}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle_intermediatecacertlist_binding
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle_intermediatecacertlist_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcacertbundle_intermediatecacertlist_binding": [ {

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertbundle_intermediatecacertlist_binding/cacertbundlename_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcacertbundle_intermediatecacertlist_binding": [ { "__count":
"#no"} ] }
```

sslcacertgroup

Configuration for Group of CA certificate-key pairs resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cacertgroupname	<String>	Read-write	Name given to the CA certificate group. The name will be used to add the CA certificates to the group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cacertgroupreferences	<Integer>	Read-only	Count for ssl actions referring to this ca certificate group.
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcacertgroup":{

<b>"cacertgroupname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup/ cacertgroupname_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcacertgroup resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup? **view=summary**

Use this query-parameter to get the summary output of sslcacertgroup resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcacertgroup resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup": [ {

"cacertgroupname":<String_value>,

"cacertgroupreferences":<Integer_value>,

"ocspcheck":<String_value>,

"crlcheck":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup/ cacertgroupname_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/ config/sslcacertgroup/ cacertgroupname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup/ cacertgroupname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of sslcacertgroup resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcacertgroup": [ {

"cacertgroupname":<String_value>,

"cacertgroupreferences":<Integer_value>,

"ocspcheck":<String_value>,

"crlcheck":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup": [ { "__count": "#no"} ] }
```

sslcacertgroup_binding

Binding object which returns the resources bound to sslcacertgroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cacertgroupname	<String>	Read-write	Name of the CA certificate group for which to show detailed information. Minimum length = 1 Maximum length = 31
sslcacertgroup_sslcertkey_binding	<sslcacertgroup_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslcacertgroup.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_binding/cacertgroupname_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup_binding": [ {

"cacertgroupname":<String_value>,

"sslcacertgroup_sslcertkey_binding":<sslcacertgroup_sslcertkey_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup_binding": [ {

"cacertgroupname":<String_value>,
```

```
"sslcacertgroup_sslcertkey_binding":<sslcacertgroup_sslcertkey_binding[]_value>

}]}
```

sslcacertgroup_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslcacertgroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ocspcheck	<String>	Read-write	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
certkeyname	<String>	Read-write	Name for the certkey added to the Citrix ADC. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created.The following

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cert" or 'my cert'). Minimum length = 1 Maximum length = 63
crlcheck	<String>	Read-write	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
cacertgroupname	<String>	Read-write	Name given to the CA certificate group. The name will be used to add the CA certificates to the group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
__count	<Double>	Read-write	count parameter

sslcert

Configuration for cerificate resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certfile	<String>	Read-write	Name for and, optionally, path to the generated certificate file. /nsconfig/ssl/ is the default path. Maximum length = 63
reqfile	<String>	Read-write	Name for and, optionally, path to the certificate-signing request (CSR). /nsconfig/ssl/ is the default path. Maximum length = 63
certtype	<String>	Read-write	Type of certificate to generate. Specify one of the following: * ROOT_CERT - Self-signed Root-CA certificate. You must specify the key file name. The generated Root-CA certificate can be used for signing end-user client or server certificates or to create

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Intermediate-CA certificates. * INTM_CERT - Intermediate-CA certificate. * CLNT_CERT - End-user client certificate used for client authentication. * SRVR_CERT - SSL server certificate used on SSL servers for end-to-end encryption. Possible values = ROOT_CERT, INTM_CERT, CLNT_CERT, SRVR_CERT
keyfile	<String>	Read-write	Name for and, optionally, path to the private key. You can either use an existing RSA or DSA key that you own or create a new private key on the Citrix ADC. This file is required only when creating a self-signed Root-CA certificate. The key file is stored in the /

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			nsconfig/ssl directory by default. If the input key specified is an encrypted key, you are prompted to enter the PEM pass phrase that was used for encrypting the key. Maximum length = 63
keyform	<String>	Read-write	Format in which the key is stored on the appliance. Default value: PEM Possible values = DER, PEM
pempassphrase	<String>	Read-write	. Minimum length = 1 Maximum length = 31
days	<Integer>	Read-write	Number of days for which the certificate will be valid, beginning with the time and day (system time) of creation. Default value: 365 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 3650
subjectaltname	<String>	Read-write	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). Names include: 1. Email addresses 2. IP addresses 3. URIs 4. DNS names (This is usually also provided as the Common Name RDN within the Subject field of the main certificate.) 5. directory names (alternative Distinguished Names to that given in the Subject). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certform	<String>	Read-write	Format in which the certificate is stored on the appliance. Default value: PEM Possible values = DER, PEM
cacert	<String>	Read-write	Name of the CA certificate file that issues and signs the Intermediate-CA certificate or the end-user client and server certificates. Maximum length = 63
cacertform	<String>	Read-write	Format of the CA certificate. Default value: PEM Possible values = DER, PEM
cakey	<String>	Read-write	Private key, associated with the CA certificate that is used to sign the Intermediate-CA certificate or the end-user client and server certificate. If the CA key file is password protected, the user is prompted to enter the pass phrase that was used to encrypt the key.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 63
cakeyform	<String>	Read-write	Format for the CA certificate. Default value: PEM Possible values = DER, PEM
caserial	<String>	Read-write	Serial number file maintained for the CA certificate. This file contains the serial number of the next certificate to be issued or signed by the CA. If the specified file does not exist, a new file is created, with /nsconfig/ssl/ as the default path. If you do not specify a proper path for the existing serial file, a new serial file is created. This might change the certificate serial numbers assigned by the CA certificate to each of the certificates it signs. Maximum length = 63

Operations

(click to see Properties)

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcert? **action=create HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcert":{

<b>"certfile":<String_value>,
```

```
</b><b>"reqfile":<String_value>,

</b><b>"certtype":<String_value>,

</b>"keyfile":<String_value>,

"keyform":<String_value>,

"pempassphrase":<String_value>,

"days":<Integer_value>,

"certform":<String_value>,

"cacert":<String_value>,

"cacertform":<String_value>,

"cakey":<String_value>,

"cakeyform":<String_value>,

"caserial":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslcertbundle

Configuration for Imported Certbundle resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported certificate bundle. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the certificate bundle to be imported or exported. For example, http://

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			www.example.com/cert_bundle_file. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access, and the issuer certificate of the HTTPS server is not present in the specific path on NetScaler to authenticate the HTTPS server. Minimum length = 1 Maximum length = 2047
inuse	<String>	Read-only	. Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle? **action=Import HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertbundle":{

<b>"name":<String_value>,

</b><b>"src":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle **Query-parameters: args= name:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

APPLY

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle? **action=apply HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertbundle":{

<b>"name":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

EXPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle? **action=export HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertbundle":{

<b>"name":<String_value>,

</b><b>"src":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcertbundle resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle? **view=summary**

Use this query-parameter to get the summary output of sslcertbundle resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertbundle resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertbundle": [ {

"name":<String_value>,

"inuse":<String_value>,
```

```
"src":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertbundle? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertbundle": [ { "__count": "#no"} ] }
```

sslcertchain

Configuration for CERT Chain resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkeyname	<String>	Read-write	Name of the Certificate. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcertchain resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain? **view=summary**

Use this query-parameter to get the summary output of sslcertchain resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertchain resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertchain": [ {

"certkeyname":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain/ certkeyname_value<String>
Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain/ certkeyname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain/ certkeyname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of sslcertchain resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcertchain_sslcertkey_binding": [ { "__count": "#no"} ] }
```

sslcertfile

Configuration for Imported Certfile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported certificate file. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the certificate file to be imported. For example, http://www.example.com/cert_file.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access, and the issuer certificate of the HTTPS server is not present in the specific path on NetScaler to authenticate the HTTPS server. Minimum length = 1 Maximum length = 2047
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

sslcertkey

Configuration for certificate key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkey	<String>	Read-write	Name for the certificate and private-key pair. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			single quotation marks (for example, "my cert" or 'my cert'). Minimum length = 1
cert	<String>	Read-write	Name of and, optionally, path to the X509 certificate file that is used to form the certificate-key pair. The certificate file should be present on the appliance's hard-disk drive or solid-state drive. Storing a certificate in any location other than the default might cause inconsistency in a high availability setup. /nsconfig/ssl/ is the default path. Minimum length = 1
key	<String>	Read-write	Name of and, optionally, path to the private-key file that is used to form the certificate-key pair. The certificate file should be present on the appliance's hard-disk drive or solid-state drive. Storing a certificate in any location other than the default might cause inconsistency

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			in a high availability setup. /nsconfig/ssl/ is the default path. Minimum length = 1
password	<Boolean>	Read-write	Passphrase that was used to encrypt the private-key. Use this option to load encrypted private-keys in PEM format.
fipskey	<String>	Read-write	Name of the FIPS key that was created inside the Hardware Security Module (HSM) of a FIPS appliance, or a key that was imported into the HSM. Minimum length = 1
hsmkey	<String>	Read-write	Name of the HSM key that was created in the External Hardware Security Module (HSM) of a FIPS appliance. Minimum length = 1
inform	<String>	Read-write	Input format of the certificate and the private-key files. The three formats supported by the appliance are: PEM - Privacy Enhanced Mail

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DER - Distinguished Encoding Rule PFX - Personal Information Exchange. Default value: PEM Possible values = DER, PEM, PFX
passplain	<String>	Read-write	Pass phrase used to encrypt the private-key. Required when adding an encrypted private-key in PEM format. Minimum length = 1
expirymonitor	<String>	Read-write	Issue an alert when the certificate is about to expire. Possible values = ENABLED, DISABLED
notificationperiod	<Integer>	Read-write	Time, in number of days, before certificate expiration, at which to generate an alert that the certificate is about to expire. Minimum value = 10 Maximum value = 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bundle	<String>	Read-write	Parse the certificate chain as a single file after linking the server certificate to its issuer's certificate within the file. Default value: NO Possible values = YES, NO
deletecertkeyfilesonremoval	<String>	Read-write	This option is used to automatically delete certificate/key files from physical device when the added certkey is removed. When deleteCertKeyFilesOnRemoval option is used at rm certkey command, it overwrites the deleteCertKeyFilesOnRemoval setting used at add/set certkey command. Default value: CERTKEYFILE_DELETE_NO Possible values = NO, ALWAYS, IF_EXPIRED
deletefromdevice	<Boolean>	Read-write	Delete cert/key file from file system.
linkcertkeyname	<String>	Read-write	Name of the Certificate Authority

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate-key pair to which to link a certificate-key pair. Minimum length = 1
nodomaincheck	<Boolean>	Read-write	Override the check for matching domain names during a certificate update operation.
ocspstaplingcache	<Boolean>	Read-write	Clear cached ocspStapling response in certkey.
signaturealg	<String>	Read-only	Signature algorithm.
certificatetype	<String[]>	Read-only	Specifies whether the certificate is of type root-CA, intermediate-CA, server, client, or client and server. Possible values = ROOT_CERT, INTM_CERT, CLNT_CERT, SRVR_CERT, UNKNOWN_CERT
serial	<String>	Read-only	Serial number.
issuer	<String>	Read-only	Issuer name.
clientcertnotbefore	<String>	Read-only	Not-Before date.
clientcertnotafter	<String>	Read-only	Not-After date.
daystoexpiration	<Integer>	Read-only	Days remaining for the certificate to expire.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
subject	<String>	Read-only	Subject name.
publickey	<String>	Read-only	Public key algorithm.
publickeysize	<Integer>	Read-only	Size of the public key.
version	<Integer>	Read-only	Version.
priority	<Integer>	Read-only	ocsp priority.
status	<String>	Read-only	Status of the certificate. Possible values = Valid, Not yet valid, Expired
passcrypt	<String>	Read-only	Passcrypt. Minimum length = 1
data	<Integer>	Read-only	Vserver Id.
servicename	<String>	Read-only	Service name to which the certificate key pair is bound.
sandns	<String>	Read-only	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). This field is for DNS names.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sanipadd	<String>	Read-only	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). This field is for IP address.
ocspresponsestatus	<String>	Read-only	Ocsp response status of the certificate. Possible values = NONE, EXPIRED, VALID
builtin	<String[]>	Read-only	Flag to determine if Cert key is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
certkeydigest	<String>	Read-only	Stores the added md5sum of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate and key files.
certificatesource	<String>	Read-only	Location of the certificate. Default value: LOCAL Possible values = LOCAL, REMOTE
certkeystatus	<String>	Read-only	Status of the certkey in PE. Possible values = ACTIVE, INACTIVE(Default state), INACTIVE(No Private Key), INACTIVE(Duplicate SAN-Multiple clashing certs), INACTIVE(Duplicate SAN-All SAN entires not covered), INACTIVE(Duplicate SAN-Earlier expiry), INACTIVE(Crossed MAX SAN limit), INACTIVE(No common name), INACTIVE(Common name/SAN too long), INACTIVE(No memory),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			INACTIVE(MAX cert req len reached), INACTIVE(X509 Name failure)
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- LINK
- UNLINK
- GET (ALL)
- GET
- COUNT
- CHANGE
- CLEAR

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>,

</b><b>"cert":<String_value>,

</b>"key":<String_value>,

"password":<Boolean_value>,

"fipskey":<String_value>,

"hsmkey":<String_value>,

"inform":<String_value>,
```

```
"passplain":<String_value>,

"expirymonitor":<String_value>,

"notificationperiod":<Integer_value>,

"bundle":<String_value>,

"deletecertkeyfilesonremoval":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey/ certkey_value<String> **Query-parameters: args=deletefromdevice: <Boolean_value> ,deletecertkeyfilesonremoval: <String_value>**
update
URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>,

</b>"expirymonitor":<String_value>,

"notificationperiod":<Integer_value>,

"deletecertkeyfilesonremoval":<String_value>
```

```
}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

unset

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>,

</b>"expirymonitor":true,

"notificationperiod":true,

"deletecertkeyfilesonremoval":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

link

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **action=link HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>,

</b><b>"linkcertkeyname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

unlink

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **action=unlink HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

change

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **action=update HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>,

</b>"cert":<String_value>,

"key":<String_value>,

"password":<Boolean_value>,

"fipskey":<String_value>,

"inform":<String_value>,

"passplain":<String_value>,

"nodomaincheck":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

clear

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>,

</b>"ocspstaplingcache":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error
get (all)
URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcertkey resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **view=summary**

Use this query-parameter to get the summary output of sslcertkey resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey resources in chunks.

HTTP Method: GET

Request Headers:

sslcertkey_binding

Binding object which returns the resources bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkey	<String>	Read-write	Name of the certificate-key pair for which to show detailed information. Minimum length = 1
sslcertkey_sslvserver_binding	<sslcertkey_sslvserver_binding[]>	Read-only	sslvserver that can be bound to sslcertkey.
sslcertkey_crldistribution_binding	<sslcertkey_crldistribution_binding[]>	Read-only	crldistribution that can be bound to sslcertkey.
sslcertkey_sslprofile_binding	<sslcertkey_sslprofile_binding[]>	Read-only	sslprofile that can be bound to sslcertkey.
sslcertkey_service_binding	<sslcertkey_service_binding[]>	Read-only	service that can be bound to sslcertkey.
sslcertkey_sslocspresponder_binding	<sslcertkey_sslocspresponder_binding[]>	Read-only	sslocspresponder that can be bound to sslcertkey.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_binding/ certkey_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertkey_binding": [ {

"certkey":<String_value>,

"sslcertkey_sslvserver_binding":<sslcertkey_sslvserver_binding[]_value>,

"sslcertkey_crldistribution_binding":<sslcertkey_crldistribution_binding[]
_value>,

"sslcertkey_sslprofile_binding":<sslcertkey_sslprofile_binding[]_value>,

"sslcertkey_service_binding":<sslcertkey_service_binding[]_value>,

"sslcertkey_sslocspresponder_binding":<sslcertkey_sslocspresponder_binding
[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertkey_binding": [ {

"certkey":<String_value>,

"sslcertkey_sslvserver_binding":<sslcertkey_sslvserver_binding[]_value>,

"sslcertkey_crldistribution_binding":<sslcertkey_crldistribution_binding[]
_value>,

"sslcertkey_sslprofile_binding":<sslcertkey_sslprofile_binding[]_value>,

"sslcertkey_service_binding":<sslcertkey_service_binding[]_value>,

"sslcertkey_sslocspresponder_binding":<sslcertkey_sslocspresponder_binding
[]_value>

}]}
```

sslcertkey_crldistribution_binding

Binding object showing the crldistribution that can be bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkey	<String>	Read-write	Name of the certificate-key pair. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	The certificate-key pair being unbound is a Certificate Authority (CA) certificate. If you choose this option, the certificate-key pair is unbound from the list of CA certificates that were bound to the specified SSL virtual server or SSL service.
issuer	<String>	Read-write	Issuer name.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_crldistribution_binding/ certkey_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ sslcertkey_crldistribution_binding/ certkey_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcertkey_crldistribution_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_crldistribution_binding/ certkey_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey_crldistribution_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertkey_crldistribution_binding": [ {

"certkey":<String_value>,

"ca":<Boolean_value>,

"issuer":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_crldistribution_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_crldistribution_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertkey_crldistribution_binding": [ {

"certkey":<String_value>,

"ca":<Boolean_value>,

"issuer":<String_value>

}]}
```

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_crldistribution_binding/ certkey_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcertkey_crldistribution_binding": [ { "__count": "#no"} ] }
```

sslcertkey_service_binding

Binding object showing the service that can be bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkey	<String>	Read-write	Name of the certificate-key pair. Minimum length = 1
service	<Boolean>	Read-write	Bind the certificate to the named SSL service or service group.
servicename	<String>	Read-write	Service name to which the certificate key pair is bound.
ca	<Boolean>	Read-write	The certificate-key pair being unbound is a Certificate Authority (CA) certificate. If you choose this option, the certificate-key pair is unbound from the list of CA certificates that were bound to the specified SSL virtual server or SSL service.
servicegroupname	<String>	Read-write	The name of the SSL service group to which the certificate-key pair needs to be bound. Use the "add servicegroup" command to create this service. Minimum length = 1
version	<Integer>	Read-only	Version.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
data	<Integer>	Read-only	Vserver Id.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_service_binding/ certkey_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ sslcertkey_service_binding/ certkey_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcertkey_service_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_service_binding/ certkey_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey_service_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertkey_service_binding": [ {

"certkey":<String_value>,

"service":<Boolean_value>,

"servicename":<String_value>,

"ca":<Boolean_value>,

"servicegroupname":<String_value>,
```

```
"version":<Integer_value>,

"data":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_service_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_service_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertkey_service_binding": [ {

"certkey":<String_value>,

"service":<Boolean_value>,

"servicename":<String_value>,
```

```
"ca":<Boolean_value>,

"servicegroupname":<String_value>,

"version":<Integer_value>,

"data":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_service_binding/ certkey_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcertkey_service_binding": [ { "__count": "#no"} ] }
```

sslcertkey_sslocspresponder_binding

Binding object showing the sslocspresponder that can be bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-write	ocsp priority.
ocspresponder	<String>	Read-write	OCSP responders bound to this certkey.
certkey	<String>	Read-write	Name of the certificate-key pair. Minimum length = 1
ca	<Boolean>	Read-write	The certificate-key pair being unbound is a Certificate Authority (CA) certificate. If you choose this option, the certificate-key pair is unbound from the list of CA certificates that were bound to the specified SSL virtual server or SSL service.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslcertkey_sslocspresponder_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslcertkey_sslocspresponder_binding":{

"certkey":<String_value>,
```

```
"ocspresponder":<String_value>,

"priority":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslocspresponder_binding/ certkey_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ sslcertkey_sslocspresponder_binding/ certkey_value<String> ? **args=ocspresponder: <String_value> ,ca: <Boolean_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslocspresponder_binding/ certkey_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ sslcertkey_sslocspresponder_binding/ certkey_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcertkey_sslocspresponder_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslocspresponder_binding/ certkey_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey_sslocspresponder_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertkey_sslocspresponder_binding": [ {

"priority":<Integer_value>,

"ocspresponder":<String_value>,

"certkey":<String_value>,

"ca":<Boolean_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslocspresponder_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslocspresponder_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertkey_sslocspresponder_binding": [ {

"priority":<Integer_value>,

"ocspresponder":<String_value>,

"certkey":<String_value>,

"ca":<Boolean_value>

sslcertkeybundle

Configuration for certkey bundle resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkeybundlename	<String>	Read-write	Name given to the cerKeyBundle. The name will be used to bind/unbind certkey bundle to vip. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 127
bundlefile	<String>	Read-write	Name of and, optionally, path to the X509 certificate bundle file that is used to form the certificate-key bundle. The certificate bundle file should be present on the appliance's hard-disk drive or solid-state drive. /nsconfig/ssl/ is the default path. The certificate bundle file consists of list of certificates and one key in PEM format. Minimum length = 1
passplain	<String>	Read-write	Pass phrase used to encrypt the private-key. Required when certificate bundle file contains encrypted private-key in PEM format.
certkeybundledigest	<String>	Read-only	Stores the digest of certificate and key bundle file.
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkeybundle_binding/ certkeybundlename_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertkeybundle_binding": [ {

"certkeybundlename":<String_value>,

"sslcertkeybundle_intermediatecertlinks_binding":<sslcertkeybundle_interme
diatecertlinks_binding[]_value>,

"sslcertkeybundle_sslvserver_binding":<sslcertkeybundle_sslvserver_binding
[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkeybundle_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcertkeybundle_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertkeybundle_binding": [ {

"certkeybundlename":<String_value>,

"sslcertkeybundle_intermediatecertlinks_binding":<sslcertkeybundle_interme
diatecertlinks_binding[]_value>,

"sslcertkeybundle_sslvserver_binding":<sslcertkeybundle_sslvserver_binding
[]_value>

}]}
```

sslcertkeybundle_intermediatecertlinks_binding

Binding object showing the intermediatecertlinks that can be bound to sslcertkeybundle.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkeybundlename	<String>	Read-write	Name given to the cerKeyBundle. The name will be used to bind/unbind certkey bundle to vip. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 127
subject	<String>	Read-write	Subject name.
daystoexpiration	<Integer>	Read-only	Days remaining for the certificate to expire.
sandns	<String>	Read-only	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). This field is for DNS names.
issuer	<String>	Read-only	Issuer name.
clientcertnotbefore	<String>	Read-only	Not-Before date.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
status	<String>	Read-only	Status of the certificate. Possible values = Valid, Not yet valid, Expired
clientcertnotafter	<String>	Read-only	Not-After date.
publickey	<String>	Read-only	Public key algorithm.
sanipadd	<String>	Read-only	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). This field is for IP address.
signaturealg	<String>	Read-only	Signature algorithm.
serial	<String>	Read-only	Serial number.
publickeysize	<Integer>	Read-only	Size of the public key.
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertlink": [ { "__count": "#no"} ] }
```

sslcertreq

Configuration for certificate request resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqfile	<String>	Read-write	Name for and, optionally, path to the certificate signing request (CSR). /nsconfig/ssl/ is the default path. Maximum length = 63
keyfile	<String>	Read-write	Name of and, optionally, path to the private key used to create the certificate signing request, which then becomes part of the certificate-key pair. The private key can be either an RSA or a DSA key. The key must be present in the appliance's local storage. /nsconfig/ssl is the default path. Maximum length = 63
subjectaltname	<String>	Read-write	Subject Alternative Name (SAN) is an extension to X.509 that allows various

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). Names include: 1. Email addresses 2. IP addresses 3. URIs 4. DNS names (this is usually also provided as the Common Name RDN within the Subject field of the main certificate.) 5. Directory names (alternative Distinguished Names to that given in the Subject) Example:- subjectAltName "DNS:*.example.com DNS:www.example.org" . Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fipskeyname	<String>	Read-write	Name of the FIPS key used to create the certificate signing request. FIPS keys are created inside the Hardware Security Module of the FIPS card. Minimum length = 1 Maximum length = 31
keyform	<String>	Read-write	Format in which the key is stored on the appliance. Default value: PEM Possible values = DER, PEM
pempassphrase	<String>	Read-write	. Minimum length = 1 Maximum length = 31
countryname	<String>	Read-write	Two letter ISO code for your country. For example, US for United States. Minimum length = 2 Maximum length = 2
statename	<String>	Read-write	Full name of the state or province where your

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			organization is located. Do not abbreviate. Minimum length = 1
organizationname	<String>	Read-write	Name of the organization that will use this certificate. The organization name (corporation, limited partnership, university, or government agency) must be registered with some authority at the national, state, or city level. Use the legal name under which the organization is registered. Do not abbreviate the organization name and do not use the following characters in the name: Angle brackets (< >) tilde (~), exclamation mark, at (@), pound (#), zero (0), caret (\^), asterisk (*), forward slash (/), square brackets ([ ]), question mark (?).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
organizationunitname	<String>	Read-write	Name of the division or section in the organization that will use the certificate. Minimum length = 1
localityname	<String>	Read-write	Name of the city or town in which your organization's head office is located. Minimum length = 1
commonname	<String>	Read-write	Fully qualified domain name for the company or web site. The common name must match the name used by DNS servers to do a DNS lookup of your server. Most browsers use this information for authenticating the server's certificate during the SSL handshake. If the server name in the URL does not match the common name as given in the server certificate, the browser terminates the SSL handshake or prompts the user with a warning message.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Do not use wildcard characters, such as asterisk (*) or question mark (?), and do not use an IP address as the common name. The common name must not contain the protocol specifier <http://> or <https://>. Minimum length = 1
emailaddress	<String>	Read-write	Contact person's e-mail address. This address is publically displayed as part of the certificate. Provide an e-mail address that is monitored by an administrator who can be contacted about the certificate. Minimum length = 1
challengepassword	<String>	Read-write	Pass phrase, embedded in the certificate signing request that is shared only between the client or server requesting the certificate and the SSL certificate issuer (typically the certificate authority). This pass phrase

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			can be used to authenticate a client or server that is requesting a certificate from the certificate authority. Minimum length = 4
companyname	<String>	Read-write	Additional name for the company or web site. Minimum length = 1
digestmethod	<String>	Read-write	Digest algorithm used in creating CSR. Possible values = SHA1, SHA256

Operations

(click to see Properties)

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertreq? **action=create HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertreq":{

<b>"reqfile":<String_value>,

</b>"keyfile":<String_value>,

"subjectaltname":<String_value>,

"fipskeyname":<String_value>,

"keyform":<String_value>,

<b>"countryname":<String_value>,

</b><b>"statename":<String_value>,

</b><b>"organizationname":<String_value>,
```

```
</b>"organizationunitname":<String_value>,

"localityname":<String_value>,

"commonname":<String_value>,

"emailaddress":<String_value>,

"challengepassword":<String_value>,

"companyname":<String_value>,

"digestmethod":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslcipher

Configuration for cipher resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphergroupname	<String>	Read-write	Name for the user-defined cipher group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), and hyphen (-) characters. Cannot be changed after the cipher group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ciphergroup" or 'my ciphergroup'). Minimum length = 1
ciphgrpalias	<String>	Read-write	The individual cipher name(s), a user-defined cipher group, or a system predefined cipher alias that will be added to the predefined cipher alias that will be added to the group cipherGroupName. If a cipher alias or a cipher group is specified, all the individual ciphers in the cipher alias or group will be added

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to the user-defined cipher group. Minimum length = 1
ciphername	<String>	Read-write	Cipher name.
cipherpriority	<Integer>	Read-write	This indicates priority assigned to the particular cipher. Minimum value = 1
sslprofile	<String>	Read-write	Name of the profile to which cipher is attached.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcipher":{

<b>"ciphergroupname":<String_value>,

</b>"ciphername":<String_value>,

"cipherpriority":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcipher":{

<b>"ciphergroupname":<String_value>,

</b>"ciphername":true,

"cipherpriority":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher/ ciphergroupname_value<String>
Query-parameters: args=ciphername: <String_value>
get (all)
URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **args=ciphergroupname: <String_value> ,sslprofile: <String_value>**

Use this query-parameter to get sslcipher resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcipher resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **view=summary**

Use this query-parameter to get the summary output of sslcipher resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcipher resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcipher": [ {

ciphergroupname:<String_value>,sslprofile:<String_value>"ciphername":<Stri
ng_value>,

"cipherpriority":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

get
URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher/ ciphergroupname_value<String>
Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/sslcipher/ ciphergroupname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcipher/ ciphergroupname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of sslcipher resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcipher": [ {

ciphergroupname:<String_value>,sslprofile:<String_value>"ciphername":<Stri
ng_value>,

"cipherpriority":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

count

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcipher": [ { "__count": "#no"} ] }
```

sslcipher_binding

Binding object which returns the resources bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphergroupname	<String>	Read-write	Name of the cipher group for which to show detailed information. Minimum length = 1
sslcipher_sslciphersuite_binding	<sslcipher_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslcipher.
sslcipher_individualcipher_binding	<sslcipher_individualcipher_binding[]>	Read-only	individualcipher that can be bound to sslcipher.
sslcipher_sslprofile_binding	<sslcipher_sslprofile_binding[]>	Read-only	sslprofile that can be bound to sslcipher.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_binding/ciphergroupname_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcipher_binding": [ {

"ciphergroupname":<String_value>,

"sslcipher_individualcipher_binding":<sslcipher_individualcipher_binding[]
_value>,

"sslcipher_sslciphersuite_binding":<sslcipher_sslciphersuite_binding[]_val
ue>,

"sslcipher_sslprofile_binding":<sslcipher_sslprofile_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcipher_binding": [ {

"ciphergroupname":<String_value>,

"sslcipher_individualcipher_binding":<sslcipher_individualcipher_binding[]
_value>,

"sslcipher_sslciphersuite_binding":<sslcipher_sslciphersuite_binding[]_val
ue>,

"sslcipher_sslprofile_binding":<sslcipher_sslprofile_binding[]_value>

}]}
```

sslcipher_individualcipher_binding

Binding object showing the individualcipher that can be bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphgrpals	<String>	Read-write	A cipher-suite can consist of an individual cipher name, the system predefined cipher-alias name, or user defined cipher-group name. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherpriority	<Integer>	Read-write	This indicates priority assigned to the particular cipher. Minimum value = 1
cipheroperation	<String>	Read-write	The operation that is performed when adding the cipher-suite.

Possible cipher operations are: ADD - Appends the given cipher-suite to the existing one configured for the virtual server. REM - Removes the given cipher-suite from the existing one configured for the virtual server. ORD - Overrides the current configured cipher-suite for the virtual server with the given cipher-suite.

Default value: 0

Possible values = ADD, REM, ORD

Minimum length = 1

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_individualcipher_binding/ ciphergroupname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/ config/sslcipher_individualcipher_binding/ ciphergroupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcipher_individualcipher_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_individualcipher_binding/ ciphergroupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcipher_individualcipher_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcipher_individualcipher_binding": [ {

"ciphgrpals":<String_value>,

"cipherpriority":<Integer_value>,

"cipheroperation":<String_value>,

"ciphername":<String_value>,

"ciphergroupname":<String_value>,

"description":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_individualcipher_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_individualcipher_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcipher_individualcipher_binding": [ {

"ciphgrpals":<String_value>,

"cipherpriority":<Integer_value>,

"cipheroperation":<String_value>,

"ciphername":<String_value>,

"ciphergroupname":<String_value>,

"description":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_individualcipher_binding/ciphergroupname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcipher_individualcipher_binding": [ { "__count": "#no"} ] }
```

sslcipher_service_binding

Binding object showing the service that can be bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherpriority	<Integer>	Read-write	Priority of the cipher to be added. Minimum value = 1 Maximum value = 1000
cipheroperation	<String>	Read-write	The operation that is performed when adding the cipher-suite.

Possible cipher operations are: ADD - Appends the given cipher-suite to the existing one configured for the virtual server. REM - Removes the given cipher-suite from the existing one configured for the virtual server. ORD - Overrides the current configured cipher-suite for the virtual server with the given cipher-suite.

Default value: 0

Possible values = ADD, REM, ORD

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcipher_sslprofile_binding": [ {

"ciphergroupname":<String_value>,

"description":<String_value>,

"cipherpriority":<Integer_value>,

"cipheroperation":<String_value>,

"sslprofile":<String_value>,

"ciphgrpals":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslprofile_binding/ciphergroupname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcipher_sslprofile_binding": [ { "__count": "#no"} ] }
```

sslcipher_sslvserver_binding

Binding object showing the sslvserver that can be bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	The name of the SSL virtual server to which the cipher-suite is to be bound. Minimum length = 1
ciphergroupname	<String>	Read-write	Name of the user-defined cipher group. Minimum length = 1
vserver	<Boolean>	Read-write	Select the -vServer flag when the cipher operation is performed on an SSL virtual server.

Note: By default the bind ssl cipher command internally assumes the flag of -vServer argument. Hence, while working with the SSL vserver, you need not specify this flag.

Possible cipher operations are: ADD - Appends the given cipher-suite to the existing one configured for the virtual server. REM - Removes the given cipher-suite from the existing one configured for the virtual server. ORD - Overrides the current configured cipher-suite for the virtual server with the given cipher-suite.

Default value: 0

Possible values = ADD, REM, ORD

Minimum value = 1

Maximum value = 1000

Minimum length = 1

Operations

(click to see Properties)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

sslciphersuite

Configuration for ciphersuite resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphername	<String>	Read-write	Name of the cipher suite for which to show detailed information.
description	<String>	Read-only	Cipher suite description.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslciphersuite resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite? **view=summary**

Use this query-parameter to get the summary output of sslciphersuite resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslciphersuite resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslciphersuite": [ {

"ciphername":<String_value>,

"description":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite/ ciphername_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite/ ciphername_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite/ ciphername_value<String> ? **view=summary**

Use this query-parameter to get the summary output of sslciphersuite resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslciphersuite": [ {

```

sslcrl

Configuration for Certificate Revocation List resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crlname	<String>	Read-write	Name for the Certificate Revocation List (CRL). Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CRL is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my crl" or 'my crl'). Minimum length = 1
crlpath	<String>	Read-write	Path to the CRL file. /var/netscaler/ssl/ is the default path. Minimum length = 1
inform	<String>	Read-write	Input format of the CRL file. The two formats supported on the appliance are: PEM - Privacy Enhanced Mail. DER - Distinguished Encoding Rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: PEM Possible values = DER, PEM
refresh	<String>	Read-write	Set CRL auto refresh. Possible values = ENABLED, DISABLED
cacert	<String>	Read-write	CA certificate that has issued the CRL. Required if CRL Auto Refresh is selected. Install the CA certificate on the appliance before adding the CRL. Minimum length = 1
method	<String>	Read-write	Method for CRL refresh. If LDAP is selected, specify the method, CA certificate, base DN, port, and LDAP server name. If HTTP is selected, specify the CA certificate, method, URL, and port. Cannot be changed after a CRL is added. Possible values = HTTP, LDAP
server	<String>	Read-write	IP address of the LDAP server from

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which to fetch the CRLs. Minimum length = 1
url	<String>	Read-write	URL of the CRL distribution point.
port	<Integer>	Read-write	Port for the LDAP server. Minimum value = 1
basedn	<String>	Read-write	Base distinguished name (DN), which is used in an LDAP search to search for a CRL. Citrix recommends searching for the Base DN instead of the Issuer Name from the CA certificate, because the Issuer Name field might not exactly match the LDAP directory structure's DN. Minimum length = 1
scope	<String>	Read-write	Extent of the search operation on the LDAP server. Available settings function as follows: One - One level below Base DN. Base - Exactly the same level as Base DN.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: One Possible values = Base, One
interval	<String>	Read-write	CRL refresh interval. Use the NONE setting to unset this parameter. Possible values = MONTHLY, WEEKLY, DAILY, NOW, NONE
day	<Integer>	Read-write	Day on which to refresh the CRL, or, if the Interval parameter is not set, the number of days after which to refresh the CRL. If Interval is set to MONTHLY, specify the date. If Interval is set to WEEKLY, specify the day of the week (for example, Sun=0 and Sat=6). This parameter is not applicable if the Interval is set to DAILY. Minimum value = 0 Maximum value = 31
time	<String>	Read-write	Time, in hours (1-24) and minutes (1-60),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			at which to refresh the CRL.
binddn	<String>	Read-write	Bind distinguished name (DN) to be used to access the CRL object in the LDAP repository if access to the LDAP repository is restricted or anonymous access is not allowed. Minimum length = 1
password	<String>	Read-write	Password to access the CRL in the LDAP repository if access to the LDAP repository is restricted or anonymous access is not allowed. Minimum length = 1
binary	<String>	Read-write	Set the LDAP-based CRL retrieval mode to binary. Default value: NO Possible values = YES, NO
cacertfile	<String>	Read-write	Name of and, optionally, path to the CA certificate file. /nsconfig/ssl/ is the default path.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 63
cakeyfile	<String>	Read-write	Name of and, optionally, path to the CA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
indexfile	<String>	Read-write	Name of and, optionally, path to the file containing the serial numbers of all the certificates that are revoked. Revoked certificates are appended to the file. /nsconfig/ssl/ is the default path. Maximum length = 63
revoke	<String>	Read-write	Name of and, optionally, path to the certificate to be revoked. /nsconfig/ssl/ is the default path. Maximum length = 63
gencrl	<String>	Read-write	Name of and, optionally, path to the CRL file to be generated. The list of certificates that have been revoked is obtained from the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			index file. /nsconfig/ssl/ is the default path. Maximum length = 63
flags	<Integer>	Read-only	CRL status flag.
lastupdatetime	<Integer>	Read-only	Last CRL refresh time.
version	<Integer>	Read-only	CRL version.
signaturealgo	<String>	Read-only	Signature algorithm.
issuer	<String>	Read-only	Issuer name.
lastupdate	<String>	Read-only	Last update time.
nextupdate	<String>	Read-only	Next update time.
daystoexpiration	<Integer>	Read-only	Number of days remaining for the CRL to expire.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

sslcrl_binding

Binding object which returns the resources bound to sslcrl.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crlname	<String>	Read-write	Name of the CRL for which to show detailed information. Minimum length = 1
sslcrl_serialnumber_binding	<sslcrl_serialnumber_binding[]>	Read-only	serialnumber that can be bound to sslcrl.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_binding/ crlname_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcrl_binding": [ {

"crlname":<String_value>,

"sslcrl_serialnumber_binding":<sslcrl_serialnumber_binding[]_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcrl_binding": [ {

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding/ crlname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ sslcrl_serialnumber_binding/ crlname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcrl_serialnumber_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding/ crlname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcrl_serialnumber_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcrl_serialnumber_binding": [ {

"crlname":<String_value>,

"number":<String_value>,

"date":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcrl_serialnumber_binding": [ {

"crlname":<String_value>,
```

```
"number":<String_value>,

"date":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding/ crlname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcrl_serialnumber_binding": [ { "__count": "#no"} ] }
```

sslcrlfile

Configuration for Imported crl files resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported CRL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			file. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name to the CRL file to be imported. For example, http://www.example.com/crl_file. NOTE: The import fails if the object to be imported is on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			an HTTPS server that requires client certificate authentication for access, and the issuer certificate of the HTTPS server is not present in the specific path on NetScaler to authenticate the HTTPS server. Minimum length = 1 Maximum length = 2047
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- IMPORT
- DELETE
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **action=Import HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcrlfile":{

<b>"name":<String_value>,

</b><b>"src":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile **Query-parameters: args= name:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcrlfile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **view=summary**

Use this query-parameter to get the summary output of sslcrlfile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcrlfile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcrlfile": [ {

"name":<String_value>,

"src":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcrlfile": [ { "__count": "#no"} ] }
```

ssldefaultprofile

Configuration for 0 resource.

