Now whenever Citrix ADC system needs to use realm in diameter messages. It will use 'com' as Origin-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Realm AVP as defined in RFC3588 . Minimum length = 1
servercloseproposagation	<String>	Read-write	when a Server connection goes down, whether to close the corresponding client connection if there were requests pending on the server. Default value: NO Possible values = YES, NO
ownernode	<Double>	Read-write	ID of the cluster node for which the diameter id is set, can be configured only through CLIP. Default value: -1 Minimum value = 0 Maximum value = 31
__count	<Double>	Read-only	count parameter

Operations

UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsdiameter

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nsdiameter":{
```

```
"identity":<String_value>,

"realm":<String_value>,

"serverclosepropagation":<String_value>,

"ownernode":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsdiameter?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nsdiameter":{

"serverclosepropagation":true,

"ownernode":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsdiameter

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsdiameter?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsdiameter?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsdiameter resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsdiameter?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsdiameter?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nsdiameter resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

```

nsencryptionkey

Configuration for encryption key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Key name. This follows the same syntax rules as other expression entity names: It must begin with an alpha character (A-Z or a-z) or an underscore (_). The rest of the characters must be alpha, numeric (0-9) or underscores. It cannot be re or xp (reserved for regular and XPath expressions). It cannot be an expression reserved

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			word (e.g. SYS or HTTP). It cannot be used for an existing expression object (HTTP callout, patset, dataset, stringmap, or named expression). Minimum length = 1
method	<String>	Read-write	Cipher method to be used to encrypt and decrypt content. NONE - no encryption or decryption is performed The output of ENCRYPT() and DECRYPT() is the same as the input. RC4 - the RC4 stream cipher with a 128 bit (16 byte) key; RC4 is now considered insecure and should only be used if required by existing applciations. DES[-<mode>] - the Data Encryption Standard (DES)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			block cipher with a 64-bit (8 byte) key, with 56 data bits and 8 parity bits. DES is considered less secure than DES3 or AES so it should only be used if required by an existing applicastion. The optional mode is described below; DES without a mode is equivalent to DES-CBC. DES3[-<mode>] - the Triple Data Encryption Standard (DES) block cipher with a 192-bit (24 byte) key. The optional mode is described below; DES3 without a mode is equivalent to DES3-CBC. AES<keysize>[-<mode>] - the Advanced Encryption Standard block cipher, available with 128 bit (16

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			byte), 192 bit (24 byte), and 256 bit (32 byte) keys. The optional mode is described below; AES<keysize> without a mode is equivalent to AES<keysize>-CBC. For a block cipher, the <mode> specifies how multiple blocks of plaintext are encrypted and how the Initialization Vector (IV) is used. Choices are CBC (Cipher Block Chaining) - Each block of plaintext is XORed with the previous ciphertext block, or IV for the first block, before being encrypted. Padding is required if the plaintext is not a multiple of the cipher block size. CFB (Cipher Feedback) - The previous ciphertext

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			block, or the IV for the first block, is encrypted and the output is XORed with the current plaintext block to create the current ciphertext block. The 128-bit version of CFB is provided. Padding is not required. OFB (Output Feedback) - A keystream is generated by applying the cipher successfully to the IV and XORing the keystream blocks with the plaintext. Padding is not required. ECB (Electronic Codebook) - Each block of plaintext is independently encrypted. An IV is not used. Padding is required. This mode is considered less secure than the other modes because the same plaintext always

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			produces the same encrypted text and should only be used if required by an existing application. Possible values = NONE, RC4, DES3, AES128, AES192, AES256, DES, DES-CBC, DES-CFB, DES-OFB, DES-ECB, DES3-CBC, DES3-CFB, DES3-OFB, DES3-ECB, AES128-CBC, AES128-CFB, AES128-OFB, AES128-ECB, AES192-CBC, AES192-CFB, AES192-OFB, AES192-ECB, AES256-CBC, AES256-CFB, AES256-OFB, AES256-ECB
keyvalue	<String>	Read-write	The hex-encoded key value. The length is determined by the cipher method: RC4 - 16 bytes

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DES - 8 bytes (all modes) DES3 - 24 bytes (all modes) AES128 - 16 bytes (all modes) AES192 - 24 bytes (all modes) AES256 - 32 bytes (all modes) Note that the keyValue will be encrypted when it it is saved.
padding	<String>	Read-write	Enables or disables the padding of plaintext to meet the block size requirements of block ciphers: ON - For encryption, PKCS5/7 padding is used, which appends n bytes of value n on the end of the plaintext to bring it to the cipher block lnegth. If the plaintext length is alraady a multiple of the block length, an additional block with

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bytes of value block_length will be added. For decryption, ISO 10126 padding is accepted, which expects the last byte of the block to be the number of added pad bytes. Note that this accepts PKCS5/7 padding, as well as ANSI_X923 padding. Padding ON is the default for the ECB and CBD modes. OFF - No padding. An Undef error will occur with the ECB or CBC modes if the plaintext length is not a multitple of the cipher block size. This can be used with the CFB and OFB modes, and with the ECB and CBC modes if the plaintext will always be an integral number of blocks, or if custom padding is implemented

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			using a policy extension function. Padding OFf is the default for CFB and OFB modes. Default value: DEFAULT Possible values = OFF, ON
iv	<String>	Read-write	The initalization voector (IV) for a block cipher, one block of data used to initialize the encryption. The best practice is to not specify an IV, in which case a new random IV will be generated for each encryption. The format must be iv_data or keyid_iv_data to include the generated IV in the encrypted data. The IV should only be specified if it cannot be included in the encrypted data. The IV length is the cipher block size: RC4 - not used (error if IV is specified)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DES - 8 bytes (all modes) DES3 - 8 bytes (all modes) AES128 - 16 bytes (all modes) AES192 - 16 bytes (all modes) AES256 - 16 bytes (all modes).
comment	<String>	Read-write	Comments associated with this encryption key.
__count	<Double>	Read-only	count parameter

Operations

ADD| UPDATE| UNSET| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsencryptionkey

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nsencryptionkey":{

<b>"name":<String_value>,

</b><b>"method":<String_value>,

</b>"keyvalue":<String_value>,

"padding":<String_value>,

"iv":<String_value>,

"comment":<String_value>
```

```
}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsencryptionkey

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nsencryptionkey":{

<b>"name":<String_value>,

nsextension

Configuration for Extension resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
src	<String>	Read-write	Local path to and name of, or URL (protocol, host, path, and file name) for, the file in which to store the imported extension. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
name	<String>	Read-write	Name to assign to the extension object on the Citrix ADC. Minimum length = 1 Maximum length = 31
comment	<String>	Read-write	Any comments to preserve information about the extension object. Maximum length = 128
overwrite	<Boolean>	Read-write	Overwrites the existing file.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trace	<String>	Read-write	Enables tracing to the NS log file of extension execution: off - turns off tracing (equivalent to unset ns extension <extension-name> -trace) calls - traces extension function calls with arguments and function returns with the first return value lines - traces the above plus line numbers for executed extension lines all - traces the above plus local variables changed by executed extension lines Note that the DEBUG log level must be enabled to see extension tracing. This can be done by set audit syslogParams

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-loglevel ALL or -loglevel DEBUG. Default value: off Possible values = off, calls, lines, all
tracefunctions	<String>	Read-write	Comma-separated list of extension functions to trace. By default, all extension functions are traced. Maximum length = 256
tracevariables	<String>	Read-write	Comma-separated list of variables (in traced extension functions) to trace. By default, all variables are traced. Maximum length = 256
detail	<String>	Read-write	Show detail for extension function. Possible values = brief, all
type	<String>	Read-only	. Possible values = WSDL, CustomSettings, XMLSchema, XMLErrorPage, htmlpage, CustomResp, Extension

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
functionhits	<Double>	Read-only	Number of time function evaluates successfully.
functionundefhits	<Double>	Read-only	Number of times error occured in evaluating extension function.
functionhaltcount	<Double>	Read-only	Number of time function evaluation is halted.
__count	<Double>	Read-only	count parameter

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsextension?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsextension resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsextension?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsextension?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nsextension resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

```

nsextension_binding

Binding object which returns the resources bound to nsextension.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the extension object. Minimum length = 1 Maximum length = 31
nsextension_extensionfunction_binding	<nsextension_extensionfunction_binding[]>	Read-only	extensionfunction that can be bound to nsextension.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsextension_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nsextension_binding": [ {

"name":<String_value>,

"nsextension_extensionfunction_binding":<nsextension_extensionfunction_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsextension_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsextension_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nsextension_binding": [ {

"name":<String_value>,

"nsextension_extensionfunction_binding":<nsextension_extensionfunction_binding[]_value>

}]}
```

nsextension_extensionfunction_binding

Binding object showing the extensionfunction that can be bound to nsextension.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the extension object. Minimum length = 1 Maximum length = 31
extensionfunctionline number	<Double>	Read-only	Line number of the function in file.
extensionfunctionclasses	<String[]>	Read-only	List of classes (including inherited) that the function is present in.
extensionfunctionargtype	<String[]>	Read-only	List of extension function's arguments types.
activeextensionfunction	<Integer>	Read-only	Extension function is in use or not.
extensionfunctionname	<String>	Read-only	Name of extension function given in the extension. Minimum length = 1 Maximum length = 31
extensionfunctionclasstype	<String>	Read-only	Extension function class type. Minimum length = 1 Maximum length = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
extensionfuncdescription	<String>	Read-only	Any description to preserve information about the extension function. Maximum length = 1023
extensionfunctionallparams	<String[]>	Read-only	List of parameters (including promotions) that the function can accept.
extensionfunctionargcount	<Double>	Read-only	Number of parameters in the extension function.
extensionfunctionreturntype	<String>	Read-only	Extension function return type. Minimum length = 1 Maximum length = 31
extensionfunctionclassescount	<Double>	Read-only	Number of classes the function is present in.
extensionfunctionallparamscount	<Double>	Read-only	Number of parameters (including promotions) that the function can accept.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsextension_extensionfunction_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsextension_extensionfunction_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of nsextension_extensionfunction_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsextension_extensionfunction_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nsextension_extensionfunction_binding resources in chunks.

nsfeature

Configuration for feature resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String[]>	Read-write	Feature to be enabled. Multiple features can be specified by providing a blank space between each feature.
wl	<Boolean>	Read-only	Web Logging.
sp	<Boolean>	Read-only	Surge Protection.
lb	<Boolean>	Read-only	Load Balancing.
cs	<Boolean>	Read-only	Content Switching.
cr	<Boolean>	Read-only	Cache Redirect.
sc	<Boolean>	Read-only	Sure Connect.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cmp	<Boolean>	Read-only	Compression.
pq	<Boolean>	Read-only	Priority Queuing.
ssl	<Boolean>	Read-only	Secure Sockets Layer.
gslb	<Boolean>	Read-only	Global Server Load Balancing.
hdosp	<Boolean>	Read-only	DOS Protection.
cf	<Boolean>	Read-only	Content Filter.
ic	<Boolean>	Read-only	Integrated Caching.
sslvpn	<Boolean>	Read-only	SSL VPN.
aaa	<Boolean>	Read-only	AAA.
ospf	<Boolean>	Read-only	OSPF Routing.
rip	<Boolean>	Read-only	RIP Routing.
bgp	<Boolean>	Read-only	BGP Routing.
rewrite	<Boolean>	Read-only	Rewrite.
ipv6pt	<Boolean>	Read-only	IPv6 protocol translation.
appfw	<Boolean>	Read-only	Application Firewall.
responder	<Boolean>	Read-only	Responder.
htmlinjection	<Boolean>	Read-only	HTML Injection.
push	<Boolean>	Read-only	Citrix ADC Push.
appflow	<Boolean>	Read-only	AppFlow.
cloudbridge	<Boolean>	Read-only	CloudBridge.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
isis	<Boolean>	Read-only	ISIS Routing.
ch	<Boolean>	Read-only	Call Home.
appqoe	<Boolean>	Read-only	AppQoS.
contentaccelerator	<Boolean>	Read-only	Transparent Integrated Caching.
rise	<Boolean>	Read-only	RISE.
feo	<Boolean>	Read-only	Optimize Web content (HTML, CSS, JavaScript, images).
lsn	<Boolean>	Read-only	Large Scale NAT.
rdpproxy	<Boolean>	Read-only	RDPPROXY.
rep	<Boolean>	Read-only	Reputation Services.
urlfiltering	<Boolean>	Read-only	URL Filtering.
videooptimization	<Boolean>	Read-only	Video Optimization.
forwardproxy	<Boolean>	Read-only	Forward Proxy.
sslinterception	<Boolean>	Read-only	SSL Interception.
adaptivetcp	<Boolean>	Read-only	Adaptive TCP.
cqa	<Boolean>	Read-only	Connection Quality Analytics.
ci	<Boolean>	Read-only	Content Inspection.

Operations

(click to see Properties)

ENABLE| DISABLE| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

enable

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsfeature?**action=enable**

HTTP Method:POST

Request Headers:

```

nshmackey

Configuration for HMAC key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Key name. This follows the same syntax rules as other expression entity names: It must begin with an alpha character (A-Z or a-z) or an underscore (_). The rest of the characters must be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alpha, numeric (0-9) or underscores. It cannot be re or xp (reserved for regular and XPath expressions). It cannot be an expression reserved word (e.g. SYS or HTTP). It cannot be used for an existing expression object (HTTP callout, patset, dataset, stringmap, or named expression). Minimum length = 1
digest	<String>	Read-write	Digest (hash) function to be used in the HMAC computation. Possible values = MD2, MD4, MD5, SHA1, SHA224, SHA256, SHA384, SHA512
keyvalue	<String>	Read-write	The hex-encoded key to be used in the HMAC computation. The key can be any length (up to a Citrix ADC-imposed

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			maximum of 255 bytes). If the length is less than the digest block size, it will be zero padded up to the block size. If it is greater than the block size, it will be hashed using the digest function to the block size. The block size for each digest is: MD2 - 16 bytes MD4 - 16 bytes MD5 - 16 bytes SHA1 - 20 bytes SHA224 - 28 bytes SHA256 - 32 bytes SHA384 - 48 bytes SHA512 - 64 bytes Note that the key will be encrypted when it it is saved.
comment	<String>	Read-write	Comments associated with this encryption key.
__count	<Double>	Read-only	count parameter