Operations

- CONVERT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CONVERT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldefaultprofile? **action=convert**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ssldefaultprofile":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ssldhfile

Configuration for dh imported file resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported DH file. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the DH file to be imported. For example, http://www.example.com/dh_file. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access, and the issuer certificate of the HTTPS server is not present in the specific path on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NetScaler to authenticate the HTTPS server. Minimum length = 1 Maximum length = 2047

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ssldhfile": [ { "__count": "#no"} ] }
```

ssldhparam

Configuration for dh Parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dhfile	<String>	Read-write	Name of and, optionally, path to the DH key file. /nsconfig/ssl/ is the default path. Maximum length = 63
bits	<Integer>	Read-write	Size, in bits, of the DH key being generated. Minimum value = 512 Maximum value = 2048
gen	<String>	Read-write	Random number required for generating the DH key. Required as part of the DH key generation algorithm. Default value: 2 Possible values = 2, 5

Operations

(click to see Properties)

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldhparam? **action=create HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ssldhparam":{

<b>"dhfile":<String_value>,

</b>"bits":<Integer_value>,
```

```
"gen":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ssldtlsprofile

Configuration for DTLS profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DTLS profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),equals sign (=), and hyphen (-) characters. Cannot be changed after the profile is created. Minimum length = 1 Maximum length = 127
pmtudiscovery	<String>	Read-write	Source for the maximum record

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			size value. If ENABLED, the value is taken from the PMTU table. If DISABLED, the value is taken from the profile. Default value: DISABLED Possible values = ENABLED, DISABLED
maxrecordsize	<Integer>	Read-write	Maximum size of records that can be sent if PMTU is disabled. Default value: 1459 Minimum value = 250 Maximum value = 1459
maxretrytime	<Integer>	Read-write	Wait for the specified time, in seconds, before resending the request. Default value: 3
helloverifyrequest	<String>	Read-write	Send a Hello Verify request to validate the client. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
terminatesession	<String>	Read-write	Terminate the session if the message authentication code (MAC) of the client and server do not match. Default value: DISABLED Possible values = ENABLED, DISABLED
maxpacketsize	<Integer>	Read-write	Maximum number of packets to reassemble. This value helps protect against a fragmented packet attack. Default value: 120 Minimum value = 0 Maximum value = 86400
maxholdqlen	<Integer>	Read-write	Maximum number of datagrams that can be queued at DTLS layer for processing. Default value: 32 Minimum value = 32

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65535
maxbadmacignorecount	<Integer>	Read-write	Maximum number of bad MAC errors to ignore for a connection prior disconnect. Disabling parameter terminateSession terminates session immediately when bad MAC is detected in the connection. Default value: 100 Minimum value = 1 Maximum value = 65535
initialretrytimeout	<Integer>	Read-write	Initial time out value to retransmit the last flight sent from the NetScaler. Default value: 3 Minimum value = 1 Maximum value = 3
builtin	<String[]>	Read-only	Flag to determine whether dtls profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldtlsprofile? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ssldtlsprofile": [ { "__count": "#no"} ] }
```

sslecdsakey

Configuration for ecdsa key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyfile	<String>	Read-write	Name for and, optionally, path to the ECDSA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
curve	<String>	Read-write	Curve id to generate ECDSA key. Only P_256 and P_384 are supported. Default value: FIPSEXP_F4 Possible values = P_256, P_384
keyform	<String>	Read-write	Format in which the ECDSA key file is stored on the appliance. Default value: PEM Possible values = DER, PEM
des	<Boolean>	Read-write	Encrypt the generated ECDSA key by using the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
des3	<Boolean>	Read-write	Encrypt the generated ECDSA key by using the Triple-DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
aes256	<Boolean>	Read-write	Encrypt the generated ECDSA key by using the AES algorithm.
password	<String>	Read-write	Pass phrase to use for encryption if DES or DES3 option is selected. Minimum length = 1 Maximum length = 31
pkcs8	<Boolean>	Read-write	Create the private key in PKCS#8 format.

Operations

(click to see Properties)

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslecdsakey? **action=create HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslecdsakey":{

<b>"keyfile":<String_value>,

</b><b>"curve":<String_value>,

</b>"keyform":<String_value>,

"des":<Boolean_value>,

"des3":<Boolean_value>,

"aes256":<Boolean_value>,

"password":<String_value>,

"pkcs8":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslechconfig

Configuration for ech config resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
echconfigname	<String>	Read-write	The ECH config name configured. Minimum length = 1
echcipher	<String>	Read-write	The supported cipher suite that encrypts

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the client Hello Message. Possible values = AES128-GCM-HKDFSHA256, AES128-GCM-HKDFSHA384, AES128-GCM-HKDFSHA512, AES256-GCM-HKDFSHA256, AES256-GCM-HKDFSHA384, AES256-GCM-HKDFSHA512, CHACHA20-POLY1305-HKDFSHA256, CHACHA20-POLY1305-HKDFSHA384, CHACHA20-POLY1305-HKDFSHA512
hpkekeyname	<String>	Read-write	The name of the configured HPKE key. Minimum length = 1
echpublicname	<String>	Read-write	The public name of ech config means FQDN or any string. Minimum length = 1
echconfigid	<Integer>	Read-write	The config id of the ech config.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 255
version	<Integer>	Read-write	The version of ECH for which this configuration is used. Default value: 65037
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

sslfips

Configuration for fips resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
inithsm	<String>	Read-write	FIPS initialization level. The appliance currently supports Level-2 (FIPS 140-2). Possible values = Level-2
sopassword	<String>	Read-write	Security officer password that will be in effect after you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			have configured the HSM. Minimum length = 1
oldsopassword	<String>	Read-write	Old password for the security officer. Minimum length = 1
userpassword	<String>	Read-write	The Hardware Security Module's (HSM) User password. Minimum length = 1
hsmlabel	<String>	Read-write	Label to identify the Hardware Security Module (HSM). Minimum length = 1
fipsfw	<String>	Read-write	Path to the FIPS firmware file. Minimum length = 1
erasedata	<String>	Read-only	Erase data. Default value: FIPS_ERASE Minimum length = 1
serial	<Integer>	Read-only	FIPS card serial number.
majorversion	<Integer>	Read-only	Firmware major version.
minorversion	<Integer>	Read-only	Firmware minor version.
fipshwmajorversion	<Integer>	Read-only	FIPS card hardware major version.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fipshwminorversion	<Integer>	Read-only	FIPS card hardware minor version.
fipshwversionstring	<String>	Read-only	FIPS card hardware extended version string.
flashmemorytotal	<Integer>	Read-only	Total size of the flash memory on card.
flashmemoryfree	<Integer>	Read-only	Total size of free flash memory.
sramtotal	<Integer>	Read-only	Total size of the SRAM memory on card.
sramfree	<Integer>	Read-only	Total size of free SRAM memory.
status	<Integer>	Read-only	Status.
flag	<Integer>	Read-only	Internal Flags.
serialno	<String>	Read-only	FIPS card serial number.
model	<String>	Read-only	FIPS card model info.
state	<Integer>	Read-only	FIPS card state.
firmwarereleasedate	<String>	Read-only	FIPS card firmware revision date.
coresmax	<Integer>	Read-only	Maximum number of crypto cores present in the FIPS card.
coresenabled	<Integer>	Read-only	Number of crypto cores enabled in the FIPS card.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.

sslfipskey

Configuration for FIPS key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fipskeyname	<String>	Read-write	Name for the FIPS key. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the FIPS key is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my fipskey" or 'my fipskey').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
keytype	<String>	Read-write	Only RSA key and ECDSA Key are supported. Default value: RSA Possible values = RSA, ECDSA
exponent	<String>	Read-write	Exponent value for the FIPS key to be created. Available values function as follows: 3=3 (hexadecimal) F4=10001 (hexadecimal). Default value: 3 Possible values = 3, F4
modulus	<Integer>	Read-write	Modulus, in multiples of 64, of the FIPS key to be created. Minimum value = 0 Maximum value = 4096
curve	<String>	Read-write	Only p_256 (prime256v1) and P_384 (secp384r1) are supported. Default value: P_256

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = P_256, P_384
key	<String>	Read-write	Name of and, optionally, path to the key file to be imported. /nsconfig/ssl/ is the default path. Minimum length = 1
inform	<String>	Read-write	Input format of the key file. Available formats are: SIM - Secure Information Management; select when importing a FIPS key. If the external FIPS key is encrypted, first decrypt it, and then import it. PEM - Privacy Enhanced Mail; select when importing a non-FIPS key. Default value: SIM Possible values = SIM, DER, PEM
wrapkeyname	<String>	Read-write	Name of the wrap key to use for importing the key. Required for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			importing a non-FIPS key. Minimum length = 1
iv	<String>	Read-write	Initialization Vector (IV) to use for importing the key. Required for importing a non-FIPS key. Minimum length = 1
size	<Integer>	Read-only	Size.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslfipskey": [ { "__count": "#no"} ] }
```

sslfipssimsource

Configuration for FIPsSIM source resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
targetsecret	<String>	Read-write	Name of and, optionally, path to the target FIPS appliance's secret data. /nsconfig/ssl/ is the default path. Minimum length = 1
sourcesecret	<String>	Read-write	Name for and, optionally, path to the source FIPS appliance's secret data. /nsconfig/ssl/ is the default path. Minimum length = 1
certfile	<String>	Read-write	Name for and, optionally, path to the source FIPS appliance's certificate file. /nsconfig/ssl/ is the default path. Minimum length = 1

Operations

(click to see Properties)

- ENABLE
- INIT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslfipssimsource? **action=enable HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslfipssimsource":{

<b>"targetsecret":<String_value>,

</b><b>"sourcesecret":<String_value>
```

```
</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

INIT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslfipssimsource? **action=init HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslfipssimsource":{

<b>"certfile":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslfipssimtarget

Configuration for FIPS SIM Target resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyvector	<String>	Read-write	Name of and, optionally, path to the target FIPS appliance's key vector. /nsconfig/ssl/ is the default path. Minimum length = 1
sourcesecret	<String>	Read-write	Name of and, optionally, path to the source FIPS appliance's secret data. /nsconfig/ssl/ is the default path. Minimum length = 1
certfile	<String>	Read-write	Name of and, optionally, path to the source FIPS appliance's certificate file. /nsconfig/ssl/ is the default path. Minimum length = 1
targetsecret	<String>	Read-write	Name for and, optionally, path to the target FIPS appliance's secret data. The default input path for the secret data is /nsconfig/ssl/. Minimum length = 1

```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslglobal_binding

Binding object which returns the resources bound to sslglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslglobal_sslpolicy_binding	<sslglobal_sslpolicy_binding[]>	Read-write	sslpolicy that can be bound to sslglobal.

Operations

(click to see Properties)

- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslglobal_binding": [ {

"sslglobal_sslpolicy_binding":<sslglobal_sslpolicy_binding[]_value>

}]}
```

sslglobal_sslpolicy_binding

Binding object showing the sslpolicy that can be bound to sslglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
labeltype	<String>	Read-write	Type of policy label to invoke. Specify virtual server for a policy label associated with a virtual server, or policy label for a user-defined policy label. Possible values = vserver, service, policylabel
priority	<Integer>	Read-write	The priority of the policy binding.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL, APPFW_GLOBAL, TM_GLOBAL
policyname	<String>	Read-write	The name for the SSL policy.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			85 does not exist in the policy label. Default value: "END"
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server, service, or policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority.
type	<String>	Read-write	Global bind point to which the policy is bound. Possible values = CONTROL_OVERRIDE, CONTROL_DEFAULT, DATA_OVERRIDE, DATA_DEFAULT, HTTPQUIC_CONTROL_OVERRIDE, HTTPQUIC_CONTROL_DEFAULT, HTTPQUIC_DATA_OVERRIDE, HTTPQUIC_DATA_DEFAULT
__count	<Double>	Read-write	count parameter

{ "sslhsmkey": [ { "__count": "#no"} ] }
```

sslkeyfile

Configuration for Imported ssl key files resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported key file. Must begin with an ASCII alphanumeric or underscore(_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the key file to be imported. For example, http://www.example.com/key_file. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access, and the issuer certificate of the HTTPS server is not present in the specific path on NetScaler to authenticate the HTTPS server. Minimum length = 1 Maximum length = 2047
password	<String>	Read-write	.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- IMPORT
- DELETE
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile? **action=Import HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslkeyfile":{

<b>"name":<String_value>,

</b><b>"src":<String_value>,

</b>"password":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile **Query-parameters: args= name:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslkeyfile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile? **view=summary**

Use this query-parameter to get the summary output of sslkeyfile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslkeyfile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslkeyfile": [ {

"name":<String_value>,

"src":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

```
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslkeyfile": [ { "__count": "#no"} ] }
```

ssllogprofile

Configuration for SSL logging Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the ssllogprofile. Minimum length = 1 Maximum length = 127
ssllogclauth	<String>	Read-write	log all SSL ClAuth events.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
ssllogclauthfailures	<String>	Read-write	log all SSL ClAuth error events. Default value: DISABLED Possible values = ENABLED, DISABLED
ssllogs	<String>	Read-write	log all SSL HS events. Default value: DISABLED Possible values = ENABLED, DISABLED
ssllogsfailures	<String>	Read-write	log all SSL HS error events. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

sslocspresponder

Configuration for OCSP responser resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the OCSP responder. Cannot begin with a hash (#) or space character and must contain only ASCII alphanumeric, underscore (_), hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the responder is created. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder" or 'my responder'). Minimum length = 1 Maximum length = 127
url	<String>	Read-write	URL of the OCSP responder. Minimum length = 1 Maximum length = 127
cache	<String>	Read-write	Enable caching of responses. Caching of responses received from the OCSP responder enables faster responses to the clients and reduces the load on the OCSP responder. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
cachetimeout	<Integer>	Read-write	Timeout for caching the OCSP response. After the timeout, the Citrix ADC sends a fresh request to the OCSP responder for the certificate status. If a timeout is not specified, the timeout provided in the OCSP response applies. Default value: 1 Minimum value = 1 Maximum value = 43200
batchingdepth	<Integer>	Read-write	Number of client certificates to batch together into one OCSP request. Batching avoids overloading the OCSP responder. A value of 1 signifies that each request is queried independently. For a value greater than 1, specify a timeout (batching delay) to avoid inordinately delaying the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			processing of a single certificate. Minimum value = 1 Maximum value = 8
batchingdelay	<Integer>	Read-write	Maximum time, in milliseconds, to wait to accumulate OCSP requests to batch. Does not apply if the Batching Depth is 1. Minimum value = 1 Maximum value = 10000
resptimeout	<Integer>	Read-write	Time, in milliseconds, to wait for an OCSP response. When this time elapses, an error message appears or the transaction is forwarded, depending on the settings on the virtual server. Includes Batching Delay time. Minimum value = 100 Maximum value = 120000
ocspurlresolvetimeout	<Integer>	Read-write	Time, in milliseconds, to wait for an OCSP URL Resolution. When this time elapses, an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			error message appears or the transaction is forwarded, depending on the settings on the virtual server. Minimum value = 100 Maximum value = 2000
respondercert	<String>	Read-write	. Minimum length = 1
trustresponder	<Boolean>	Read-write	A certificate to use to validate OCSP responses. Alternatively, if -trustResponder is specified, no verification will be done on the reponse. If both are omitted, only the response times (producedAt, lastUpdate, nextUpdate) will be verified.
producedattimeskew	<Integer>	Read-write	Time, in seconds, for which the Citrix ADC waits before considering the response as invalid. The response is considered invalid if the Produced At time stamp in the OCSP response exceeds or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			precedes the current Citrix ADC clock time by the amount of time specified. Default value: 300 Minimum value = 0 Maximum value = 86400
signingcert	<String>	Read-write	Certificate-key pair that is used to sign OCSP requests. If this parameter is not set, the requests are not signed. Minimum length = 1
usenonce	<String>	Read-write	Enable the OCSP nonce extension, which is designed to prevent replay attacks. Possible values = YES, NO
insertclientcert	<String>	Read-write	Include the complete client certificate in the OCSP request. Possible values = YES, NO
httpmethod	<String>	Read-write	HTTP method used to send ocsp request. POST is the default httpmethod. If request length is > 255, POST wil be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			used even if GET is set as httpMethod. Default value: POST Possible values = GET, POST
ocspaiarefcount	<Integer>	Read-only	No of CA certs referencing this AIA responder.
ocspipaddrstr	<String>	Read-only	DNS resolved IP address.
port	<Integer>	Read-only	Port number on which OCSP Server listens. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- FLUSH
- UPDATE
- UNSET
- GET (ALL)

- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslocspresponder **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslocspresponder":{

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslocspresponder": [ { "__count": "#no"} ] }
```

sslparameter

Configuration for SSL parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
quantumsize	<String>	Read-write	Amount of data to collect before the data is pushed to the crypto hardware for encryption. For large downloads, a larger quantum size better utilizes the crypto resources. Default value: 8192 Possible values = 4096, 8192, 16384

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crlmemorysizemb	<Integer>	Read-write	Maximum memory size to use for certificate revocation lists (CRLs). This parameter reserves memory for a CRL but sets a limit to the maximum memory that the CRLs loaded on the appliance can consume. Default value: 256 Minimum value = 10 Maximum value = 1024
strictcachecks	<String>	Read-write	Enable strict CA certificate checks on the appliance. Default value: NO Possible values = YES, NO
ssltriggertimeout	<Integer>	Read-write	Time, in milliseconds, after which encryption is triggered for transactions that are not tracked on the Citrix ADC because their length is not known. There can be a delay of up to 10ms from the specified timeout value before the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packet is pushed into the queue. Default value: 100 Minimum value = 1 Maximum value = 200
sendclosenotify	<String>	Read-write	Send an SSL Close-Notify message to the client at the end of a transaction. Default value: YES Possible values = YES, NO
encrypttriggerpktcount	<Integer>	Read-write	Maximum number of queued packets after which encryption is triggered. Use this setting for SSL transactions that send small packets from server to Citrix ADC. Default value: 45 Minimum value = 10 Maximum value = 50
denysslreneg	<String>	Read-write	Deny renegotiation in specified circumstances. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* NO - Allow SSL renegotiation. * FRONTEND_CLIENT - Deny secure and nonsecure SSL renegotiation initiated by the client. * FRONTEND_CLIENTSERVER - Deny secure and nonsecure SSL renegotiation initiated by the client or the Citrix ADC during policy-based client authentication. * ALL - Deny all secure and nonsecure SSL renegotiation. * NONSECURE - Deny nonsecure SSL renegotiation. Allows only clients that support RFC 5746. Default value: ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NO, FRONTEND_CLIENT, FRONTEND_CLIENTSERVER, ALL, NONSECURE
insertionencoding	<String>	Read-write	Encoding method used to insert the subject or issuer's name in HTTP requests to servers. Default value: Unicode Possible values = Unicode, UTF-8
ocspcachesize	<Integer>	Read-write	Size, per packet engine, in megabytes, of the OCSP cache. A maximum of 10% of the packet engine memory can be assigned. Because the maximum allowed packet engine memory is 4GB, the maximum value that can be assigned to the OCSP cache is approximately 410 MB. Default value: 10 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 512
pushflag	<Integer>	Read-write	Insert PUSH flag into decrypted, encrypted, or all records. If the PUSH flag is set to a value other than 0, the buffered records are forwarded on the basis of the value of the PUSH flag. Available settings function as follows: 0 - Auto (PUSH flag is not set.) 1 - Insert PUSH flag into every decrypted record. 2 -Insert PUSH flag into every encrypted record. 3 - Insert PUSH flag into every decrypted and encrypted record. Minimum value = 0 Maximum value = 3
dropreqwithnohostheader	<String>	Read-write	Host header check for SNI enabled sessions. If this check is enabled and the HTTP request does not contain the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			host header for SNI enabled sessions(i.e vserver or profile bound to vserver has SNI enabled and 'Client Hello' arrived with SNI extension), the request is dropped. Default value: NO Possible values = YES, NO
snihttphostmatch	<String>	Read-write	Controls how the HTTP 'Host' header value is validated. These checks are performed only if the session is SNI enabled (i.e when vserver or profile bound to vserver has SNI enabled and 'Client Hello' arrived with SNI extension) and HTTP request contains 'Host' header. Available settings function as follows: CERT - Request is forwarded if the 'Host' value is covered

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by the certificate used to establish this SSL session. Note: 'CERT' matching mode cannot be applied in TLS 1.3 connections established by resuming from a previous TLS 1.3 session. On these connections, 'STRICT' matching mode will be used instead. STRICT - Request is forwarded only if value of 'Host' header in HTTP is identical to the 'Server name' value passed in 'Client Hello' of the SSL connection. NO - No validation is performed on the HTTP 'Host' header value.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: CERT Possible values = NO, CERT, STRICT
pushenctriggertimeout	<Integer>	Read-write	PUSH encryption trigger timeout value. The timeout value is applied only if you set the Push Encryption Trigger parameter to Timer in the SSL virtual server settings. Default value: 1 Minimum value = 1 Maximum value = 200
cryptodevdisablelimit	<Integer>	Read-write	Limit to the number of disabled SSL chips after which the ADC restarts. A value of zero implies that the ADC does not automatically restart. Default value: 0
undefactioncontrol	<String>	Read-write	Name of the undefined built-in control action: CLIENTAUTH, NOCLIENTAUTH, NOOP, RESET, or DROP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: "CLIENTAUTH"
undefactiondata	<String>	Read-write	Name of the undefined built-in data action: NOOP, RESET or DROP. Default value: "NOOP"
defaultprofile	<String>	Read-write	Global parameter used to enable default profile feature. Default value: DISABLED Possible values = ENABLED, DISABLED
softwarecryptothreshold	<Integer>	Read-write	Citrix ADC CPU utilization threshold (in percentage) beyond which crypto operations are not done in software. A value of zero implies that CPU is not utilized for doing crypto in software. Default value: 0 Minimum value = 0 Maximum value = 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hybridfipsmode	<String>	Read-write	When this mode is enabled, system will use additional crypto hardware to accelerate symmetric crypto operations. Default value: DISABLED Possible values = ENABLED, DISABLED
sigdigesttype	<String[]>	Read-write	Signature Digest Algorithms that are supported by appliance. Default value is "ALL" and it will enable the following algorithms depending on the platform. On VPX: ECDSA-SHA1 ECDSA-SHA224 ECDSA-SHA256 ECDSA-SHA384 ECDSA-SHA512 RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-SHA512 DSA-SHA1 DSA-SHA224 DSA-SHA256 DSA-SHA384 DSA-SHA512

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			On MPX with Nitrox-III and coleto cards: RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-SHA512 ECDSA-SHA1 ECDSA-SHA224 ECDSA-SHA256 ECDSA-SHA384 ECDSA-SHA512 Others: RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-SHA512. Note:ALL doesnot include RSA-MD5 for any platform. Default value: ALL Possible values = ALL, RSA-MD5, RSA-SHA1, RSA-SHA224, RSA-SHA256, RSA-SHA384, RSA-SHA512, DSA-SHA1, DSA-SHA224, DSA-SHA256, DSA-SHA384, DSA-SHA512, ECDSA-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SHA1, ECDSA-SHA224, ECDSA-SHA256, ECDSA-SHA384, ECDSA-SHA512
sslierrorcache	<String>	Read-write	Enable or disable dynamically learning and caching the learned information to make the subsequent interception or bypass decision. When enabled, NS does the lookup of this cached data to do early bypass. Default value: DISABLED Possible values = ENABLED, DISABLED
sslimaxerrorcachemem	<Integer>	Read-write	Specify the maximum memory that can be used for caching the learned data. This memory is used as a LRU cache so that the old entries gets replaced with new entry once the set memory limit is fully utilised. A value of 0 decides the limit automatically.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 4294967294
insertcertspace	<String>	Read-write	To insert space between lines in the certificate header of request. Default value: YES Possible values = YES, NO
ndcppcompliancecertcheck	<String>	Read-write	Determines whether or not additional checks are carried out during a TLS handshake when validating an X.509 certificate received from the peer. Settings apply as follows: YES - (1) During certificate verification, ignore the Common Name field (inside the subject name) if Subject Alternative Name X.509 extension is present

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			in the certificate for backend connection. (2) Verify the Extended Key Usage X.509 extension server/client leaf certificate received over the wire is consistent with the peer's role. (applicable for frontend and backend connections) (3) Verify the Basic Constraint CA field set to TRUE for non-leaf certificates. (applicable for frontend, backend connections and CAs bound to the Citrix ADC. NO - (1) Verify the Common Name

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			field (inside the subject name) irrespective of Subject Alternative Name X.509 extension. (2) Ignore the Extended Key Usage X.509 extension for server/client leaf certificate. (3) Do not verify the Basic Constraint CA true flag for non-leaf certificates. Default value: NO Possible values = YES, NO
heterogeneoussslhw	<String>	Read-write	To support both cavium and coleto based platforms in cluster environment, this mode has to be enabled. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
operationqueuelimit	<Integer>	Read-write	Limit in percentage of capacity of the crypto operations queue beyond which new SSL connections are not accepted until the queue is reduced. Default value: 150 Minimum value = 0 Maximum value = 10000
svctls1112disable	<String>	Read-only	Disable TLS 1.1 and 1.2 for dynamic and VPN created services. Default value: NO Possible values = YES, NO
montls1112disable	<String>	Read-only	Disable TLS 1.1 and 1.2 for secure (https) monitors bound to SSL_BRIDGE services. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslparameter **HTTP Method:** PUT

sslpkcs12

Configuration for pkcs12 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
outfile	<String>	Read-write	Name for and, optionally, path to, the output file that contains the certificate and the private key after converting from PKCS#12 to PEM format. /nsconfig/ssl/ is the default path. If importing, the certificate-key pair is stored in PEM format. If exporting, the certificate-key pair is stored in PKCS#12 format. Maximum length = 255
Import	<Boolean>	Read-write	Convert the certificate and private-key from PKCS#12 format to PEM format.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pkcs12file	<String>	Read-write	Name for and, optionally, path to, the PKCS#12 file. If importing, specify the input file name that contains the certificate and the private key in PKCS#12 format. If exporting, specify the output file name that contains the certificate and the private key after converting from PEM to PKCS#12 format. /nsconfig/ssl/ is the default path. During the import operation, if the key is encrypted, you are prompted to enter the pass phrase used for encrypting the key. Maximum length = 255
des	<Boolean>	Read-write	Encrypt the private key by using the DES algorithm in CBC mode during the import operation. On the command line, you are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			prompted to enter the pass phrase.
des3	<Boolean>	Read-write	Encrypt the private key by using the Triple-DES algorithm in EDE CBC mode (168-bit key) during the import operation. On the command line, you are prompted to enter the pass phrase.
aes256	<Boolean>	Read-write	Encrypt the private key by using the AES algorithm (256-bit key) during the import operation. On the command line, you are prompted to enter the pass phrase.
export	<Boolean>	Read-write	Convert the certificate and private key from PEM format to PKCS#12 format. On the command line, you are prompted to enter the pass phrase.
certfile	<String>	Read-write	Certificate file to be converted from PEM to PKCS#12 format. Maximum length = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyfile	<String>	Read-write	Name of the private key file to be converted from PEM to PKCS#12 format. If the key file is encrypted, you are prompted to enter the pass phrase used for encrypting the key. Maximum length = 255
password	<String>	Read-write	. Minimum length = 1 Maximum length = 31
pempassphrase	<String>	Read-write	. Minimum length = 1 Maximum length = 31

sslpolicy

Configuration for SSL policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new SSL policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqaction	<String>	Read-write	The name of the action to be performed on the request. Refer to 'add ssl action' command to add a new action. Builtin actions like NOOP, RESET, DROP, CLIENTAUTH and NOCLIENTAUTH are also allowed. Minimum length = 1
action	<String>	Read-write	Name of the built-in or user-defined action to perform on the request. Available built-in actions are NOOP, RESET, DROP, CLIENTAUTH, NOCLIENTAUTH, INTERCEPT AND BYPASS.
undefaction	<String>	Read-write	Name of the action to be performed when the result of rule evaluation is undefined. Possible values for control policies: CLIENTAUTH, NOCLIENTAUTH, NOOP, RESET, DROP. Possible values for data policies: NOOP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RESET, DROP and BYPASS.
comment	<String>	Read-write	Any comments associated with this policy.
hits	<Integer>	Read-only	Number of hits.
undefhits	<Integer>	Read-only	Number of Undef hits.
description	<String>	Read-only	Description of the policy.
builtin	<String[]>	Read-only	Flag to determine if SSL policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **view=summary**

Use this query-parameter to get the summary output of sslpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslpolicy": [ { "__count": "#no"} ] }
```

sslpolicy_binding

Binding object which returns the resources bound to sslpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the SSL policy for which to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			display detailed information. Minimum length = 1
sslpolicy_lbvserver_binding	<sslpolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to sslpolicy.
sslpolicy_sslservice_binding	<sslpolicy_sslservice_binding[]>	Read-only	sslservice that can be bound to sslpolicy.
sslpolicy_sslvserver_binding	<sslpolicy_sslvserver_binding[]>	Read-only	sslvserver that can be bound to sslpolicy.
sslpolicy_sslglobal_binding	<sslpolicy_sslglobal_binding[]>	Read-only	sslglobal that can be bound to sslpolicy.
sslpolicy_sslpolicylabel_binding	<sslpolicy_sslpolicylabel_binding[]>	Read-only	sslpolicylabel that can be bound to sslpolicy.
sslpolicy_csvserver_binding	<sslpolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to sslpolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslpolicy_binding": [ {

"name":<String_value>,
```

```
"sslpolicy_lbvserver_binding":<sslpolicy_lbvserver_binding[]_value>,

"sslpolicy_csvserver_binding":<sslpolicy_csvserver_binding[]_value>,

"sslpolicy_sslservice_binding":<sslpolicy_sslservice_binding[]_value>,

"sslpolicy_sslpolicylabel_binding":<sslpolicy_sslpolicylabel_binding[]_val
ue>,

"sslpolicy_sslglobal_binding":<sslpolicy_sslglobal_binding[]_value>,

"sslpolicy_sslvserver_binding":<sslpolicy_sslvserver_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslpolicy_binding": [ {

"name":<String_value>,

"sslpolicy_lbvserver_binding":<sslpolicy_lbvserver_binding[]_value>,

"sslpolicy_csvserver_binding":<sslpolicy_csvserver_binding[]_value>,

"sslpolicy_sslservice_binding":<sslpolicy_sslservice_binding[]_value>,

"sslpolicy_sslpolicylabel_binding":<sslpolicy_sslpolicylabel_binding[]_val
ue>,

"sslpolicy_sslglobal_binding":<sslpolicy_sslglobal_binding[]_value>,

"sslpolicy_sslvserver_binding":<sslpolicy_sslvserver_binding[]_value>

}]}
```

sslpolicy_csvserver_binding

Binding object showing the csvserver that can be bound to sslpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the SSL policy for which to display detailed information. Minimum length = 1
activepolicy	<Integer>	Read-only	.
priority	<Integer>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

Operations

```

sslpolicy_sslservice_binding

Binding object showing the sslservice that can be bound to sslpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the SSL policy for which to display detailed information. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy rule evaluates to TRUE.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
priority	<Integer>	Read-only	.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel
activepolicy	<Integer>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_sslservice_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ sslpolicy_sslservice_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslpolicy_sslservice_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_sslservice_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslpolicy_sslservice_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslpolicy_sslservice_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"gotopriorityexpression":<String_value>,

"labelname":<String_value>,

"priority":<Integer_value>,

"labeltype":<String_value>,

"activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_sslservice_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_sslservice_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

sslpolicylabel

Configuration for SSL policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the SSL policy label. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy label is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my label" or 'my label').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of policies that the policy label can contain. Possible values = CONTROL, DATA, HTTPQUIC_CONTROL, HTTPQUIC_DATA
numpol	<Integer>	Read-only	Number of polices bound to label.
hits	<Integer>	Read-only	Number of times policy label was invoked.
policyname	<String>	Read-only	Name of the SSL policy to bind to the policy label.
priority	<Integer>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-only	Invoke flag.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke_labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
flowtype	<Integer>	Read-only	Flowtype of the bound SSL policy.
description	<String>	Read-only	Description of the policylabel.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```
{"sslpolicylabel_sslpolicy_binding": [ { "__count": "#no"} ] }
```

sslprofile

Configuration for SSL profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SSL profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created. Minimum length = 1 Maximum length = 127
sslprofiletype	<String>	Read-write	Type of profile. Front end profiles apply to the entity that receives requests from a client. Backend profiles apply to the entity

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that sends client requests to a server. Default value: FrontEnd Possible values = BackEnd, FrontEnd, QUIC-FrontEnd, QUIC-BackEnd
ssllogprofile	<String>	Read-write	The name of the ssllogprofile. Minimum length = 1 Maximum length = 127
dhcount	<Integer>	Read-write	Number of interactions, between the client and the Citrix ADC, after which the DH private-public pair is regenerated. A value of zero (0) specifies refresh every time. This parameter is not applicable when configuring a backend profile. Allowed DH count values are 0 and >= 500. Minimum value = 0 Maximum value = 65534

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dh	<String>	Read-write	State of Diffie-Hellman (DH) key exchange. This parameter is not applicable when configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
dhfile	<String>	Read-write	The file name and path for the DH parameter. Minimum length = 1
ersa	<String>	Read-write	State of Ephemeral RSA (eRSA) key exchange. Ephemeral RSA allows clients that support only export ciphers to communicate with the secure server even if the server certificate does not support export clients. The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			When you remove the export cipher, the eRSA key is not deleted. It is reused at a later date when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when the appliance restarts. This parameter is not applicable when configuring a backend profile. Default value: ENABLED Possible values = ENABLED, DISABLED
ersacount	<Integer>	Read-write	The refresh count for the re-generation of RSA public-key and private-key pair. Minimum value = 0 Maximum value = 65534
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Integer>	Read-write	The Session timeout value in seconds. Minimum value = 0 Maximum value = 4294967294
cipherredirect	<String>	Read-write	State of Cipher Redirect. If this parameter is set to ENABLED, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a cipher mismatch between the virtual server or service and the client. This parameter is not applicable when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-write	The redirect URL to be used with the Cipher Redirect feature.
clientauth	<String>	Read-write	State of client authentication. In service-based SSL offload, the service terminates the SSL handshake if the SSL client does not provide a valid certificate. This parameter is not applicable when configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
clientcert	<String>	Read-write	The rule for client certificate requirement in client authentication.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Mandatory, Optional
dhkeyexpsizelimit	<String>	Read-write	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Default value: DISABLED Possible values = ENABLED, DISABLED
sslredirect	<String>	Read-write	State of HTTPS redirects for the SSL service. For an SSL session, if the client browser receives a redirect message, the browser tries to connect to the new location. However, the secure SSL session breaks if the object has moved from a secure site (https://)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to an unsecure site (http://). Typically, a warning message appears on the screen, prompting the user to continue or disconnect. If SSL Redirect is ENABLED, the redirect message is automatically converted from http:// to https:// and the SSL session does not break. This parameter is not applicable when configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-write	State of the port rewrite while performing HTTPS redirect. If this parameter is set to ENABLED, and the URL from the server does not contain the standard port, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			port is rewritten to the standard. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL profile. Note: On platforms with SSL acceleration chips, if the SSL chip does not support SSLv3, this parameter cannot be set to ENABLED. Default value: DISABLED Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL profile. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL profile. Default value: ENABLED Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL profile. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL profile. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the virtual server and service-based offload. SNI helps to enable SSL encryption on multiple domains on a single virtual server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
allowunknownsni	<String>	Read-write	Controls how the handshake is handled when the server name extension does not match any of the bound certificates. These checks are performed only if the session is SNI enabled (i.e. when profile bound to vserver has SNIEnable and Client Hello arrived with SNI extension). Available settings function as follows : ENABLED - handshakes with an unknown SNI are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			allowed to continue, if a default cert is bound. DISLABED - handshakes with an unknown SNI are not allowed to continue. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL handshake with the client, the OCSP-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. . Default value: DISABLED Possible values = ENABLED, DISABLED
serverauth	<String>	Read-write	State of server authentication support for the SSL Backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
commonname	<String>	Read-write	Name to be checked against the CommonName (CN) field in the server certificate bound to the SSL server. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pushenctrigger	<String>	Read-write	Trigger encryption on the basis of the PUSH flag value. Available settings function as follows: * ALWAYS - Any PUSH packet triggers encryption. * IGNORE - Ignore PUSH packet for triggering encryption. * MERGE - For a consecutive sequence of PUSH packets, the last PUSH packet triggers encryption. * TIMER - PUSH packet triggering encryption is delayed by the time defined in the set ssl parameter command or in the Change Advanced SSL Settings dialog box. Possible values = Always, Merge, Ignore, Timer

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
cleartextport	<Integer>	Read-write	Port on which clear-text data is sent by the appliance to the server. Do not specify this parameter for SSL offloading with end-to-end encryption. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
insertionencoding	<String>	Read-write	Encoding method used to insert the subject or issuer's name in HTTP requests to servers. Default value: Unicode Possible values = Unicode, UTF-8
denysslreneg	<String>	Read-write	Deny renegotiation in specified circumstances. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* NO - Allow SSL renegotiation. * FRONTEND_CLIENT - Deny secure and nonsecure SSL renegotiation initiated by the client. * FRONTEND_CLIENTSERVER - Deny secure and nonsecure SSL renegotiation initiated by the client or the Citrix ADC during policy-based client authentication. * ALL - Deny all secure and nonsecure SSL renegotiation. * NONSECURE - Deny nonsecure SSL renegotiation. Allows only clients that support RFC 5746. Default value: ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NO, FRONTEND_CLIENT, FRONTEND_CLIENTSERVER, ALL, NONSECURE
maxrenegrate	<Integer>	Read-write	Maximum number of renegotiation requests allowed, in one second, to each SSL entity to which this profile is bound. When set to 0, an unlimited number of renegotiation requests are allowed. Applicable only when Deny SSL renegotiation is set to a value other than ALL. Default value: 0 Minimum value = 0 Maximum value = 65535
quantumsize	<String>	Read-write	Amount of data to collect before the data is pushed to the crypto hardware for encryption. For large downloads, a larger quantum size better utilizes the crypto resources.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 8192 Possible values = 4096, 8192, 16384
strictcachecks	<String>	Read-write	Enable strict CA certificate checks on the appliance. Default value: NO Possible values = YES, NO
encrypttriggerpktcount	<Integer>	Read-write	Maximum number of queued packets after which encryption is triggered. Use this setting for SSL transactions that send small packets from server to Citrix ADC. Default value: 45 Minimum value = 10 Maximum value = 50
pushflag	<Integer>	Read-write	Insert PUSH flag into decrypted, encrypted, or all records. If the PUSH flag is set to a value other than 0, the buffered records are forwarded on the basis of the value of the PUSH flag. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			0 - Auto (PUSH flag is not set.) 1 - Insert PUSH flag into every decrypted record. 2 -Insert PUSH flag into every encrypted record. 3 - Insert PUSH flag into every decrypted and encrypted record. Minimum value = 0 Maximum value = 3
dropreqwithnohostheader	<String>	Read-write	Host header check for SNI enabled sessions. If this check is enabled and the HTTP request does not contain the host header for SNI enabled sessions(i.e vserver or profile bound to vserver has SNI enabled and 'Client Hello' arrived with SNI extension), the request is dropped. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
snihttphostmatch	<String>	Read-write	Controls how the HTTP 'Host' header value is validated. These checks are performed only if the session is SNI enabled (i.e when vserver or profile bound to vserver has SNI enabled and 'Client Hello' arrived with SNI extension) and HTTP request contains 'Host' header. Available settings function as follows: CERT - Request is forwarded if the 'Host' value is covered by the certificate used to establish this SSL session. Note: 'CERT' matching mode cannot be applied in TLS 1.3 connections established by resuming from a previous TLS 1.3 session. On these

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connections, 'STRICT' matching mode will be used instead. STRICT - Request is forwarded only if value of 'Host' header in HTTP is identical to the 'Server name' value passed in 'Client Hello' of the SSL connection. NO - No validation is performed on the HTTP 'Host' header value. Default value: CERT Possible values = NO, CERT, STRICT
pushenctriggertimeout	<Integer>	Read-write	PUSH encryption trigger timeout value. The timeout value is applied only if you set the Push Encryption Trigger parameter to Timer in the SSL virtual server settings. Default value: 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 200
ssltriggertimeout	<Integer>	Read-write	Time, in milliseconds, after which encryption is triggered for transactions that are not tracked on the Citrix ADC because their length is not known. There can be a delay of up to 10ms from the specified timeout value before the packet is pushed into the queue. Default value: 100 Minimum value = 1 Maximum value = 200
clientauthuseboundcachain	<String>	Read-write	Certficates bound on the VIP are used for validating the client cert. Certficates came along with client cert are not used for validating the client cert. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
sslinterception	<String>	Read-write	Enable or disable transparent interception of SSL sessions. Default value: DISABLED Possible values = ENABLED, DISABLED
sslireneg	<String>	Read-write	Enable or disable triggering the client renegotiation when renegotiation request is received from the origin server. Default value: ENABLED Possible values = ENABLED, DISABLED
ssliocspcheck	<String>	Read-write	Enable or disable OCSP check for origin server certificate. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslimaxsessperserver	<Integer>	Read-write	Maximum ssl session to be cached per dynamic origin server. A unique ssl session is created for each SNI received from the client on ClientHello and the matching session is used for server session reuse. Default value: 10 Minimum value = 1 Maximum value = 1000
sessionticket	<String>	Read-write	This option enables the use of session tickets, as per the RFC 5077. Default value: DISABLED Possible values = ENABLED, DISABLED
sessionticketlifetime	<Integer>	Read-write	This option sets the life time of session tickets issued by NS in secs. Default value: 300 Minimum value = 0 Maximum value = 172800

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessionticketkeyrefresh	<String>	Read-write	This option enables the use of session tickets, as per the RFC 5077. Default value: ENABLED Possible values = ENABLED, DISABLED
sessionticketkeydata	<String>	Read-write	Session ticket enc/dec key , admin can set it.
sessionkeylifetime	<Integer>	Read-write	This option sets the life time of symm key used to generate session tickets issued by NS in secs. Default value: 3000 Minimum value = 600 Maximum value = 86400
prevsessionkeylifetime	<Integer>	Read-write	This option sets the life time of symm key used to generate session tickets issued by NS in secs. Default value: 0 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 172800
hsts	<String>	Read-write	State of HSTS protocol support for the SSL profile. Using HSTS, a server can enforce the use of an HTTPS connection for all communication with a client. Default value: DISABLED Possible values = ENABLED, DISABLED
maxage	<Integer>	Read-write	Set the maximum time, in seconds, in the strict transport security (STS) header during which the client must send only HTTPS requests to the server. Default value: 0 Minimum value = 0 Maximum value = 4294967294
includesubdomains	<String>	Read-write	Enable HSTS for subdomains. If set to Yes, a client must send only HTTPS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requests for subdomains. Default value: NO Possible values = YES, NO
preload	<String>	Read-write	Flag indicates the consent of the site owner to have their domain preloaded. Default value: NO Possible values = YES, NO
skipclientcertpolicycheck	<String>	Read-write	This flag controls the processing of X509 certificate policies. If this option is Enabled, then the policy check in Client authentication will be skipped. This option can be used only when Client Authentication is Enabled and ClientCert is set to Mandatory. Default value: DISABLED Possible values = ENABLED, DISABLED
zerorttearlydata	<String>	Read-write	State of TLS 1.3 0-RTT early data support for the SSL Virtual Server. This

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			setting only has an effect if resumption is enabled, as early data cannot be sent along with an initial handshake. Early application data has significantly different security properties - in particular there is no guarantee that the data cannot be replayed. Default value: DISABLED Possible values = ENABLED, DISABLED
tls13sessionticketsperauthcontext	<Integer>	Read-write	Number of tickets the SSL Virtual Server will issue anytime TLS 1.3 is negotiated, ticket-based resumption is enabled, and either (1) a handshake completes or (2) post-handhsake client auth completes. This value can be increased to enable clients to open multiple parallel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connections using a fresh ticket for each connection. No tickets are sent if resumption is disabled. Default value: 1 Minimum value = 1 Maximum value = 10
dhekeyexchangewithpsk	<String>	Read-write	Whether or not the SSL Virtual Server will require a DHE key exchange to occur when a PSK is accepted during a TLS 1.3 resumption handshake. A DHE key exchange ensures forward secrecy even in the event that ticket keys are compromised, at the expense of an additional round trip and resources required to carry out the DHE key exchange. If disabled, a DHE key exchange will be performed when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a PSK is accepted but only if requested by the client. If enabled, the server will require a DHE key exchange when a PSK is accepted regardless of whether the client supports combined PSK-DHE key exchange. This setting only has an effect when resumption is enabled. Default value: NO Possible values = YES, NO
allowextendedmaster secret	<String>	Read-write	When set to YES, attempt to use the TLS Extended Master Secret (EMS, as described in RFC 7627) when negotiating TLS 1.0, TLS 1.1 and TLS 1.2 connection parameters. EMS must be supported

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by both the TLS client and server in order to be enabled during a handshake. This setting applies to both frontend and backend SSL profiles. Default value: NO Possible values = YES, NO
allowlegacykdf	<String>	Read-write	FIPS 140-3 certification requires all handshakes without EMS be blocked. Such KDFs are allowed by default. This setting is to allow/disallow such legacy KDFs when needed. This setting applies to both frontend and backend SSL profiles. Default value: YES Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
alpnprotocol	<String>	Read-write	Application protocol supported by the server and used in negotiation of the protocol with the client. Possible values are HTTP1.1, HTTP2 and NONE. Default value is NONE which implies application protocol is not enabled hence remain unknown to the TLS layer. This parameter is relevant only if SSL connection is handled by the virtual server of the type SSL_TCP. Default value: NONE Possible values = NONE, HTTP1.1, HTTP2
encryptedclienthello	<String>	Read-write	State of TLS 1.3 Encrypted Client Hello Support. Default value: DISABLED Possible values = ENABLED, DISABLED
defaultsni	<String>	Read-write	Default domain name supported by the SSL virtual

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server. The parameter is effective, when zero touch certificate management is active for the SSL virtual server i.e. no manual SNI cert or default server cert is bound to the v-server. For SSL transactions, when SNI is not presented by the client, server-certificate corresponding to the default SNI, if available in the cert-store, is selected else connection is terminated. Minimum length = 1 Maximum length = 126
sslclientlogs	<String>	Read-write	When enabled, NetScaler will log the session ID and SNI name during SSL handshakes on both the external and internal interfaces. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
strictclientekucheck	<String>	Read-write	Enable strict EKU extension check during client authentication. Default value: ENABLED Possible values = ENABLED, DISABLED
dynamicclientcert	<String>	Read-write	Enable or disable Dynamic Client Certificate Generation for SSL sessions. Default value: DISABLED Possible values = ENABLED, DISABLED
ciphername	<String>	Read-write	The cipher group/ alias/individual cipher configuration.
cipherpriority	<Integer>	Read-write	cipher priority. Minimum value = 1
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer entity certificate during TLS1.2 handshake is signed with one of signature-hash combination supported by Citrix ADC.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
nonfipsciphers	<String>	Read-only	State of usage of ciphers that are not FIPS approved. Valid only for an SSL service bound with a FIPS key and certificate. Default value: DISABLED Possible values = ENABLED, DISABLED
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
snicert	<Boolean>	Read-only	The name of the CertKey. Use this option to bind Certkey(s) which will

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be used in SNI processing.
skipcaname	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
invoke	<Boolean>	Read-only	Invoke flag. This attribute is relevant only for ADVANCED policies.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel
service	<Integer>	Read-only	Service.
builtin	<String[]>	Read-only	Flag to determine whether ssl profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
sslpfobjecttype	<Integer>	Read-only	Internal flag to indicate what type of object binds this profile: monitor or service.
ssliverifyservercertforreuse	<String>	Read-only	Verify the origin server's certificate before reusing the front-end SSL session. Making it hidden since we always verify for now. Default value: ENABLED Possible values = ENABLED, DISABLED
nodefaultbindings	<String>	Read-only	When set to YES, the SSL profile will not have default Cipher and Elliptic Curve bindings. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslprofile? **view=summary**

Use this query-parameter to get the summary output of sslprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslprofile resources in chunks.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslprofile": [ { "__count": "#no"} ] }
```

sslprofile_binding

Binding object which returns the resources bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the SSL profile for which to show detailed information. Minimum length = 1 Maximum length = 127
sslprofile_sslvserver_binding	<sslprofile_sslvserver_binding[]>	Read-only	sslvserver that can be bound to sslprofile.
sslprofile_sslechconfig_binding	<sslprofile_sslechconfig_binding[]>	Read-only	sslechconfig that can be bound to sslprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslprofile_sslcipher_binding	<sslprofile_sslcipher_binding[]>	Read-only	sslcipher that can be bound to sslprofile.
sslprofile_sslcertkey_binding	<sslprofile_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslprofile.
sslprofile_ecccurve_binding	<sslprofile_ecccurve_binding[]>	Read-only	ecccurve that can be bound to sslprofile.
sslprofile_sslciphersuite_binding	<sslprofile_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslprofile.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslprofile_binding": [ {

"name":<String_value>,

"sslprofile_sslciphersuite_binding":<sslprofile_sslciphersuite_binding[]_value>,

"sslprofile_sslechconfig_binding":<sslprofile_sslechconfig_binding[]_value>,

"sslprofile_sslcipher_binding":<sslprofile_sslcipher_binding[]_value>,

"sslprofile_ecccurve_binding":<sslprofile_ecccurve_binding[]_value>,

"sslprofile_sslcertkey_binding":<sslprofile_sslcertkey_binding[]_value>,
```

```
"sslprofile_sslvserver_binding":<sslprofile_sslvserver_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslprofile_binding": [ {

"name":<String_value>,

"sslprofile_sslciphersuite_binding":<sslprofile_sslciphersuite_binding[]_value>,

"sslprofile_sslechconfig_binding":<sslprofile_sslechconfig_binding[]_value>,

"sslprofile_sslcipher_binding":<sslprofile_sslcipher_binding[]_value>,
```

```
"sslprofile_ecccurve_binding":<sslprofile_ecccurve_binding[]_value>,

"sslprofile_sslcertkey_binding":<sslprofile_sslcertkey_binding[]_value>,

"sslprofile_sslvserver_binding":<sslprofile_sslvserver_binding[]_value>

}]}
```

sslprofile_ecccurve_binding

Binding object showing the ecccurve that can be bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ecccurvename	<String>	Read-write	Named ECC curve bound to vserver/ service. Possible values = ALL, P_224, P_256, P_384, P_521, X_25519, X25519_MLKEM768
cipherpriority	<Integer>	Read-write	Priority of the cipher binding. Minimum value = 1 Maximum value = 1000
name	<String>	Read-write	Name of the SSL profile. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
__count	<Double>	Read-write	count parameter

"forgingcacertkey":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_forgingcacertkey_binding/ name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_forgingcacertkey_binding/ name_value<String> ? **args=forgingcacertkey: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_forgingcacertkey_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_forgingcacertkey_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslprofile_forgingcacertkey_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_forgingcacertkey_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslprofile_forgingcacertkey_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslprofile_forgingcacertkey_binding": [ {

"name":<String_value>,

"cipherpriority":<Integer_value>,

"forgingcacertkey":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_forgingcacertkey_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_forgingcacertkey_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslprofile_forgingcacertkey_binding": [ {

"name":<String_value>,

"cipherpriority":<Integer_value>,

"forgingcacertkey":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_forgingcacertkey_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslprofile_forgingcacertkey_binding": [ { "__count": "#no"} ] }
```

sslprofile_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the SSL profile. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
cipherpriority	<Integer>	Read-write	Priority of the cipher binding. Minimum value = 1 Maximum value = 1000
forgingcacertkey	<Boolean>	Read-write	The certkey (CA certificate + private key) to be used for signing Forged Client Certificate.
certkeyname	<String>	Read-write	The certkey (CA certificate + private key) to be bound with profile.
sslicacertkey	<String>	Read-write	The certkey (CA certificate + private key) to be used for SSL interception.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslprofile_sslcertkey_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslprofile_sslcertkey_binding":{

<b>"name":<String_value>,
```

```
</b>"cipherpriority":<Integer_value>,

"certkeyname":<String_value>,

"forgingcacertkey":<Boolean_value>,

"sslicacertkey":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding/ name_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ sslprofile_sslcertkey_binding/ name_value<String> ? **args=certkeyname: <String_value> ,forgingcacertkey: <Boolean_value> ,sslicacertkey: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ sslprofile_sslcertkey_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslprofile_sslcertkey_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslprofile_sslcertkey_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslprofile_sslcertkey_binding": [ {

"name":<String_value>,

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslprofile_sslechconfig_binding": [ { "__count": "#no"} ] }
```

sslprofile_sslvserver_binding

Binding object showing the sslvserver that can be bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
description	<String>	Read-write	The cipher suite description.
servicename	<String>	Read-write	Service name.
cipherpriority	<Integer>	Read-write	Priority of the cipher binding. Minimum value = 1 Maximum value = 1000
name	<String>	Read-write	Name of the SSL profile. Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ sslprofile_sslvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslprofile_sslvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslprofile_sslvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslprofile_sslvserver_binding": [ {

"description":<String_value>,

"servicename":<String_value>,

"cipherpriority":<Integer_value>,

"name":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslprofile_sslvserver_binding": [ {

"description":<String_value>,

"servicename":<String_value>,

"cipherpriority":<Integer_value>,

"name":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslprofile_sslvserver_binding": [ { "__count": "#no"} ] }
```

sslrsakey

Configuration for RSA key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyfile	<String>	Read-write	Name for and, optionally, path to the RSA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
bits	<Integer>	Read-write	Size, in bits, of the RSA key. Minimum value = 512 Maximum value = 4096
exponent	<String>	Read-write	Public exponent for the RSA key. The exponent is part of the cipher algorithm and is required for creating the RSA key. Default value: F4 Possible values = 3, F4

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyform	<String>	Read-write	Format in which the RSA key file is stored on the appliance. Default value: PEM Possible values = DER, PEM
des	<Boolean>	Read-write	Encrypt the generated RSA key by using the DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
des3	<Boolean>	Read-write	Encrypt the generated RSA key by using the Triple-DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
aes256	<Boolean>	Read-write	Encrypt the generated RSA key by using the AES algorithm.
password	<String>	Read-write	Pass phrase to use for encryption if DES or DES3 option is selected. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 31
pkcs8	<Boolean>	Read-write	Create the private key in PKCS#8 format.

Operations

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslrsakey? **action=create HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslrsakey":{

<b>"keyfile":<String_value>,

</b><b>"bits":<Integer_value>,

</b>"exponent":<String_value>,

"keyform":<String_value>,

"des":<Boolean_value>,

"des3":<Boolean_value>,

"aes256":<Boolean_value>,

"password":<String_value>,

"pkcs8":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslservice

Configuration for SSL service resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name of the SSL service. Minimum length = 1
dh	<String>	Read-write	State of Diffie-Hellman (DH) key exchange. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
dhfile	<String>	Read-write	Name for and, optionally, path to the PEM-format DH parameter file to be installed. /nsconfig/ssl/ is the default path. This parameter is not applicable when configuring a backend service. Minimum length = 1
dhcount	<Integer>	Read-write	Number of interactions, between the client and the Citrix ADC, after which the DH private-public pair is regenerated. A value

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of zero (0) specifies refresh every time. This parameter is not applicable when configuring a backend service. Allowed DH count values are 0 and >= 500. Minimum value = 0 Maximum value = 65534
dhkeyexpsizelimit	<String>	Read-write	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Default value: DISABLED Possible values = ENABLED, DISABLED
ersa	<String>	Read-write	State of Ephemeral RSA (eRSA) key exchange. Ephemeral RSA allows clients that support only export

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ciphers to communicate with the secure server even if the server certificate does not support export clients. The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted. It is reused at a later date when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when the appliance restarts. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ersacount	<Integer>	Read-write	Refresh count for regeneration of RSA public-key and private-key pair. Zero (0) specifies infinite usage (no refresh). This parameter is not applicable when configuring a backend service. Minimum value = 0 Maximum value = 65534
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Integer>	Read-write	Time, in seconds, for which to keep the session active. Any

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			session resumption request received after the timeout period will require a fresh SSL handshake and establishment of a new SSL session. Default value: 300 Minimum value = 0 Maximum value = 4294967294
cipherredirect	<String>	Read-write	State of Cipher Redirect. If this parameter is set to ENABLED, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a cipher mismatch between the virtual server or service and the client. This parameter is not applicable when configuring a backend service. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-write	URL of the page to which to redirect the client in case of a cipher mismatch. Typically, this page has a clear explanation of the error or an alternative location that the transaction can continue from. This parameter is not applicable when configuring a backend service.
sslv2redirect	<String>	Read-write	State of SSLv2 Redirect. If this parameter is set to ENABLED, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a protocol version mismatch between the virtual server or service and the client. This parameter is not applicable when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
sslv2url	<String>	Read-write	URL of the page to which to redirect the client in case of a protocol version mismatch. Typically, this page has a clear explanation of the error or an alternative location that the transaction can continue from. This parameter is not applicable when configuring a backend service.
clientauth	<String>	Read-write	State of client authentication. In service-based SSL offload, the service terminates the SSL handshake if the SSL client does not provide a valid certificate. This parameter is not applicable when configuring a backend service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
clientcert	<String>	Read-write	Type of client authentication. If this parameter is set to MANDATORY, the appliance terminates the SSL handshake if the SSL client does not provide a valid certificate. With the OPTIONAL setting, the appliance requests a certificate from the SSL clients but proceeds with the SSL transaction even if the client presents an invalid certificate. This parameter is not applicable when configuring a backend SSL service. Caution: Define proper access control policies before changing this setting to Optional. Possible values = Mandatory, Optional

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslredirect	<String>	Read-write	State of HTTPS redirects for the SSL service. For an SSL session, if the client browser receives a redirect message, the browser tries to connect to the new location. However, the secure SSL session breaks if the object has moved from a secure site (https://) to an unsecure site (http://). Typically, a warning message appears on the screen, prompting the user to continue or disconnect. If SSL Redirect is ENABLED, the redirect message is automatically converted from http:// to https:// and the SSL session does not break. This parameter is not applicable when configuring a backend service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-write	State of the port rewrite while performing HTTPS redirect. If this parameter is set to ENABLED, and the URL from the server does not contain the standard port, the port is rewritten to the standard. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl2	<String>	Read-write	State of SSLv2 protocol support for the SSL service. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL service. Note: On platforms with SSL acceleration chips, if the SSL chip does not support SSLv3, this parameter cannot be set to ENABLED. Default value: ENABLED Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL service. Default value: DISABLED Possible values = ENABLED, DISABLED
dtls1	<String>	Read-write	State of DTLSv1.0 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED
dtls12	<String>	Read-write	State of DTLSv1.2 protocol support for the SSL service. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the virtual server and service-based offload. SNI helps to enable SSL encryption on multiple domains on a single virtual server or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL handshake with the client, the OCSP-based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. . Default value: DISABLED Possible values = ENABLED, DISABLED
serverauth	<String>	Read-write	State of server authentication support for the SSL service. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
commonname	<String>	Read-write	Name to be checked against the CommonName (CN) field in the server certificate bound to the SSL server. Minimum length = 1
pushenctrigger	<String>	Read-write	Trigger encryption on the basis of the PUSH flag value. Available settings function as follows: * ALWAYS - Any PUSH packet triggers encryption. * IGNORE - Ignore PUSH packet for triggering encryption. * MERGE - For a consecutive sequence of PUSH packets, the last PUSH packet triggers encryption. * TIMER - PUSH packet triggering encryption is delayed by the time defined in the set ssl parameter

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			command or in the Change Advanced SSL Settings dialog box. Possible values = Always, Merge, Ignore, Timer
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
dtlsprofilename	<String>	Read-write	Name of the DTLS profile that contains DTLS settings for the service. Minimum length = 1 Maximum length = 127
sslprofile	<String>	Read-write	Name of the SSL profile that contains SSL settings for the service. Minimum length = 1 Maximum length = 127
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer's certificate during TLS1.2 handshake is signed with one of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			signature-hash combination supported by Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
sslclientlogs	<String>	Read-write	This parameter is used to enable or disable the logging of additional information, such as the Session ID and SNI name, from SSL handshakes to the audit logs. Default value: DISABLED Possible values = ENABLED, DISABLED
strictclientekucheck	<String>	Read-write	Enable strict EKU extension check during client authentication. This can be set to DISABLED only for SSL service types Internal and Transparent. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
nonfipsciphers	<String>	Read-only	The state of usage of non FIPS approved ciphers. Default value: DISABLED Possible values = ENABLED, DISABLED
service	<Integer>	Read-only	.
skipcaname	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
dtlsflag	<Boolean>	Read-only	The flag is used to indicate whether DTLS is set or not.
quicflag	<Boolean>	Read-only	This flag is used to indicate the use of the QUIC transport protocol by a virtual server or service.
skipcacertbundle	<Boolean>	Read-only	The flag is used to indicate whether all CA_names in this particular CA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate bundle needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslservice": [ { "__count": "#no"} ] }
```

sslservice_binding

Binding object which returns the resources bound to sslservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name of the SSL service for which to show detailed information. Minimum length = 1
sslservice_ecccurve_binding	<sslservice_ecccurve_binding[]>	Read-only	ecccurve that can be bound to sslservice.
sslservice_sslcertkey_binding	<sslservice_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslservice.
sslservice_sslcipher_binding	<sslservice_sslcipher_binding[]>	Read-only	sslcipher that can be bound to sslservice.
sslservice_sslciphersuite_binding	<sslservice_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslservice.
sslservice_sslcacertbundle_binding	<sslservice_sslcacertbundle_binding[]>	Read-only	sslcacertbundle that can be bound to sslservice.
sslservice_sslpolicy_binding	<sslservice_sslpolicy_binding[]>	Read-only	sslpolicy that can be bound to sslservice.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_binding/ servicename_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslservice_binding": [ {

"servicename":<String_value>,
```

```
"sslservice_sslcertkey_binding":<sslservice_sslcertkey_binding[]_value>,

"sslservice_sslcacertbundle_binding":<sslservice_sslcacertbundle_binding[]
_value>,

"sslservice_sslciphersuite_binding":<sslservice_sslciphersuite_binding[]_v
alue>,

"sslservice_sslpolicy_binding":<sslservice_sslpolicy_binding[]_value>,

"sslservice_ecccurve_binding":<sslservice_ecccurve_binding[]_value>,

"sslservice_sslcipher_binding":<sslservice_sslcipher_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslservice_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslservice_binding": [ {

"servicename":<String_value>,

"sslservice_sslcertkey_binding":<sslservice_sslcertkey_binding[]_value>,

"sslservice_sslcacertbundle_binding":<sslservice_sslcacertbundle_binding[]
_value>,

"sslservice_sslciphersuite_binding":<sslservice_sslciphersuite_binding[]_v
alue>,

"sslservice_sslpolicy_binding":<sslservice_sslpolicy_binding[]_value>,

"sslservice_ecccurve_binding":<sslservice_ecccurve_binding[]_value>,

"sslservice_sslcipher_binding":<sslservice_sslcipher_binding[]_value>

}]}
```

sslservice_ecccurve_binding

Binding object showing the ecccurve that can be bound to sslservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name of the SSL service for which to set advanced configuration. Minimum length = 1
ecccurvename	<String>	Read-write	Named ECC curve bound to service/ vserver. Possible values = ALL, P_224, P_256, P_384, P_521,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			X_25519, X25519_MLKEM768

```

sslservice_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
snicert	<Boolean>	Read-write	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
crlcheck	<String>	Read-write	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
ocspcheck	<String>	Read-write	Rule to use for the OCSP responder associated with the CA certificate during client authentication. If MANDATORY is specified, deny all SSL clients if the OCSP check fails because of connectivity issues with the remote OCSP server, or any other reason that prevents the OCSP check. With the OPTIONAL setting, allow SSL clients even if the OCSP check fails except when the client certificate is revoked.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Mandatory, Optional
skipcaname	<Boolean>	Read-write	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
certkeyname	<String>	Read-write	The certificate key pair binding.
ca	<Boolean>	Read-write	CA certificate.
servicename	<String>	Read-write	Name of the SSL service for which to set advanced configuration. Minimum length = 1
cleartextport	<Integer>	Read-only	The clearTextPort settings. Minimum value = 0 Maximum value = 65534 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslservice_sslcipher_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslservice_sslcipher_binding":{

<b>"servicename":<String_value>,

</b>"ciphername":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcipher_binding/ servicename_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/ config/sslservice_sslcipher_binding/ servicename_value<String> ? **args=ciphername: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcipher_binding/ servicename_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/

config/sslservice_sslcipher_binding/ servicename_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslservice_sslcipher_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcipher_binding/ servicename_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservice_sslcipher_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservice_sslcipher_binding": [ {

"cipheraliasname":<String_value>,

"cipherdefaulton":<Integer_value>,

"description":<String_value>,

"servicename":<String_value>,

"ciphername":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcipher_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcipher_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservice_sslcipher_binding": [ {

```

sslservice_sslpolicy_binding

Binding object showing the sslpolicy that can be bound to sslservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke	<Boolean>	Read-write	Invoke flag. This attribute is relevant only for ADVANCED policies.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
policyname	<String>	Read-write	The SSL policy binding.
servicename	<String>	Read-write	Name of the SSL service for which to set advanced configuration. Minimum length = 1
type	<String>	Read-write	The phase of the SSL connection in which the policy rule is evaluated. Possible Value: SERVER_AUTH_VAL_REQ. The bindpoint means:: 1. SERVER_AUTH_VAL_REQ: Policy evaluation will be performed during the verification of the server certificate. Action allowed with this type is:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OCSPCERTVALIDATION. Possible values = SERVER_AUTH_VAL
labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE.
priority	<Integer>	Read-write	The priority of the policies bound to this SSL service. Minimum value = 0 Maximum value = 65534
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = vserver, service, policylabel
polinherit	<Integer>	Read-only	Whether the bound policy is a inherited policy or not. Minimum value = 0 Maximum value = 254
__count	<Double>	Read-only	count parameter

```

sslservicegroup

Configuration for SSL service group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the SSL service group for which to set advanced configuration. Minimum length = 1
sslprofile	<String>	Read-write	Name of the SSL profile that contains SSL settings for the Service Group. Minimum length = 1 Maximum length = 127
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Integer>	Read-write	Time, in seconds, for which to keep the session active. Any session resumption request received after the timeout period will require a fresh SSL handshake and establishment of a new SSL session. Default value: 300 Minimum value = 0 Maximum value = 4294967294
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL service group. Note: On platforms with SSL acceleration chips, if the SSL chip does not support SSLv3, this parameter cannot be set to ENABLED.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL service group. Default value: ENABLED Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL service group. Default value: ENABLED Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL service group. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL service group. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the service. SNI helps to enable SSL encryption on multiple domains on a single virtual server or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL handshake with the client, the OCSP-based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverauth	<String>	Read-write	State of server authentication support for the SSL service group. Default value: DISABLED Possible values = ENABLED, DISABLED
commonname	<String>	Read-write	Name to be checked against the CommonName (CN) field in the server certificate bound to the SSL server. Minimum length = 1
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer's certificate is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
sslclientlogs	<String>	Read-write	This parameter is used to enable or disable the logging of additional information, such as the Session ID and SNI names, from SSL handshakes to the audit logs. Default value: DISABLED Possible values = ENABLED, DISABLED
dh	<String>	Read-only	The state of DH key exchange support for the SSL service group. Possible values = ENABLED, DISABLED
dhfile	<String>	Read-only	The file name and path for the DH parameter.
dhcount	<Integer>	Read-only	The refresh count for the re-generation of DH public-key and private-key from the DH parameter. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65534
dhkeyexpsizelimit	<String>	Read-only	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Possible values = ENABLED, DISABLED
ersa	<String>	Read-only	The state of Ephemeral RSA key exchange support for the SSL service group.Ephemeral RSA is used for export ciphers. Possible values = ENABLED, DISABLED
ersacount	<Integer>	Read-only	The refresh count for the re-generation of RSA public-key and private-key pair. Minimum value = 0 Maximum value = 65534

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherredirect	<String>	Read-only	The state of Cipher Redirect feature. Cipher Redirect feature can be used to provide more readable information to SSL clients about mismatch in ciphers between the client and the SSL vserver. Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-only	The redirect URL to be used with the Cipher Redirect feature.
sslv2redirect	<String>	Read-only	The state of SSLv2 Redirect feature.SSLv2 Redirect feature can be used to provide more readable information to SSL client about non-support of SSLv2 protocol on the SSL vserver. Possible values = ENABLED, DISABLED
sslv2url	<String>	Read-only	The redirect URL to be used with SSLv2 Redirect feature.
clientauth	<String>	Read-only	The state of Client-Authentication

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			support for the SSL service group. Possible values = ENABLED, DISABLED
clientcert	<String>	Read-only	The rule for client certificate requirement in client authentication. Possible values = Mandatory, Optional
sslredirect	<String>	Read-only	The state of HTTPS redirects for the SSL service group. This is required for the proper functioning of the redirect messages from the server. The redirect message from the server provides the new location for the moved object. This is contained in the HTTP header field: Location, e.g. Location: http://www.moved.org/here.html For the SSL session, if the client browser receives this message, the browser will try to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connect to the new location. This will break the secure SSL session, as the object has moved from a secure site (https://) to an un-secure one (http://). Generally browsers flash a warning message on the screen and prompt the user, either to continue or disconnect. The above feature, when enabled will automatically convert all such http:// redirect message to https://. This will not break the client SSL session. Note: The set ssl service command can be used for configuring a front-end SSL service for service based SSL Off-Loading, or a backend SSL service for backend-encryption setup.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-only	The state of port-rewrite feature. Possible values = ENABLED, DISABLED
nonfipsciphers	<String>	Read-only	The state of usage of non FIPS approved ciphers. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl2	<String>	Read-only	The state of SSLv2 protocol support for the SSL service group. Possible values = ENABLED, DISABLED
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
crlcheck	<String>	Read-only	The state of the CRL check parameter.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(Mandatory/ Optional). Possible values = Mandatory, Optional
cleartextport	<Integer>	Read-only	The port on the back-end web-servers where the clear-text data is sent by system. Use this setting for the wildcard IP based SSL Acceleration configuration (*:443). Minimum value = 0 Maximum value = 65534 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
servicename	<String>	Read-only	The service name.
ca	<Boolean>	Read-only	CA certificate.
snicert	<Boolean>	Read-only	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
quicflag	<Boolean>	Read-only	This flag is used to indicate the use of the QUIC transport

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			protocol by a virtual server or service.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslservicegroup":{

<b>"servicegroupname":<String_value>,

</b>"sslprofile":true,

"sessreuse":true,

"sesstimeout":true,

"ssl3":true,

"tls1":true,

"tls11":true,

"tls12":true,
```

```
"tls13":true,

"snienable":true,

"ocspstapling":true,

"serverauth":true,

"commonname":true,

"sendclosenotify":true,

"strictsigdigestcheck":true,

"sslclientlogs":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslservicegroup resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **view=summary**

Use this query-parameter to get the summary output of sslservicegroup resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservicegroup resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslservicegroup": [ { "__count": "#no"} ] }
```

sslservicegroup_binding

Binding object which returns the resources bound to sslservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the SSL service group for which to show detailed information. Minimum length = 1
sslservicegroup_sslcipher_binding	<sslservicegroup_sslcipher_binding[]>	Read-only	sslcipher that can be bound to sslservicegroup.
sslservicegroup_eccurve_binding	<sslservicegroup_eccurve_binding[]>	Read-only	ecccurve that can be bound to sslservicegroup.
sslservicegroup_sslcertkey_binding	<sslservicegroup_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslservicegroup.
sslservicegroup_sslciphersuite_binding	<sslservicegroup_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslservicegroup.
sslservicegroup_sslcacertbundle_binding	<sslservicegroup_sslcacertbundle_binding[]>	Read-only	sslcacertbundle that can be bound to sslservicegroup.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_binding/ servicegroupname_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslservicegroup_binding": [ {

"servicegroupname":<String_value>,
```

```
"sslservicegroup_sslcacertbundle_binding":<sslservicegroup_sslcacertbundle
_binding[]_value>,

"sslservicegroup_ecccurve_binding":<sslservicegroup_ecccurve_binding[]_val
ue>,

"sslservicegroup_sslcertkey_binding":<sslservicegroup_sslcertkey_binding[]
_value>,

"sslservicegroup_sslcipher_binding":<sslservicegroup_sslcipher_binding[]_v
alue>,

"sslservicegroup_sslciphersuite_binding":<sslservicegroup_sslciphersuite_b
inding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslservicegroup_binding": [ {

"servicegroupname":<String_value>,

"sslservicegroup_sslcacertbundle_binding":<sslservicegroup_sslcacertbundle
_binding[]_value>,

"sslservicegroup_ecccurve_binding":<sslservicegroup_ecccurve_binding[]_val
ue>,

"sslservicegroup_sslcertkey_binding":<sslservicegroup_sslcertkey_binding[]
_value>,

"sslservicegroup_sslcipher_binding":<sslservicegroup_sslcipher_binding[]_v
alue>,

"sslservicegroup_sslciphersuite_binding":<sslservicegroup_sslciphersuite_b
inding[]_value>

}]}
```

sslservicegroup_ecccurve_binding

Binding object showing the ecccurve that can be bound to sslservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The name of the SSL service to which the SSL policy needs to be bound. Minimum length = 1
ecccurvename	<String>	Read-write	Named ECC curve bound to servicegroup.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ALL, P_224, P_256, P_384, P_521, X_25519, X25519_MLKEM768
__count	<Double>	Read-write	count parameter

```

sslservicegroup_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	CA certificate.
certkeyname	<String>	Read-write	The name of the certificate bound to the SSL service group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ocspcheck	<String>	Read-write	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
crlcheck	<String>	Read-write	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
snicert	<Boolean>	Read-write	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
servicegroupname	<String>	Read-write	The name of the SSL service to which the SSL policy needs to be bound. Minimum length = 1
__count	<Double>	Read-write	count parameter