Operations

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshmackey?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshmackey?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nshmackey resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshmackey?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshmackey?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nshmackey resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nshmackey": [ { "__count": "#no"} ] }
```

nshostname

Configuration for host name resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hostname	<String>	Read-write	Host name for the Citrix ADC. Minimum length = 1 Maximum length = 255
ownernode	<Double>	Read-write	ID of the cluster node for which you are setting the hostname. Can be configured only through the cluster IP address. Default value: 255 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 31
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

UPDATE| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshostname

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nshostname":{

<b>"hostname":<String_value>,

</b>"ownernode":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshostname

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshostname?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshostname?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nshostname resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshostname?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nshostname?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nshostname resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

nshttpprofile

Configuration for HTTP profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for an HTTP profile. Must begin with a letter, number, or the underscore \(_\) character. Other characters allowed, after the first character, are the hyphen \(-\), period \(.\), hash \(#\), space \(\), at \(@\), colon \(:\), and equal \(=\) characters. The name of a HTTP profile cannot be changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks \(for example, "my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			http profile" or 'my http profile'\). Minimum length = 1 Maximum length = 127
dropinvalreqs	<String>	Read-write	Drop invalid HTTP requests or responses. Default value: DISABLED Possible values = ENABLED, DISABLED
markhttp09inval	<String>	Read-write	Mark HTTP/0.9 requests as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
markconnreqinval	<String>	Read-write	Mark CONNECT requests as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
marktracereqinval	<String>	Read-write	Mark TRACE requests as invalid.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
cmponpush	<String>	Read-write	Start data compression on receiving a TCP packet with PUSH flag set. Default value: DISABLED Possible values = ENABLED, DISABLED
conmultiplex	<String>	Read-write	Reuse server connections for requests from more than one client connections. Default value: ENABLED Possible values = ENABLED, DISABLED
maxreusepool	<Double>	Read-write	Maximum limit on the number of connections, from the Citrix ADC to a particular server that are kept in the reuse pool. This setting is helpful for optimal memory utilization

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and for reducing the idle connections to the server just after the peak time. Zero implies no limit on reuse pool size. If non-zero value is given, it has to be greater than or equal to the number of running Packet Engines. Default value: 0 Minimum value = 0 Maximum value = 360000
dropextracrlf	<String>	Read-write	Drop any extra 'CR' and 'LF' characters present after the header. Default value: ENABLED Possible values = ENABLED, DISABLED
incomphdrdelay	<Double>	Read-write	Maximum time to wait, in milliseconds, between incomplete header packets. If the header packets take longer to arrive at Citrix ADC, the connection is silently dropped. Default value: 7000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 360000
websocket	<String>	Read-write	HTTP connection to be upgraded to a web socket connection. Once upgraded, Citrix ADC does not process Layer 7 traffic on this connection. Default value: DISABLED Possible values = ENABLED, DISABLED
rtsptunnel	<String>	Read-write	Allow RTSP tunnel in HTTP. Once application/x-rtsp-tunnelled is seen in Accept or Content-Type header, Citrix ADC does not process Layer 7 traffic on this connection. Default value: DISABLED Possible values = ENABLED, DISABLED
reqtimeout	<Double>	Read-write	Time, in seconds, within which the HTTP request must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			complete. If the request does not complete within this time, the specified request timeout action is executed. Zero disables the timeout. Default value: 0 Minimum value = 0 Maximum value = 86400
adpttimeout	<String>	Read-write	Adapts the configured request timeout based on flow conditions. The timeout is increased or decreased internally and applied on the flow. Default value: DISABLED Possible values = ENABLED, DISABLED
reqtimeoutaction	<String>	Read-write	Action to take when the HTTP request does not complete within the specified request timeout duration. You can configure the following actions: * RESET - Send RST (reset) to client

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			when timeout occurs. * DROP - Drop silently when timeout occurs. * Custom responder action - Name of the responder action to trigger when timeout occurs, used to send custom message.
dropextradata	<String>	Read-write	Drop any extra data when server sends more data than the specified content-length. Default value: DISABLED Possible values = ENABLED, DISABLED
weblog	<String>	Read-write	Enable or disable web logging. Default value: ENABLED Possible values = ENABLED, DISABLED
clientiphdrexpr	<String>	Read-write	Name of the header that contains the real client IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxreq	<Double>	Read-write	Maximum number of requests allowed on a single connection. Zero implies no limit on the number of requests. Default value: 0 Minimum value = 0 Maximum value = 65534
persistentetag	<String>	Read-write	Generate the persistent Citrix ADC specific ETag for the HTTP response with ETag header. Default value: DISABLED Possible values = ENABLED, DISABLED
spdy	<String>	Read-write	Enable SPDYv2 or SPDYv3 or both over SSL vserver. SSL will advertise SPDY support either during NPN Handshake or when client will advertises SPDY support during ALPN handshake. Both SPDY versions are enabled when this parameter is set to ENABLED.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = DISABLED, ENABLED, V2, V3
http2	<String>	Read-write	Choose whether to enable support for HTTP/2. Default value: DISABLED Possible values = ENABLED, DISABLED
http2direct	<String>	Read-write	Choose whether to enable support for Direct HTTP/2. Default value: DISABLED Possible values = ENABLED, DISABLED
altsvc	<String>	Read-write	Choose whether to enable support for Alternative Service. Default value: DISABLED Possible values = ENABLED, DISABLED
reusepooltimeout	<Double>	Read-write	Idle timeout (in seconds) for server connections in re-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			use pool. Connections in the re-use pool are flushed, if they remain idle for the configured timeout. Default value: 0 Minimum value = 0 Maximum value = 31536000
maxheaderlen	<Double>	Read-write	Number of bytes to be queued to look for complete header before returning error. If complete header is not obtained after queuing these many bytes, request will be marked as invalid and no L7 processing will be done for that TCP connection. Default value: 24820 Minimum value = 2048 Maximum value = 61440
minreusepool	<Double>	Read-write	Minimum limit on the number of connections, from the Citrix ADC to a particular server that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are kept in the reuse pool. This setting is helpful for optimal memory utilization and for reducing the idle connections to the server just after the peak time. Zero implies no limit on reuse pool size. Default value: 0 Minimum value = 0 Maximum value = 360000
http2maxheaderlistsize	<Double>	Read-write	Maximum size of header list that the Citrix ADC is prepared to accept, in bytes. NOTE: The actual plain text header size that the Citrix ADC accepts is limited by maxHeaderLen. Please change maxHeaderLen parameter as well when modifying http2MaxHeaderListSize. Default value: 24576 Minimum value = 8192 Maximum value = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
http2maxframesize	<Double>	Read-write	Maximum size of the frame payload that the Citrix ADC is willing to receive, in bytes. Default value: 16384 Minimum value = 16384 Maximum value = 32768
http2maxconcurrentstreams	<Double>	Read-write	Maximum number of concurrent streams that is allowed per connection. Default value: 100 Minimum value = 0 Maximum value = 1000
http2initialwindowsize	<Double>	Read-write	Initial window size for stream level flow control, in bytes. Default value: 65535 Minimum value = 8192 Maximum value = 20971520
http2headertablesize	<Double>	Read-write	Maximum size of the header compression table used to decode

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			header blocks, in bytes. Default value: 4096 Minimum value = 0 Maximum value = 16384
http2minseverconn	<Double>	Read-write	Minimum number of HTTP2 connections established to backend server, on receiving HTTP requests from client before multiplexing the streams into the available HTTP/2 connections. Default value: 20 Minimum value = 1 Maximum value = 360000
apdexcltresptimethreshold	<Double>	Read-write	This option sets the satisfactory threshold (T) for client response time in milliseconds to be used for APDEX calculations. This means a transaction responding in less than this threshold is considered satisfactory. Transaction responding between T and 4*T is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			considered tolerable. Any transaction responding in more than 4*T time is considered frustrating. Citrix ADC maintains stats for such tolerable and frustrating transcations. And client response time related apdex counters are only updated on a vserver which receives clients traffic. Default value: 500 Minimum value = 1 Maximum value = 3600000