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding/ servicegroupname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/

v1/config/sslservicegroup_sslcertkey_binding/ servicegroupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslservicegroup_sslcertkey_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding/ servicegroupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservicegroup_sslcertkey_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservicegroup_sslcertkey_binding": [ {

"ca":<Boolean_value>,

"certkeyname":<String_value>,

"ocspcheck":<String_value>,

"crlcheck":<String_value>,

"snicert":<Boolean_value>,

"servicegroupname":<String_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservicegroup_sslcertkey_binding": [ {

"ca":<Boolean_value>,

"certkeyname":<String_value>,

"ocspcheck":<String_value>,

"crlcheck":<String_value>,

"snicert":<Boolean_value>,
```

```
"servicegroupname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding/servicegroupname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslservicegroup_sslcertkey_binding": [ { "__count": "#no"} ] }
```

sslservicegroup_sslcipher_binding

Binding object showing the sslcipher that can be bound to sslservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The name of the SSL service to which the SSL policy needs to be bound.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
ciphername	<String>	Read-write	A cipher-suite can consist of an individual cipher name, the system predefined cipher-alias name, or user defined cipher-group name.
description	<String>	Read-write	The description of the cipher.
cipheraliasname	<String>	Read-write	The name of the cipher group/alias/ name configured for the SSL service group.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslservicegroup_sslcipher_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslservicegroup_sslcipher_binding":{

<b>"servicegroupname":<String_value>,

</b>"ciphername":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcipher_binding/ servicegroupname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcipher_binding/ servicegroupname_value<String> ? **args=ciphername: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcipher_binding/ servicegroupname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcipher_binding/ servicegroupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslservicegroup_sslcipher_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcipher_binding/ servicegroupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservicegroup_sslcipher_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservicegroup_sslcipher_binding": [ {

"servicegroupname":<String_value>,

"ciphername":<String_value>,

"description":<String_value>,

"cipheraliasname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcipher_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcipher_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservicegroup_sslcipher_binding": [ {

"servicegroupname":<String_value>,

"ciphername":<String_value>,

"description":<String_value>,

"cipheraliasname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcipher_binding/servicegroupname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

```

sslvserver

Configuration for SSL virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	Name of the SSL virtual server for which to set advanced configuration. Minimum length = 1
cleartextport	<Integer>	Read-write	Port on which clear-text data is sent by the appliance to the server. Do not specify this parameter for SSL offloading with end-to-end encryption. Default value: 0 Minimum value = 0 Maximum value = 65534
dh	<String>	Read-write	State of Diffie-Hellman (DH) key exchange. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dhfile	<String>	Read-write	Name of and, optionally, path to the DH parameter file, in PEM format, to be installed. /nsconfig/ssl/ is the default path. Minimum length = 1
dhcount	<Integer>	Read-write	Number of interactions, between the client and the Citrix ADC, after which the DH private-public pair is regenerated. A value of zero (0) specifies refresh every time. Minimum value = 0 Maximum value = 65534
dhkeyexpsizelimit	<String>	Read-write	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			rounded-up to 256bits. Default value: DISABLED Possible values = ENABLED, DISABLED
ersa	<String>	Read-write	State of Ephemeral RSA (eRSA) key exchange. Ephemeral RSA allows clients that support only export ciphers to communicate with the secure server even if the server certificate does not support export clients. The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted. It is reused at a later date when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the appliance restarts. Default value: ENABLED Possible values = ENABLED, DISABLED
ersacount	<Integer>	Read-write	Refresh count for regeneration of the RSA public-key and private-key pair. Zero (0) specifies infinite usage (no refresh). Minimum value = 0 Maximum value = 65534
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sesstimeout	<Integer>	Read-write	Time, in seconds, for which to keep the session active. Any session resumption request received after the timeout period will require a fresh SSL handshake and establishment of a new SSL session. Default value: 120 Minimum value = 0 Maximum value = 4294967294
cipherredirect	<String>	Read-write	State of Cipher Redirect. If cipher redirect is enabled, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a cipher mismatch between the virtual server or service and the client. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherurl	<String>	Read-write	The redirect URL to be used with the Cipher Redirect feature.
sslv2redirect	<String>	Read-write	State of SSLv2 Redirect. If SSLv2 redirect is enabled, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a protocol version mismatch between the virtual server or service and the client. Default value: DISABLED Possible values = ENABLED, DISABLED
sslv2url	<String>	Read-write	URL of the page to which to redirect the client in case of a protocol version mismatch. Typically, this page has a clear explanation of the error or an alternative location that the transaction can continue from.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientauth	<String>	Read-write	State of client authentication. If client authentication is enabled, the virtual server terminates the SSL handshake if the SSL client does not provide a valid certificate. Default value: DISABLED Possible values = ENABLED, DISABLED
clientcert	<String>	Read-write	Type of client authentication. If this parameter is set to MANDATORY, the appliance terminates the SSL handshake if the SSL client does not provide a valid certificate. With the OPTIONAL setting, the appliance requests a certificate from the SSL clients but proceeds with the SSL transaction even if the client presents an invalid certificate. Caution: Define proper access control policies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			before changing this setting to Optional. Possible values = Mandatory, Optional
sslredirect	<String>	Read-write	State of HTTPS redirects for the SSL virtual server. For an SSL session, if the client browser receives a redirect message, the browser tries to connect to the new location. However, the secure SSL session breaks if the object has moved from a secure site (https://) to an unsecure site (http://). Typically, a warning message appears on the screen, prompting the user to continue or disconnect. If SSL Redirect is ENABLED, the redirect message is automatically converted from http:// to https:// and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SSL session does not break. Default value: DISABLED Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-write	State of the port rewrite while performing HTTPS redirect. If this parameter is ENABLED and the URL from the server does not contain the standard port, the port is rewritten to the standard. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl2	<String>	Read-write	State of SSLv2 protocol support for the SSL Virtual Server. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL Virtual Server. Note: On platforms with SSL acceleration chips, if the SSL chip does not support SSLv3, this parameter cannot be set to ENABLED. Default value: ENABLED Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL Virtual Server. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL Virtual Server. Default value: DISABLED Possible values = ENABLED, DISABLED
dtls1	<String>	Read-write	State of DTLSv1.0 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
dtls12	<String>	Read-write	State of DTLSv1.2 protocol support for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SSL Virtual Server. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the virtual server and service-based offload. SNI helps to enable SSL encryption on multiple domains on a single virtual server or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL handshake with the client, the OCSP-based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. . Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pushenctrigger	<String>	Read-write	Trigger encryption on the basis of the PUSH flag value. Available settings function as follows: * ALWAYS - Any PUSH packet triggers encryption. * IGNORE - Ignore PUSH packet for triggering encryption. * MERGE - For a consecutive sequence of PUSH packets, the last PUSH packet triggers encryption. * TIMER - PUSH packet triggering encryption is delayed by the time defined in the set ssl parameter command or in the Change Advanced SSL Settings dialog box. Possible values = Always, Merge, Ignore, Timer

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
dtlsprofilename	<String>	Read-write	Name of the DTLS profile whose settings are to be applied to the virtual server. Minimum length = 1 Maximum length = 127
sslprofile	<String>	Read-write	Name of the SSL profile that contains SSL settings for the virtual server. Minimum length = 1 Maximum length = 127
hsts	<String>	Read-write	State of HSTS protocol support for the SSL Virtual Server. Using HSTS, a server can enforce the use of an HTTPS connection for all communication with a client. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
maxage	<Integer>	Read-write	Set the maximum time, in seconds, in the strict transport security (STS) header during which the client must send only HTTPS requests to the server. Default value: 0 Minimum value = 0 Maximum value = 4294967294
includesubdomains	<String>	Read-write	Enable HSTS for subdomains. If set to Yes, a client must send only HTTPS requests for subdomains. Default value: NO Possible values = YES, NO
preload	<String>	Read-write	Flag indicates the consent of the site owner to have their domain preloaded. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer entity certificate during TLS1.2 handshake is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
zerorttearlydata	<String>	Read-write	State of TLS 1.3 0-RTT early data support for the SSL Virtual Server. This setting only has an effect if resumption is enabled, as early data cannot be sent along with an initial handshake. Early application data has significantly different security properties - in particular there is no guarantee that the data cannot be replayed.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
tls13sessionticketsperauthcontext	<Integer>	Read-write	Number of tickets the SSL Virtual Server will issue anytime TLS 1.3 is negotiated, ticket-based resumption is enabled, and either (1) a handshake completes or (2) post-handhsake client auth completes. This value can be increased to enable clients to open multiple parallel connections using a fresh ticket for each connection. No tickets are sent if resumption is disabled. Default value: 1 Minimum value = 1 Maximum value = 10
dhekeyexchangewithpsk	<String>	Read-write	Whether or not the SSL Virtual Server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			will require a DHE key exchange to occur when a PSK is accepted during a TLS 1.3 resumption handshake. A DHE key exchange ensures forward secrecy even in the event that ticket keys are compromised, at the expense of an additional round trip and resources required to carry out the DHE key exchange. If disabled, a DHE key exchange will be performed when a PSK is accepted but only if requested by the client. If enabled, the server will require a DHE key exchange when a PSK is accepted regardless of whether the client supports combined PSK-DHE key exchange. This setting only has an effect when

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resumption is enabled. Default value: NO Possible values = YES, NO
defaultsni	<String>	Read-write	Default domain name supported by the SSL virtual server. The parameter is effective, when zero touch certificate management is active for the SSL virtual server i.e. no manual SNI cert or default server cert is bound to the v-server. For SSL transactions, when SNI is not presented by the client, server-certificate corresponding to the default SNI, if available in the cert-store, is selected else connection is terminated. Minimum length = 1 Maximum length = 126

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslclientlogs	<String>	Read-write	This parameter is used to enable or disable the logging of additional information, such as the Session ID and SNI names, from SSL handshakes to the audit logs. Default value: DISABLED Possible values = ENABLED, DISABLED
strictclientekucheck	<String>	Read-write	Enable strict EKU extension check during client authentication. Default value: ENABLED Possible values = ENABLED, DISABLED
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
nonfipsciphers	<String>	Read-only	The state of usage of non FIPS approved ciphers.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
service	<Integer>	Read-only	Service. Minimum value = 0 Maximum value = 65534
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
ca	<Boolean>	Read-only	CA certificate.
snicert	<Boolean>	Read-only	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
skipcaname	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dtlsflag	<Boolean>	Read-only	The flag is used to indicate whether DTLS is set or not.
quicflag	<Boolean>	Read-only	This flag is used to indicate the use of the QUIC transport protocol by an SSL virtual server or service.
skipcacertbundle	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```

sslvserver_binding

Binding object which returns the resources bound to sslvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	Name of the SSL virtual server for which to show detailed information. Minimum length = 1
sslvserver_sslcacertbundle_binding	<sslvserver_sslcacertbundle_binding[]>	Read-only	sslcacertbundle that can be bound to sslvserver.
sslvserver_sslpolicy_binding	<sslvserver_sslpolicy_binding[]>	Read-only	sslpolicy that can be bound to sslvserver.
sslvserver_sslciphersuite_binding	<sslvserver_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslvserver.
sslvserver_sslcertkey_binding	<sslvserver_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslvserver.
sslvserver_sslcertkeybundle_binding	<sslvserver_sslcertkeybundle_binding[]>	Read-only	sslcertkeybundle that can be bound to sslvserver.
sslvserver_ecccurve_binding	<sslvserver_ecccurve_binding[]>	Read-only	ecccurve that can be bound to sslvserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslvserver_hashicorp_binding	<sslvserver_hashicorp_binding[]>	Read-only	hashicorp that can be bound to sslvserver.
sslvserver_sslcipher_binding	<sslvserver_sslcipher_binding[]>	Read-only	sslcipher that can be bound to sslvserver.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_binding/ vservername_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslvserver_binding": [ {

"vservername":<String_value>,

"sslvserver_sslcipher_binding":<sslvserver_sslcipher_binding[]_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslvserver_binding": [ {

"vservername":<String_value>,

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_hashicorp_binding/ vservername_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslvserver_hashicorp_binding": [ { "__count": "#no"} ] }
```

sslvserver_sslcacertbundle_binding

Binding object showing the sslcacertbundle that can be bound to sslvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
skipcacertbundle	<Boolean>	Read-write	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
vservername	<String>	Read-write	Name of the SSL virtual server. Minimum length = 1
cacertbundlename	<String>	Read-write	CA certbundle name bound to the vserver. Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslvserver_sslcacertbundle_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslvserver_sslcacertbundle_binding":{
```

```
<b>"vservername":<String_value>,

</b>"cacertbundlename":<String_value>,

"skipcacertbundle":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslcacertbundle_binding/ vservername_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/ config/sslvserver_sslcacertbundle_binding/ vservername_value<String> ? **args=cacertbundlename: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslcacertbundle_binding/ vservername_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/ config/sslvserver_sslcacertbundle_binding/ vservername_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslvserver_sslcacertbundle_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslcacertbundle_binding/ vservername_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslvserver_sslcacertbundle_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslvserver_sslcacertbundle_binding": [ {

"skipcacertbundle":<Boolean_value>,

"vservername":<String_value>,

"cacertbundlename":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslcacertbundle_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslcacertbundle_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslciphersuite_binding/ vservername_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/ config/sslvserver_sslciphersuite_binding/ vservername_value<String> ? **args=ciphername: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslciphersuite_binding/ vservername_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/ config/sslvserver_sslciphersuite_binding/ vservername_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslvserver_sslciphersuite_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslciphersuite_binding/ vservername_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslvserver_sslciphersuite_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslvserver_sslciphersuite_binding": [ {

"description":<String_value>,

"vservername":<String_value>,

"ciphername":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslciphersuite_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslciphersuite_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslvserver_sslciphersuite_binding": [ {

"description":<String_value>,

"vservername":<String_value>,

"ciphername":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslciphersuite_binding/ vservername_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslvserver_sslciphersuite_binding": [ { "__count": "#no"} ] }
```

sslvserver_sslpolicy_binding

Binding object showing the sslpolicy that can be bound to sslvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = vserver, service, policylabel
priority	<Integer>	Read-write	The priority of the policies bound to this SSL service. Minimum value = 0 Maximum value = 65534
policyname	<String>	Read-write	The name of the SSL policy binding.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag. This attribute is relevant only for ADVANCED policies.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	Name of the SSL virtual server. Minimum length = 1
type	<String>	Read-write	Bind point to which to bind the policy. Possible Values: REQUEST, INTERCEPT_REQ, CLIENTHELLO_REQ and CLIENT_AUTH_VAL_REQ. These bindpoints mean: 1. REQUEST: Policy evaluation will be done at appplication above SSL. This bindpoint is default and is used for actions based on clientauth and client cert. 2. INTERCEPT_REQ: Policy evaluation will be done during SSL handshake to decide whether to intercept or not. Actions allowed with this type are: INTERCEPT, BYPASS and RESET. 3. CLIENTHELLO_REQ: Policy evaluation will be done during handling of Client Hello Request. Action allowed with this type is: RESET, FORWARD,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			PICKCACERTGRP and OCSPSTAPLING. 4. CLIENT_AUTH_VAL_REQ: Policy evaluation will be performed during the verification of the client certificate. Action allowed with this type is: OCSPCERTVALIDATION. Default value: REQUEST Possible values = INTERCEPT_REQ, REQUEST, CLIENTHELLO_REQ, CLIENT_AUTH_VAL
polinherit	<Integer>	Read-only	Whether the bound policy is a inherited policy or not. Minimum value = 0 Maximum value = 254
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslvserver_sslpolicy_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslvserver_sslpolicy_binding":{

<b>"vservername":<String_value>,

</b>"policyname":<String_value>,

"priority":<Integer_value>,

"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"labelname":<String_value>,

"type":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslpolicy_binding/ vservername_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/ config/sslvserver_sslpolicy_binding/ vservername_value<String> ? **args=policyname: <String_value> ,priority: <Integer_value> ,type: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslpolicy_binding/ vservername_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/ config/sslvserver_sslpolicy_binding/ vservername_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslvserver_sslpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/sslvserver_sslpolicy_binding/ vservername_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslvserver_sslpolicy_binding resources in chunks.

sslwrapkey

Configuration for WRAP key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wrapkeyname	<String>	Read-write	Name for the wrap key. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the wrap key is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my key" or 'my key'). Minimum length = 1
password	<String>	Read-write	Password string for the wrap key. Minimum length = 1
salt	<String>	Read-write	Salt string for the wrap key. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

```

stream

Stream

Stream configuration.

NAME	DESCRIPTION
streamidentifier	Configuration for identifier
streamidentifier_analyticsprofile_binding	Binding object showing the analyticsprofile that can be bound to streamidentifier
streamidentifier_binding	Binding object showing the resources that can be bound to streamidentifier
streamidentifier_streamsession_binding	Binding object showing the streamsession that can be bound to streamidentifier
streamselector	Configuration for selector
streamsession	Configuration for active connection

streamidentifier

Configuration for identifier resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of stream identifier.
selectorname	<String>	Read-write	Name of the selector to use with the stream identifier.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
interval	<Integer>	Read-write	Number of minutes of data to use when calculating session statistics (number of requests, bandwidth, and response times). The interval is a moving window that keeps the most recently collected data. Older data is discarded at regular intervals. Default value: 1 Minimum value = 1 Maximum value = 10080
samplecount	<Integer>	Read-write	Size of the sample from which to select a request for evaluation. The smaller the sample count, the more accurate is the statistical data. To evaluate all requests, set the sample count to 1. However, such a low setting can result in excessive consumption of memory and processing resources. Default value: 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 65535
sort	<String>	Read-write	Sort stored records by the specified statistics column, in descending order. Performed during data collection, the sorting enables real-time data evaluation through Citrix ADC policies (for example, compression and caching policies) that use functions such as IS_TOP(n). Default value: REQUESTS Possible values = REQUESTS, CONNECTIONS, RESPTIME, BANDWIDTH, RESPTIME_BREACHES, TOKENS, NONE
snmptrap	<String>	Read-write	Enable/disable SNMP trap for stream identifier. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
appflowlog	<String>	Read-write	Enable/disable Appflow logging for stream identifier. Default value: DISABLED Possible values = ENABLED, DISABLED
trackackonlypackets	<String>	Read-write	Track ack only packets as well. This setting is applicable only when packet rate limiting is being used. Default value: DISABLED Possible values = ENABLED, DISABLED
tracktransactions	<String>	Read-write	Track transactions exceeding configured threshold. Transaction tracking can be enabled for following metrics: ResponseTime (RESPTIME) or LLM token consumption (TOKENS). When set to TOKENS, minTransactionThre

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			shold, maxTransactionThreshold, acceptanceThreshold and breachThreshold are not applicable. By default transaction tracking is disabled. Default value: NONE Possible values = RESPTIME, TOKENS, NONE
maxtransactionthreshold	<Integer>	Read-write	Maximum per transcation value of metric. Metric to be tracked is specified by tracktransactions attribute. Default value: 0
mintransactionthreshold	<Integer>	Read-write	Minimum per transcation value of metric. Metric to be tracked is specified by tracktransactions attribute. Default value: 0
acceptancethreshold	<String>	Read-write	Non-Breaching transactions to Total transactions

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			threshold expressed in percent. Maximum of 6 decimal places is supported. Default value: 0.000000 Maximum length = 10
breachthreshold	<Integer>	Read-write	Breaching transactions threshold calculated over interval. Default value: 0
log	<String>	Read-write	Location where objects collected on the identifier will be logged. Default value: NONE Possible values = SYSLOG, NONE
loginterval	<Integer>	Read-write	Time interval in minutes for logging the collected objects. Log interval should be greater than or equal to the inteval of the stream identifier. Default value: 5

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 10080
loglimit	<Integer>	Read-write	Maximum number of objects to be logged in the log interval. Default value: 100 Minimum value = 1 Maximum value = 1000
rule	<String[]>	Read-only	Rule.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

```
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/streamidentifier? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "streamidentifier": [ { "__count": "#no"} ] }
```

streamidentifier_analyticsprofile_binding

Binding object showing the analyticsprofile that can be bound to streamidentifier.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
analyticsprofile	<String>	Read-write	Name of the analytics profile.
name	<String>	Read-write	The name of stream identifier.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/streamidentifier_analyticsprofile_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"streamidentifier_analyticsprofile_binding":{

<b>"name":<String_value>,

</b>"analyticsprofile":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/streamidentifier_analyticsprofile_binding

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/streamidentifier_analyticsprofile_binding? **args= name:<String_value>, analyticsprofile: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/streamidentifier_analyticsprofile_binding

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/streamidentifier_analyticsprofile_binding?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of streamidentifier_analyticsprofile_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/streamidentifier_analyticsprofile_binding?**pagesize=#no;pageno=#no**

Use this query-parameter to get the streamidentifier_analyticsprofile_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "streamidentifier_analyticsprofile_binding": [ {

"analyticsprofile":<String_value>,

"name":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/streamidentifier_analyticsprofile_binding

HTTP Method: GET

Request Headers:

streamselector

Configuration for selector resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the selector. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. If the name includes one or more spaces, and you are using the Citrix ADC CLI, enclose the name in double or single quotation marks (for example, "my selector" or 'my selector').
rule	<String[]>	Read-write	Set of up to five expressions. Maximum length: 7499 characters. Each expression must identify a specific request characteristic, such as the client's IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address (with CLIENT.IP.SRC) or requested server resource (with HTTP.REQ.URL). Note: If two or more selectors contain the same expressions in different order, a separate set of records is created for each selector. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

subscriber

Subscriber

Subscriber configuration

NAME	DESCRIPTION
subscribergxinterface	Configuration for Gx interface Parameters
subscriberparam	Configuration for Subscriber Params
subscriberprofile	Configuration for Subscriber Profile
subscriberradiusinterface	Configuration for RADIUS interface Parameters
subscribersessions	Configuration for subscriber sesions

subscribergxinterface

Configuration for Gx interface Parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserver	<String>	Read-write	Name of the load balancing, or content switching vserver to which the Gx connections are established. The service type of the virtual server must be DIAMETER/ SSL_DIAMETER. Mutually exclusive with the service parameter. Therefore, you cannot set both service and the Virtual Server in the Gx Interface. Minimum length = 1
service	<String>	Read-write	Name of DIAMETER/ SSL_DIAMETER service corresponding to PCRF to which the Gx connection is established. The service type of the service must be DIAMETER/ SSL_DIAMETER. Mutually exclusive with vserver

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parameter. Therefore, you cannot set both Service and the Virtual Server in the Gx Interface. Minimum length = 1
pcrfrealm	<String>	Read-write	PCRF realm is of type DiameterIdentity and contains the realm of PCRF to which the message is to be routed. This is the realm used in Destination-Realm AVP by Citrix ADC Gx client (as a Diameter node). Minimum length = 1
holdonsubscriberabsence	<String>	Read-write	Set this setting to yes if Citrix ADC needs to Hold pakcets till subscriber session is fetched from PCRF. Else set to NO. By default set to yes. If this setting is set to NO, then till Citrix ADC fetches subscriber from PCRF, default subscriber profile will be applied to this subscriber if configured. If default subscriber profile is also not configured an undef would be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			raised to expressions which use Subscriber attributes. . Default value: YES Possible values = YES, NO
requesttimeout	<Integer>	Read-write	q!Time, in seconds, within which the Gx CCR request must complete. If the request does not complete within this time, the request is retransmitted for requestRetryAttempts time. If still reuqest is not complete then default subscriber profile will be applied to this subscriber if configured. If default subscriber profile is also not configured an undef would be raised to expressions which use Subscriber attributes. Zero disables the timeout. !. Default value: 10 Minimum value = 0 Maximum value = 86400

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
requestretryattempts	<Integer>	Read-write	If the request does not complete within requestTimeout time, the request is retransmitted for requestRetryAttempts time. Default value: 3
idlettl	<Integer>	Read-write	q!Idle Time, in seconds, after which the Gx CCR-U request will be sent after any PCRF activity on a session. Any RAR or CCA message resets the timer. Zero value disables the idle timeout. !. Default value: 900 Minimum value = 0 Maximum value = 86400
revalidationtimeout	<Integer>	Read-write	q!Revalidation Timeout, in seconds, after which the Gx CCR-U request will be sent after any PCRF activity on a session. Any RAR or CCA message resets the timer. Zero value disables the idle timeout. !.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 86400
healthcheck	<String>	Read-write	q!Set this setting to yes if Citrix ADC should send DWR packets to PCRF server. When the session is idle, healthcheck timer expires and DWR packets are initiated in order to check that PCRF server is active. By default set to No. !. Default value: NO Possible values = YES, NO
healthcheckttl	<Integer>	Read-write	q!Healthcheck timeout, in seconds, after which the DWR will be sent in order to ensure the state of the PCRF server. Any CCR, CCA, RAR or RRA message resets the timer. !. Default value: 30 Minimum value = 6 Maximum value = 86400

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cerrequesttimeout	<Integer>	Read-write	q!Healthcheck request timeout, in seconds, after which the Citrix ADC considers that no CCA packet received to the initiated CCR. After this time Citrix ADC should send again CCR to PCRF server. !. Default value: 0 Minimum value = 0 Maximum value = 86400
negativettl	<Integer>	Read-write	q!Negative TTL, in seconds, after which the Gx CCR-I request will be resent for sessions that have not been resolved by PCRF due to server being down or no response or failed response. Instead of polling the PCRF server constantly, negative-TTL makes Citrix ADC stick to un-resolved session. Meanwhile Citrix ADC installs a negative session to avoid going to PCRF.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			For Negative Sessions, Netcaler inherits the attributes from default subscriber profile if default subscriber is configured. A default subscriber could be configured as 'add subscriber profile *'. Or these attributes can be inherited from Radius as well if Radius is configued. Zero value disables the Negative Sessions. And Citrix ADC does not install Negative sessions even if subscriber session could not be fetched. !. Default value: 600 Minimum value = 0 Maximum value = 86400
negativettllimitedsuccess	<String>	Read-write	Set this to YES if Citrix ADC should create negative session for Result-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Code DIAMETER_LIMITED_SUCCESS (2002) received in CCA-I. If set to NO, regular session is created. Default value: NO Possible values = YES, NO
purgesdbongxfailure	<String>	Read-write	Set this setting to YES if needed to purge Subscriber Database in case of Gx failure. By default set to NO. . Default value: NO Possible values = YES, NO
servicepathavp	<Integer[]>	Read-write	The AVP code in which PCRF sends service path applicable for subscriber. Minimum value = 1
servicepathvendorid	<Integer>	Read-write	The vendorid of the AVP in which PCRF sends service path for subscriber.
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svrstate	<String>	Read-only	The state of the gx service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
identity	<String>	Read-only	DiameterIdentity to be used by NS. DiameterIdentity is used to identify a Diameter node uniquely. Before setting up diameter configuration, Citrix ADC (as a Diameter node) MUST be assigned a unique DiameterIdentity. example => set ns diameter -identity Citrix ADC.com Now whenever Citrix ADC system needs to use identity in diameter messages. It will use 'netscaler.com'

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			as Origin-Host AVP as defined in RFC3588 . Minimum length = 1
realm	<String>	Read-only	Diameter Realm to be used by NS. example => set ns diameter -realm com Now whenever Citrix ADC system needs to use realm in diameter messages. It will use 'com' as Origin-Realm AVP as defined in RFC3588 . Minimum length = 1
status	<String>	Read-only	Citrix ADC PCRF connection Status. (Gx Protocol State).
servicepathinfomode	<String>	Read-only	The type of info in which service path is passed from PCRF, SERVICE_FUNCTION: Denotes the service chain is passed as servicefunction

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			names in-order in AVPS with code servicepathAVP SERVICE_PATH: Denotes the service path name is passed in AVPS with code servicepathAVP.q. Default value: SERVICEPATH Possible values = SERVICEFUNCTIONS, SERVICEPATH
gxreportingavp1	<Integer[]>	Read-only	The AVP code to report as 1st custom AVP. Minimum value = 1
gxreportingavp1vendorid	<Integer>	Read-only	The vendorid of the AVP which will be reported as 1st custom AVP.
gxreportingavp1type	<String>	Read-only	The type of the AVP which will be reported as 1st custom AVP. Default value: OctetString Possible values = OctetString, Integer32, Integer64, Unsigned32,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Unsigned64, Float32, Float64
gxreportingavp2	<Integer[]>	Read-only	The AVP code to report as 2nd custom AVP. Minimum value = 1
gxreportingavp2vendorid	<Integer>	Read-only	The vendorid of the AVP which will be reported as 2nd custom AVP.
gxreportingavp2type	<String>	Read-only	The type of the AVP which will be reported as 2nd custom AVP. Default value: OctetString Possible values = OctetString, Integer32, Integer64, Unsigned32, Unsigned64, Float32, Float64
gxreportingavp3	<Integer[]>	Read-only	The AVP code to report as 3rd custom AVP. Minimum value = 1
gxreportingavp3vendorid	<Integer>	Read-only	The vendorid of the AVP which will be reported as 3rd custom AVP.
gxreportingavp3type	<String>	Read-only	The type of the AVP which will be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			reported as 3rd custom AVP. Default value: OctetString Possible values = OctetString, Integer32, Integer64, Unsigned32, Unsigned64, Float32, Float64
gxreportingavp4	<Integer[]>	Read-only	The AVP code to report as 4th custom AVP. Minimum value = 1
gxreportingavp4vendorid	<Integer>	Read-only	The vendorid of the AVP which will be reported as 4th custom AVP.
gxreportingavp4type	<String>	Read-only	The type of the AVP which will be reported as 4th custom AVP. Default value: OctetString Possible values = OctetString, Integer32, Integer64, Unsigned32, Unsigned64, Float32, Float64

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gxreportingavp5	<Integer[]>	Read-only	The AVP code to report as 5th custom AVP. Minimum value = 1
gxreportingavp5vendorid	<Integer>	Read-only	The vendorid of the AVP which will be reported as 5th custom AVP.
gxreportingavp5type	<String>	Read-only	The type of the AVP which will be reported as 5th custom AVP. Default value: OctetString Possible values = OctetString, Integer32, Integer64, Unsigned32, Unsigned64, Float32, Float64
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/subscribergxinterface **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"subscribergxinterface":{

"vserver":<String_value>,

"service":<String_value>,

"pcrfrealm":<String_value>,
```

```

subscriberparam

Configuration for Subscriber Params resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keytype	<String>	Read-write	Type of subscriber key type IP or IPANDVLAN. IPANDVLAN option can be used only when the interfaceType is set to gxOnly. Changing the lookup method should result to the subscriber session database being flushed.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: IP Possible values = IP, IPANDVLAN
interfacetype	<String>	Read-write	Subscriber Interface refers to Citrix ADC interaction with control plane protocols, RADIUS and GX. Types of subscriber interface: NONE, RadiusOnly, RadiusAndGx, GxOnly. NONE: Only static subscribers can be configured. RadiusOnly: GX interface is absent. Subscriber information is obtained through RADIUS Accounting messages. RadiusAndGx: Subscriber ID obtained through RADIUS Accounting is used to query PCRF. Subscriber information is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtained from both RADIUS and PCRF. GxOnly: RADIUS interface is absent. Subscriber information is queried using Subscriber IP or IP+VLAN. Default value: None Possible values = None, RadiusOnly, RadiusAndGx, GxOnly
idlettl	<Integer>	Read-write	q!Idle Timeout, in seconds, after which Citrix ADC will take an idleAction on a subscriber session (refer to 'idleAction' arguement in 'set subscriber param' for more details on idleAction). Any data-plane or control plane activity updates the idleTimeout on subscriber session. idleAction could be to 'just delete the session' or 'delete and CCR-T' (if PCRF is configured) or 'do not delete but send a CCR-U'.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Zero value disables the idle timeout. !. Default value: 0 Minimum value = 0 Maximum value = 172800
idleaction	<String>	Read-write	q!Once idleTTL exprires on a subscriber session, Citrix ADC will take an idle action on that session. idleAction could be chosen from one of these ==> 1. ccrTerminate: (default) send CCR-T to inform PCRF about session termination and delete the session. 2. delete: Just delete the subscriber session without informing PCRF. 3. ccrUpdate: Do not delete the session and instead send a CCR-U to PCRF requesting

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for an updated session. !. Default value: ccrTerminate Possible values = ccrTerminate, delete, ccrUpdate
ipv6prefixlookuplist	<Integer[]>	Read-write	The ipv6PrefixLookupList should consist of all the ipv6 prefix lengths assigned to the UE's'. Minimum value = 1 Maximum value = 128
builtin	<String[]>	Read-only	. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.

subscribersessions

Configuration for subscriber sesions resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ip	<String>	Read-write	Subscriber IP Address. Default value: 0
vlan	<Integer>	Read-write	The vlan number on which the subscriber is located. Default value: 0 Minimum value = 0 Maximum value = 4096
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 31
subscriptionidtype	<String>	Read-only	Subscription-Id type. Possible values = E164, IMSI, SIP_URI, NAI, PRIVATE
subscriptionidvalue	<String>	Read-only	Subscription-Id value.
subscriberrules	<String[]>	Read-only	Rules stored in this session for this subscriber. When PCRF sends Charging-Rule-Name or Charging-Rule-Base-Name AVP for a subscriber, Citrix ADC stores these AVPs in the subscriber session. These Rules can be retreived using 'Subscriber.Rule_Active(<rule name>)' expression. For static subscriber profiles, these rules are configured using '-subscriberRules <list of rules>'.
flags	<Integer>	Read-only	Subscriber Session flags.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ttl	<Integer>	Read-only	Subscriber Session revalidation Timeout remaining. This TTL gets refreshed when a radius or CCA or RAR message is received for this subscriber session. Citrix ADC will send a CCR-U after revalidation timer expires. If subscriber sessions is a negative session, then Citrix ADC will send a CCR-I after TTL expires. Negative Sessions are sessions which have not been resolved by PCRF and instead of polling PCRF continously, Citrix ADC has installed a negative session. If default subscriber is configued, then Negative Sessions inherits default subscriber profile. .
idlettl	<Integer>	Read-only	Subscriber Session Activity Timeout remaining. Citrix ADC will take an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			idleAction after ttl expires. idleaction could be --> 1. ccrTerminate: (default) send CCR-T to inform PCRF about session termination and delete the session. 2. delete: Just delete the subscriber session without informing PCRF. 3. ccrUpdate: Do not delete the session and instead send a CCR-U to PCRF requesting for an updated session. But if this is a negative session and idleaction is ccrUpdate then Citrix ADC won't take any action. Also on negative sessions ccrTerminate translates to delete.
avpdisplaybuffer	<String>	Read-only	Subscriber Attributes Display.

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/subscribersessions? **action=clear HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"subscribersessions":{

"ip":<String_value>,

"vlan":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/subscribersessions **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/subscribersessions? **args=ip: <String_value> ,vlan: <Integer_value> ,nodeid: <Integer_value>**

Use this query-parameter to get subscribersessions resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/subscribersessions? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/subscribersessions? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of subscribersessions resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/subscribersessions? **view=summary**

Use this query-parameter to get the summary output of subscribersessions resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/subscribersessions? **pagesize=#no;pageno=#no**

Use this query-parameter to get the subscribersessions resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "subscribersessions": [ {

ip:<String_value>,vlan:<Integer_value>,nodeid:<Integer_value>"subscription
idtype":<String_value>,

"subscriptionidvalue":<String_value>,

systemcmdpolicy

Configuration for command policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name for a command policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Must begin with a letter, number, or the underscore (_) character, and must contain only alphanumeric, hyphen (-), period (.), hash (#), space ( ), at (@), equal (=), colon (:), and underscore characters. Cannot be changed after the policy is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
action	<String>	Read-write	Action to perform when a request matches the policy. Possible values = ALLOW, DENY
cmdspec	<String>	Read-write	Regular expression specifying the data that matches the policy. Minimum length = 1
builtin	<String[]>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemcpuparam **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemcpuparam":{

"pemode":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemcpuparam? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemcpuparam":{

"pemode":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemcpuparam **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/systemcpuparam? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/systemcpuparam? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of systemcpuparam resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/systemcpuparam? **view=summary**

Use this query-parameter to get the summary output of systemcpuparam resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/systemcpuparam? **pagesize=#no;pageno=#no**

Use this query-parameter to get the systemcpuparam resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemcpuparam": [ {

"pemode":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemcpuparam? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemcpuparam": [ { "__count": "#no"} ] }
```

systemextramgmtcpu

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
configuredstate	<String>	Read-only	Get the configured state of extra management cpu. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
effectivestate	<String>	Read-only	Get the current running state of extra management cpu. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.

systemglobal_authenticationlocalpolicy_binding

Binding object showing the authenticationlocalpolicy that can be bound to systemglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-write	The priority of the command policy.
builtin	<String[]>	Read-write	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
nextfactor	<String>	Read-write	On success invoke label. Applicable for advanced authentication policy binding.
feature	<String>	Read-write	The feature to be checked while applying this config.
gotopriorityexpression	<String>	Read-write	Applicable only to advance authentication policy. Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: *

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation.
policyname	<String>	Read-write	The name of the command policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL, APPFW_GLOBAL, TM_GLOBAL
__count	<Double>	Read-write	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

```

systemgroup

Configuration for system group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupname	<String>	Read-write	Name for the group. Must begin with a letter, number, hash(#) or the underscore (_) character, and must contain only alphanumeric, hyphen (-), period (.), hash (#), space ( ), at (@), equal (=), colon (:), and underscore characters. Cannot be changed after the group is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my group" or 'my group'). Minimum length = 1
promptstring	<String>	Read-write	String to display at the command-line prompt. Can consist of letters, numbers, hyphen (-), period (.), hash (#), space ( ), at (@), equal (=), colon (:), underscore (_), and the following variables: * %u - Will be replaced by the user name. * %h - Will be replaced by the hostname of the Citrix ADC. * %t - Will be replaced by the current time in 12-hour format. * %T - Will be replaced by the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current time in 24-hour format. * %d - Will be replaced by the current date. * %s - Will be replaced by the state of the Citrix ADC. Note: The 63-character limit for the length of the string does not apply to the characters that replace the variables. Minimum length = 1
timeout	<Integer>	Read-write	CLI session inactivity timeout, in seconds. If Restrictedtimeout argument of system parameter is enabled, Timeout can have values in the range [300-86400] seconds.If Restrictedtimeout argument of system parameter is disabled, Timeout can have values in the range [0, 10-100000000]

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			seconds. Default value is 900 seconds.
allowedmanagementinterface	<String[]>	Read-write	Allowed Management interfaces of the system users in the group. By default allowed from both API and CLI interfaces. If management interface for a group is set to API, then all users under this group will not allowed to access NS through CLI. GUI interface will come under API interface. Default value: NS_INTERFACE_ALL Possible values = CLI, API
daystoexpire	<Integer>	Read-write	Password days to expire for system groups. The daystoexpire value ranges from 30 to 255. Minimum value = 30 Maximum value = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
warnpriorndays	<Integer>	Read-write	Number of days before which password expiration warning would be thrown with respect to daystoexpire. The warnpriorndays value ranges from 5 to 40. Minimum value = 5 Maximum value = 40
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT
- UPDATE
- UNSET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemgroup":{

<b>"groupname":<String_value>,

</b>"promptstring":<String_value>,

"timeout":<Integer_value>,

"allowedmanagementinterface":<String[]_value>,

"daystoexpire":<Integer_value>,

"warnpriorndays":<Integer_value>
```

```
}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup/ groupname_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemgroup":{

<b>"groupname":<String_value>,

</b>"promptstring":<String_value>,

"timeout":<Integer_value>,

"allowedmanagementinterface":<String[]_value>,

"daystoexpire":<Integer_value>,
```

```
"warnpriorndays":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemgroup":{

<b>"groupname":<String_value>,

</b>"promptstring":true,

"timeout":true,

"allowedmanagementinterface":true,

"daystoexpire":true,

"warnpriorndays":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/systemgroup? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/systemgroup? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of systemgroup resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/systemgroup? **view=summary**

Use this query-parameter to get the summary output of systemgroup resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/systemgroup? **pagesize=#no;pageno=#no**

Use this query-parameter to get the systemgroup resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemgroup": [ {

"groupname":<String_value>,

"promptstring":<String_value>,

"timeout":<Integer_value>,

"allowedmanagementinterface":<String[]_value>,

"daystoexpire":<Integer_value>,

"warnpriorndays":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup/ groupname_value<String>
Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/systemgroup/ groupname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/systemgroup/ groupname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of systemgroup resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "systemgroup": [ {

"groupname":<String_value>,

"promptstring":<String_value>,

"timeout":<Integer_value>,

"allowedmanagementinterface":<String[]_value>,

"daystoexpire":<Integer_value>,

"warnpriorndays":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemgroup": [ { "__count": "#no"} ] }
```

systemgroup_binding

Binding object which returns the resources bound to systemgroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupname	<String>	Read-write	Name of the system group about which to display information. Minimum length = 1
systemgroup_systemcmdpolicy_binding	<systemgroup_systemcmdpolicy_binding[]>	Read-only	systemcmdpolicy that can be bound to systemgroup.
systemgroup_systemuser_binding	<systemgroup_systemuser_binding[]>	Read-only	systemuser that can be bound to systemgroup.
systemgroup_nspartition_binding	<systemgroup_nspartition_binding[]>	Read-only	nspartition that can be bound to systemgroup.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup_binding/groupname_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemgroup_binding": [ {

"groupname":<String_value>,

"systemgroup_nspartition_binding":<systemgroup_nspartition_binding[]_value
>,

"systemgroup_systemuser_binding":<systemgroup_systemuser_binding[]_value>,

"systemgroup_systemcmdpolicy_binding":<systemgroup_systemcmdpolicy_binding
[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/systemgroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemgroup_binding": [ {

"groupname":<String_value>,

"systemgroup_nspartition_binding":<systemgroup_nspartition_binding[]_value
>,

"systemgroup_systemuser_binding":<systemgroup_systemuser_binding[]_value>,

"systemgroup_systemcmdpolicy_binding":<systemgroup_systemcmdpolicy_binding
[]_value>

}]}
```

systemgroup_nspartition_binding

Binding object showing the nspartition that can be bound to systemgroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of the Partition to bind to the system group. Minimum length = 1

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup_systemuser_binding/ groupname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ systemgroup_systemuser_binding/ groupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of systemgroup_systemuser_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/systemgroup_systemuser_binding/ groupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the systemgroup_systemuser_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "systemgroup_systemuser_binding": [ {

"username":<String_value>,

"groupname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup_systemuser_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/systemgroup_systemuser_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "systemgroup_systemuser_binding": [ {

"username":<String_value>,

"groupname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemgroup_systemuser_binding/ groupname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"systemgroup_systemuser_binding": [ { "__count": "#no"} ] }
```

systemhwerror

Configuration for Hardware errors resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
diskcheck	<Boolean>	Read-write	Perform only disk error checking.
response	<String>	Read-only	Response captured during hardware examination.
hwerrorcount	<Integer>	Read-only	Number of errors found. Check response field for more information on errors if this value is non zero.

Operations

(click to see Properties)

- CHECK

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CHECK

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemhwerror? **action=check**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemhwerror":{

<b>"diskcheck":<Boolean_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Payload:

```
{ "systemhwerror": [ {

"response":<String_value>,

"hwerrorcount":<Integer_value>
```

```
}]}
```

systemkek

Configuration for Key encryption Key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
level	<String>	Read-write	Type of update KEK to be performed. *basic : The level basic will backup old keys and create new keys and respond back. *extended : The level extended will backup old keys and create new keys, update ns.conf, nscfg.db, all ns.conf for same release, in all partitions. While doing so will block all config changes and once done shall respond back.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = basic, extended

Operations

(click to see Properties)

- CHANGE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

CHANGE

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemkek? **action=update HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemkek":{

<b>"level":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

systemnsbtracing

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
configuredstate	<String>	Read-only	Get the configured state of nsb tracing. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
effectivestate	<String>	Read-only	Get the current running state of nsb tracing. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.

Operations

systemparameter

Configuration for system parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rbaonresponse	<String>	Read-write	Enable or disable Role-Based Authentication (RBA) on responses. Default value: ENABLED Possible values = ENABLED, DISABLED
promptstring	<String>	Read-write	String to display at the command-line prompt. Can consist of letters, numbers, hyphen (-), period (.), hash (#), space ( ), at (@), equal (=), colon (:), underscore (_), and the following variables: * %u - Will be replaced by the user name. * %h - Will be replaced by the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hostname of the Citrix ADC. * %t - Will be replaced by the current time in 12-hour format. * %T - Will be replaced by the current time in 24-hour format. * %d - Will be replaced by the current date. * %s - Will be replaced by the state of the Citrix ADC. Note: The 63-character limit for the length of the string does not apply to the characters that replace the variables. Minimum length = 1
natpcbforceflushlimit	<Integer>	Read-write	Flush the system if the number of Network Address Translation Protocol Control Blocks

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(NATPCBs) exceeds this value. Default value: 2147483647 Minimum value = 1000
natpcbrstontimeout	<String>	Read-write	Send a reset signal to client and server connections when their NATPCBs time out. Avoids the buildup of idle TCP connections on both the sides. Default value: DISABLED Possible values = ENABLED, DISABLED
timeout	<Integer>	Read-write	CLI session inactivity timeout, in seconds. If Restrictedtimeout argument is enabled, Timeout can have values in the range [300-86400] seconds. If Restrictedtimeout argument is disabled, Timeout can have values in the range [0, 10-100000000] seconds. Default

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			value is 900 seconds.
localauth	<String>	Read-write	When enabled, local users can access Citrix ADC even when external authentication is configured. When disabled, local users are not allowed to access the Citrix ADC, Local users can access the Citrix ADC only when the configured external authentication servers are unavailable. This parameter is not applicable to SSH Key-based authentication. Default value: ENABLED Possible values = ENABLED, DISABLED
minpasswordlen	<Integer>	Read-write	Minimum length of system user password. When strong password is enabled default minimum length is 8. User entered value can be greater than or equal to 8. Default mininum value is 1 when strong

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			password is disabled. Maximum value is 127 in both cases. Minimum value = 1 Maximum value = 127
strongpassword	<String>	Read-write	After enabling strong password (enableall / enablelocal - not included in exclude list), all the passwords / sensitive information must have - Atleast 1 Lower case character, Atleast 1 Upper case character, Atleast 1 numeric character, Atleast 1 special character (~, `, !, @, #, $, %, \^, ;, *, -, _, =, +, {, }, [,], |, \, :, <, >, /, ., ,, " "). Exclude list in case of enablelocal is - NS_FIPS, NS_CRL, NS_RSAKEY, NS_PKCS12, NS_PKCS8, NS_LDAP, NS_TACACS, NS_TACACSACTION, NS_RADIUS, NS_RADIUSACTION, NS_ENCRYPTION_PARAMS. So no

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Strong Password checks will be performed on these ObjectType commands for enablelocal case. Default value: disabled Possible values = enableall, enablelocal, disabled
restrictedtimeout	<String>	Read-write	Enable/Disable the restricted timeout behaviour. When enabled, timeout cannot be configured beyond admin configured timeout and also it will have the [minimum - maximum] range check. When disabled, timeout will have the old behaviour. By default the value is disabled. Default value: DISABLED Possible values = ENABLED, DISABLED
fipsusermode	<String>	Read-write	Use this option to set the FIPS mode for key user-land processes. When

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enabled, these user-land processes will operate in FIPS mode. In this mode, these processes will use FIPS 140-2 certified crypto algorithms. With a FIPS license, it is enabled by default and cannot be disabled. Without a FIPS license, it is disabled by default, wherein these user-land processes will not operate in FIPS mode. Default value: DISABLED Possible values = ENABLED, DISABLED
doppler	<String>	Read-write	Enable or disable Doppler. Default value: ENABLED Possible values = ENABLED, DISABLED
googleanalytics	<String>	Read-write	Enable or disable Google analytics.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
totalauthtimeout	<Integer>	Read-write	Total time a request can take for authentication/ authorization. Default value: 20 Minimum value = 5 Maximum value = 120
cliloglevel	<String>	Read-write	Audit log level, which specifies the types of events to log for cli executed commands. Available values function as follows: * EMERGENCY - Events that indicate an immediate crisis on the server. * ALERT - Events that might require action. * CRITICAL - Events that indicate an imminent server crisis.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ERROR - Events that indicate some type of error. * WARNING - Events that require action in the near future. * NOTICE - Events that the administrator should know about. * INFORMATIONAL - All but low-level events. * DEBUG - All events, in extreme detail. Default value: INFORMATIONAL Possible values = EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG
forcepasswordchange	<String>	Read-write	Enable or disable force password change for nsroot user.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
basicauth	<String>	Read-write	Enable or disable basic authentication for Nitro API. Default value: ENABLED Possible values = ENABLED, DISABLED
reauthonauthparamchange	<String>	Read-write	Enable or disable External user reauthentication when authentication parameter changes. Default value: DISABLED Possible values = ENABLED, DISABLED
removesensitivefiles	<String>	Read-write	Use this option to remove the sensitive files from the system like authorise keys, public keys etc. The commands which will remove sensitive files when this system paramter is enabled are rm cluster instance, rm

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cluster node, rm ha node, clear config full, join cluster and add cluster instance. Default value: DISABLED Possible values = ENABLED, DISABLED
maxsessionperuser	<Integer>	Read-write	Maximum number of client connection allowed per user.The maxsessionperuser value ranges from 1 to 40. Minimum value = 1 Maximum value = 40
wafprotection	<String[]>	Read-write	Configure WAF protection for endpoints used by NetScaler management interfaces. The available options are: * DEFAULT - NetScaler decides which endpoints have WAF protection enabled. * GUI - Endpoints used by the Management GUI

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Interface are WAF protected. * DISABLED - WAF protection is disabled. Default value: DEFAULT Possible values = DEFAULT, DISABLED, GUI
denylist	<String>	Read-write	Enable or disable denylist protection. The available options are: * ON - Denylist feature is enabled. * OFF - Denylist feature is disabled. Default value: ON Possible values = ON, OFF
denylistlogging	<String>	Read-write	Enable or disable denylist protection logging. The available options are: * ON - Denylist logging is enabled. * OFF - Denylist logging is disabled. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
passwordhistorycontrol	<String>	Read-write	Enables or disable password expiry feature for system users. If the feature is ENABLED, by default the last 6 passwords of users will be maintained and will not be allowed to reuse same. When the feature is enabled the daystoexpire, warnpriorndays and pwdhistoryCount will be set with default values. The values can only be set in system for system parameter. It cannot be unset. It is possible to set and unset the values for daytoexpire and warnpriorndays in system groups.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default values if feature is ENABLED: daystoexpire: 30 warnpriorndays: 5 pwdhistoryCount: 6 If the feature is DISABLED the values cannot be set or unset in system parameter and system groups. Default value: DISABLED Possible values = ENABLED, DISABLED
daystoexpire	<Integer>	Read-write	Password expiry days for all the system users. The daystoexpire value ranges from 30 to 255. Minimum value = 30 Maximum value = 255
warnpriorndays	<Integer>	Read-write	Number of days before which password expiration warning would be thrown with respect to daystoexpire. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			warnpriorndays value ranges from 5 to 40. Minimum value = 5 Maximum value = 40
pwdhistorycount	<Integer>	Read-write	Number of passwords to be maintained as history for system users. The pwdhistorycount value ranges from 1 to 10. Minimum value = 1 Maximum value = 10
maxclient	<Integer>	Read-only	Maximum number of client connection allowed by the system. Minimum value = 10 Maximum value = 40
allowdefaultpartition	<String>	Read-only	Enable/Disable the allowing partition users to access default partition. Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemparameter **HTTP Method:** PUT

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemrestorepoint **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/systemrestorepoint? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/systemrestorepoint? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of systemrestorepoint resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/systemrestorepoint? **view=summary**

Use this query-parameter to get the summary output of systemrestorepoint resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/systemrestorepoint? **pagesize=#no;pageno=#no**

Use this query-parameter to get the systemrestorepoint resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemrestorepoint": [ {

"filename":<String_value>,

"backupfilename":<String_value>,
```

```
"techsuprtname":<String_value>,

"creationtime":<String_value>,

"version":<String_value>,

"createdby":<String_value>,

"ipaddress":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemrestorepoint/ filename_value<String>
Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/systemrestorepoint/ filename_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/systemrestorepoint/ filename_value<String> ? **view=summary**

Use this query-parameter to get the summary output of systemrestorepoint resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "systemrestorepoint": [ {

"filename":<String_value>,

"backupfilename":<String_value>,

"techsuprtname":<String_value>,

"creationtime":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemrestorepoint? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemrestorepoint": [ { "__count": "#no"} ] }
```

systemsession

Configuration for system session resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sid	<Integer>	Read-write	ID of the system session about which to display information. Minimum value = 1
all	<Boolean>	Read-write	Terminate all the system sessions except the current session.
username	<String>	Read-only	user name of the session.
logintime	<String>	Read-only	logged-in time of this session.
logintimelocal	<String>	Read-only	logged-in time (in local ADC timezone) of this session.
lastactivitytime	<String>	Read-only	last activity time of this session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lastactivitytimelocal	<String>	Read-only	last activity time (in local ADC timezone) of this session.
expirytime	<Integer>	Read-only	Time left in expire the session in seconds.
numofconnections	<Integer>	Read-only	number of connection using this token.
currentconn	<Boolean>	Read-only	True if the token is used for current session.
clienttype	<String>	Read-only	client type of the session. Possible values = CLI, CONSOLE, API, GUI
partitionname	<String>	Read-only	Name of the partition where the user is currently present.
clientipaddress	<String>	Read-only	IP address of client connecting to ADC.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- GET
- COUNT

- KILL

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

KILL

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemsession? **action=kill HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemsession":{

"sid":<Integer_value>,

"all":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemsession **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/systemsession? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/systemsession? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of systemsession resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/systemsession? **view=summary**

Use this query-parameter to get the summary output of systemsession resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/systemsession? **pagesize=#no;pageno=#no**

Use this query-parameter to get the systemsession resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemsession": [ {

"sid":<Integer_value>,

"username":<String_value>,

"logintime":<String_value>,

"logintimelocal":<String_value>,

"lastactivitytime":<String_value>,

- DISABLE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemsignedexereport? **action=enable**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemsignedexereport":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DISABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemsignedexereport? **action=disable**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"systemsignedexereport":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

systemsshkey

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	URL \(protocol, host, path, and file name\) from where the location file will be imported. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sshkeytype	<String>	Read-write	The type of the ssh key whether public or private key. Possible values = PRIVATE, PUBLIC
src	<String>	Read-write	URL \(protocol, host, path, and file name\) from where the location file will be imported. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
_nextgenapiresource	<String>	Read-only	.

Response Payload:

```
{ "systemsshkey": [ {

sshkeytype:<String_value>"name":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

systemuser

Configuration for system user resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name for a user. Must begin with a letter, number, or the underscore (_) character, and must contain only alphanumeric, hyphen (-), period (.), hash (#), space ( ), at (@), equal (=), colon (:), and underscore characters. Cannot be changed after the user is added. CLI Users: If the name includes one or more spaces, enclose the name in double or single

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotation marks (for example, "my user" or 'my user'). Minimum length = 1
password	<String>	Read-write	Password for the system user. Can include any ASCII character. Minimum length = 1
externalauth	<String>	Read-write	Whether to use external authentication servers for the system user authentication or not. Default value: ENABLED Possible values = ENABLED, DISABLED
promptstring	<String>	Read-write	String to display at the command-line prompt. Can consist of letters, numbers, hyphen (-), period (.), hash (#), space ( ), at (@), equal (=), colon (:), underscore (_), and the following variables: * %u - Will be replaced by the user name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* %h - Will be replaced by the hostname of the Citrix ADC. * %t - Will be replaced by the current time in 12-hour format. * %T - Will be replaced by the current time in 24-hour format. * %d - Will be replaced by the current date. * %s - Will be replaced by the state of the Citrix ADC. Note: The 63-character limit for the length of the string does not apply to the characters that replace the variables. Minimum length = 1
timeout	<Integer>	Read-write	CLI session inactivity timeout, in seconds. If Restrictedtimeout argument of system

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parameter is enabled, Timeout can have values in the range [300-86400] seconds. If Restrictedtimeout argument of system parameter is disabled, Timeout can have values in the range [0, 10-100000000] seconds. Default value is 900 seconds.
logging	<String>	Read-write	Users logging privilege. Default value: DISABLED Possible values = ENABLED, DISABLED
maxsession	<Integer>	Read-write	Maximum number of client connection allowed per user. Minimum value = 1 Maximum value = 40
allowedmanagementinterface	<String[]>	Read-write	Allowed Management interfaces to the system user. By default user is allowed from both API and CLI

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interfaces. If management interface for a user is set to API, then user is not allowed to access NS through CLI. GUI interface will come under API interface. Default value: NS_INTERFACE_ALL Possible values = CLI, API
encrypted	<Boolean>	Read-only	.
hashmethod	<String>	Read-only	. Possible values = SHA1, SHA512, PBKDF2
promptinheritedfrom	<String>	Read-only	From where the prompt has been inherited. Possible values = User, Group, Global, Climode
timeoutkind	<String>	Read-only	From where the timeout has been inherited. Possible values = User, Group, Global, Climode
allowedmanagementinterfacekind	<String>	Read-only	Value of allowed interface which can be inherited from

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Global, Group or User. Possible values = User, Group, Global, Climode
lastpwdchangetimestamp	<Integer>	Read-only	Timestamp for the last password change for system user.
daystoexpirekind	<String>	Read-only	From where the daystoexpire value has been inherited. Possible values = User, Group, Global, Climode
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemuser": [ { "__count": "#no"} ] }
```

systemuser_binding

Binding object which returns the resources bound to systemuser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name of a system user about whom to display information. Minimum length = 1
systemuser_nspartition_binding	<systemuser_nspartition_binding[]>	Read-only	nspartition that can be bound to systemuser.
systemuser_systemgroup_binding	<systemuser_systemgroup_binding[]>	Read-only	systemgroup that can be bound to systemuser.
systemuser_systemcmdpolicy_binding	<systemuser_systemcmdpolicy_binding[]>	Read-only	systemcmdpolicy that can be bound to systemuser.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemuser_binding/ username_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemuser_binding": [ {

"username":<String_value>,

"systemuser_systemcmdpolicy_binding":<systemuser_systemcmdpolicy_binding[]
_value>,

"systemuser_nspartition_binding":<systemuser_nspartition_binding[]_value>,

"systemuser_systemgroup_binding":<systemuser_systemgroup_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/systemuser_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/systemuser_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "systemuser_binding": [ {

"username":<String_value>,

"systemuser_systemcmdpolicy_binding":<systemuser_systemcmdpolicy_binding[]
_value>,

"systemuser_nspartition_binding":<systemuser_nspartition_binding[]_value>,

"systemuser_systemgroup_binding":<systemuser_systemgroup_binding[]_value>

}]}
```

systemuser_nspartition_binding

Binding object showing the nspartition that can be bound to systemuser.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name of the system-user entry to which to bind the command policy. Minimum length = 1
partitionname	<String>	Read-write	Name of the Partition to bind to the system user.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-write	count parameter

tm

Traffic Management

TM session/policy configuration.

NAME	DESCRIPTION
tmformssoaction	Configuration for Form sso action
tmglobal_auditnslogpolicy_binding	Binding object showing the auditnslogpolicy that can be bound to tmglobal
tmglobal_auditsyslogpolicy_binding	Binding object showing the auditsyslogpolicy that can be bound to tmglobal
tmglobal_binding	Binding object showing the resources that can be bound to tmglobal
tmglobal_tmsessionpolicy_binding	Binding object showing the tmsessionpolicy that can be bound to tmglobal
tmglobal_tmtrafficpolicy_binding	Binding object showing the tmtrafficpolicy that can be bound to tmglobal
tmsamlssoprofile	Configuration for SAML sso action
tmsessionaction	Configuration for TM session action
tmsessionparameter	Configuration for session parameter
tmsessionpolicy	Configuration for TM session policy

NAME	DESCRIPTION
tmsessionpolicy_aaagroup_binding	Binding object showing the aaagroup that can be bound to tmsessionpolicy
tmsessionpolicy_aaauser_binding	Binding object showing the aaauser that can be bound to tmsessionpolicy
tmsessionpolicy_authenticationvserver_binding	Binding object showing the authenticationvserver that can be bound to tmsessionpolicy
tmsessionpolicy_binding	Binding object showing the resources that can be bound to tmsessionpolicy
tmsessionpolicy_tmglobal_binding	Binding object showing the tmglobal that can be bound to tmsessionpolicy
tmtrafficaction	Configuration for TM traffic action
tmtrafficpolicy	Configuration for TM traffic policy
tmtrafficpolicy_binding	Binding object showing the resources that can be bound to tmtrafficpolicy
tmtrafficpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to tmtrafficpolicy
tmtrafficpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to tmtrafficpolicy
tmtrafficpolicy_tmglobal_binding	Binding object showing the tmglobal that can be bound to tmtrafficpolicy

NAME	DESCRIPTION

tmformssoaction

Configuration for Form sso action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new form-based single sign-on profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an SSO action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my action" or 'my action'). Minimum length = 1
actionurl	<String>	Read-write	URL to which the completed form is submitted. Minimum length = 1
userfield	<String>	Read-write	Name of the form field in which the user types in the user ID. Minimum length = 1
passwdfield	<String>	Read-write	Name of the form field in which the user types in the password. Minimum length = 1
ssosuccessrule	<String>	Read-write	Expression, that checks to see if single sign-on is successful.
namevaluepair	<String>	Read-write	Name-value pair attributes to send to the server in addition to sending the username and password. Value names are separated by an ampersand (;) (for example, name1=value1;name2=value2).
responsesize	<Integer>	Read-write	Number of bytes, in the response, to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parse for extracting the forms. Default value: 8096
nvtype	<String>	Read-write	Type of processing of the name-value pair. If you specify STATIC, the values configured by the administrator are used. For DYNAMIC, the response is parsed, and the form is extracted and then submitted. Default value: DYNAMIC Possible values = STATIC, DYNAMIC
submitmethod	<String>	Read-write	HTTP method used by the single sign-on form to send the logon credentials to the logon server. Applies only to STATIC name-value type. Default value: GET Possible values = GET, POST
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmformssoaction/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/tmformssoaction/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/tmformssoaction/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of tmformssoaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "tmformssoaction": [ {

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmformssoaction? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "tmformssoaction": [ { "__count": "#no"} ] }
```

tmglobal_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to tmglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Applicable only to advance tmsession policy. Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a priority number that is numerically higher than the highest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
priority	<Integer>	Read-write	The priority of the policy.
policyname	<String>	Read-write	The name of the policy.
priority	<Integer>	Read-write	The priority of the policy.
bindpolicytype	<Integer>	Read-only	Bound policy type.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/tmglobal_auditnslogpolicy_binding

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "tmglobal_tmtrafficpolicy_binding": [ { "__count": "#no"} ] }
```

tmsamlssoprofile

Configuration for SAML sso action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new saml single sign-on profile. Must begin with an ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an SSO action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
samlsigningcertname	<String>	Read-write	Name of the SSL certificate that is used to Sign Assertion. Minimum length = 1
assertionconsumerserviceurl	<String>	Read-write	URL to which the assertion is to be sent.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
relaystaterule	<String>	Read-write	Expression to extract relaystate to be sent along with assertion. Evaluation of this expression should return TEXT content. This is typically a targ et url to which user is redirected after the recipient validates SAML token.
sendpassword	<String>	Read-write	Option to send password in assertion. Default value: OFF Possible values = ON, OFF
samlissuername	<String>	Read-write	The name to be used in requests sent from Citrix ADC to IdP to uniquely identify Citrix ADC. Minimum length = 1
signaturealg	<String>	Read-write	Algorithm to be used to sign/verify SAML transactions. Default value: RSA-SHA256

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = RSA-SHA1, RSA-SHA256
digestmethod	<String>	Read-write	Algorithm to be used to compute/verify digest for SAML transactions. Default value: SHA256 Possible values = SHA1, SHA256
audience	<String>	Read-write	Audience for which assertion sent by IdP is applicable. This is typically entity name or url that represents ServiceProvider.
nameidformat	<String>	Read-write	Format of Name Identifier sent in Assertion. Default value: transient Possible values = Unspecified, emailAddress, X509SubjectName, WindowsDomainQualifiedName, kerberos, entity, persistent, transient
nameidexpr	<String>	Read-write	Expression that will be evaluated to obtain

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NameIdentifier to be sent in assertion. Maximum length = 128
attribute1	<String>	Read-write	Name of attribute1 that needs to be sent in SAML Assertion.
attribute1expr	<String>	Read-write	Expression that will be evaluated to obtain attribute1's value to be sent in Assertion. Maximum length = 128
attribute1friendlyname	<String>	Read-write	User-Friendly Name of attribute1 that needs to be sent in SAML Assertion.
attribute1format	<String>	Read-write	Format of Attribute1 to be sent in Assertion. Possible values = URI, Basic
attribute2	<String>	Read-write	Name of attribute2 that needs to be sent in SAML Assertion.
attribute2expr	<String>	Read-write	Expression that will be evaluated to obtain attribute2's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute2friendlyname	<String>	Read-write	User-Friendly Name of attribute2 that needs to be sent in SAML Assertion.
attribute2format	<String>	Read-write	Format of Attribute2 to be sent in Assertion. Possible values = URI, Basic
attribute3	<String>	Read-write	Name of attribute3 that needs to be sent in SAML Assertion.
attribute3expr	<String>	Read-write	Expression that will be evaluated to obtain attribute3's value to be sent in Assertion. Maximum length = 128
attribute3friendlyname	<String>	Read-write	User-Friendly Name of attribute3 that needs to be sent in SAML Assertion.
attribute3format	<String>	Read-write	Format of Attribute3 to be sent in Assertion. Possible values = URI, Basic
attribute4	<String>	Read-write	Name of attribute4 that needs to be sent in SAML Assertion.
attribute4expr	<String>	Read-write	Expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain attribute4's value to be sent in Assertion. Maximum length = 128
attribute4friendlyname	<String>	Read-write	User-Friendly Name of attribute4 that needs to be sent in SAML Assertion.
attribute4format	<String>	Read-write	Format of Attribute4 to be sent in Assertion. Possible values = URI, Basic
attribute5	<String>	Read-write	Name of attribute5 that needs to be sent in SAML Assertion.
attribute5expr	<String>	Read-write	Expression that will be evaluated to obtain attribute5's value to be sent in Assertion. Maximum length = 128
attribute5friendlyname	<String>	Read-write	User-Friendly Name of attribute5 that needs to be sent in SAML Assertion.
attribute5format	<String>	Read-write	Format of Attribute5 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute6	<String>	Read-write	Name of attribute6 that needs to be sent in SAML Assertion.
attribute6expr	<String>	Read-write	Expression that will be evaluated to obtain attribute6's value to be sent in Assertion. Maximum length = 128
attribute6friendlyname	<String>	Read-write	User-Friendly Name of attribute6 that needs to be sent in SAML Assertion.
attribute6format	<String>	Read-write	Format of Attribute6 to be sent in Assertion. Possible values = URI, Basic
attribute7	<String>	Read-write	Name of attribute7 that needs to be sent in SAML Assertion.
attribute7expr	<String>	Read-write	Expression that will be evaluated to obtain attribute7's value to be sent in Assertion. Maximum length = 128
attribute7friendlyname	<String>	Read-write	User-Friendly Name of attribute7 that needs to be sent in SAML Assertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute7format	<String>	Read-write	Format of Attribute7 to be sent in Assertion. Possible values = URI, Basic
attribute8	<String>	Read-write	Name of attribute8 that needs to be sent in SAML Assertion.
attribute8expr	<String>	Read-write	Expression that will be evaluated to obtain attribute8's value to be sent in Assertion. Maximum length = 128
attribute8friendlyname	<String>	Read-write	User-Friendly Name of attribute8 that needs to be sent in SAML Assertion.
attribute8format	<String>	Read-write	Format of Attribute8 to be sent in Assertion. Possible values = URI, Basic
attribute9	<String>	Read-write	Name of attribute9 that needs to be sent in SAML Assertion.
attribute9expr	<String>	Read-write	Expression that will be evaluated to obtain attribute9's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute9friendlyname	<String>	Read-write	User-Friendly Name of attribute9 that needs to be sent in SAML Assertion.
attribute9format	<String>	Read-write	Format of Attribute9 to be sent in Assertion. Possible values = URI, Basic
attribute10	<String>	Read-write	Name of attribute10 that needs to be sent in SAML Assertion.
attribute10expr	<String>	Read-write	Expression that will be evaluated to obtain attribute10's value to be sent in Assertion. Maximum length = 128
attribute10friendlyname	<String>	Read-write	User-Friendly Name of attribute10 that needs to be sent in SAML Assertion.
attribute10format	<String>	Read-write	Format of Attribute10 to be sent in Assertion. Possible values = URI, Basic
attribute11	<String>	Read-write	Name of attribute11 that needs to be sent in SAML Assertion.
attribute11expr	<String>	Read-write	Expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain attribute11's value to be sent in Assertion. Maximum length = 128
attribute11friendlyname	<String>	Read-write	User-Friendly Name of attribute11 that needs to be sent in SAML Assertion.
attribute11format	<String>	Read-write	Format of Attribute11 to be sent in Assertion. Possible values = URI, Basic
attribute12	<String>	Read-write	Name of attribute12 that needs to be sent in SAML Assertion.
attribute12expr	<String>	Read-write	Expression that will be evaluated to obtain attribute12's value to be sent in Assertion. Maximum length = 128
attribute12friendlyname	<String>	Read-write	User-Friendly Name of attribute12 that needs to be sent in SAML Assertion.
attribute12format	<String>	Read-write	Format of Attribute12 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute13	<String>	Read-write	Name of attribute13 that needs to be sent in SAML Assertion.
attribute13expr	<String>	Read-write	Expression that will be evaluated to obtain attribute13's value to be sent in Assertion. Maximum length = 128
attribute13friendlyname	<String>	Read-write	User-Friendly Name of attribute13 that needs to be sent in SAML Assertion.
attribute13format	<String>	Read-write	Format of Attribute13 to be sent in Assertion. Possible values = URI, Basic
attribute14	<String>	Read-write	Name of attribute14 that needs to be sent in SAML Assertion.
attribute14expr	<String>	Read-write	Expression that will be evaluated to obtain attribute14's value to be sent in Assertion. Maximum length = 128
attribute14friendlyname	<String>	Read-write	User-Friendly Name of attribute14 that needs to be sent in SAML Assertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute14format	<String>	Read-write	Format of Attribute14 to be sent in Assertion. Possible values = URI, Basic
attribute15	<String>	Read-write	Name of attribute15 that needs to be sent in SAML Assertion.
attribute15expr	<String>	Read-write	Expression that will be evaluated to obtain attribute15's value to be sent in Assertion. Maximum length = 128
attribute15friendlyname	<String>	Read-write	User-Friendly Name of attribute15 that needs to be sent in SAML Assertion.
attribute15format	<String>	Read-write	Format of Attribute15 to be sent in Assertion. Possible values = URI, Basic
attribute16	<String>	Read-write	Name of attribute16 that needs to be sent in SAML Assertion.
attribute16expr	<String>	Read-write	Expression that will be evaluated to obtain attribute16's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute16friendlyname	<String>	Read-write	User-Friendly Name of attribute16 that needs to be sent in SAML Assertion.
attribute16format	<String>	Read-write	Format of Attribute16 to be sent in Assertion. Possible values = URI, Basic
encryptassertion	<String>	Read-write	Option to encrypt assertion when Citrix ADC sends one. Default value: OFF Possible values = ON, OFF
samlspcertname	<String>	Read-write	Name of the SSL certificate of peer/ receving party using which Assertion is encrypted. Minimum length = 1
encryptionalgorithm	<String>	Read-write	Algorithm to be used to encrypt SAML assertion. Default value: AES256 Possible values = DES3, AES128, AES192, AES256
skewtime	<Integer>	Read-write	This option specifies the number of minutes on either side of current time

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that the assertion would be valid. For example, if skewTime is 10, then assertion would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
signassertion	<String>	Read-write	Option to sign portions of assertion when Citrix ADC IDP sends one. Based on the user selection, either Assertion or Response or Both or none can be signed. Default value: ASSERTION Possible values = NONE, ASSERTION, RESPONSE, BOTH
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmsamlssoprofile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/tmsamlssoprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/tmsamlssoprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of tmsamlssoprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/tmsamlssoprofile? **view=summary**

Use this query-parameter to get the summary output of tmsamlssoprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/tmsamlssoprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the tmsamlssoprofile resources in chunks.