refcnt	<Double>	Read-only	Number of entities using this profile.
apdexsvrresptimethreshold	<Double>	Read-only	This option sets the satisfactory threshold (T) for server response time in milliseconds to be used for APDEX calculations. This means a transaction responding in less than this threshold is considered satisfactory. Transaction responding between T and 4*T is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			considered tolerable. Any transaction responding in more than 4*T time is considered frustrating. Citrix ADC maintains stats for such tolerable and frustrating transcations. Server Response time related apdex counters are only updated on backend services or a backend vserver which is not accepting client traffic. Default value: 400 Minimum value = 1 Maximum value = 3600000
__count	<Double>	Read-only	count parameter

nsicapprofile

Configuration for ICAP profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for an ICAP profile. Must begin with a letter, number, or the underscore \(_\) character. Other characters allowed, after the first character, are the hyphen \(-\), period \(.\), hash \(#\), space \(\), at \(@\), colon \(:\), and equal \(=\) characters. The name of a ICAP profile cannot be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks \ (for example, "my icap profile" or 'my icap profile'\). Minimum length = 1 Maximum length = 127
preview	<String>	Read-write	Enable or Disable preview header with ICAP request. This feature allows an ICAP server to see the beginning of a transaction, then decide if it wants to opt-out of the transaction early instead of receiving the remainder of the request message. Default value: DISABLED Possible values = ENABLED, DISABLED
previewlength	<Double>	Read-write	Value of Preview Header field. Citrix ADC uses the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			minimum of this set value and the preview size received on OPTIONS response. Default value: 4096 Minimum value = 0 Maximum value = 4294967294
uri	<String>	Read-write	URI representing icap service. It is a mandatory argument while creating an icapprofile. Minimum length = 1
hostheader	<String>	Read-write	ICAP Host Header. Minimum length = 1
useragent	<String>	Read-write	ICAP User Agent Header String. Minimum length = 1
mode	<String>	Read-write	ICAP Mode of operation. It is a mandatory argument while creating an icapprofile. Possible values = REQMOD, RESPMOD
queryparams	<String>	Read-write	Query parameters to be included with ICAP request URI. Entered values should be in arg=value format.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			For more than one parameters, add ; separated values. e.g.: arg1=val1;arg2=val2. Minimum length = 1
connectionkeepalive	<String>	Read-write	If enabled, Citrix ADC keeps the ICAP connection alive after a transaction to reuse it to send next ICAP request. Default value: ENABLED Possible values = ENABLED, DISABLED
allow204	<String>	Read-write	Enable or Disable sending Allow: 204 header in ICAP request. Default value: ENABLED Possible values = ENABLED, DISABLED
inserticapheaders	<String>	Read-write	Insert custom ICAP headers in the ICAP request to send to ICAP server. The headers can be static or can be dynamically constructed using PI Policy Expression.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			For example, to send static user agent and Client's IP address, the expression can be specified as "User-Agent: NS-ICAP-Client/ V1.0\r\nX-Client-IP: "+CLIENT.IP.SRC+"\r \n". The Citrix ADC does not check the validity of the specified header name-value. You must manually validate the specified header syntax. Minimum length = 1
inserthttprequest	<String>	Read-write	Exact HTTP request, in the form of an expression, which the Citrix ADC encapsulates and sends to the ICAP server. If you set this parameter, the ICAP request is sent using only this header. This can be used when the HTTP header is not available to send or ICAP server only needs part of the incoming HTTP request. The request expression is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			constrained by the feature for which it is used. The Citrix ADC does not check the validity of this request. You must manually validate the request. Minimum length = 1
reqtimeout	<Double>	Read-write	Time, in seconds, within which the remote service request must complete. If the request does not complete within this time, the specified request timeout action is executed. Zero disables the timeout. Default value: 0 Minimum value = 0 Maximum value = 86400
reqtimeoutaction	<String>	Read-write	Name of the action to perform if the Vserver/Server representing the remote service does not respond. There are also some built-in actions which can be used. These are:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* BYPASS - ignore this remote service action and send the request as is.This is done by default. * RESET - Reset the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user. Default value: BYPASS Possible values = BYPASS, DROP, RESET
logaction	<String>	Read-write	Name of the audit message action which would be evaluated on receiving the ICAP response to emit the logs.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsicapprofile

HTTP Method:POST

nsip

Configuration for ip resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IPv4 address to create on the Citrix ADC. Cannot be changed after the IP address is created. Minimum length = 1
netmask	<String>	Read-write	Subnet mask associated with the IP address.
type	<String>	Read-write	Type of the IP address to create on the Citrix ADC. Cannot be changed after the IP address is created. The following are the different types of Citrix ADC owned IP addresses: * A Subnet IP (SNIP) address is used by the Citrix ADC to communicate with the servers. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix ADC also uses the subnet IP address when generating its own packets, such as packets related to dynamic routing protocols, or to send monitor probes to check the health of the servers. * A Virtual IP (VIP) address is the IP address associated with a virtual server. It is the IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured. Some of the attributes of the VIP address are customized to meet the requirements of the virtual server. * A GSLB site IP (GSLBIP) address is associated with a GSLB site. It is not mandatory to specify a GSLBIP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address when you initially configure the Citrix ADC. A GSLBIP address is used only when you create a GSLB site. * A Cluster IP (CLIP) address is the management address of the cluster. All cluster configurations must be performed by accessing the cluster through this IP address. Default value: SNIP Possible values = SNIP, VIP, NSIP, GSLBsiteIP, CLIP
arp	<String>	Read-write	Respond to ARP requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
icmp	<String>	Read-write	Respond to ICMP requests for this IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
vserver	<String>	Read-write	Use this option to set (enable or disable) the virtual server attribute for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
telnet	<String>	Read-write	Allow Telnet access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
ftp	<String>	Read-write	Allow File Transfer Protocol (FTP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gui	<String>	Read-write	Allow graphical user interface (GUI) access to this IP address. Default value: ENABLED Possible values = ENABLED, SECUREONLY, DISABLED
ssh	<String>	Read-write	Allow secure shell (SSH) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
snmp	<String>	Read-write	Allow Simple Network Management Protocol (SNMP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
mgmtaccess	<String>	Read-write	Allow access to management applications on this IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
restrictaccess	<String>	Read-write	Block access to nonmanagement applications on this IP. This option is applicable for MIPs, SNIPs, and NSIP, and is disabled by default. Nonmanagement applications can run on the underlying Citrix ADC Free BSD operating system. Default value: DISABLED Possible values = ENABLED, DISABLED
dynamicrouting	<String>	Read-write	Allow dynamic routing on this IP address. Specific to Subnet IP (SNIP) address. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
decrementttl	<String>	Read-write	Decrement TTL by 1 when ENABLED.This setting is applicable only for UDP traffic. Default value: DISABLED Possible values = ENABLED, DISABLED
ospf	<String>	Read-write	Use this option to enable or disable OSPF on this IP address for the entity. Default value: DISABLED Possible values = ENABLED, DISABLED
bgp	<String>	Read-write	Use this option to enable or disable BGP on this IP address for the entity. Default value: DISABLED Possible values = ENABLED, DISABLED
rip	<String>	Read-write	Use this option to enable or disable RIP on this IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address for the entity. Default value: DISABLED Possible values = ENABLED, DISABLED
hostroute	<String>	Read-write	Option to push the VIP to ZebOS routing table for Kernel route redistribution through dynamic routing protocols. Possible values = ENABLED, DISABLED
advertiseondefaultpartition	<String>	Read-write	Advertise VIPs from Shared VLAN on Default Partition. Default value: DISABLED Possible values = ENABLED, DISABLED
networkroute	<String>	Read-write	Option to push the SNIP subnet to ZebOS routing table for Kernel route redistribution through dynamic routing protocol.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tag	<Double>	Read-write	Tag value for the network/host route associated with this IP. Default value: 0