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmsamlssoprofile/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/tmsamlssoprofile/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/tmsamlssoprofile/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of tmsamlssoprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "tmsamlssoprofile": [ { "__count": "#no"} ] }
```

tmsessionaction

Configuration for TM session action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the session action. Must begin with an ASCII alphanumeric or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after a session action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
sesstimeout	<Integer>	Read-write	Session timeout, in minutes. If there is no traffic during the timeout period, the user is disconnected and must reauthenticate to access intranet resources. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
defaultauthorizationaction	<String>	Read-write	Allow or deny access to content for which there is no specific authorization policy. Possible values = ALLOW, DENY
sso	<String>	Read-write	Use single sign-on (SSO) to log users on to all web applications automatically after they authenticate, or pass users to the web application logon page to authenticate to each application individually. Note that this configuration does not honor the following authentication types for security reason. BASIC, DIGEST, and NTLM (without Negotiate NTLM2 Key or Negotiate Sign Flag). Use TM TrafficAction to configure SSO for these authentication types. Default value: OFF Possible values = ON, OFF
ssocredential	<String>	Read-write	Use the primary or secondary

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication credentials for single sign-on (SSO). Possible values = PRIMARY, SECONDARY
ssodomain	<String>	Read-write	Domain to use for single sign-on (SSO). Minimum length = 1 Maximum length = 32
httponlycookie	<String>	Read-write	Allow only an HTTP session cookie, in which case the cookie cannot be accessed by scripts. Default value: YES Possible values = YES, NO
kcdaccount	<String>	Read-write	Kerberos constrained delegation account name. Minimum length = 1 Maximum length = 32
persistentcookie	<String>	Read-write	Enable or disable persistent SSO cookies for the traffic management (TM) session. A persistent cookie remains on the user device and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is sent with each HTTP request. The cookie becomes stale if the session ends. This setting is overwritten if a traffic action sets persistent cookie to OFF. Note: If persistent cookie is enabled, make sure you set the persistent cookie validity. Possible values = ON, OFF
persistentcookievalidity	<Integer>	Read-write	Integer specifying the number of minutes for which the persistent cookie remains valid. Can be set only if the persistent cookie setting is enabled. Minimum value = 1
homepage	<String>	Read-write	Web address of the home page that a user is displayed when authentication vserver is bookmarked and used to login.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmsessionaction **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"tmsessionaction":{

<b>"name":<String_value>,

</b>"sesstimeout":<Integer_value>,

"defaultauthorizationaction":<String_value>,

"sso":<String_value>,

"ssocredential":<String_value>,

"ssodomain":<String_value>,

"kcdaccount":<String_value>,
```

```
"persistentcookie":<String_value>,

"persistentcookievalidity":<Integer_value>,

"homepage":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmsessionaction/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmsessionaction **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"tmsessionaction":{

<b>"name":<String_value>,

</b>"sesstimeout":<Integer_value>,
```

```
"defaultauthorizationaction":<String_value>,

tmsessionpolicy

Configuration for TM session policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the session policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. Cannot be changed after a session policy is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression, against which traffic is evaluated. Both classic and advance expressions are supported in default partition but only advance expressions in non-default partition. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Action to be applied to connections that match this policy. Minimum length = 1
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced) .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Classic Policy, Advanced Policy
hits	<Integer>	Read-only	Number of hits.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

<b>"name":<String_value>,

</b>"rule":true,

"action":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmsessionpolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/tmsessionpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/tmsessionpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of tmsessionpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/tmsessionpolicy? **view=summary**

Use this query-parameter to get the summary output of tmsessionpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/tmsessionpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the tmsessionpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "tmsessionpolicy": [ {

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "tmsessionpolicy": [ { "__count": "#no"} ] }
```

tmsessionpolicy_aaagroup_binding

Binding object showing the aaagroup that can be bound to tmsessionpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the session policy for which to display detailed information. Minimum length = 1
priority	<Integer>	Read-only	.
activepolicy	<Integer>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmsessionpolicy_aaagroup_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ tmsessionpolicy_aaagroup_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of tmsessionpolicy_aaagroup_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/tmsessionpolicy_aaagroup_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the tmsessionpolicy_aaagroup_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "tmsessionpolicy_aaagroup_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmsessionpolicy_aaagroup_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/tmsessionpolicy_aaagroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

tmtrafficaction

Configuration for TM traffic action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the traffic action. Must begin with an ASCII alphanumeric or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after a traffic action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
apptimeout	<Integer>	Read-write	Time interval, in minutes, of user inactivity after which the connection is closed. Minimum value = 1 Maximum value = 715827
sso	<String>	Read-write	Use single sign-on for the resource that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the user is accessing now. Possible values = ON, OFF
formssoaction	<String>	Read-write	Name of the configured form-based single sign-on profile.
persistentcookie	<String>	Read-write	Use persistent cookies for the traffic session. A persistent cookie remains on the user device and is sent with each HTTP request. The cookie becomes stale if the session ends. Possible values = ON, OFF
initiatelogout	<String>	Read-write	Initiate logout for the traffic management (TM) session if the policy evaluates to true. The session is then terminated after two minutes. Possible values = ON, OFF
kcdaccount	<String>	Read-write	Kerberos constrained delegation account name. Default value: "None"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 32
samlssoprofile	<String>	Read-write	Profile to be used for doing SAML SSO to remote relying party. Minimum length = 1
forcedtimeout	<String>	Read-write	Setting to start, stop or reset TM session force timer. Possible values = START, STOP, RESET
forcedtimeoutval	<Integer>	Read-write	Time interval, in minutes, for which force timer should be set.
userexpression	<String>	Read-write	expression that will be evaluated to obtain username for SingleSignOn. Maximum length = 256
passwdexpression	<String>	Read-write	expression that will be evaluated to obtain password for SingleSignOn. Maximum length = 256
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"tmtrafficaction":{

<b>"name":<String_value>,

</b>"apptimeout":<Integer_value>,

"sso":<String_value>,

"formssoaction":<String_value>,

"persistentcookie":<String_value>,

"initiatelogout":<String_value>,

"kcdaccount":<String_value>,

"samlssoprofile":<String_value>,

"forcedtimeout":<String_value>,

"forcedtimeoutval":<Integer_value>,

"userexpression":<String_value>,

"passwdexpression":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"tmtrafficaction":{

<b>"name":<String_value>,

</b>"apptimeout":<Integer_value>,

"sso":<String_value>,

"formssoaction":<String_value>,

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"tmtrafficaction":{

<b>"name":<String_value>,

</b>"persistentcookie":true,

"kcdaccount":true,

"forcedtimeout":true,

"userexpression":true,

"passwdexpression":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of tmtrafficaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction? **view=summary**

Use this query-parameter to get the summary output of tmtrafficaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the tmtrafficaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "tmtrafficaction": [ {

"name":<String_value>,

"apptimeout":<Integer_value>,

"sso":<String_value>,

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficaction? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "tmtrafficaction": [ { "__count": "#no"} ] }
```

tmtrafficpolicy

Configuration for TM traffic policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the traffic policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Name of the Citrix ADC named expression, or an expression, that the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy uses to determine whether to apply certain action on the current traffic.
action	<String>	Read-write	Name of the action to apply to requests or connections that match this policy. Minimum length = 1
hits	<Integer>	Read-only	Number of hits.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

{  "tmtrafficpolicy_lbvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficpolicy_lbvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficpolicy_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "tmtrafficpolicy_lbvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficpolicy_lbvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"tmtrafficpolicy_lbvserver_binding": [ { "__count": "#no"} ] }
```

tmtrafficpolicy_tmglobal_binding

Binding object showing the tmglobal that can be bound to tmtrafficpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the traffic policy for which to display detailed information. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Integer>	Read-only	.
activepolicy	<Integer>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficpolicy_tmglobal_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ tmtrafficpolicy_tmglobal_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of tmtrafficpolicy_tmglobal_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficpolicy_tmglobal_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the tmtrafficpolicy_tmglobal_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "tmtrafficpolicy_tmglobal_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficpolicy_tmglobal_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficpolicy_tmglobal_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "tmtrafficpolicy_tmglobal_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/tmtrafficpolicy_tmglobal_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"tmtrafficpolicy_tmglobal_binding": [ { "__count": "#no"} ] }
```

transform

Transform

URL Transformation configuration.

NAME	DESCRIPTION
transformaction	Configuration for transform action
transformglobal_binding	Binding object showing the resources that can be bound to transformglobal
transformglobal_transformpolicy_binding	Binding object showing the transformpolicy that can be bound to transformglobal
transformpolicy	Configuration for URL Transformation policy
transformpolicy_binding	Binding object showing the resources that can be bound to transformpolicy
transformpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to transformpolicy
transformpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to transformpolicy
transformpolicy_transformglobal_binding	Binding object showing the transformglobal that can be bound to transformpolicy
transformpolicy_transformpolicylabel_binding	Binding object showing the transformpolicylabel that can be bound to transformpolicy
transformpolicylabel	Configuration for transform policy label
transformpolicylabel_binding	Binding object showing the resources that can be bound to transformpolicylabel

NAME	DESCRIPTION
transformpolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to transformpolicylabel
transformpolicylabel_transformpolicy_binding	Binding object showing the transformpolicy that can be bound to transformpolicylabel
transformprofile	Configuration for URL Transformation profile
transformprofile_binding	Binding object showing the resources that can be bound to transformprofile
transformprofile_transformaction_binding	Binding object showing the transformaction that can be bound to transformprofile

transformaction

Configuration for transform action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the URL transformation action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), colon (:), and underscore characters. Cannot be changed after the URL Transformation action is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, my transform action or my transform action). Minimum length = 1
profilename	<String>	Read-write	Name of the URL Transformation profile with which to associate this action. Minimum length = 1
priority	<Integer>	Read-write	Positive integer specifying the priority of the action within the profile. A lower number specifies a higher priority. Must be unique within the list of actions bound

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to the profile. Policies are evaluated in the order of their priority numbers, and the first policy that matches is applied. Minimum value = 1 Maximum value = 2147483647
state	<String>	Read-write	Enable or disable this action. Default value: ENABLED Possible values = ENABLED, DISABLED
requrlfrom	<String>	Read-write	PCRE-format regular expression that describes the request URL pattern to be transformed. Minimum length = 1
requrlinto	<String>	Read-write	PCRE-format regular expression that describes the transformation to be performed on URLs that match the reqUrlFrom pattern. Minimum length = 1
resurlfrom	<String>	Read-write	PCRE-format regular expression that describes the response URL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			pattern to be transformed. Minimum length = 1
resurlinto	<String>	Read-write	PCRE-format regular expression that describes the transformation to be performed on URLs that match the resUrlFrom pattern. Minimum length = 1
cookiedomainfrom	<String>	Read-write	Pattern that matches the domain to be transformed in Set-Cookie headers. Minimum length = 1
cookiedomaininto	<String>	Read-write	PCRE-format regular expression that describes the transformation to be performed on cookie domains that match the cookieDomainFrom pattern. NOTE: The cookie domain to be transformed is extracted from the request. Minimum length = 1
comment	<String>	Read-write	Any comments to preserve information about this URL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Transformation action.
continuematching	<String>	Read-only	Continue transforming using the next rule in the list. Possible values = ON, OFF
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

```
"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformaction? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"transformaction":{

<b>"name":<String_value>,

</b>"requrlfrom":true,

"requrlinto":true,

"resurlfrom":true,

"resurlinto":true,

"cookiedomainfrom":true,

"cookiedomaininto":true,

"state":true,

"comment":true
```

```
}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformaction **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/transformaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/transformaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of transformaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/transformaction? **view=summary**

Use this query-parameter to get the summary output of transformaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/transformaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the transformaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformaction? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "transformaction": [ { "__count": "#no"} ] }
```

transformglobal_binding

Binding object which returns the resources bound to transformglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
transformglobal_transformpolicy_binding	<transformglobal_transformpolicy_binding []>	Read-write	transformpolicy that can be bound to transformglobal.

Operations

(click to see Properties)

- GET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "transformglobal_binding": [ {

"transformglobal_transformpolicy_binding":<transformglobal_transformpolicy
_binding[]_value>

}]}
```

transformglobal_transformpolicy_binding

Binding object showing the transformpolicy that can be bound to transformglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the policy label to invoke if the current policy evaluates to TRUE, the invoke parameter is set, and the label type is Policy Label.
priority	<Integer>	Read-write	Specifies the priority of the policy.
labeltype	<String>	Read-write	Type of invocation. Available settings function as follows: * reqvserver - Send the request to the specified request virtual server. * resvserver - Send the response to the specified response virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, resvserver, policylabel
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forwards the request

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or response to the specified virtual server or evaluates the specified policy label.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL, APPFW_GLOBAL, TM_GLOBAL
policyname	<String>	Read-write	Name of the transform policy.
type	<String>	Read-write	Specifies the bind point to which to bind the policy. Available settings function as follows: * REQ_OVERRIDE. Request override. Binds the policy to the priority request queue. * REQ_DEFAULT. Binds the policy to the default request

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			queue. * HTTPQUIC_REQ_OVERRIDE - Binds the policy to the HTTP_QUIC override request queue. * HTTPQUIC_REQ_DEFAULT - Binds the policy to the HTTP_QUIC default request queue. Possible values = REQ_OVERRIDE, REQ_DEFAULT, HTTPQUIC_REQ_OVERRIDE, HTTPQUIC_REQ_DEFAULT
numpol	<Integer>	Read-only	The number of policies bound to the bindpoint.
flowtype	<Integer>	Read-only	flowtype of the bound transform policy.
__count	<Double>	Read-only	count parameter

transformpolicy

Configuration for URL Transformation policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the URL Transformation policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the URL Transformation policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, my transform policy or my transform policy).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
rule	<String>	Read-write	Expression, or name of a named expression, against which to evaluate traffic. The following requirements apply only to the Citrix ADC CLI: * If the expression includes blank spaces, the entire expression must be enclosed in double quotation marks. * If the expression itself includes double quotation marks, you must escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
profilename	<String>	Read-write	Name of the URL Transformation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			profile to use to transform requests and responses that match the policy. Minimum length = 1
comment	<String>	Read-write	Any comments to preserve information about this URL Transformation policy.
logaction	<String>	Read-write	Log server to use to log connections that match this policy.
newname	<String>	Read-write	New name for the policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			my transform policy or my transform policy). Minimum length = 1
hits	<Integer>	Read-only	Number of hits.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default transform policy.
builtin	<String[]>	Read-only	Flag to determine if Transform policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)

- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"transformpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"profilename":<String_value>,

</b>"comment":<String_value>,

"logaction":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"transformpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"profilename":<String_value>,

"comment":<String_value>,

"logaction":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"transformpolicy":{

<b>"name":<String_value>,

</b>"comment":true,

"logaction":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"transformpolicy":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of transformpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy? **view=summary**

Use this query-parameter to get the summary output of transformpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the transformpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "transformpolicy": [ {

"name":<String_value>,

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "transformpolicy": [ { "__count": "#no"} ] }
```

transformpolicy_binding

Binding object which returns the resources bound to transformpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the URL Transformation policy. Minimum length = 1
transformpolicy_lbvserver_binding	<transformpolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to transformpolicy.
transformpolicy_transformpolicylabel_binding	<transformpolicy_transformpolicylabel_binding[]>	Read-only	transformpolicylabel that can be bound to transformpolicy.
transformpolicy_csvserver_binding	<transformpolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to transformpolicy.
transformpolicy_transformglobal_binding	<transformpolicy_transformglobal_binding[]>	Read-only	transformglobal that can be bound to transformpolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "transformpolicy_binding": [ {

"name":<String_value>,

"transformpolicy_transformpolicylabel_binding":<transformpolicy_transformp
olicylabel_binding[]_value>,

"transformpolicy_lbvserver_binding":<transformpolicy_lbvserver_binding[]_v
alue>,

"transformpolicy_csvserver_binding":<transformpolicy_csvserver_binding[]_v
alue>,

"transformpolicy_transformglobal_binding":<transformpolicy_transformglobal
_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "transformpolicy_binding": [ {

"name":<String_value>,

"transformpolicy_transformpolicylabel_binding":<transformpolicy_transformpolicylabel_binding[]_value>,

```

transformpolicy_transformpolicylabel_binding

Binding object showing the transformpolicylabel that can be bound to transformpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the URL Transformation policy. Minimum length = 1
boundto	<String>	Read-write	Location where policy is bound.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
priority	<Integer>	Read-only	Specifies the priority of the policy.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy_transformpolicylabel_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ transformpolicy_transformpolicylabel_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of transformpolicy_transformpolicylabel_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ transformpolicy_transformpolicylabel_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the transformpolicy_transformpolicylabel_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "transformpolicy_transformpolicylabel_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"gotopriorityexpression":<String_value>,

"labelname":<String_value>,
```

```
"activepolicy":<Integer_value>,

"priority":<Integer_value>,

"labeltype":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy_transformpolicylabel_binding
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy_transformpolicylabel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "transformpolicy_transformpolicylabel_binding": [ {

"name":<String_value>,

"boundto":<String_value>,
```

```
"gotopriorityexpression":<String_value>,

"labelname":<String_value>,

"activepolicy":<Integer_value>,

"priority":<Integer_value>,

"labeltype":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicy_transformpolicylabel_binding/name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"transformpolicy_transformpolicylabel_binding": [ { "__count": "#no"} ] }
```

transformpolicylabel

Configuration for transform policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the URL Transformation policy label is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, my transform policylabel or my transform policylabel).
policylabeltype	<String>	Read-write	Types of transformations allowed by the policies bound to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			label. For URL transformation, always http_req (HTTP Request). Possible values = http_req, httpquic_req
newname	<String>	Read-write	New name for the policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, my transform policylabel or my

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			transform policylabel). Minimum length = 1
numpol	<Integer>	Read-only	Number of polices bound to label.
hits	<Integer>	Read-only	Number of times policy label was invoked.
priority	<Integer>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of invocation. Available settings function as follows: * reqvserver - Forward the request to the specified request virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke_labelname	<String>	Read-only	Name of the policy label.
description	<String>	Read-only	Description of the policylabel.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicylabel_transformpolicy_binding
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/transformpolicylabel_transformpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "transformpolicylabel_transformpolicy_binding": [ {

"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"policyname":<String_value>,

"invoke_labelname":<String_value>,

"labelname":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>
```

```
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformpolicylabel_transformpolicy_binding/labelname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"transformpolicylabel_transformpolicy_binding": [ { "__count": "#no"} ] }
```

transformprofile

Configuration for URL Transformation profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the URL transformation profile. Must begin with a letter, number, or the underscore character (_), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the URL transformation profile is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, my transform profile or my transform profile). Minimum length = 1
type	<String>	Read-write	Type of transformation. Always URL for URL Transformation profiles. Possible values = URL
onlytransformabsurlinbody	<String>	Read-write	In the HTTP body, transform only absolute URLs.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Relative URLs are ignored. Possible values = ON, OFF
comment	<String>	Read-write	Any comments to preserve information about this URL Transformation profile.
regexforfindingurlinjavascript	<String>	Read-only	Patclass having regexes to find the URLs in JavaScript.
regexforfindingurlincss	<String>	Read-only	Patclass having regexes to find the URLs in CSS.
regexforfindingurlinxcomponent	<String>	Read-only	Patclass having regexes to find the URLs in X-Component.
regexforfindingurlinxml	<String>	Read-only	Patclass having regexes to find the URLs in XML.
additionalreqheaderslist	<String>	Read-only	Patclass having a list of additional request header names that should transformed.
additionalrespheaderslist	<String>	Read-only	Patclass having a list of additional response header names that should transformed.
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformprofile **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"transformprofile":{

<b>"name":<String_value>,

</b>"type":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformprofile/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformprofile **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"transformprofile":{

<b>"name":<String_value>,

</b>"type":<String_value>,

"onlytransformabsurlinbody":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformprofile? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"transformprofile":{

<b>"name":<String_value>,

</b>"type":true,

"onlytransformabsurlinbody":true,
```

```
"comment":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformprofile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/transformprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/transformprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of transformprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/transformprofile? **view=summary**

Use this query-parameter to get the summary output of transformprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/transformprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the transformprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "transformprofile": [ { "__count": "#no"} ] }
```

transformprofile_binding

Binding object which returns the resources bound to transformprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the profile. Minimum length = 1
transformprofile_transformaction_binding	<transformprofile_transformaction_binding[]>	Read-only	transformaction that can be bound to transformprofile.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformprofile_binding/ name_value<String>
HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "transformprofile_binding": [ {

"name":<String_value>,

"transformprofile_transformaction_binding":<transformprofile_transformacti
on_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/transformprofile_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/ transformprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "transformprofile_binding": [ {

"name":<String_value>,

"transformprofile_transformaction_binding":<transformprofile_transformacti
on_binding[]_value>

}]}
```

transformprofile_transformaction_binding

Binding object showing the transformaction that can be bound to transformprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the profile. Minimum length = 1
actionname	<String>	Read-write	URL Transformation action name.
requrlinto	<String>	Read-only	Pattern of transformed request URLs. It corresponds to internal addresses

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and indicates how they are created.
actioncomment	<String>	Read-only	Comments.
cookiedomainfrom	<String>	Read-only	Pattern of the original domain in Set-Cookie headers.
resurlfrom	<String>	Read-only	Pattern of original response URLs. It corresponds to the way external users view the server, and acts as a source for response transformations.
cookiedomaininto	<String>	Read-only	Pattern of the transformed domain in Set-Cookie headers.
profilename	<String>	Read-only	URL Transformation profile name.
requrlfrom	<String>	Read-only	Pattern of original request URLs. It corresponds to the way external users view the server, and acts as a source for request transformations.
resurlinto	<String>	Read-only	Pattern of transformed response URLs. It corresponds to internal addresses

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and indicates how they are created.
priority	<Integer>	Read-only	Priority of the Action within the Profile.

URL: http:// <netscaler-ip-address> /nitro/v1/config/tunnelglobal_tunneltrafficpolicy_binding?**count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "tunnelglobal_tunneltrafficpolicy_binding": [ { "__count": "#no"} ] }
```

tunneltrafficpolicy

Configuration for tunnel policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the tunnel traffic policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my policy" or 'my policy)'. Minimum length = 1
rule	<String>	Read-write	Expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes blank spaces, the entire expression must be enclosed in double quotation marks. * If the expression itself includes double quotation marks, you must escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
action	<String>	Read-write	Name of the built-in compression action to associate with the policy. Minimum length = 1
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
newname	<String>	Read-write	New name for the tunnel traffic policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), e quals (=), and hyphen (-) characters. Choose a name that reflects the function that the policy performs. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my tunnel policy" or 'my tunnel policy'). Minimum length = 1
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced). Possible values = Classic Policy, Advanced Policy
hits	<Integer>	Read-only	No of hits.
undefhits	<Integer>	Read-only	Number of policy UNDEF hits.
txbytes	<Integer>	Read-only	Number of bytes transmitted.
rxbytes	<Integer>	Read-only	Number of bytes received.
clientttlb	<Integer>	Read-only	Total client TTLB value.
clienttransactions	<Integer>	Read-only	Number of client transactions.
serverttlb	<Integer>	Read-only	Total server TTLB value.
servertransactions	<Integer>	Read-only	Number of server transactions.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default tunnelpolicy.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"tunneltrafficpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>,
```

```
</b>"comment":<String_value>,

"logaction":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"tunneltrafficpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>,
```

```
"comment":<String_value>,

"logaction":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"tunneltrafficpolicy":{

<b>"name":<String_value>,

</b>"comment":true,

"logaction":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy? **action=rename HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"tunneltrafficpolicy":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of tunneltrafficpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy? **view=summary**

Use this query-parameter to get the summary output of tunneltrafficpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/tunneltrafficpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the tunneltrafficpolicy resources in chunks.

HTTP Method: GET

Request Headers:

</b>"extension":<String_value>,

"wasmmodule":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/userprotocol/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/userprotocol **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"userprotocol":{

<b>"name":<String_value>,
```

```
</b>"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/userprotocol? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"userprotocol":{

<b>"name":<String_value>,

</b>"comment":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/userprotocol **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/userprotocol? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/userprotocol? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of userprotocol resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/userprotocol? **view=summary**

Use this query-parameter to get the summary output of userprotocol resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/userprotocol? **pagesize=#no;pageno=#no**

Use this query-parameter to get the userprotocol resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "userprotocol": [ {

"name":<String_value>,

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/userprotocol? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "userprotocol": [ { "__count": "#no"} ] }
```

uservserver

Configuration for virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the virtual server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at sign (@), equal sign (=), and hyphen (-) characters. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vserver" or 'my vserver'). . Minimum length = 1
userprotocol	<String>	Read-write	User protocol uesd by the service.
ipaddress	<String>	Read-write	IPv4 or IPv6 address to assign to the virtual server.
port	<Integer>	Read-write	Port number for the virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
defaultlb	<String>	Read-write	Name of the default Load Balancing virtual server used for load balancing of services. The protocol type of default Load Balancing virtual server should be a user type.
Params	<String>	Read-write	Any comments associated with the protocol.
comment	<String>	Read-write	Any comments that you might want to associate with the virtual server.
state	<String>	Read-write	Initial state of the user vserver. Default value: ENABLED Possible values = ENABLED, DISABLED
curstate	<String>	Read-only	Current user vserver state. Possible values = UP, DOWN,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
value	<String>	Read-only	SSL status. Possible values = Certkey/ Certkeybundle/Vault not bound/Cert-store not usable, SSL feature disabled
statechangetimesec	<String>	Read-only	Time when last state change happened. Seconds part.
statechangetimemsec	<Integer>	Read-only	Time at which last state change happened. Milliseconds part.
tickssincelaststatechange	<Integer>	Read-only	Time in 10 millisecond ticks since the last state change.
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

- UPDATE
- UNSET
- ENABLE
- DISABLE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/uservserver **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"uservserver":{

<b>"name":<String_value>,

</b><b>"userprotocol":<String_value>,

</b><b>"ipaddress":<String_value>,

</b><b>"port":<Integer_value>,

</b><b>"defaultlb":<String_value>,

</b>"Params":<String_value>,

"comment":<String_value>,

"state":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/uservserver/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/uservserver **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"uservserver":{

<b>"name":<String_value>,

</b>"ipaddress":<String_value>,

"defaultlb":<String_value>,

"Params":<String_value>,

"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/uservserver? **action=unset HTTP Method:** POST

ping	
ping6	
raid	Configuration for raid support
techsupport	Configuration for tech support
traceroute	
traceroute6	

callhome

Configuration for callhome resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mode	<String>	Read-write	CallHome mode of operation. Default value: Default Possible values = Default, CSP, Connector
emailaddress	<String>	Read-write	Email address of the contact administrator. Maximum length = 78
hbcustominterval	<Integer>	Read-write	Interval (in days) between CallHome heartbeats. Default value: 7 Minimum value = 1 Maximum value = 30
proxymode	<String>	Read-write	Enables or disables the proxy mode. The proxy server can be set by either specifying the IP address of the server or the name of the service representing the proxy server. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the proxy server. Minimum length = 1
proxyauthservice	<String>	Read-write	Name of the service that represents the proxy server. Maximum length = 128
port	<Integer>	Read-write	HTTP port on the Proxy server. This is a mandatory parameter for both IP address and service name based configuration. Minimum value = 1 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
sslcardfirstfailure	<String>	Read-only	First occurrence SSL card failure.
sslcardlatestfailure	<String>	Read-only	Latest occurrence SSL card failure.
powfirstfail	<String>	Read-only	First occurrence power supply unit failure.
powlatestfailure	<String>	Read-only	Latest occurrence power supply unit failure.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hddfirstfail	<String>	Read-only	First occurrence hard disk drive failure.
hddlatestfailure	<String>	Read-only	Latest occurrence hard disk drive failure.
flashfirstfail	<String>	Read-only	First occurrence compact flash failure.
flashlatestfailure	<String>	Read-only	Latest occurrence compact flush failure.
rlfirsthighdrop	<String>	Read-only	First occurence of high rate limit drops.
rllatesthighdrop	<String>	Read-only	Latest occurence of high rate limit drops.
restartlatestfail	<String>	Read-only	Latest occurrence warm restart failure.
memthrefirstanomaly	<String>	Read-only	First occurrence of memory anomaly.
memthrelatestanomaly	<String>	Read-only	Latest occurrence of memory anomaly.
callhomestatus	<String[]>	Read-only	Callhome feature enabled/disable, register with upload server successful/ failed. Possible values = ENABLED, DISABLED, SUCCESSFUL, FAILED, INVALID HOSTNAME, NO DNSSERVER,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			HOSTNAME RESOLUTION FAILED
anomalydetection	<String>	Read-only	Enables or disables anomaly detection. Default value: DISABLED Possible values = ENABLED, DISABLED
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- GET (ALL)
- UPDATE
- UNSET

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/callhome **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"callhome":{

"mode":<String_value>,

"emailaddress":<String_value>,

"hbcustominterval":<Integer_value>,

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/filesystemencryption **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/filesystemencryption? **args=nodeid: <Integer_value>**

Use this query-parameter to get filesystemencryption resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "filesystemencryption": [ {

nodeid:<Integer_value>"supportedstate":<String_value>,

"effectivestate":<String_value>,
```

```
"_nextgenapiresource":<String_value>

}]}
```

install

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
url	<String>	Read-write	Url for the build file. Must be in the following formats: http://[user]:[password]@host/path/to/file https://[user]:[password]@host/path/to/file sftp://[user]:[password]@host/path/to/file scp://[user]:[password]@host/path/to/file ftp://[user]:[password]@host/path/to/file file://path/to/file.
Async	<Boolean>	Read-write	Use this flag to return the install id

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			when the nitro api request is sent. The id can be used later to track the installation progress via show ns job <id> command. For the cli request of install the flag is by default set as false as the installation progress details can be tracked via cli.
y	<Boolean>	Read-write	Do not prompt for yes/no before rebooting.
l	<Boolean>	Read-write	Use this flag to enable callhome.
a	<Boolean>	Read-write	Use this flag to enable Citrix ADM Service Connect. This feature helps you discover your Citrix ADC instances effortlessly on Citrix ADM service and get insights and curated machine learning based recommendations for applications and Citrix ADC infrastructure. This feature lets the Citrix ADC instance

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			automatically send system, usage and telemetry data to Citrix ADM service. View here [https://docs.citrix.com/en-us/citrix-adc/13/data-governance.html] to learn more about this feature. Use of this feature is subject to the Citrix End User ServiceAgreement. View here [https://www.citrix.com/buy/licensing/agreements.html].
fipsinstall	<Boolean>	Read-write	Use this flag to perform FIPS installation.
answeryestoall	<Boolean>	Read-write	Use this flag to answer yes to all prompts.
dontreboot	<Boolean>	Read-write	Use this flag to prevent reboot after installation when answerYesToAll is true.
dontchecknsconf	<Boolean>	Read-write	Use this flag to skip ns.conf version equivalence check during downgrade.
deletesigfiles	<Boolean>	Read-write	Use this flag to delete all signature files and associated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			kernel images during installation.
ignorensapimgrerrors	<Boolean>	Read-write	Use this flag to ignore nsapimgr symbols not found error(s) during installation.
exitonlicserverconnerror	<Boolean>	Read-write	Use this flag to exit on license server connectivity errors.
precheck	<Boolean>	Read-write	Use this flag to run all installation pre-checks in a single step.
advancedoptions	<String>	Read-write	Use this string to pass extra flags which are not yet supported. Example: -flag1 -flag2 -flag3.
ignoreunsavedconfig	<Boolean>	Read-write	Use this flag to ignore unsaved config check during build update.
ignoreunsyncedconfig	<Boolean>	Read-write	Use this flag to ignore unsynced HA config check during build update.
ignorecertcheckerrors	<Boolean>	Read-write	Use this flag to ignore certificate digest verification errors during build update.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Integer>	Read-only	Job Id for install process.

- INSTALL

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

INSTALL

URL: http:// <netscaler-ip-address> /nitro/v1/config/install **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"install":{

<b>"url":<String_value>,

</b>"Async":<Boolean_value>,

"y":<Boolean_value>,

techsupport

Configuration for tech support resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
scope	<String>	Read-write	Use this option to gather data on the present node, all cluster nodes, or for the specified partitions. The CLUSTER scope generates smaller abbreviated archives

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for all nodes. The PARTITION scope collects the admin partition in addition to those specified. The partitionName option is only required for the PARTITION scope. Default value: NODE Possible values = NODE, CLUSTER, PARTITION
partitionname	<String>	Read-write	Name of the partition. Minimum length = 1
upload	<Boolean>	Read-write	Securely upload the collector archive to Citrix Technical Support using SSL. MyCitrix credentials will be required. If used with the -file option, no new collector archive is generated. Instead, the specified archive is uploaded. Note that the upload operation time depends on the size of the archive file, and the connection bandwidth.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
proxy	<String>	Read-write	Specifies the proxy server to be used when uploading a collector archive. Use this parameter if the Citrix ADC does not have direct internet connectivity. The basic format of the proxy string is: "proxy_IP:<proxy_port>" (without quotes). If the proxy requires authentication the format is: "username:password@proxy_IP:<proxy_port>".
casenumber	<String>	Read-write	Specifies the associated case or service request number if it has already been opened with Citrix Technical Support.
file	<String>	Read-write	Specifies the name (with full path) of the collector archive file to be uploaded. If this is specified, no new collector archive is generated.
description	<String>	Read-write	Provides a text description for the the upload, and can be used for logging purposes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authtoken	<String>	Read-write	Specifies the Authentication Token, which is used to login to Citrix upload server. Please copy/paste the URL https://cis.citrix.com/auth/api/create_identity_v2/?expiration=3600 in a browser to complete the two factor authentication and generate it. The token is valid for 3600 seconds (1 hour).
time	<String>	Read-write	Specifies the time in common log format, ie. DD/MMM/YYYY:HH:MM:SS, to be used for locating the newnslog file. With this option at most four newnslog log files are collected. First is the newnslog file, spanning the given time. Second is the one, created just prior to the first (if it exists). Third is the one, created just later than the first (if it exists). And the fourth is the latest newnslog directory. In case, the scope is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cluster, then second and third type is skipped on all nodes. Minimum length = 20 Maximum length = 20
period	<Integer>	Read-write	Specifies the time window in hours around the time specified by -time option. This parameter is only valid when -time is specified. Defines the range for collecting newnslog files, text logs, and non-PE core files. For example, with -time "01/Jan/2026:12:00:00" and -period 2, logs and cores from 11:00:00 to 13:00:00 will be collected. Minimum value = 1
adss	<Boolean>	Read-write	Option for collecting showtechsupport bundle on ADSS cluster/node.
notruncate	<Boolean>	Read-write	Option for collecting showtechsupport bundle without truncating log files.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nopecore	<Boolean>	Read-write	Option for collecting showtechsupport bundle without PE core files.
nodes	<Integer[]>	Read-write	Use this option to collect showtechsupport bundle only from the nodes given as a list to this option. If -file option is used, it will collect the files from the given nodes back to the cco and will upload the compressed folder containing the files from there. Minimum value = 0 Maximum value = 255
response	<String>	Read-only	Output as text printed to console and syslog at NOTICE level.
servername	<String>	Read-only	.
_nextgenapiresource	<String>	Read-only	.

Operations

s	<String>	Read-write	Source IP address to use in the outgoing query packets. If the IP address does not belong to this appliance, an error is returned and nothing is sent. Minimum length = 1
T	<Integer>	Read-write	Traffic Domain Id. Minimum value = 1 Maximum value = 4094
w	<Integer>	Read-write	Time (in seconds) to wait for a response to a query. For Nitro API, defalut value is set to 3. Default value: 5 Minimum value = 2 Maximum value = 86399
host	<String>	Read-write	Destination host IP address or name. Minimum length = 1 Maximum length = 256
packetlen	<Integer>	Read-write	Length (in bytes) of the query packets.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 44 Minimum value = 44 Maximum value = 32768
response	<String>	Read-only	.

Operations

(click to see Properties)

- TRACEROUTE6

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

TRACEROUTE6

URL: http:// <netscaler-ip-address> /nitro/v1/config/traceroute6 **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"traceroute6":{

"n":<Boolean_value>,

"I":<Boolean_value>,

"r":<Boolean_value>,

"v":<Boolean_value>,

"m":<Integer_value>,

"p":<Integer_value>,

"q":<Integer_value>,

"s":<String_value>,

"T":<Integer_value>,

"w":<Integer_value>,

<b>"host":<String_value>,

</b>"packetlen":<Integer_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Payload:

```
{ "traceroute6": [ {

"response":<String_value>

}]}
```

videooptimization

VideoOptimization

Video optimization feature is used to show (i) the stats of different media types that are being served by the Citrix ADC and (ii) the details of optimization applied on ABR videos

NAME	DESCRIPTION
videooptimizationdetectionaction	Configuration for videooptimization detectionaction
videooptimizationdetectionpolicy	Configuration for videooptimization detectionpolicy
videooptimizationdetectionpolicy_binding	Binding object showing the resources that can be bound to videooptimizationdetectionpolicy
videooptimizationdetectionpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to videooptimizationdetectionpolicy

NAME	DESCRIPTION
videooptimizationdetectionpolicy_videooptimizationglobaldetection_binding	Binding object showing the videooptimizationglobaldetection that can be bound to videooptimizationdetectionpolicy
videooptimizationdetectionpolicylabel	Configuration for videooptimization detection policy label
videooptimizationdetectionpolicylabel_binding	Binding object showing the resources that can be bound to videooptimizationdetectionpolicylabel
videooptimizationdetectionpolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to videooptimizationdetectionpolicylabel

videooptimizationpacingpolicylabel	Configuration for videooptimization pacing policy label
videooptimizationpacingpolicylabel_binding	Binding object showing the resources that can be bound to videooptimizationpacingpolicylabel
videooptimizationpacingpolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to videooptimizationpacingpolicylabel

NAME	DESCRIPTION
videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding	Binding object showing the videooptimizationpacingpolicy that can be bound to videooptimizationpacingpolicylabel
videooptimizationparameter	Configuration for VideoOptimization parameter

videooptimizationdetectionaction

Configuration for videooptimization detectionaction resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the video optimization detection action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters.
type	<String>	Read-write	Type of video optimization action. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* clear_text_pd - Cleartext PD type is detected. * clear_text_abr - Cleartext ABR is detected. * encrypted_abr - Encrypted ABR is detected. * trigger_enc_abr - Possible encrypted ABR is detected. * trigger_body_detection - Possible cleartext ABR is detected. Triggers body content detection. Possible values = clear_text_pd, clear_text_abr, encrypted_abr, trigger_enc_abr, trigger_body_detection
comment	<String>	Read-write	Comment. Any type of information about this video optimization detection action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the videooptimization detection action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1
hits	<Integer>	Read-only	The number of times the action has been taken.
referencecount	<Integer>	Read-only	The number of references to the action.
undefhits	<Integer>	Read-only	The number of times the action resulted in UNDEF.
builtin	<String[]>	Read-only	Flag to determine whether video optimization detection action is built-in or not. Possible values = MODIFIABLE, DELETABLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

```

videooptimizationdetectionpolicy

Configuration for videooptimization detectionpolicy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the videooptimization detection policy. Must begin with a letter, number, or the underscore character

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.Can be modified, removed or renamed.
rule	<String>	Read-write	Expression that determines which request or response match the video optimization detection policy. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Name of the videooptimization detection action to perform if the request matches this videooptimization detection policy. Built-in actions should be used. These are: * DETECT_CLEARTEXT_PD - Cleartext PD is detected and increment related counters. * DETECT_CLEARTEXT_ABR - Cleartext ABR is detected and increment related counters. * DETECT_ENCRYPTED_ABR - Encrypted ABR is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			detected and increment related counters. * TRIGGER_ENC_ABR_DETECTION - This is potentially encrypted ABR. Internal traffic heuristics algorithms will further process traffic to confirm detection. * TRIGGER_CT_ABR_BODY_DETECTION - This is potentially cleartext ABR. Internal traffic heuristics algorithms will further process traffic to confirm detection. * RESET - Reset the client connection by closing it. * DROP - Drop the connection without sending a response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any type of information about this videooptimization detection policy.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
newname	<String>	Read-write	New name for the videooptimization detection policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1
hits	<Integer>	Read-only	Number of hits.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefhits	<Integer>	Read-only	Number of policy UNDEF hits.
builtin	<String[]>	Read-only	Flag to determine if videooptimization detection policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

videooptimizationdetectionpolicy_binding

Binding object which returns the resources bound to videooptimizationdetectionpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the videooptimization detection policy for which to display settings.Must provide policy name.
videooptimizationdetectionpolicy_videooptimizationglobaldetection_binding	<videooptimizationdetectionpolicy_videooptimizationglobaldetection_binding[]>	Read-only	videooptimizationglobaldetection that can be bound to videooptimizationdetectionpolicy.
videooptimizationdetectionpolicy_lbvserver_binding	<videooptimizationdetectionpolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to videooptimizationdetectionpolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/videooptimizationdetectionpolicy_binding/name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "videooptimizationdetectionpolicy_binding": [ {