hostrtgw	<String>	Read-write	IP address of the gateway of the route for this VIP address. Default value: -1
metric	<Integer>	Read-write	Integer value to add to or subtract from the cost of the route advertised for the VIP address. Minimum value = -16777215
vserverrhilevel	<String>	Read-write	Advertise the route for the Virtual IP (VIP) address on the basis of the state of the virtual servers associated with that VIP. * NONE - Advertise the route for the VIP address, regardless of the state of the virtual servers associated with the address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ONE VSERVER - Advertise the route for the VIP address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - Advertise the route for the VIP address if all of the associated virtual servers are in UP state. * VSVR_CNTRLD - Advertise the route for the VIP address according to the RHIstate (RHI STATE) parameter setting on all the associated virtual servers of the VIP address along with their states. When Vserver RHI Level (RHI) parameter is set to VSVR_CNTRLD, the following are different RHI behaviors for the VIP address on the basis of RHIstate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(RHI STATE) settings on the virtual servers associated with the VIP address: * If you set RHI STATE to PASSIVE on all virtual servers, the Citrix ADC always advertises the route for the VIP address. * If you set RHI STATE to ACTIVE on all virtual servers, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers is in UP state. *If you set RHI STATE to ACTIVE on some and PASSIVE on others, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers, whose RHI STATE set to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ACTIVE, is in UP state. Default value: ONE_VSERVER Possible values = ONE_VSERVER, ALL_VSERVERS, NONE, VSVR_CNTRLD
vserverrhimode	<String>	Read-write	Advertise the route for the Virtual IP (VIP) address using dynamic routing protocols or using RISE * DYNMAIC_ROUTING - Advertise the route for the VIP address using dynamic routing protocols (default) * RISE - Advertise the route for the VIP address using RISE. Default value: DYNAMIC_ROUTING Possible values = DYNAMIC_ROUTING, RISE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ospflsatype	<String>	Read-write	Type of LSAs to be used by the OSPF protocol, running on the Citrix ADC, for advertising the route for this VIP address. Default value: TYPE5 Possible values = TYPE1, TYPE5
ospfarea	<Double>	Read-write	ID of the area in which the type1 link-state advertisements (LSAs) are to be advertised for this virtual IP (VIP) address by the OSPF protocol running on the Citrix ADC. When this parameter is not set, the VIP is advertised on all areas. Default value: -1 Minimum value = 0 Maximum value = 4294967294LU
state	<String>	Read-write	Enable or disable the IP address. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vrid	<Double>	Read-write	A positive integer that uniquely identifies a VMAC address for binding to this VIP address. This binding is used to set up Citrix ADCs in an active-active configuration using VRRP. Minimum value = 1 Maximum value = 255
icmpresponse	<String>	Read-write	Respond to ICMP requests for a Virtual IP (VIP) address on the basis of the states of the virtual servers associated with that VIP. Available settings function as follows: * NONE - The Citrix ADC responds to any ICMP request for the VIP address, irrespective of the states of the virtual servers associated with the address. * ONE VSERVER - The Citrix ADC responds to any ICMP request for the VIP address if at least one of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			associated virtual servers is in UP state. * ALL VSERVER - The Citrix ADC responds to any ICMP request for the VIP address if all of the associated virtual servers are in UP state. * VSVR_CNTRLD - The behavior depends on the ICMP VSERVER RESPONSE setting on all the associated virtual servers. The following settings can be made for the ICMP VSERVER RESPONSE parameter on a virtual server: * If you set ICMP VSERVER RESPONSE to PASSIVE on all virtual servers,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix ADC always responds. * If you set ICMP VSERVER RESPONSE to ACTIVE on all virtual servers, Citrix ADC responds if even one virtual server is UP. * When you set ICMP VSERVER RESPONSE to ACTIVE on some and PASSIVE on others, Citrix ADC responds if even one virtual server set to ACTIVE is UP. Default value: 5 Possible values = NONE, ONE_VSERVER, ALL_VSERVERS, VSVR_CNTRLD
ownernode	<Double>	Read-write	The owner node in a Cluster for this IP address. Owner node can vary from 0 to 31. If ownernode is not specified then

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the IP is treated as Striped IP. Default value: 255
arpresponse	<String>	Read-write	Respond to ARP requests for a Virtual IP (VIP) address on the basis of the states of the virtual servers associated with that VIP. Available settings function as follows: * NONE - The Citrix ADC responds to any ARP request for the VIP address, irrespective of the states of the virtual servers associated with the address. * ONE VSERVER - The Citrix ADC responds to any ARP request for the VIP address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - The Citrix ADC responds to any ARP request for the VIP address if all of the associated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			virtual servers are in UP state. Default value: 5 Possible values = NONE, ONE_VSERVER, ALL_VSERVERS
ownerdownresponse	<String>	Read-write	in cluster system, if the owner node is down, whether should it respond to icmp/arp. Default value: YES Possible values = YES, NO
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. TD id 4095 is used reserved for LSN use . Minimum value = 0 Maximum value = 4095

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flags	<Double>	Read-only	The flags for this entry.
hostrtgwact	<String>	Read-only	Actual Gateway used for advertising host route.
ospfareaval	<Double>	Read-only	The area ID of the area in which OSPF Type1 LSAs are advertised.
viprtadv2bsd	<Boolean>	Read-only	Whether this route is advertised to FreeBSD.
vipvsercount	<Double>	Read-only	Number of vservers bound to this VIP.
vipvserdowncount	<Double>	Read-only	Number of vservers bound to this VIP, which are down.
vipvsrvrrhiactivecoun t	<Double>	Read-only	Number of vservers that have RHI state ACTIVE.
vipvsrvrrhiactiveupco unt	<Double>	Read-only	Number of vservers that have RHI state ACTIVE, which are UP.
freeports	<Double>	Read-only	Number of free Ports available on this IP.
riserhimsgcode	<Integer>	Read-only	The code indicating the rise rhi status.
iptype	<String[]>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = SNIP, VIP, NSIP, GSLBsiteIP, CLIP
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip?**args=ipaddress:<String_value>,td:<Double_value>,type:<String_value>**

Use this query-parameter to get nsip resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsip resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsip?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nsip resources in chunks.

nsip6

Configuration for ip6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipv6address	<String>	Read-write	IPv6 address to create on the Citrix ADC. Minimum length = 1
scope	<String>	Read-write	Scope of the IPv6 address to be created. Cannot be changed after the IP address is created. Default value: global Possible values = global, link-local
type	<String>	Read-write	Type of IP address to be created on the Citrix ADC. Cannot be changed after the IP address is created. Default value: SNIP Possible values = NSIP, VIP, SNIP, GSLBsiteIP, ADNSsvcIP, RADIUSListenersvcIP, CLIP
vlan	<Double>	Read-write	The VLAN number. Default value: 0 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 4094
nd	<String>	Read-write	Respond to Neighbor Discovery (ND) requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
icmp	<String>	Read-write	Respond to ICMP requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
vserver	<String>	Read-write	Enable or disable the state of all the virtual servers associated with this VIP6 address. Default value: ENABLED Possible values = ENABLED, DISABLED
telnet	<String>	Read-write	Allow Telnet access to this IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
ftp	<String>	Read-write	Allow File Transfer Protocol (FTP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
gui	<String>	Read-write	Allow graphical user interface (GUI) access to this IP address. Default value: ENABLED Possible values = ENABLED, SECUREONLY, DISABLED
ssh	<String>	Read-write	Allow secure Shell (SSH) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
snmp	<String>	Read-write	Allow Simple Network Management Protocol (SNMP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
mgmtaccess	<String>	Read-write	Allow access to management applications on this IP address. Default value: DISABLED Possible values = ENABLED, DISABLED
restrictaccess	<String>	Read-write	Block access to nonmanagement applications on this IP address. This option is applicable forMIP6s, SNIP6s, and NSIP6s, and is disabled by default. Nonmanagement applications can run on the underlying Citrix ADC Free BSD operating system. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dynamicrouting	<String>	Read-write	Allow dynamic routing on this IP address. Specific to Subnet IPv6 (SNIP6) address. Default value: DISABLED Possible values = ENABLED, DISABLED
decrementhoplimit	<String>	Read-write	Decrement Hop Limit by 1 when ENABLED.This setting is applicable only for UDP traffic. Default value: DISABLED Possible values = ENABLED, DISABLED
hostroute	<String>	Read-write	Option to push the VIP6 to ZebOS routing table for Kernel route redistribution through dynamic routing protocols. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
advertiseondefaultpartition	<String>	Read-write	Advertise VIPs from Shared VLAN on Default Partition. Default value: DISABLED Possible values = ENABLED, DISABLED