"name":<String_value>,

"videooptimizationdetectionpolicy_lbvserver_binding":<videooptimizationdet
ectionpolicy_lbvserver_binding[]_value>,

"videooptimizationdetectionpolicy_videooptimizationglobaldetection_binding
":<videooptimizationdetectionpolicy_videooptimizationglobaldetection_bindi
ng[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/videooptimizationdetectionpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/videooptimizationdetectionpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "videooptimizationdetectionpolicy_binding": [ {

ng[]_value>

}]}
```

videooptimizationdetectionpolicy_lbvserver_binding

Binding object showing the lbvserver that can be bound to videooptimizationdetectionpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the videooptimization detection policy for which to display settings.Must provide policy name.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, policylabel
priority	<Integer>	Read-only	Specifies the priority of the policy.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicy_lbvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicy_lbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of videooptimizationdetectionpolicy_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicy_lbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the videooptimizationdetectionpolicy_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "videooptimizationdetectionpolicy_lbvserver_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicy_lbvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicy_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

videooptimizationdetectionpolicylabel

Configuration for videooptimization detection policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the Video optimization

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			detection policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the videooptimization detection policy label is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my videooptimization detection policy label" or my videooptimization

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			detection policy label').
policylabeltype	<String>	Read-write	Type of responses sent by the policies bound to this policy label. Types are: * HTTP - HTTP responses. * OTHERTCP - NON-HTTP TCP responses. Default value: NS_PLTMAP_RSP_REQ Possible values = videoopt_req, videoopt_res
comment	<String>	Read-write	Any comments to preserve information about this videooptimization detection policy label.
newname	<String>	Read-write	New name for the videooptimization detection policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1
numpol	<Integer>	Read-only	number of polices bound to label.
hits	<Integer>	Read-only	Number of times policy label was invoked.
priority	<Integer>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label to invoke. Available settings function as follows: * vserver - Invoke an unnamed policy label associated with a virtual server. * policylabel - Invoke a user-defined policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = vserver, policylabel
invoke_labelname	<String>	Read-only	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicylabel_policybinding_binding/ labelname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicylabel_policybinding_binding/ labelname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of videooptimizationdetectionpolicylabel_policybinding_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicylabel_policybinding_binding/ labelname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the videooptimizationdetectionpolicylabel_policybinding_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "videooptimizationdetectionpolicylabel_policybinding_binding": [ {

"invoke_labelname":<String_value>,

"invoke":<Boolean_value>,

"gotopriorityexpression":<String_value>,

"policyname":<String_value>,

"priority":<Integer_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicylabel_policybinding_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicylabel_policybinding_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "videooptimizationdetectionpolicylabel_policybinding_binding": [ {

"invoke_labelname":<String_value>,

"invoke":<Boolean_value>,

"priority":<Integer_value>,

"labeltype":<String_value>,

"labelname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationdetectionpolicylabel_policybinding_binding/ labelname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"videooptimizationdetectionpolicylabel_policybinding_binding":
[ { "__count": "#no"} ] }
```

videooptimizationdetectionpolicylabel_videooptimizationdetectionpolicy_binding

Binding object showing the videooptimizationdetectionpolicy that can be bound to videooptimizationdetectionpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labeltype	<String>	Read-write	Type of policy label to invoke. Available settings function as follows: * vserver - Invoke an unnamed policy label associated with a virtual server. * policylabel - Invoke a user-defined policy label. Possible values = vserver, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-write	Specifies the priority of the policy.
labelname	<String>	Read-write	Name of the videooptimization detection policy label to which to bind the policy.
invoke_labelname	<String>	Read-write	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server.
policyname	<String>	Read-write	Name of the videooptimization policy.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label and evaluate the specified policy label.
__count	<Double>	Read-write	count parameter

videooptimizationpacingaction

Configuration for videooptimization pacingaction resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the video optimization pacing action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters.
rate	<Integer>	Read-write	ABR Video Optimization Pacing Rate (in Kbps). Default value: 1000 Minimum value = 1 Maximum value = 2147483647
comment	<String>	Read-write	Comment. Any type of information about this video optimization detection action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the videooptimization pacing action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1
hits	<Integer>	Read-only	The number of times the action has been taken.
referencecount	<Integer>	Read-only	The number of references to the action.
undefhits	<Integer>	Read-only	The number of times the action resulted in UNDEF.
builtin	<String[]>	Read-only	Flag to determine whether video optimization detection action is built-in or not. Possible values = MODIFIABLE, DELETABLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/videooptimizationpacingaction **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"videooptimizationpacingaction":{

<b>"name":<String_value>,

</b><b>"rate":<Integer_value>,

</b>"comment":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/videooptimizationpacingaction/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/videooptimizationpacingaction **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

videooptimizationpacingpolicy

Configuration for videooptimization pacingpolicy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the videooptimization pacing policy. Must begin with a letter, number, or the underscore character

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters.Can be modified, removed or renamed.
rule	<String>	Read-write	Expression that determines which request or response match the video optimization pacing policy. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Name of the videooptimization pacing action to perform if the request matches this videooptimization pacing policy.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any type of information about this videooptimization pacing policy.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
newname	<String>	Read-write	New name for the videooptimization

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			pacing policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1
hits	<Integer>	Read-only	Number of hits.
undefhits	<Integer>	Read-only	Number of policy UNDEF hits.
builtin	<String[]>	Read-only	Flag to determine if videooptimization pacing policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "videooptimizationpacingpolicy_lbvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicy_lbvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicy_lbvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "videooptimizationpacingpolicy_lbvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicy_lbvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"videooptimizationpacingpolicy_lbvserver_binding": [ { "__count":
"#no"} ] }
```

videooptimizationpacingpolicy_videooptimizationglobalpacing_binding

Binding object showing the videooptimizationglobalpacing that can be bound to videooptimizationpacingpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the videooptimization pacing policy for which to display settings.Must provide policy name.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, policylabel
priority	<Integer>	Read-only	Specifies the priority of the policy.
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicy_videooptimizationglobalpacing_binding/ name_value<String>
Query-parameters: filter http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicy_videooptimizationglobalpacing_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of videooptimizationpacingpolicy_videooptimizationglobalpacing_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicy_videooptimizationglobalpacing_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the videooptimizationpacingpolicy_videooptimizationglobalpacing_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "videooptimizationpacingpolicy_videooptimizationglobalpacing_binding":
[ {

"boundto":<String_value>,

"name":<String_value>,

"labeltype":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicy_videooptimizationglobalpacing_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicy_videooptimizationglobalpacing_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "videooptimizationpacingpolicy_videooptimizationglobalpacing_binding":
[ {

"boundto":<String_value>,

"name":<String_value>,

"labeltype":<String_value>,

"gotopriorityexpression":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicy_videooptimizationglobalpacing_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"videooptimizationpacingpolicy_videooptimizationglobalpacing_binding":
[ { "__count": "#no"} ] }
```

videooptimizationpacingpolicylabel

Configuration for videooptimization pacing policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the Video optimization pacing policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the videooptimization pacing policy label is added. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my videooptimization pacing policy label" or my videooptimization pacing policy label').
policylabeltype	<String>	Read-write	Type of responses sent by the policies bound to this policy label. Types are: * HTTP - HTTP responses. * OTHERTCP - NON-HTTP TCP responses. Default value: NS_PLTMAP_RSP_REQ Possible values = videoopt_req, videoopt_res
comment	<String>	Read-write	Any comments to preserve information about this

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			videooptimization pacing policy label.
newname	<String>	Read-write	New name for the videooptimization pacing policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1
numpol	<Integer>	Read-only	number of polices bound to label.
hits	<Integer>	Read-only	Number of times policy label was invoked.
priority	<Integer>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labeltype	<String>	Read-only	Type of policy label to invoke. Available settings function as follows: * vserver - Invoke an unnamed policy label associated with a virtual server. * policylabel - Invoke a user-defined policy label. Possible values = vserver, policylabel
invoke_labelname	<String>	Read-only	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			follows: * vserver - Invoke an unnamed policy label associated with a virtual server. * policylabel - Invoke a user-defined policy label. Possible values = vserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/ videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding"
:{

<b>"labelname":<String_value>,

</b><b>"policyname":<String_value>,

</b><b>"priority":<Integer_value>,

</b>"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"invoke_labelname":<String_value>
```

```
}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding/ labelname_value<String> **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding/ labelname_value<String> ? **args= policyname:<String_value>, priority: <Integer_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding/ labelname_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding/ labelname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding/ labelname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_bindi
ng": [ {

"policyname":<String_value>,

"invoke":<Boolean_value>,

"gotopriorityexpression":<String_value>,

"invoke_labelname":<String_value>,

"labelname":<String_value>,

"priority":<Integer_value>,

"labeltype":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_bindi
ng": [ {

"policyname":<String_value>,

"invoke":<Boolean_value>,

"gotopriorityexpression":<String_value>,

"invoke_labelname":<String_value>,

"labelname":<String_value>,

"priority":<Integer_value>,

"labeltype":<String_value>
```

```
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding/ labelname_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"videooptimizationpacingpolicylabel_videooptimizationpacingpolicy_binding
": [ { "__count": "#no"} ] }
```

videooptimizationparameter

Configuration for VideoOptimization parameter resource.

Properties

vpnalwaysonprofile

Configuration for AlwyasON profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	name of AlwaysON profile. Minimum length = 1
networkaccessonvpnfailure	<String>	Read-write	Option to block network traffic when tunnel is not established(and the config requires that tunnel be established). When set to onlyToGateway, the network traffic to and from the client (except Gateway IP) is blocked. When set to fullAccess, the network traffic is not blocked. Default value: fullAccess, Possible values = onlyToGateway, fullAccess
clientcontrol	<String>	Read-write	Allow/Deny user to log off and connect to another Gateway. Default value: DENY Possible values = ALLOW, DENY

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
locationbasedvpn	<String>	Read-write	Option to decide if tunnel should be established when in enterprise network. When locationBasedVPN is remote, client tries to detect if it is located in enterprise network or not and establishes the tunnel if not in enterprise network. Dns suffixes configured using -add dns suffix- are used to decide if the client is in the enterprise network or not. If the resolution of the DNS suffix results in private IP, client is said to be in enterprise network. When set to EveryWhere, the client skips the check to detect if it is on the enterprise network and tries to establish the tunnel. Default value: Remote Possible values = Remote, Everywhere
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile **HTTP Method:** POST

Request Headers:

</b>"networkaccessonvpnfailure":<String_value>,

"clientcontrol":<String_value>,

"locationbasedvpn":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile/ name_value<String>
HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnalwaysonprofile":{

<b>"name":<String_value>,

</b>"networkaccessonvpnfailure":<String_value>,

"clientcontrol":<String_value>,

"locationbasedvpn":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnalwaysonprofile":{

<b>"name":<String_value>,

</b>"networkaccessonvpnfailure":true,

"clientcontrol":true,

"locationbasedvpn":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnalwaysonprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile? **view=summary**

Use this query-parameter to get the summary output of vpnalwaysonprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnalwaysonprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnalwaysonprofile": [ {

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnalwaysonprofile? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnalwaysonprofile": [ { "__count": "#no"} ] }
```

vpnclientlessaccesspolicy

Configuration for Clientless VPN rewrite policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the new clientless access policy. Minimum length = 1
rule	<String>	Read-write	Expression, or name of a named expression, specifying the traffic that matches the policy. The following requirements apply only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
profilename	<String>	Read-write	Name of the profile to invoke for the clientless access.
undefaction	<String>	Read-only	The UNDEF action.
hits	<Integer>	Read-only	The number of times the policy evaluated to true.
undefhits	<Integer>	Read-only	The number of times the policy evaluation resulted in undefined processing.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
description	<String>	Read-only	Description of the clientless access policy.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default vpnclientlessrwpolicy .
builtin	<String[]>	Read-only	Flag to determine if vpn clientless rewrite policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnclientlessaccesspolicy":{

<b>"name":<String_value>,
```

```
</b><b>"rule":<String_value>,

</b><b>"profilename":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnclientlessaccesspolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"profilename":<String_value>
```

```
}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnclientlessaccesspolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy? **view=summary**

Use this query-parameter to get the summary output of vpnclientlessaccesspolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnclientlessaccesspolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnclientlessaccesspolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"profilename":<String_value>,

"undefaction":<String_value>,

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnclientlessaccesspolicy": [ { "__count": "#no"} ] }
```

vpnclientlessaccesspolicy_binding

Binding object which returns the resources bound to vpnclientlessaccesspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the clientless access policy to display. Minimum length = 1
vpnclientlessaccesspolicy_vpnvserver_binding	<vpnclientlessaccesspolicy_vpnvserver_binding[]>	Read-only	vpnvserver that can be bound to vpnclientlessaccesspolicy.
vpnclientlessaccesspolicy_vpnglobal_binding	<vpnclientlessaccesspolicy_vpnglobal_binding[]>	Read-only	vpnglobal that can be bound to vpnclientlessaccesspolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy_binding/ name_value<String> **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnclientlessaccesspolicy_binding": [ {

"name":<String_value>,

"vpnclientlessaccesspolicy_vpnvserver_binding":<vpnclientlessaccesspolicy_
vpnvserver_binding[]_value>,

"vpnclientlessaccesspolicy_vpnglobal_binding":<vpnclientlessaccesspolicy_v
pnglobal_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vpnclientlessaccesspolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnclientlessaccesspolicy_binding": [ {

"name":<String_value>,

"vpnclientlessaccesspolicy_vpnvserver_binding":<vpnclientlessaccesspolicy_
vpnvserver_binding[]_value>,

"vpnclientlessaccesspolicy_vpnglobal_binding":<vpnclientlessaccesspolicy_v
pnglobal_binding[]_value>

}]}
```

vpnclientlessaccesspolicy_vpnglobal_binding

Binding object showing the vpnglobal that can be bound to vpnclientlessaccesspolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the clientless access policy to display. Minimum length = 1
priority	<Integer>	Read-only	Specifies the priority of the policy. Minimum value = 1 Maximum value = 2147483647
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

vpnclientlessaccessprofile

Configuration for Clientless VPN rewrite profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
profilename	<String>	Read-write	Name for the Citrix Gateway clientless access profile. Must begin with an ASCII alphabetic or underscore (_) character, and must consist only of ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my profile" or 'my profile'). Minimum length = 1
urlrewritepolicylabel	<String>	Read-write	Name of the configured URL rewrite policy label. If you do not specify a policy label name, then URLs are not rewritten. Minimum length = 1
javascriptrewritepolicylabel	<String>	Read-write	Name of the configured JavaScript rewrite policy label. If you do not specify a policy label name, then JAVA scripts are not rewritten. Minimum length = 1
reqhdrrewritepolicylabel	<String>	Read-write	Name of the configured Request rewrite policy label. If you do not specify a policy label name, then requests are not rewritten. Minimum length = 1
reshdrrewritepolicylabel	<String>	Read-write	Name of the configured Response rewrite policy label. Minimum length = 1
regexforfindingurlinjavascript	<String>	Read-write	Name of the pattern set that contains the regular expressions,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which match the URL in Java script. Minimum length = 1
regexforfindingurlincss	<String>	Read-write	Name of the pattern set that contains the regular expressions, which match the URL in the CSS. Minimum length = 1
regexforfindingurlinxcomponent	<String>	Read-write	Name of the pattern set that contains the regular expressions, which match the URL in X Component. Minimum length = 1
regexforfindingurlinxml	<String>	Read-write	Name of the pattern set that contains the regular expressions, which match the URL in XML. Minimum length = 1
regexforfindingcustomurls	<String>	Read-write	Name of the pattern set that contains the regular expressions, which match the URLs in the custom content type other than HTML, CSS, XML, XCOMP, and JavaScript. The custom content type should be included in the patset ns_cvpn_custom_content_types.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
clientconsumedcookies	<String>	Read-write	Specify the name of the pattern set containing the names of the cookies, which are allowed between the client and the server. If a pattern set is not specified, Citrix Gateway does not allow any cookies between the client and the server. A cookie that is not specified in the pattern set is handled by Citrix Gateway on behalf of the client. Minimum length = 1
requirepersistentcookie	<String>	Read-write	Specify whether a persistent session cookie is set and accepted for clientless access. If this parameter is set to ON, COM objects, such as MSOffice, which are invoked by the browser can access the files using clientless access. Use caution because the persistent cookie is stored on the disk. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
cssrewritepolicylabel	<String>	Read-only	The configured CSS rewrite policylabel. Minimum length = 1
xmlrewritepolicylabel	<String>	Read-only	The configured XML rewrite policylabel. Minimum length = 1
xcomponentrewritepolicylabel	<String>	Read-only	The configured X-Component rewrite policylabel. Minimum length = 1
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default vpnclientlessrwprofile.
description	<String>	Read-only	Description of the clientless access profile.
builtin	<String[]>	Read-only	Flag to determine if vpn clientless rewrite profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

vpnepaprofile

Configuration for Epa profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	name of device profile. Minimum length = 1
filename	<String>	Read-write	filename of the deviceprofile data xml. Minimum length = 1
data	<String>	Read-write	deviceprofile data xml. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnepaprofile":{

<b>"name":<String_value>,

</b>"filename":<String_value>,

"data":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnepaprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile? **view=summary**

Use this query-parameter to get the summary output of vpnepaprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnepaprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnepaprofile": [ {

"name":<String_value>,

"data":<String_value>,
```

```
"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnepaprofile/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of vpnepaprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

vpnformssoaction

Configuration for Form sso action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the form based single sign-on profile. Minimum length = 1
actionurl	<String>	Read-write	Root-relative URL to which the completed form is submitted. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
userfield	<String>	Read-write	Name of the form field in which the user types in the user ID. Minimum length = 1
passwdfield	<String>	Read-write	Name of the form field in which the user types in the password. Minimum length = 1
ssosuccessrule	<String>	Read-write	Expression that defines the criteria for SSO success. Expression such as checking for cookie in the response is a common example.
namevaluepair	<String>	Read-write	Other name-value pair attributes to send to the server, in addition to sending the user name and password. Value names are separated by an ampersand (;), such as in name1=value1;name2=value2.
responsesize	<Integer>	Read-write	Maximum number of bytes to allow in the response size. Specifies the number of bytes in the response to be parsed for extracting the forms.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 8096
nvtype	<String>	Read-write	How to process the name-value pair. Available settings function as follows: * STATIC - The administrator-configured values are used. * DYNAMIC - The response is parsed, the form is extracted, and then submitted. Default value: DYNAMIC Possible values = STATIC, DYNAMIC
submitmethod	<String>	Read-write	HTTP method (GET or POST) used by the single sign-on form to send the logon credentials to the logon server. Default value: GET Possible values = GET, POST
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

vpnglobal_appcontroller_binding

Binding object showing the appcontroller that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression or other value specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
appcontroller	<String>	Read-write	Configured App Controller server.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vpnglobal_appcontroller_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"vpnglobal_appcontroller_binding":{
```

```
"appcontroller":<String_value>,

"gotopriorityexpression":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnglobal_appcontroller_binding

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/vpnglobal_appcontroller_binding?
args=appcontroller: <String_value>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnglobal_appcontroller_binding

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/vpnglobal_appcontroller_binding? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vpnglobal_appcontroller_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/vpnglobal_appcontroller_binding? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnglobal_appcontroller_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vpnglobal_appcontroller_binding": [ {

"gotopriorityexpression":<String_value>,

"appcontroller":<String_value>

}]}
```

```
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnglobal_appcontroller_binding? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnglobal_appcontroller_binding": [ { "__count": "#no"} ] }
```

vpnglobal_appfwpolicy_binding

Binding object showing the appfwpolicy that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	The name of the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression or other value specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
groupextraction	<Boolean>	Read-write	Bind the Authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server, and this will only be called it primary and/or secondary authentication has succeeded.
priority	<Integer>	Read-write	Integer specifying the policy's priority. The lower the priority number, the higher the policy's priority. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
secondary	<Boolean>	Read-write	Bind the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only to a primary authentication server but also to a secondary authentication server. User groups are aggregated across both authentication servers. The user name must be exactly the same on both authentication servers, but the authentication servers can require different passwords.
__count	<Double>	Read-write	count parameter

			secondary authentication server. User groups are aggregated across both authentication servers. The user name must be exactly the same on both authentication servers, but the authentication servers can require different passwords.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

- ADD
- DELETE
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vpnglobal_authenticationsamlpolicy_binding

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

vpnglobal_vpnclientlessaccesspolicy_binding

Binding object showing the vpnclientlessaccesspolicy that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-write	The feature to be checked while applying this config.
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression or other value specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
globalbindtype	<String>	Read-write	. Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL, APPFW_GLOBAL, TM_GLOBAL
policyname	<String>	Read-write	The name of the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupextraction	<Boolean>	Read-write	Bind the Authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server, and this will only be called it primary and/or secondary authentication has succeeded.
type	<String>	Read-write	Bindpoint to which the policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT
builtin	<String[]>	Read-write	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
secondary	<Boolean>	Read-write	Bind the authentication policy as the secondary policy to use in a two-factor configuration. A user must then

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authenticate not only to a primary authentication server but also to a secondary authentication server. User groups are aggregated across both authentication servers. The user name must be exactly the same on both authentication servers, but the authentication servers can require different passwords.
priority	<Integer>	Read-write	Integer specifying the policy's priority. The lower the priority number, the higher the policy's priority. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
__count	<Double>	Read-write	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

vpnglobal_vpnsessionpolicy_binding

Binding object showing the vpnsessionpolicy that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
secondary	<Boolean>	Read-write	Bind the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only to a primary authentication server but also to a secondary authentication server. User groups are aggregated across both authentication servers. The user name must be exactly the same on both authentication servers, but the authentication servers can require different passwords.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Integer>	Read-write	Integer specifying the policy's priority. The lower the priority number, the higher the policy's priority. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
feature	<String>	Read-write	The feature to be checked while applying this config.
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression or other value specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
policyname	<String>	Read-write	The name of the policy.
groupextraction	<Boolean>	Read-write	Bind the Authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			against this server, and this will only be called it primary and/or secondary authentication has succeeded.
builtin	<String[]>	Read-write	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
__count	<Double>	Read-write	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vpnglobal_vpnsessionpolicy_binding **HTTP Method:** PUT

vpnicadtlsconnection

Configuration for active ica connections resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User name for which to display connections. Minimum length = 1
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
domain	<String>	Read-only	The domain name.
srcip	<String>	Read-only	The client IP address.
srcport	<Integer>	Read-only	The client port. Range 1 - 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* in CLI is represented as 65535 in NITRO API
destip	<String>	Read-only	The CPS server IP address.
destport	<Integer>	Read-only	The CPS server port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
channelnumber	<Integer>	Read-only	The channel number.
peid	<Integer>	Read-only	Core id of the session owner.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnicadtlsconnection **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/vpnicadtlsconnection? **args=username: <String_value> ,nodeid: <Integer_value>**

Use this query-parameter to get vpnicadtlsconnection resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/vpnicadtlsconnection? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/vpnicadtlsconnection? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnicadtlsconnection resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnicadtlsconnection? **view=summary**

Use this query-parameter to get the summary output of vpnicadtlsconnection resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnicadtlsconnection? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnicadtlsconnection resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnicadtlsconnection": [ {

```

vpnintranetapplication

Configuration for SSLVPN intranet application resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
intranetapplication	<String>	Read-write	Name of the intranet application. Minimum length = 1 Maximum length = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
protocol	<String>	Read-write	Protocol used by the intranet application. If protocol is set to BOTH, TCP and UDP traffic is allowed. Possible values = TCP, UDP, ANY
destip	<String>	Read-write	Destination IP address, IP range, or host name of the intranet application. This address is the server IP address. Minimum length = 1
netmask	<String>	Read-write	Destination subnet mask for the intranet application.
iprange	<String>	Read-write	If you have multiple servers in your network, such as web, email, and file shares, configure an intranet application that includes the IP range for all the network applications. This allows users to access all the intranet applications contained in the IP address range. Minimum length = 1
hostname	<String>	Read-write	Name of the host for which to configure interception. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			names are resolved during interception when users log on with the Citrix Gateway Plug-in. Minimum length = 1
clientapplication	<String[]>	Read-write	Names of the client applications, such as PuTTY and Xshell. Minimum length = 1
spoofiip	<String>	Read-write	IP address that the intranet application will use to route the connection through the virtual adapter. Default value: ON Possible values = ON, OFF
destport	<String>	Read-write	Destination TCP or UDP port number for the intranet application. Use a hyphen to specify a range of port numbers, for example 90-95. Minimum length = 1
interception	<String>	Read-write	Interception mode for the intranet application or resource. Correct value depends on the type of client software used to make connections. If the interception

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			mode is set to TRANSPARENT, users connect with the Citrix Gateway Plug-in for Windows. With the PROXY setting, users connect with the Citrix Gateway Plug-in for Java. Possible values = PROXY, TRANSPARENT
srcip	<String>	Read-write	Source IP address. Required if interception mode is set to PROXY. Default is the loopback address, 127.0.0.1. Minimum length = 1
srcport	<Integer>	Read-write	Source port for the application for which the Citrix Gateway virtual server proxies the traffic. If users are connecting from a device that uses the Citrix Gateway Plug-in for Java, applications must be configured manually by using the source IP address and TCP port values specified in the intranet application profile. If a port value is not

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			set, the destination port value is used. Minimum value = 1
ipaddress	<String>	Read-only	The IP address for the application. This address is the real application server IP address.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

vpnparameter

Configuration for VPN parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpport	<Integer[]>	Read-write	Destination port numbers other than port 80, added as a comma-separated list. Traffic to these ports is processed as HTTP traffic, which allows functionality, such as HTTP authorization and single sign-on to a web application to work. Minimum value = 1
winsip	<String>	Read-write	WINS server IP address to add to Citrix Gateway for name resolution. Minimum length = 1
dnsvservername	<String>	Read-write	Name of the DNS virtual server for the user session. Minimum length = 1
splitdns	<String>	Read-write	Route the DNS requests to the local DNS server configured on the user device, or Citrix Gateway (remote), or both. Possible values = LOCAL, REMOTE, BOTH

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
icauseraccounting	<String>	Read-write	The name of the radiusPolicy to use for RADIUS user accounting info on the session.
sesstimeout	<Integer>	Read-write	Number of minutes after which the session times out. Default value: 30 Minimum value = 1 Maximum value = 65535
clientsecurity	<String>	Read-write	Specify the client security check for the user device to permit a Citrix Gateway session. The web address or IP address is not included in the expression for the client security check.
clientsecuritygroup	<String>	Read-write	The client security group that will be assigned on failure of the client security check. Users can in general be organized into Groups. In this case, the Client Security Group may have a more restrictive security policy. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientsecuritymessage	<String>	Read-write	The client security message that will be displayed on failure of the client security check. Minimum length = 1 Maximum length = 127
clientsecuritylog	<String>	Read-write	Specifies whether or not to display all failed Client Security scans to the end user. Default value: OFF Possible values = ON, OFF
smartgroup	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Minimum length = 1 Maximum length = 64
splittunnel	<String>	Read-write	Send, through the tunnel, traffic only for intranet applications that are defined in Citrix Gateway. Route all other traffic directly to the Internet. The OFF setting routes all traffic through Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Gateway. With the REVERSE setting, intranet applications define the network traffic that is not intercepted. All network traffic directed to internal IP addresses bypasses the VPN tunnel, while other traffic goes through Citrix Gateway. Reverse split tunneling can be used to log all non-local LAN traffic. For example, if users have a home network and are logged on through the Citrix Gateway Plug-in, network traffic destined to a printer or another device within the home network is not intercepted. Default value: OFF Possible values = ON, OFF, REVERSE
locallanaccess	<String>	Read-write	Set local LAN access. If split tunneling is OFF, and you set local LAN access to ON, the local client can route traffic to its local interface. When the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			local area network switch is specified, this combination of switches is useful. The client can allow local LAN access to devices that commonly have non-routable addresses, such as local printers or local file servers. Default value: OFF Possible values = ON, OFF, FORCED
rfc1918	<String>	Read-write	As defined in the local area network, allow only the following local area network addresses to bypass the VPN tunnel when the local LAN access feature is enabled: * 10.*.*.*, * 172.16.*.*, * 192.168.*.*. Default value: OFF Possible values = ON, OFF
spoofiip	<String>	Read-write	Indicate whether or not the application requires IP spoofing, which routes the connection to the intranet application

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			through the virtual adapter. Default value: ON Possible values = ON, OFF
killconnections	<String>	Read-write	Specify whether the Citrix Gateway Plug-in should disconnect all preexisting connections, such as the connections existing before the user logged on to Citrix Gateway, and prevent new incoming connections on the Citrix Gateway Plug-in for Windows and MAC when the user is connected to Citrix Gateway and split tunneling is disabled. Default value: OFF Possible values = ON, OFF
transparentintercepti on	<String>	Read-write	Allow access to network resources by using a single IP address and subnet mask or a range of IP addresses. The OFF setting sets the mode to proxy, in which you configure destination and source IP addresses

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and port numbers. If you are using the Citrix Gateway Plug-in for Windows, set this parameter to ON, in which the mode is set to transparent. If you are using the Citrix Gateway Plug-in for Java, set this parameter to OFF. Default value: OFF Possible values = ON, OFF
windowsclienttype	<String>	Read-write	The Windows client type. Choose between two types of Windows Client\ a) Application Agent - which always runs in the task bar as a standalone application and also has a supporting service which runs permanently when installed b) Activex Control - ActiveX control run by Microsoft Internet Explorer. Default value: AGENT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = AGENT, PLUGIN
defaultauthorizationaction	<String>	Read-write	Specify the network resources that users have access to when they log on to the internal network. The default setting for authorization is to deny access to all network resources. Citrix recommends using the default global setting and then creating authorization policies to define the network resources users can access. If you set the default authorization policy to DENY, you must explicitly authorize access to any network resource, which improves security. Default value: DENY Possible values = ALLOW, DENY
authorizationgroup	<String>	Read-write	Comma-separated list of groups in which the user is placed when none of the groups that the user is a part of is configured on Citrix Gateway. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authorization policy can be bound to these groups to control access to the resources. Minimum length = 1
clientidletimeout	<Integer>	Read-write	Time, in minutes, after which to time out the user session if Citrix Gateway does not detect mouse or keyboard activity. Minimum value = 1 Maximum value = 9999
proxy	<String>	Read-write	Set options to apply proxy for accessing the internal resources. Available settings function as follows: * BROWSER - Proxy settings are configured only in Internet Explorer and Firefox browsers. * NS - Proxy settings are configured on the Citrix ADC.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* OFF - Proxy settings are not configured. Possible values = BROWSER, NS, OFF
allprotocolproxy	<String>	Read-write	IP address of the proxy server to use for all protocols supported by Citrix Gateway. Minimum length = 1
httpproxy	<String>	Read-write	IP address of the proxy server to be used for HTTP access for all subsequent connections to the internal network. Minimum length = 1
ftpproxy	<String>	Read-write	IP address of the proxy server to be used for FTP access for all subsequent connections to the internal network. Minimum length = 1
socksproxy	<String>	Read-write	IP address of the proxy server to be used for SOCKS access for all subsequent connections to the internal network. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gopherproxy	<String>	Read-write	IP address of the proxy server to be used for GOPHER access for all subsequent connections to the internal network. Minimum length = 1
sslproxy	<String>	Read-write	IP address of the proxy server to be used for SSL access for all subsequent connections to the internal network. Minimum length = 1
proxyexception	<String>	Read-write	Proxy exception string that will be configured in the browser for bypassing the previously configured proxies. Allowed only if proxy type is Browser. Minimum length = 1
proxylocalbypass	<String>	Read-write	Bypass proxy server for local addresses option in Internet Explorer and Firefox proxy server settings. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientcleanupprompt	<String>	Read-write	Prompt for client-side cache clean-up when a client-initiated session closes. Default value: ON Possible values = ON, OFF
forcecleanup	<String[]>	Read-write	Force cache clean-up when the user closes a session. You can specify all, none, or any combination of the client-side items. Possible values = none, all, cookie, addressbar, plugin, filesystemapplicatio n, application, applicationdata, clientcertificate, autocomplete, cache
clientoptions	<String[]>	Read-write	Display only the configured menu options when you select the "Configure Citrix Gateway" option in the Citrix Gateway Plug-in's system tray icon for Windows. Possible values = none, all, services,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			filetransfer, configuration
clientconfiguration	<String[]>	Read-write	Allow users to change client Debug logging level in Configuration tab of the Citrix Gateway Plug-in for Windows. Possible values = none, trace
sso	<String>	Read-write	Set single sign-on (SSO) for the session. When the user accesses a server, the user's logon credentials are passed to the server for authentication. NOTE : This configuration does not honor the following authentication types for security reason. BASIC, DIGEST, and NTLM (without Negotiate NTLM2 Key or Negotiate Sign Flag). Use VPN TrafficAction to configure SSO for these authentication types. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
ssocredential	<String>	Read-write	Specify whether to use the primary or secondary authentication credentials for single sign-on to the server. Default value: PRIMARY Possible values = PRIMARY, SECONDARY
windowsautologon	<String>	Read-write	Enable or disable the Windows Auto Logon for the session. If a VPN session is established after this setting is enabled, the user is automatically logged on by using Windows credentials after the system is restarted. Default value: OFF Possible values = ON, OFF
usemip	<String>	Read-write	Enable or disable the use of a unique IP address alias, or a mapped IP address, as the client IP address for each client session. Allow Citrix Gateway to use the mapped IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address as an intranet IP address when all other IP addresses are not available. When IP pooling is configured and the mapped IP is used as an intranet IP address, the mapped IP address is used when an intranet IP address cannot be assigned. Default value: NS Possible values = NS, OFF
useiip	<String>	Read-write	Define IP address pool options. Available settings function as follows: * SPILLOVER - When an address pool is configured and the mapped IP is used as an intranet IP address, the mapped IP address is used when an intranet IP address cannot be assigned.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* NOSPILLOVER - When intranet IP addresses are enabled and the mapped IP address is not used, the Transfer Login page appears for users who have used all available intranet IP addresses. * OFF - Address pool is not configured. Default value: NOSPILLOVER Possible values = NOSPILLOVER, SPILLOVER, OFF
clientdebug	<String>	Read-write	Set the trace level on Citrix Gateway. Technical support technicians use these debug logs for in-depth debugging and troubleshooting purposes. Available settings function as follows: * DEBUG - Detailed debug messages are collected and written into the specified file.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* STATS - Application audit level error messages and debug statistic counters are written into the specified file. * EVENTS - Application audit-level error messages are written into the specified file. * OFF - Only critical events are logged into the Windows Application Log. Default value: OFF Possible values = debug, stats, events, OFF
loginscript	<String>	Read-write	Path to the logon script that is run when a session is established. Separate multiple scripts by using comma. A "$" in the path signifies that the word following the "$" is an environment variable. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
logoutscript	<String>	Read-write	Path to the logout script. Separate multiple scripts by using comma. A "$" in the path signifies that the word following the "$" is an environment variable. Minimum length = 1
homepage	<String>	Read-write	Web address of the home page that appears when users log on. Otherwise, users receive the default home page for Citrix Gateway, which is the Access Interface.
icaproxy	<String>	Read-write	Enable ICA proxy to configure secure Internet access to servers running Citrix XenApp or XenDesktop by using Citrix Receiver instead of the Citrix Gateway Plug-in. Default value: OFF Possible values = ON, OFF
wihome	<String>	Read-write	Web address of the Web Interface server, such as http://<ipAddress>/Citrix/XenApp, or Receiver for Web,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which enumerates the virtualized resources, such as XenApp, XenDesktop, and cloud applications. This web address is used as the home page in ICA proxy mode. If Client Choices is ON, you must configure this setting. Because the user can choose between FullClient and ICAProxy, the user may see a different home page. An Internet web site may appear if the user gets the FullClient option, or a Web Interface site if the user gets the ICAProxy option. If the setting is not configured, the XenApp option does not appear as a client choice.
wihomeaddresstype	<String>	Read-write	Type of the wihome address(IPV4/V6). Possible values = IPV4, IPV6

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
citrixreceiverhome	<String>	Read-write	Web address for the Citrix Receiver home page. Configure Citrix Gateway so that when users log on to the appliance, the Citrix Gateway Plug-in opens a web browser that allows single sign-on to the Citrix Receiver home page.
wiportalmode	<String>	Read-write	Layout on the Access Interface. The COMPACT value indicates the use of small icons. Possible values = NORMAL, COMPACT
clientchoices	<String>	Read-write	Provide users with multiple logon options. With client choices, users have the option of logging on by using the Citrix Gateway Plug-in for Windows, Citrix Gateway Plug-in for Java, the Web Interface, or clientless access from one location. Depending on how Citrix Gateway is configured, users are presented with up to three icons for logon

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			choices. The most common are the Citrix Gateway Plug-in for Windows, Web Interface, and clientless access. Default value: OFF Possible values = ON, OFF
epaclienttype	<String>	Read-write	Choose between two types of End point Windows Client a) Application Agent - which always runs in the task bar as a standalone application and also has a supporting service which runs permanently when installed b) Activex Control - ActiveX control run by Microsoft Internet Explorer. Possible values = AGENT, PLUGIN
iipdnssuffix	<String>	Read-write	An intranet IP DNS suffix. When a user logs on to Citrix Gateway and is assigned an IP address, a DNS record for the user name and IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address combination is added to the Citrix Gateway DNS cache. You can configure a DNS suffix to append to the user name when the DNS record is added to the cache. You can reach to the host from where the user is logged on by using the user's name, which can be easier to remember than an IP address. When the user logs off from Citrix Gateway, the record is removed from the DNS cache. Minimum length = 1
forcedtimeout	<Integer>	Read-write	Force a disconnection from the Citrix Gateway Plug-in with Citrix Gateway after a specified number of minutes. If the session closes, the user must log on again. Minimum value = 1 Maximum value = 65535
forcedtimeoutwarning	<Integer>	Read-write	Number of minutes to warn a user before