networkroute	<String>	Read-write	Option to push the SNIP6 subnet to ZebOS routing table for Kernel route redistribution through dynamic routing protocol. Possible values = ENABLED, DISABLED
tag	<Double>	Read-write	Tag value for the network/host route associated with this IP. Default value: 0
ip6hostrtgw	<String>	Read-write	IPv6 address of the gateway for the route. If Gateway is not set, VIP uses :: as the gateway. Default value: 0
metric	<Integer>	Read-write	Integer value to add to or subtract from the cost of the route advertised for the VIP6 address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = -16777215
vserverrhilevel	<String>	Read-write	Advertise or do not advertise the route for the Virtual IP (VIP6) address on the basis of the state of the virtual servers associated with that VIP6. * NONE - Advertise the route for the VIP6 address, irrespective of the state of the virtual servers associated with the address. * ONE VSERVER - Advertise the route for the VIP6 address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - Advertise the route for the VIP6 address if all of the associated virtual servers are in UP state.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* VSVR_CNTRLD. Advertise the route for the VIP address according to the RHIstate (RHI STATE) parameter setting on all the associated virtual servers of the VIP address along with their states. When Vserver RHI Level (RHI) parameter is set to VSVR_CNTRLD, the following are different RHI behaviors for the VIP address on the basis of RHIstate (RHI STATE) settings on the virtual servers associated with the VIP address: * If you set RHI STATE to PASSIVE on all virtual servers, the Citrix ADC always advertises the route for the VIP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If you set RHI STATE to ACTIVE on all virtual servers, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers is in UP state. *If you set RHI STATE to ACTIVE on some and PASSIVE on others, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers, whose RHI STATE set to ACTIVE, is in UP state. Default value: ONE_VSERVER Possible values = ONE_VSERVER, ALL_VSERVERS, NONE, VSVR_CNTRLD
ospf6lsatype	<String>	Read-write	Type of LSAs to be used by the IPv6 OSPF protocol,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			running on the Citrix ADC, for advertising the route for the VIP6 address. Default value: EXTERNAL Possible values = INTRA_AREA, EXTERNAL
ospfarea	<Double>	Read-write	ID of the area in which the Intra-Area-Prefix LSAs are to be advertised for the VIP6 address by the IPv6 OSPF protocol running on the Citrix ADC. When ospfArea is not set, VIP6 is advertised on all areas. Default value: -1 Minimum value = 0 Maximum value = 4294967294LU
state	<String>	Read-write	Enable or disable the IP address. Default value: ENABLED Possible values = DISABLED, ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
map	<String>	Read-write	Mapped IPV4 address for the IPV6 address.
vrid6	<Double>	Read-write	A positive integer that uniquely identifies a VMAC address for binding to this VIP address. This binding is used to set up Citrix ADCs in an active-active configuration using VRRP. Minimum value = 1 Maximum value = 255
ownernode	<Double>	Read-write	ID of the cluster node for which you are adding the IP address. Must be used if you want the IP address to be active only on the specific node. Can be configured only through the cluster IP address. Cannot be changed after the IP address is created. Default value: 255
ownerdownresponse	<String>	Read-write	in cluster system, if the owner node is down, whether should it respond to icmp/arp.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: YES Possible values = YES, NO
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
iptype	<String[]>	Read-only	The type of the IPv6 address. Possible values = NSIP, VIP, SNIP, GSLBsiteIP, ADNSsvcIP, RADIUSListenersvcIP, CLIP
curstate	<String>	Read-only	Current state of this IP. Default value: ENABLED Possible values = DISABLED, ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
viprtadv2bsd	<Boolean>	Read-only	Whether this route is advertised to FreeBSD.
vipvsercount	<Double>	Read-only	Number of vservers bound to this VIP.
vipvserdowncount	<Double>	Read-only	Number of vservers bound to this VIP, which are down.
systemtype	<String>	Read-only	The type of the System. Possible Values: Standalone, HA, Cluster. Used for display purpose. Possible values = Stand-alone, HA, Cluster
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

cloudbridge	<Boolean>	Read-only	CloudBridge.
cloudbridgeappliance	<Boolean>	Read-only	.
cloudextenderappliance	<Boolean>	Read-only	.
isis	<Boolean>	Read-only	ISIS Routing.
cluster	<Boolean>	Read-only	Clustering.
ch	<Boolean>	Read-only	Call Home.
appqoe	<Boolean>	Read-only	AppQoS.
appflowica	<Boolean>	Read-only	Appflow for ICA.
isstandardlic	<Boolean>	Read-only	Standard License.
isenterpriselic	<Boolean>	Read-only	Enterprise License.
isplatinumlic	<Boolean>	Read-only	Platinum License.
issgwylic	<Boolean>	Read-only	Simple Gateway License.
isswglic	<Boolean>	Read-only	Secure Web Gateway License.
rise	<Boolean>	Read-only	RISE.
feo	<Boolean>	Read-only	Front End Optimization.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lsn	<Boolean>	Read-only	Large Scale NAT.
licensingmode	<String>	Read-only	Pooled Licensed. Default value: Local Possible values = Local, Pooled, CICO, EXPRESS, CPU, CPU-Local
daystoexpiration	<Double>	Read-only	Days to expire. Minimum value = 0 Maximum value = 4294967294
rdpproxy	<Boolean>	Read-only	RDPPROXY.
rep	<Boolean>	Read-only	Reputation Services.
urlfiltering	<Boolean>	Read-only	URL Filtering.
videooptimization	<Boolean>	Read-only	Video Optimization.
forwardproxy	<Boolean>	Read-only	Forward Proxy.
sslinterception	<Boolean>	Read-only	SSL Interception.
remotecontentinspection	<Boolean>	Read-only	Remote Content Inspection.
adaptivetcp	<Boolean>	Read-only	Adaptive TCP.
cqa	<Boolean>	Read-only	Connection Quality Analytics.

Operations

(click to see Properties)

GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Operations

(click to see Properties)

GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslicenseserverpool

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

nslimitidentifier

Configuration for limit Indetifier resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name for a rate limit identifier. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Reserved words must not be used.
threshold	<Double>	Read-write	Maximum number of requests that are allowed in the given timeslice when requests (mode is set as REQUEST_RATE) are tracked per timeslice. When connections (mode is set as CONNECTION) are tracked, it is the total number of connections that would be let through. Default value: 1 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeslice	<Double>	Read-write	Time interval, in milliseconds, specified in multiples of 10, during which requests are tracked to check if they cross the threshold. This argument is needed only when the mode is set to REQUEST_RATE. Default value: 1000 Minimum value = 10
mode	<String>	Read-write	Defines the type of traffic to be tracked. * REQUEST_RATE - Tracks requests/ timeslice. * CONNECTION - Tracks active transactions. Examples 1. To permit 20 requests in 10 ms and 2 traps in 10 ms: add limitidentifier limit_req -mode request_rate -limitType smooth -timeslice 1000 -Threshold 2000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-trapsInTimeSlice 200 2. To permit 50 requests in 10 ms: set limitidentifier limit_req -mode request_rate -timeslice 1000 -Threshold 5000 -limitType smooth 3. To permit 1 request in 40 ms: set limitidentifier limit_req -mode request_rate -timeslice 2000 -Threshold 50 -limitType smooth 4. To permit 1 request in 200 ms and 1 trap in 130 ms: set limitidentifier limit_req -mode request_rate -timeslice 1000 -Threshold 5 -limitType smooth -trapsInTimeSlice 8 5. To permit 5000 requests in 1000 ms

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and 200 traps in 1000 ms: set limitidentifier limit_req -mode request_rate -timeslice 1000 -Threshold 5000 -limitType BURSTY. Default value: REQUEST_RATE Possible values = CONNECTION, REQUEST_RATE, NONE
limittype	<String>	Read-write	Smooth or bursty request type. * SMOOTH - When you want the permitted number of requests in a given interval of time to be spread evenly across the timeslice * BURSTY - When you want the permitted number of requests to exhaust the quota anytime within the timeslice. This argument is needed only when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the mode is set to REQUEST_RATE. Default value: BURSTY Possible values = BURSTY, SMOOTH
selectorname	<String>	Read-write	Name of the rate limit selector. If this argument is NULL, rate limiting will be applied on all traffic received by the virtual server or the Citrix ADC (depending on whether the limit identifier is bound to a virtual server or globally) without any filtering. Minimum length = 1
maxbandwidth	<Double>	Read-write	Maximum bandwidth permitted, in kbps. Minimum value = 0 Maximum value = 4294967287
trapsintimeslice	<Double>	Read-write	Number of traps to be sent in the timeslice configured. A value of 0 indicates that traps are disabled. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65535
ngname	<String>	Read-only	Nodegroup name to which this identifier belongs to.
hits	<Double>	Read-only	The number of times this identifier was evaluated.
drop	<Double>	Read-only	The number of times action was taken.
rule	<String[]>	Read-only	Rule.
time	<Double>	Read-only	Time interval considered for rate limiting.
total	<Double>	Read-only	Maximum number of requests permitted in the computed timeslice.
trapscomputedintimeslice	<Double>	Read-only	The number of traps that would be sent in the timeslice configured. .
computedtraptimeslice	<Double>	Read-only	The time interval computed for sending traps.
referencecount	<Double>	Read-only	Total number of transactions pointing to this entry.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nslimitidentifier": [ { "__count": "#no"} ] }
```

nslimitidentifier_binding

Binding object which returns the resources bound to nslimitidentifier.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name of the rate limit identifier about which to display information. If a name is not provided, information about all rate limit identifiers is shown.
nslimitidentifier_nslimitsessions_binding	<nslimitidentifier_nslimitsessions_binding[]>	Read-only	nslimitsessions that can be bound to nslimitidentifier.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslimitidentifier_binding/limitidentifier_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nslimitidentifier_binding": [ {

"limitidentifier":<String_value>,

"nslimitidentifier_nslimitsessions_binding":<nslimitidentifier_nslimitsess
ions_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslimitidentifier_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslimitidentifier_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nslimitidentifier_binding": [ {

"limitidentifier":<String_value>,

"nslimitidentifier_nslimitsessions_binding":<nslimitidentifier_nslimitsessions_binding[]_value>

}]}
```

nslimitidentifier_nslimitsessions_binding

Binding object showing the nslimitsessions that can be bound to nslimitidentifier.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name of the rate limit identifier about which to display information. If a name is not provided, information about all rate limit identifiers is shown.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslimitidentifier_nslimitsessions_binding/limitidentifier_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslimitidentifier_nslimitsessions_binding/limitidentifier_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of nslimitidentifier_nslimitsessions_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nslimitidentifier_nslimitsessions_binding/limitidentifier_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nslimitidentifier_nslimitsessions_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

nslimitsessions

Configuration for limit sessions resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name of the rate limit identifier for which to display the sessions. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
detail	<Boolean>	Read-write	Show the individual hash values.
timeout	<Double>	Read-only	The time remaining on the session before a flush can be attempted. If active transactions are present the session will not be flushed.
hits	<Double>	Read-only	The number of times this entry was hit.
drop	<Double>	Read-only	The number of times action was taken.
number	<Double[]>	Read-only	The hash of the matched selectlets.
name	<String>	Read-only	The string formed by gathering selectlet values.
unit	<Double>	Read-only	Total computed hash of the matched selectlets.
flags	<Double>	Read-only	Used internally to identify ip addresses.
referencecount	<Double>	Read-only	Total number of transactions pointing to this entry. Its the sum total of the connection and bandwidth references.
maxbandwidth	<Double>	Read-only	The current bandwidth.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
selectoripv61	<String>	Read-only	First IPV6 address gathered.
selectoripv62	<String>	Read-only	Second IPV6 address gathered.
flag	<Double>	Read-only	Used internally to identify ipv6 addresses.
__count	<Double>	Read-only	count parameter

nsparam

Configuration for Citrix ADC parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpport	<Integer[]>	Read-write	HTTP ports on the web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1 Maximum value = 65535
maxconn	<Double>	Read-write	Maximum number of connections that will be made from the appliance to the web server(s) attached to it. The value entered here is applied globally to all attached servers. Default value: 0 Minimum value = 0 Maximum value = 4294967294

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
maxreq	<Double>	Read-write	Maximum number of requests that the system can pass on a particular connection between the appliance and a server attached to it. Setting this value to 0 allows an unlimited number of requests to be passed. This value is overridden by the maximum number of requests configured on the individual service. Minimum value = 0 Maximum value = 65535
cip	<String>	Read-write	Enable or disable the insertion of the actual client IP address into the HTTP header request passed from the client to one, some, or all servers attached to the system. The passed address can then be accessed through a minor modification to the server. * If the CIP header is specified, it will be used as the client IP header.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If the CIP header is not specified, the value that has been set will be used as the client IP header. Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	Text that will be used as the client IP address header. Minimum length = 1
cookieversion	<String>	Read-write	Version of the cookie inserted by the system. Possible values = 0, 1
securecookie	<String>	Read-write	Enable or disable secure flag for persistence cookie. Default value: ENABLED Possible values = ENABLED, DISABLED
pmtumin	<Double>	Read-write	Minimum path MTU value that Citrix ADC will process in the ICMP fragmentation needed message. If the ICMP message contains a value less than this value, then

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this value is used instead. Default value: 576 Minimum value = 168 Maximum value = 1500
pmtutimeout	<Double>	Read-write	Interval, in minutes, for flushing the PMTU entries. Default value: 10 Minimum value = 1 Maximum value = 1440
ftpportrange	<String>	Read-write	Minimum and maximum port (port range) that FTP services are allowed to use. Minimum length = 1024 Maximum length = 64000
crportrange	<String>	Read-write	Port range for cache redirection services. Minimum length = 1 Maximum length = 65535
timezone	<String>	Read-write	Time zone for the Citrix ADC. Name of the time zone should

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be specified as argument. Default value: CoordinatedUniversalTime Minimum length = 1 Maximum length = 63
grantquotamaxclient	<Double>	Read-write	Percentage of shared quota to be granted at a time for maxClient. Default value: 10 Minimum value = 0 Maximum value = 100
exclusivequotamaxclient	<Double>	Read-write	Percentage of maxClient to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
grantquotaspillover	<Double>	Read-write	Percentage of shared quota to be granted at a time for spillover. Default value: 10 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 100
exclusivequotaspillover	<Double>	Read-write	Percentage of maximum limit to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
useproxyport	<String>	Read-write	Enable/Disable use_proxy_port setting. Default value: ENABLED Possible values = ENABLED, DISABLED
internaluserlogin	<String>	Read-write	Enables/disables the internal user from logging in to the appliance. Before disabling internal user login, you must have key-based authentication set up on the appliance. The file name for the key pair must be "ns_comm_key". Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
aftpallowrandomsourceport	<String>	Read-write	Allow the FTP server to come from a random source port for active FTP data connections. Default value: DISABLED Possible values = ENABLED, DISABLED
icaports	<Integer[]>	Read-write	The ICA ports on the Web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1
tcpcip	<String>	Read-write	Enable or disable the insertion of the client TCP/IP header in TCP payload passed from the client to one, some, or all servers attached to the system. The passed address can then be accessed through a minor

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			modification to the server. Default value: DISABLED Possible values = ENABLED, DISABLED
servicepathingressvlan	<Double>	Read-write	VLAN on which the subscriber traffic arrives on the appliance. Minimum value = 1
secureicaports	<Integer[]>	Read-write	The Secure ICA ports on the Web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1
mgmthttpport	<Integer>	Read-write	This allow the configuration of management HTTP port. Default value: 80 Minimum value = 1 Maximum value = 65534

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mgmthttpsport	<Integer>	Read-write	This allows the configuration of management HTTPS port. Default value: 443 Minimum value = 1 Maximum value = 65534
proxyprotocol	<String>	Read-write	Disable/Enable v1 or v2 proxy protocol header for client info insertion. Default value: DISABLED Possible values = ENABLED, DISABLED

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

nspartition

Configuration for admin partition resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of the Partition. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
maxbandwidth	<Double>	Read-write	Maximum bandwidth, in Kbps, that the partition can consume. A zero value indicates the bandwidth is unrestricted on the partition and it can consume up to the system limits. Default value: 10240
minbandwidth	<Double>	Read-write	Minimum bandwidth, in Kbps, that the partition can consume. A zero value indicates the bandwidth is unrestricted on the partition and it can consume up to the system limits.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 10240
maxconn	<Double>	Read-write	Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on number of open connections. Default value: 1024
maxmemlimit	<Double>	Read-write	Maximum memory, in megabytes, allocated to the partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits. Default value: 10 Minimum value = 0 Maximum value = 1048576
partitionmac	<String>	Read-write	Special MAC address for the partition which is used for communication over shared vlans in this partition. If not specified, the MAC address is auto-generated.
partitionid	<Double>	Read-only	Partition Id.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1
partitiontype	<String>	Read-only	Type of the Partition. Possible values = Default Partition, Current Partition
pmacinternal	<Boolean>	Read-only	Partition MAC is generated internally.
__count	<Double>	Read-only	count parameter

nspartitionmac

Configuration for partition MACs resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionmac	<String>	Read-only	A configured virtual MAC address that can be used by a partition for communication over shared VLANs.
partitionname	<String>	Read-only	Name of the partition to which the MAC has been assigned. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartitionmac

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartitionmac?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartitionmac?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nspartitionmac resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartitionmac?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspartitionmac?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nspartitionmac resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

nspartition_vlan_binding

Binding object showing the vlan that can be bound to nspartition.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of the Partition. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
vlan	<Double>	Read-write	Identifier of the vlan that is assigned to this partition. Minimum value = 1 Maximum value = 4094
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

nspbr

Configuration for Policy Based Routing(PBR) entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the PBR. Must begin with an ASCII alphabetic or underscore \(_\) character, and must contain only ASCII alphanumeric, underscore, hash \(#\), period \(.\), space, colon \(:\), at \(@\), equals \(=\), and hyphen \(-\) characters. Cannot be changed after the PBR is created. Minimum length = 1
action	<String>	Read-write	Action to perform on the outgoing IPv4 packets that match the PBR. Available settings function as follows: * ALLOW - The Citrix ADC sends the packet to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			designated next-hop router. * DENY - The Citrix ADC applies the routing table for normal destination-based routing. Possible values = ALLOW, DENY
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcip	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			10.102.29.30-10.102.29.189.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipval	<String>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Port number or range of port numbers to match against the source port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols. Maximum length = 65535
destip	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			10.102.29.30-10.102.29.189.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipval	<String>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Port number or range of port numbers to match against the destination port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols. Maximum length = 65535
nexthop	<Boolean>	Read-write	IP address of the next hop router or the name of the link load balancing virtual server to which to send matching packets if action is set to ALLOW.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If you specify a link load balancing (LLB) virtual server, which can provide a backup if a next hop link fails, first make sure that the next hops bound to the LLB virtual server are actually next hops that are directly connected to the Citrix ADC. Otherwise, the Citrix ADC throws an error when you attempt to create the PBR. The next hop can be null to represent null routes.
nexthopval	<String>	Read-write	The Next Hop IP address or gateway name.
iptunnel	<Boolean>	Read-write	The Tunnel name.
iptunnelname	<String>	Read-write	The iptunnel name where packets need to be forwarded upon.
vxlanvlanmap	<String>	Read-write	The vlan to vxlan mapping to be applied for incoming packets over this pbr tunnel.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an outgoing IPv4 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"
protocol	<String>	Read-write	Protocol, identified by protocol name, to match against the protocol of an outgoing IPv4 packet. Possible values = ICMP, IGMP, TCP, EGP, IGP, ARGUS, UDP, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, ICMPV6, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-IGNORE, Mobility-Header, UDPLite
protocolnumber	<Double>	Read-write	Protocol, identified by protocol number, to match against the protocol of an outgoing IPv4 packet. Minimum value = 1 Maximum value = 255
vlan	<Double>	Read-write	ID of the VLAN. The Citrix ADC compares the PBR only to the outgoing packets on the specified VLAN. If you do not specify

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			any interface ID, the appliance compares the PBR to the outgoing packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN. The Citrix ADC compares the PBR only to the outgoing packets on the specified VXLAN. If you do not specify any interface ID, the appliance compares the PBR to the outgoing packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC compares the PBR only to the outgoing packets on the specified interface. If you do not specify any value, the appliance compares the PBR to the outgoing packets on all interfaces.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Priority of the PBR, which determines the order in which it is evaluated relative to the other PBRs. If you do not specify priorities while creating PBRs, the PBRs are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 81920
msr	<String>	Read-write	Monitor the route specified byte Next Hop parameter. This parameter is not applicable if you specify a link load balancing (LLB) virtual server name with the Next Hop parameter. Default value: DISABLED Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	The name of the monitor.(Can be only of type ping or ARP). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Enable or disable the PBR. After you apply the PBRs, the Citrix ADC compares outgoing packets to the enabled PBRs. Default value: ENABLED Possible values = ENABLED, DISABLED
ownergroup	<String>	Read-write	The owner node group in a Cluster for this pbr rule. If ownernode is not specified then the pbr rule is treated as Striped pbr rule. Default value: DEFAULT_NG Minimum length = 1
detail	<Boolean>	Read-write	To get a detailed view.
hits	<Double>	Read-only	The hits of this PBR.
kernelstate	<String>	Read-only	The commit status of the PBR. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SFNOTAPPLIED, SFAPPLIED61, SFNOTAPPLIED61
curstate	<Double>	Read-only	If this route is UP/DOWN.
totalprobes	<Double>	Read-only	The total number of probes sent.
totalfailedprobes	<Double>	Read-only	The total number of failed probes.
failedprobes	<Double>	Read-only	Number of the current failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
data	<Boolean>	Read-only	Internal data of this route.
__count	<Double>	Read-only	count parameter

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr?**args=name:<String_value>,detail:<Boolean_value>**

Use this query-parameter to get nspbr resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nspbr resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nspbr resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

nspbr6

Configuration for PBR6 entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the PBR6. Must begin with an ASCII alphabetic or underscore \(_\) character, and must contain only ASCII alphanumeric, underscore, hash \(#\), period \(.\), space, colon \(:\), at \(@\), equals \(=\), and hyphen \(-\) characters. Cannot be changed after the PBR6 is created. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
action	<String>	Read-write	Action to perform on the outgoing IPv6 packets that match the PBR6. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ALLOW - The Citrix ADC sends the packet to the designated next-hop router. * DENY - The Citrix ADC applies the routing table for normal destination-based routing. Possible values = ALLOW, DENY
srcipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipv6val	<String>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv6 packet. In the command line interface, separate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the range with a hyphen.
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Source port (range). Maximum length = 65535
destipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = =, !=, EQ, NEQ
destipv6val	<String>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
destportval	<String>	Read-write	Destination port (range). Maximum length = 65535
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an outgoing IPv6 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"
protocol	<String>	Read-write	Protocol, identified by protocol name, to match against the protocol of an outgoing IPv6 packet. Possible values = ICMPV6, TCP, UDP, ICMP, IGMP, EGP, IGP, ARGUS, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-IGNORE, Mobility-Header, UDPLite
protocolnumber	<Double>	Read-write	Protocol, identified by protocol number, to match against the protocol of an outgoing IPv6 packet. Minimum value = 1 Maximum value = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vlan	<Double>	Read-write	ID of the VLAN. The Citrix ADC compares the PBR6 only to the outgoing packets on the specified VLAN. If you do not specify an interface ID, the appliance compares the PBR6 to the outgoing packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN. The Citrix ADC compares the PBR6 only to the outgoing packets on the specified VXLAN. If you do not specify an interface ID, the appliance compares the PBR6 to the outgoing packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC compares the PBR6 only to the outgoing packets on the specified interface. If you do not specify a value, the appliance

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			compares the PBR6 to the outgoing packets on all interfaces.
priority	<Double>	Read-write	Priority of the PBR6, which determines the order in which it is evaluated relative to the other PBR6s. If you do not specify priorities while creating PBR6s, the PBR6s are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 81920
state	<String>	Read-write	Enable or disable the PBR6. After you apply the PBR6s, the Citrix ADC compares outgoing packets to the enabled PBR6s. Default value: ENABLED Possible values = ENABLED, DISABLED
msr	<String>	Read-write	Monitor the route specified by the Next Hop parameter. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	The name of the monitor.(Can be only of type ping or ARP). Minimum length = 1
nexthop	<Boolean>	Read-write	IP address of the next hop router to which to send matching packets if action is set to ALLOW. This next hop should be directly reachable from the appliance.
nexthopval	<String>	Read-write	The Next Hop IPv6 address.
iptunnel	<String>	Read-write	The iptunnel name where packets need to be forwarded upon.
vxlanvlanmap	<String>	Read-write	The vlan to vxlan mapping to be applied for incoming packets over this pbr tunnel.
nexthopvlan	<Double>	Read-write	VLAN number to be used for link local nexthop . Minimum value = 1 Maximum value = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ownergroup	<String>	Read-write	The owner node group in a Cluster for this pbr rule. If owner node group is not specified then the pbr rule is treated as Striped pbr rule. Default value: DEFAULT_NG Minimum length = 1
detail	<Boolean>	Read-write	To get a detailed view.
kernelstate	<String>	Read-only	Commit status of the PBR6. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED
hits	<Double>	Read-only	Number of hits of this PBR6.
curstate	<Double>	Read-only	If this route is UP/DOWN.
totalprobes	<Double>	Read-only	The total number of probes sent.
totalfailedprobes	<Double>	Read-only	The total number of failed probes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
failedprobes	<Double>	Read-only	Number of the current failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
data	<Boolean>	Read-only	Internal data of this route.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| RENUMBER| DELETE| UPDATE| UNSET| ENABLE| DISABLE| CLEAR| APPLY| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

apply

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr6?**action=apply**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nspbr6":{

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr6

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr6?**args=name:<String_value>,detail:<Boolean_value>**

Use this query-parameter to get nspbr6 resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr6?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr6?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nspbr6 resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr6?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbr6?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nspbr6 resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

nspbrs

Configuration for Policy based routing resource.

Operations

(click to see Properties)

RENUMBER| CLEAR| APPLY

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

renumber

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbrs?**action=renumber**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nspbrs":{

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

clear

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbrs?**action=clear**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nspbrs":{

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

apply

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nspbrs?**action=apply**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nspbrs":{

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

nsratecontrol

Configuration for rate control resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tcpthreshold	<Double>	Read-write	Number of SYNs permitted per 10 milliseconds.
udpthreshold	<Double>	Read-write	Number of UDP packets permitted per 10 milliseconds.
icmpthreshold	<Double>	Read-write	Number of ICMP packets permitted per 10 milliseconds. Default value: 100
tcprstthreshold	<Double>	Read-write	The number of TCP RST packets permitted per 10 milli second. zero means rate control is disabled and 0xffffffff means every thing is rate controlled. Default value: 100

Operations

(click to see Properties)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsrollbackcmd

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsrollbackcmd?
args=filename:<String_value>,outtype:<String_value>

Use this query-parameter to get nsrollbackcmd resources based on additional properties.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nsrollbackcmd": [ {

filename:<String_value>,outtype:<String_value>

}]}
```

nsrpcnode

Configuration for rpc node resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the node. This has to be in the same subnet as the NSIP address. Minimum length = 1
password	<String>	Read-write	Password to be used in authentication with the peer system node. Minimum length = 1
srcip	<String>	Read-write	Source IP address to be used to communicate with the peer system node. The default value is 0, which means that the appliance uses the NSIP address as the source IP address.
secure	<String>	Read-write	State of the channel when talking to the node. Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,