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the user session is disconnected. Minimum value = 1 Maximum value = 255
ntdomain	<String>	Read-write	Single sign-on domain to use for single sign-on to applications in the internal network. This setting can be overwritten by the domain that users specify at the time of logon or by the domain that the authentication server returns. Minimum length = 1 Maximum length = 32
clientlessvpnmode	<String>	Read-write	Enable clientless access for web, XenApp or XenDesktop, and FileShare resources without installing the Citrix Gateway Plug-in. Available settings function as follows: * ON - Allow only clientless access. * OFF - Allow clientless access after users log on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			with the Citrix Gateway Plug-in. * DISABLED - Do not allow clientless access. Default value: OFF Possible values = ON, OFF, DISABLED
clientlessmodeurlencoding	<String>	Read-write	When clientless access is enabled, you can choose to encode the addresses of internal web applications or to leave the address as clear text. Available settings function as follows: * OPAQUE - Use standard encoding mechanisms to make the domain and protocol part of the resource unclear to users. * TRANSPARENT - Do not encode the web address and make it visible to users.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ENCRYPT - Allow the domain and protocol to be encrypted using a session key. When the web address is encrypted, the URL is different for each user session for the same web resource. If users bookmark the encoded web address, save it in the web browser and then log off, they cannot connect to the web address when they log on and use the bookmark. If users save the encrypted bookmark in the Access Interface during their session, the bookmark works each time the user logs on. Default value: OPAQUE Possible values = TRANSPARENT, OPAQUE, ENCRYPT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientlesspersistentcookie	<String>	Read-write	State of persistent cookies in clientless access mode. Persistent cookies are required for accessing certain features of SharePoint, such as opening and editing Microsoft Word, Excel, and PowerPoint documents hosted on the SharePoint server. A persistent cookie remains on the user device and is sent with each HTTP request. Citrix Gateway encrypts the persistent cookie before sending it to the plug-in on the user device, and refreshes the cookie periodically as long as the session exists. The cookie becomes stale if the session ends. Available settings function as follows: * ALLOW - Enable persistent cookies. Users can open and edit Microsoft documents stored in SharePoint.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DENY - Disable persistent cookies. Users cannot open and edit Microsoft documents stored in SharePoint. * PROMPT - Prompt users to allow or deny persistent cookies during the session. Persistent cookies are not required for clientless access if users do not connect to SharePoint. Default value: DENY Possible values = ALLOW, DENY, PROMPT
emailhome	<String>	Read-write	Web address for the web-based email, such as Outlook Web Access.
allowedlogingroups	<String>	Read-write	Specify groups that have permission to log on to Citrix Gateway. Users who do not belong to this group or groups are denied access even

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			if they have valid credentials. Minimum length = 1 Maximum length = 511
encryptcsecexp	<String>	Read-write	Enable encryption of client security expressions. Default value: ENABLED Possible values = ENABLED, DISABLED
apptokentimeout	<Integer>	Read-write	The timeout value in seconds for tokens to access XenMobile applications. Default value: 100 Minimum value = 1 Maximum value = 255
mdxtokentimeout	<Integer>	Read-write	Validity of MDX Token in minutes. This token is used for mdx services to access backend and valid HEAD and GET request. Default value: 10 Minimum value = 1 Maximum value = 1440

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
uitheme	<String>	Read-write	Set VPN UI Theme to Green-Bubble, Caxton or Custom; default is Caxton. Possible values = DEFAULT, GREENBUBBLE, CUSTOM
securebrowse	<String>	Read-write	Allow users to connect through Citrix Gateway to network resources from iOS and Android mobile devices with Citrix Receiver. Users do not need to establish a full VPN tunnel to access resources in the secure network. Default value: ENABLED Possible values = ENABLED, DISABLED
storefronturl	<String>	Read-write	Web address for StoreFront to be used in this session for enumeration of resources from XenApp or XenDesktop. Minimum length = 1 Maximum length = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
kcdaccount	<String>	Read-write	The KCD account details to be used in SSO.
clientversions	<String>	Read-write	checkversion api. Minimum length = 1 Maximum length = 100
rdpclientprofilename	<String>	Read-write	Name of the RDP profile associated with the vserver. Minimum length = 1 Maximum length = 127
windowspluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Win. Default value: Always Possible values = Always, Essential, Never
macpluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Mac. Default value: Always Possible values = Always, Essential, Never

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linuxpluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Linux. Default value: Always Possible values = Always, Essential, Never
iconwithreceiver	<String>	Read-write	Option to decide whether to show plugin icon along with receiver icon. Default value: OFF Possible values = ON, OFF
userdomains	<String>	Read-write	List of user domains specified as comma seperated value.
icasessiontimeout	<String>	Read-write	Enable or disable ica session timeout. If enabled and in case AAA session gets terminated, ICA connections associated with that will also get terminated. Default value: OFF Possible values = ON, OFF
httptrackconnproxy	<String>	Read-write	Use separate TCP connections for each connection proxy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			request in GSLB Active-Active setups. Improves session isolation but may impact performance due to increased connections and TLS overhead. Disabled by default. Default value: OFF Possible values = ON, OFF
alwaysonprofilename	<String>	Read-write	Name of the AlwaysON profile. The builtin profile named none can be used to explicitly disable AlwaysON. Minimum length = 1 Maximum length = 127
autoproxyurl	<String>	Read-write	URL to auto proxy config file.
advancedclientlessvpnmode	<String>	Read-write	Option to enable/disable Advanced ClientlessVpnMode. Additionaly, it can be set to STRICT to block Classic ClientlessVpnMode while in AdvancedClientless Mode. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED, STRICT
pcoipprofilename	<String>	Read-write	Name of the PCOIP profile. Minimum length = 1 Maximum length = 127
backendserversni	<String>	Read-write	enables sni extension for backend server handshakes. Default value: DISABLED Possible values = ENABLED, DISABLED
backendcertvalidation	<String>	Read-write	enables backend server certificate validation. Default value: DISABLED Possible values = ENABLED, DISABLED
secureprivateaccess	<String>	Read-write	Enables or disables the secure private access configuration. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
accessrestrictedpage redirect	<String>	Read-write	By default, an access restricted page hosted on secure private access CDN is displayed when a restricted app is accessed. The setting can be changed to NS to display the access restricted page hosted on the gateway or OFF to not display any access restricted page. Default value: CDN Possible values = CDN, NS, OFF
fqdnspoofedip	<String>	Read-write	Spoofed IP address range that can be used by client for FQDN based split tunneling. Minimum length = 1
netmask	<String>	Read-write	The netmask for the spoofed ip address. Minimum length = 1
samesite	<String>	Read-write	SameSite attribute value for Cookies generated in VPN context. This

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			attribute value will be appended only for the cookies which are specified in the builtin patset ns_cookies_samesite. Possible values = None, LAX, STRICT
maxiipperuser	<Integer>	Read-write	Maximum number of Intranet IP that can be assigned to a user from AAA group, VPN vserver or VPN global pool. This setting is not applicable for AAA user level Intranet IP configuration. Default value: 1 Minimum value = 1 Maximum value = 10
deviceposture	<String>	Read-write	Enable device posture. Default value: DISABLED Possible values = ENABLED, DISABLED
backenddtls12	<String>	Read-write	Enables DTLS 1.2 for backend server handshakes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
secureprivateaccessprofile	<String>	Read-write	Clears Secure Private Access profile that may be set.
name	<String>	Read-only	The VPN name.
clientidletimeoutwarning	<Integer>	Read-only	The time after which the client gets a timeout warning, in minutes.
stricturlcheck	<String>	Read-only	Enables or disables the strict endpoint or URL checking with respect to the configuration. Default value: ENABLED Possible values = ENABLED, DISABLED
vpnsessionpolicybindtype	<String>	Read-only	Indicates current bind type (Classic/ Advanced) for VPN session policy across all bind entities. Default value: Advanced Policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Classic Policy, Advanced Policy
vpnsessionpolicycount	<Integer>	Read-only	Count of VPN session policies across all bind entities.
_nextgenapiresource	<String>	Read-only	.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

vpnpcoipconnection

Configuration for PCoIP connection resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User name for the PCOIP connections. Minimum length = 1
nodeid	<Integer>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
all	<Boolean>	Read-write	All active pcoip connections.
srcip	<String>	Read-only	The client IP address.
srcport	<Integer>	Read-only	The client port. Range 1 - 65535 * in CLI is represented as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			65535 in NITRO API
destip	<String>	Read-only	The VDA IP address.
destport	<Integer>	Read-only	The VDA server port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
peid	<Integer>	Read-only	Core id of the session owner.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- KILL

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

KILL

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnpcoipconnection? **action=kill HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnpcoipconnection":{

"username":<String_value>,

"all":<Boolean_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnpcoipconnection **Query-parameters: args** http:// <netscaler-ip-address> /nitro/v1/config/vpnpcoipconnection? **args=username: <String_value> ,nodeid: <Integer_value>**

Use this query-parameter to get vpnpcoipconnection resources based on additional properties.

attrs http:// <netscaler-ip-address> /nitro/v1/config/vpnpcoipconnection? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/vpnpcoipconnection? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnpcoipconnection resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnpcoipconnection? **view=summary**

Use this query-parameter to get the summary output of vpnpcoipconnection resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnpcoipconnection? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnpcoipconnection resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnpcoipconnection": [ {

username:<String_value>,nodeid:<Integer_value>"srcip":<String_value>,

"srcport":<Integer_value>,

"destip":<String_value>,

"destport":<Integer_value>,

"peid":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnpcoipconnection? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnpcoipconnection": [ { "__count": "#no"} ] }
```

vpnpcoipprofile

Configuration for PCoIP session profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	name of PCoIP profile. Minimum length = 1
conserverurl	<String>	Read-write	Connection server URL.
icvverification	<String>	Read-write	ICV verification for PCOIP transport packets. Default value: DISABLED Possible values = ENABLED, DISABLED
sessionidletimeout	<Integer>	Read-write	PCOIP Idle Session timeout. Default value: 180 Minimum value = 30 Maximum value = 240
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnportaltheme? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnportaltheme": [ { "__count": "#no"} ] }
```

vpnsamlssoprofile

Configuration for SAML sso action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new saml single sign-on profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an SSO action is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
samlsigningcertname	<String>	Read-write	Name of the signing authority as given in the SAML server's SSL certificate. Minimum length = 1
assertionconsumerserviceurl	<String>	Read-write	URL to which the assertion is to be sent. Minimum length = 1
relaystaterule	<String>	Read-write	Expression to extract relaystate to be sent along with assertion. Evaluation of this expression should return TEXT content. This is typically a target url to which user is redirected after the recipient validates SAML token.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sendpassword	<String>	Read-write	Option to send password in assertion. Default value: OFF Possible values = ON, OFF
samlissuername	<String>	Read-write	The name to be used in requests sent from Citrix ADC to IdP to uniquely identify Citrix ADC. Minimum length = 1
signaturealg	<String>	Read-write	Algorithm to be used to sign/verify SAML transactions. Default value: RSA-SHA256 Possible values = RSA-SHA1, RSA-SHA256
digestmethod	<String>	Read-write	Algorithm to be used to compute/verify digest for SAML transactions. Default value: SHA256 Possible values = SHA1, SHA256
audience	<String>	Read-write	Audience for which assertion sent by IdP is applicable. This is typically entity name

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or url that represents ServiceProvider.
nameidformat	<String>	Read-write	Format of Name Identifier sent in Assertion. Default value: transient Possible values = Unspecified, emailAddress, X509SubjectName, WindowsDomainQualifiedName, kerberos, entity, persistent, transient
nameidexpr	<String>	Read-write	Expression that will be evaluated to obtain NameIdentifier to be sent in assertion. Maximum length = 128
attribute1	<String>	Read-write	Name of attribute1 that needs to be sent in SAML Assertion.
attribute1expr	<String>	Read-write	Expression that will be evaluated to obtain attribute1's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute1friendlyname	<String>	Read-write	User-Friendly Name of attribute1 that needs to be sent in SAML Assertion.
attribute1format	<String>	Read-write	Format of Attribute1 to be sent in Assertion. Possible values = URI, Basic
attribute2	<String>	Read-write	Name of attribute2 that needs to be sent in SAML Assertion.
attribute2expr	<String>	Read-write	Expression that will be evaluated to obtain attribute2's value to be sent in Assertion. Maximum length = 128
attribute2friendlyname	<String>	Read-write	User-Friendly Name of attribute2 that needs to be sent in SAML Assertion.
attribute2format	<String>	Read-write	Format of Attribute2 to be sent in Assertion. Possible values = URI, Basic
attribute3	<String>	Read-write	Name of attribute3 that needs to be sent in SAML Assertion.
attribute3expr	<String>	Read-write	Expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain attribute3's value to be sent in Assertion. Maximum length = 128
attribute3friendlyname	<String>	Read-write	User-Friendly Name of attribute3 that needs to be sent in SAML Assertion.
attribute3format	<String>	Read-write	Format of Attribute3 to be sent in Assertion. Possible values = URI, Basic
attribute4	<String>	Read-write	Name of attribute4 that needs to be sent in SAML Assertion.
attribute4expr	<String>	Read-write	Expression that will be evaluated to obtain attribute4's value to be sent in Assertion. Maximum length = 128
attribute4friendlyname	<String>	Read-write	User-Friendly Name of attribute4 that needs to be sent in SAML Assertion.
attribute4format	<String>	Read-write	Format of Attribute4 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute5	<String>	Read-write	Name of attribute5 that needs to be sent in SAML Assertion.
attribute5expr	<String>	Read-write	Expression that will be evaluated to obtain attribute5's value to be sent in Assertion. Maximum length = 128
attribute5friendlyname	<String>	Read-write	User-Friendly Name of attribute5 that needs to be sent in SAML Assertion.
attribute5format	<String>	Read-write	Format of Attribute5 to be sent in Assertion. Possible values = URI, Basic
attribute6	<String>	Read-write	Name of attribute6 that needs to be sent in SAML Assertion.
attribute6expr	<String>	Read-write	Expression that will be evaluated to obtain attribute6's value to be sent in Assertion. Maximum length = 128
attribute6friendlyname	<String>	Read-write	User-Friendly Name of attribute6 that needs to be sent in SAML Assertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute6format	<String>	Read-write	Format of Attribute6 to be sent in Assertion. Possible values = URI, Basic
attribute7	<String>	Read-write	Name of attribute7 that needs to be sent in SAML Assertion.
attribute7expr	<String>	Read-write	Expression that will be evaluated to obtain attribute7's value to be sent in Assertion. Maximum length = 128
attribute7friendlyname	<String>	Read-write	User-Friendly Name of attribute7 that needs to be sent in SAML Assertion.
attribute7format	<String>	Read-write	Format of Attribute7 to be sent in Assertion. Possible values = URI, Basic
attribute8	<String>	Read-write	Name of attribute8 that needs to be sent in SAML Assertion.
attribute8expr	<String>	Read-write	Expression that will be evaluated to obtain attribute8's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute8friendlyname	<String>	Read-write	User-Friendly Name of attribute8 that needs to be sent in SAML Assertion.
attribute8format	<String>	Read-write	Format of Attribute8 to be sent in Assertion. Possible values = URI, Basic
attribute9	<String>	Read-write	Name of attribute9 that needs to be sent in SAML Assertion.
attribute9expr	<String>	Read-write	Expression that will be evaluated to obtain attribute9's value to be sent in Assertion. Maximum length = 128
attribute9friendlyname	<String>	Read-write	User-Friendly Name of attribute9 that needs to be sent in SAML Assertion.
attribute9format	<String>	Read-write	Format of Attribute9 to be sent in Assertion. Possible values = URI, Basic
attribute10	<String>	Read-write	Name of attribute10 that needs to be sent in SAML Assertion.
attribute10expr	<String>	Read-write	Expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain attribute10's value to be sent in Assertion. Maximum length = 128
attribute10friendlyname	<String>	Read-write	User-Friendly Name of attribute10 that needs to be sent in SAML Assertion.
attribute10format	<String>	Read-write	Format of Attribute10 to be sent in Assertion. Possible values = URI, Basic
attribute11	<String>	Read-write	Name of attribute11 that needs to be sent in SAML Assertion.
attribute11expr	<String>	Read-write	Expression that will be evaluated to obtain attribute11's value to be sent in Assertion. Maximum length = 128
attribute11friendlyname	<String>	Read-write	User-Friendly Name of attribute11 that needs to be sent in SAML Assertion.
attribute11format	<String>	Read-write	Format of Attribute11 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute12	<String>	Read-write	Name of attribute12 that needs to be sent in SAML Assertion.
attribute12expr	<String>	Read-write	Expression that will be evaluated to obtain attribute12's value to be sent in Assertion. Maximum length = 128
attribute12friendlyname	<String>	Read-write	User-Friendly Name of attribute12 that needs to be sent in SAML Assertion.
attribute12format	<String>	Read-write	Format of Attribute12 to be sent in Assertion. Possible values = URI, Basic
attribute13	<String>	Read-write	Name of attribute13 that needs to be sent in SAML Assertion.
attribute13expr	<String>	Read-write	Expression that will be evaluated to obtain attribute13's value to be sent in Assertion. Maximum length = 128
attribute13friendlyname	<String>	Read-write	User-Friendly Name of attribute13 that needs to be sent in SAML Assertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute13format	<String>	Read-write	Format of Attribute13 to be sent in Assertion. Possible values = URI, Basic
attribute14	<String>	Read-write	Name of attribute14 that needs to be sent in SAML Assertion.
attribute14expr	<String>	Read-write	Expression that will be evaluated to obtain attribute14's value to be sent in Assertion. Maximum length = 128
attribute14friendlyname	<String>	Read-write	User-Friendly Name of attribute14 that needs to be sent in SAML Assertion.
attribute14format	<String>	Read-write	Format of Attribute14 to be sent in Assertion. Possible values = URI, Basic
attribute15	<String>	Read-write	Name of attribute15 that needs to be sent in SAML Assertion.
attribute15expr	<String>	Read-write	Expression that will be evaluated to obtain attribute15's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute15friendlyname	<String>	Read-write	User-Friendly Name of attribute15 that needs to be sent in SAML Assertion.
attribute15format	<String>	Read-write	Format of Attribute15 to be sent in Assertion. Possible values = URI, Basic
attribute16	<String>	Read-write	Name of attribute16 that needs to be sent in SAML Assertion.
attribute16expr	<String>	Read-write	Expression that will be evaluated to obtain attribute16's value to be sent in Assertion. Maximum length = 128
attribute16friendlyname	<String>	Read-write	User-Friendly Name of attribute16 that needs to be sent in SAML Assertion.
attribute16format	<String>	Read-write	Format of Attribute16 to be sent in Assertion. Possible values = URI, Basic
encryptassertion	<String>	Read-write	Option to encrypt assertion when Citrix ADC sends one. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
samlspcertname	<String>	Read-write	Name of the SSL certificate of peer/ receving party using which Assertion is encrypted. Minimum length = 1
encryptionalgorithm	<String>	Read-write	Algorithm to be used to encrypt SAML assertion. Default value: AES256 Possible values = DES3, AES128, AES192, AES256
skewtime	<Integer>	Read-write	This option specifies the number of minutes on either side of current time that the assertion would be valid. For example, if skewTime is 10, then assertion would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
signassertion	<String>	Read-write	Option to sign portions of assertion when Citrix ADC IDP sends one. Based on the user selection,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			either Assertion or Response or Both or none can be signed. Default value: ASSERTION Possible values = NONE, ASSERTION, RESPONSE, BOTH
signatureservice	<String>	Read-write	Name of the service in cloud used to sign the data. Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsamlssoprofile/ name_value<String>
Query-parameters: attrs http:// <netscaler-ip-address> /nitro/v1/config/vpnsamlssoprofile/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnsamlssoprofile/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of vpnsamlssoprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

vpnsecureprivateaccessprofile

Configuration for Secure Private Access Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	name of Secure Private Access profile. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 31
url	<String>	Read-write	Public URL for your Secure Private Access site or load balancing server.
customerid	<String>	Read-write	Customer ID of the citrix cloud customer. Minimum length = 1
chromeenterprisepremiummode	<String>	Read-write	Secure Private Access Chrome Enterprise Premium mode of operation. Default value: OFF Possible values = OFF, WITH_PARTNER_CONNECTOR, WITHOUT_PARTNER_CONNECTOR
googlecustomerid	<String>	Read-write	Your organization's unique ID on Google's Admin console Profile settings. Minimum length = 1
googlesecuritygatewayid	<String>	Read-write	The ID of the Google Secure Gateway. Minimum length = 1
forceclienttype	<String>	Read-write	Automatically configures the session for Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Secure Access client connectivity. Default value: ON Possible values = ON, OFF
sharedsecret	<String>	Read-write	Secure Private Access Shared Secret. Minimum length = 32
clouddeployment	<String>	Read-only	Secure Private Access cloud deployment. Default value: PRODUCTION Possible values = PRODUCTION, STAGING, DEVELOPMENT
accessrestrictedpage redirect	<String>	Read-only	Redirect option for access restricted pages. Default value: CDN Possible values = CDN, NS, OFF
serverstatus	<String>	Read-only	Status of the Secure Private Access site as determined by a TCP monitor health check. Possible values = UP, DOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsecureprivateaccessprofile **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnsecureprivateaccessprofile":{

<b>"name":<String_value>,

</b><b>"url":<String_value>,

"chromeenterprisepremiummode":<String_value>,

"googlecustomerid":<String_value>,

"googlesecuritygatewayid":<String_value>,

"forceclienttype":<String_value>,

"sharedsecret":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsecureprivateaccessprofile/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsecureprivateaccessprofile **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnsecureprivateaccessprofile":{

<b>"name":<String_value>,

</b>"url":<String_value>,

"customerid":<String_value>,

"chromeenterprisepremiummode":<String_value>,

"googlecustomerid":<String_value>,

"googlesecuritygatewayid":<String_value>,

"forceclienttype":<String_value>,

"sharedsecret":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsecureprivateaccessprofile? **action=unset**
HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnsecureprivateaccessprofile":{

<b>"name":<String_value>,

</b>"customerid":true,

"chromeenterprisepremiummode":true,

"googlecustomerid":true,

"googlesecuritygatewayid":true,

"forceclienttype":true,

"sharedsecret":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsecureprivateaccessprofile **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpnsecureprivateaccessprofile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/vpnsecureprivateaccessprofile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnsecureprivateaccessprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnsecureprivateaccessprofile?**view=summary**

Use this query-parameter to get the summary output of vpnsecureprivateaccessprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnsecureprivateaccessprofile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnsecureprivateaccessprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnsecureprivateaccessprofile": [ {

Response Payload:

```
{ "vpnsecureprivateaccessprofile": [ { "__count": "#no"} ] }
```

vpnsessionaction

Configuration for VPN session action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Citrix Gateway profile (action). Must begin with an ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphabetic or underscore (_) character, and must consist only of ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
useraccounting	<String>	Read-write	The name of the radiusPolicy to use for RADIUS user accounting info on the session.
httpport	<Integer[]>	Read-write	Destination port numbers other than port 80, added as a comma-separated list. Traffic to these

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ports is processed as HTTP traffic, which allows functionality, such as HTTP authorization and single sign-on to a web application to work. Minimum value = 1
winsip	<String>	Read-write	WINS server IP address to add to Citrix Gateway for name resolution.
dnsvservername	<String>	Read-write	Name of the DNS virtual server for the user session. Minimum length = 1
splitdns	<String>	Read-write	Route the DNS requests to the local DNS server configured on the user device, or Citrix Gateway (remote), or both. Possible values = LOCAL, REMOTE, BOTH
sesstimeout	<Integer>	Read-write	Number of minutes after which the session times out. Minimum value = 1
clientsecurity	<String>	Read-write	Specify the client security check for the user device to permit a Citrix Gateway session. The web

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address or IP address is not included in the expression for the client security check.
clientsecuritygroup	<String>	Read-write	The client security group that will be assigned on failure of the client security check. Users can in general be organized into Groups. In this case, the Client Security Group may have a more restrictive security policy. Minimum length = 1
clientsecuritymessage	<String>	Read-write	The client security message that will be displayed on failure of the client security check. Minimum length = 1 Maximum length = 127
clientsecuritylog	<String>	Read-write	Set the logging of client security checks. Possible values = ON, OFF
splittunnel	<String>	Read-write	Send, through the tunnel, traffic only for intranet applications that are defined in Citrix Gateway.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Route all other traffic directly to the Internet. The OFF setting routes all traffic through Citrix Gateway. With the REVERSE setting, intranet applications define the network traffic that is not intercepted. All network traffic directed to internal IP addresses bypasses the VPN tunnel, while other traffic goes through Citrix Gateway. Reverse split tunneling can be used to log all non-local LAN traffic. For example, if users have a home network and are logged on through the Citrix Gateway Plug-in, network traffic destined to a printer or another device within the home network is not intercepted. Possible values = ON, OFF, REVERSE
locallanaccess	<String>	Read-write	Set local LAN access. If split tunneling is OFF, and you set local LAN access to ON, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			local client can route traffic to its local interface. When the local area network switch is specified, this combination of switches is useful. The client can allow local LAN access to devices that commonly have non-routable addresses, such as local printers or local file servers. Possible values = ON, OFF, FORCED
rfc1918	<String>	Read-write	As defined in the local area network, allow only the following local area network addresses to bypass the VPN tunnel when the local LAN access feature is enabled: * 10.*.*.*, * 172.16.*.*, * 192.168.*.*. Possible values = ON, OFF
spoofiip	<String>	Read-write	IP address that the intranet application uses to route the connection through the virtual adapter.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
killconnections	<String>	Read-write	Specify whether the Citrix Gateway Plug-in should disconnect all preexisting connections, such as the connections existing before the user logged on to Citrix Gateway, and prevent new incoming connections on the Citrix Gateway Plug-in for Windows and MAC when the user is connected to Citrix Gateway and split tunneling is disabled. Possible values = ON, OFF
transparentintercepti on	<String>	Read-write	Allow access to network resources by using a single IP address and subnet mask or a range of IP addresses. The OFF setting sets the mode to proxy, in which you configure destination and source IP addresses and port numbers. If you are using the Citrix Gateway Plug-in for Windows, set this parameter to ON, in which the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			mode is set to transparent. If you are using the Citrix Gateway Plug-in for Java, set this parameter to OFF. Possible values = ON, OFF
windowsclienttype	<String>	Read-write	Choose between two types of Windows Client\ a) Application Agent - which always runs in the task bar as a standalone application and also has a supporting service which runs permanently when installed b) Activex Control - ActiveX control run by Microsoft Internet Explorer. Possible values = AGENT, PLUGIN
defaultauthorizationaction	<String>	Read-write	Specify the network resources that users have access to when they log on to the internal network. The default setting for authorization is to deny access to all network resources.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix recommends using the default global setting and then creating authorization policies to define the network resources users can access. If you set the default authorization policy to DENY, you must explicitly authorize access to any network resource, which improves security. Possible values = ALLOW, DENY
authorizationgroup	<String>	Read-write	Comma-separated list of groups in which the user is placed when none of the groups that the user is a part of is configured on Citrix Gateway. The authorization policy can be bound to these groups to control access to the resources. Minimum length = 1
smartgroup	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 64
clientidletimeout	<Integer>	Read-write	Time, in minutes, after which to time out the user session if Citrix Gateway does not detect mouse or keyboard activity. Minimum value = 1 Maximum value = 9999
proxy	<String>	Read-write	Set options to apply proxy for accessing the internal resources. Available settings function as follows: * BROWSER - Proxy settings are configured only in Internet Explorer and Firefox browsers. * NS - Proxy settings are configured on the Citrix ADC. * OFF - Proxy settings are not configured.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = BROWSER, NS, OFF
allprotocolproxy	<String>	Read-write	IP address of the proxy server to use for all protocols supported by Citrix Gateway. Minimum length = 1
httpproxy	<String>	Read-write	IP address of the proxy server to be used for HTTP access for all subsequent connections to the internal network. Minimum length = 1
ftpproxy	<String>	Read-write	IP address of the proxy server to be used for FTP access for all subsequent connections to the internal network. Minimum length = 1
socksproxy	<String>	Read-write	IP address of the proxy server to be used for SOCKS access for all subsequent connections to the internal network. Minimum length = 1
gopherproxy	<String>	Read-write	IP address of the proxy server to be used for GOPHER access for all

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			subsequent connections to the internal network. Minimum length = 1
sslproxy	<String>	Read-write	IP address of the proxy server to be used for SSL access for all subsequent connections to the internal network. Minimum length = 1
proxyexception	<String>	Read-write	Proxy exception string that will be configured in the browser for bypassing the previously configured proxies. Allowed only if proxy type is Browser. Minimum length = 1
proxylocalbypass	<String>	Read-write	Bypass proxy server for local addresses option in Internet Explorer and Firefox proxy server settings. Possible values = ENABLED, DISABLED
clientcleanupprompt	<String>	Read-write	Prompt for client-side cache clean-up when a client-initiated session closes. Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
forcecleanup	<String[]>	Read-write	Force cache clean-up when the user closes a session. You can specify all, none, or any combination of the client-side items. Possible values = none, all, cookie, addressbar, plugin, filesystemapplicatio n, application, applicationdata, clientcertificate, autocomplete, cache
clientoptions	<String>	Read-write	Display only the configured menu options when you select the "Configure Citrix Gateway" option in the Citrix Gateway Plug-in system tray icon for Windows. Possible values = none, all, services, filetransfer, configuration
clientconfiguration	<String[]>	Read-write	Allow users to change client Debug logging level in Configuration tab of the Citrix Gateway Plug-in for Windows.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = none, trace
sso	<String>	Read-write	Set single sign-on (SSO) for the session. When the user accesses a server, the user's logon credentials are passed to the server for authentication. NOTE : This configuration does not honor the following authentication types for security reason. BASIC, DIGEST, and NTLM (without Negotiate NTLM2 Key or Negotiate Sign Flag). Use VPN TrafficAction to configure SSO for these authentication types. Possible values = ON, OFF
ssocredential	<String>	Read-write	Specify whether to use the primary or secondary authentication credentials for single sign-on to the server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = PRIMARY, SECONDARY
windowsautologon	<String>	Read-write	Enable or disable the Windows Auto Logon for the session. If a VPN session is established after this setting is enabled, the user is automatically logged on by using Windows credentials after the system is restarted. Possible values = ON, OFF
usemip	<String>	Read-write	Enable or disable the use of a unique IP address alias, or a mapped IP address, as the client IP address for each client session. Allow Citrix Gateway to use the mapped IP address as an intranet IP address when all other IP addresses are not available. When IP pooling is configured and the mapped IP is used as an intranet IP address, the mapped IP address is used when an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			intranet IP address cannot be assigned. Possible values = NS, OFF
useiip	<String>	Read-write	Define IP address pool options. Available settings function as follows: * SPILLOVER - When an address pool is configured and the mapped IP is used as an intranet IP address, the mapped IP address is used when an intranet IP address cannot be assigned. * NOSPILLOVER - When intranet IP addresses are enabled and the mapped IP address is not used, the Transfer Login page appears for users who have used all available intranet IP addresses. * OFF - Address pool is not configured.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NOSPILLOVER, SPILLOVER, OFF
clientdebug	<String>	Read-write	Set the trace level on Citrix Gateway. Technical support technicians use these debug logs for in-depth debugging and troubleshooting purposes. Available settings function as follows: * DEBUG - Detailed debug messages are collected and written into the specified file. * STATS - Application audit level error messages and debug statistic counters are written into the specified file. * EVENTS - Application audit-level error messages are written into the specified file. * OFF - Only critical events are logged

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			into the Windows Application Log. Possible values = debug, stats, events, OFF
loginscript	<String>	Read-write	Path to the logon script that is run when a session is established. Separate multiple scripts by using comma. A "$" in the path signifies that the word following the "$" is an environment variable. Minimum length = 1
logoutscript	<String>	Read-write	Path to the logout script. Separate multiple scripts by using comma. A "$" in the path signifies that the word following the "$" is an environment variable. Minimum length = 1
homepage	<String>	Read-write	Web address of the home page that appears when users log on. Otherwise, users receive the default home page for Citrix Gateway, which is the Access Interface.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
icaproxy	<String>	Read-write	Enable ICA proxy to configure secure Internet access to servers running Citrix XenApp or XenDesktop by using Citrix Receiver instead of the Citrix Gateway Plug-in. Possible values = ON, OFF
wihome	<String>	Read-write	Web address of the Web Interface server, such as http://<ipAddress>/Citrix/XenApp, or Receiver for Web, which enumerates the virtualized resources, such as XenApp, XenDesktop, and cloud applications. This web address is used as the home page in ICA proxy mode. If Client Choices is ON, you must configure this setting. Because the user can choose between FullClient and ICAProxy, the user may see a different home page. An Internet web site may

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			appear if the user gets the FullClient option, or a Web Interface site if the user gets the ICAProxy option. If the setting is not configured, the XenApp option does not appear as a client choice.
wihomeaddresstype	<String>	Read-write	Type of the wihome address(IPV4/V6). Possible values = IPV4, IPV6
citrixreceiverhome	<String>	Read-write	Web address for the Citrix Receiver home page. Configure Citrix Gateway so that when users log on to the appliance, the Citrix Gateway Plug-in opens a web browser that allows single sign-on to the Citrix Receiver home page.
wiportalmode	<String>	Read-write	Layout on the Access Interface. The COMPACT value indicates the use of small icons. Possible values = NORMAL, COMPACT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientchoices	<String>	Read-write	Provide users with multiple logon options. With client choices, users have the option of logging on by using the Citrix Gateway Plug-in for Windows, Citrix Gateway Plug-in for Java, the Web Interface, or clientless access from one location. Depending on how Citrix Gateway is configured, users are presented with up to three icons for logon choices. The most common are the Citrix Gateway Plug-in for Windows, Web Interface, and clientless access. Possible values = ON, OFF
epaclienttype	<String>	Read-write	Choose between two types of End point Windows Client a) Application Agent - which always runs in the task bar as a standalone application and also has a supporting service which runs

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			permanently when installed b) Activex Control - ActiveX control run by Microsoft Internet Explorer. Possible values = AGENT, PLUGIN
iipdnssuffix	<String>	Read-write	An intranet IP DNS suffix. When a user logs on to Citrix Gateway and is assigned an IP address, a DNS record for the user name and IP address combination is added to the Citrix Gateway DNS cache. You can configure a DNS suffix to append to the user name when the DNS record is added to the cache. You can reach to the host from where the user is logged on by using the user's name, which can be easier to remember than an IP address. When the user logs off from Citrix Gateway, the record is removed from the DNS cache.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
forcedtimeout	<Integer>	Read-write	Force a disconnection from the Citrix Gateway Plug-in with Citrix Gateway after a specified number of minutes. If the session closes, the user must log on again. Minimum value = 1 Maximum value = 65535
forcedtimeoutwarning	<Integer>	Read-write	Number of minutes to warn a user before the user session is disconnected. Minimum value = 1 Maximum value = 255
ntdomain	<String>	Read-write	Single sign-on domain to use for single sign-on to applications in the internal network. This setting can be overwritten by the domain that users specify at the time of logon or by the domain that the authentication server returns. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 32
clientlessvpnmode	<String>	Read-write	Enable clientless access for web, XenApp or XenDesktop, and FileShare resources without installing the Citrix Gateway Plug-in. Available settings function as follows: * ON - Allow only clientless access. * OFF - Allow clientless access after users log on with the Citrix Gateway Plug-in. * DISABLED - Do not allow clientless access. Possible values = ON, OFF, DISABLED
emailhome	<String>	Read-write	Web address for the web-based email, such as Outlook Web Access.
clientlessmodeurlencoding	<String>	Read-write	When clientless access is enabled, you can choose to encode the addresses of internal web applications or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to leave the address as clear text. Available settings function as follows: * OPAQUE - Use standard encoding mechanisms to make the domain and protocol part of the resource unclear to users. * CLEAR - Do not encode the web address and make it visible to users. * ENCRYPT - Allow the domain and protocol to be encrypted using a session key. When the web address is encrypted, the URL is different for each user session for the same web resource. If users bookmark the encoded web address, save it in the web browser and then log off, they cannot connect to the web address when they log on and use the bookmark. If users

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			save the encrypted bookmark in the Access Interface during their session, the bookmark works each time the user logs on. Possible values = TRANSPARENT, OPAQUE, ENCRYPT
clientlesspersistentcookie	<String>	Read-write	State of persistent cookies in clientless access mode. Persistent cookies are required for accessing certain features of SharePoint, such as opening and editing Microsoft Word, Excel, and PowerPoint documents hosted on the SharePoint server. A persistent cookie remains on the user device and is sent with each HTTP request. Citrix Gateway encrypts the persistent cookie before sending it to the plug-in on the user device, and refreshes the cookie periodically as long as the session

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			exists. The cookie becomes stale if the session ends. Available settings function as follows: * ALLOW - Enable persistent cookies. Users can open and edit Microsoft documents stored in SharePoint. * DENY - Disable persistent cookies. Users cannot open and edit Microsoft documents stored in SharePoint. * PROMPT - Prompt users to allow or deny persistent cookies during the session. Persistent cookies are not required for clientless access if users do not connect to SharePoint. Possible values = ALLOW, DENY, PROMPT
allowedlogingroups	<String>	Read-write	Specify groups that have permission to log on to Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Gateway. Users who do not belong to this group or groups are denied access even if they have valid credentials. Minimum length = 1 Maximum length = 511
securebrowse	<String>	Read-write	Allow users to connect through Citrix Gateway to network resources from iOS and Android mobile devices with Citrix Receiver. Users do not need to establish a full VPN tunnel to access resources in the secure network. Possible values = ENABLED, DISABLED
storefronturl	<String>	Read-write	Web address for StoreFront to be used in this session for enumeration of resources from XenApp or XenDesktop. Minimum length = 1 Maximum length = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sfgatewayauthtype	<String>	Read-write	The authentication type configured for the Citrix Gateway on StoreFront. Possible values = domain, RSA, domainAndRSA, SMS, smartCard, sfAuth, sfAuthAndRSA
kcdaccount	<String>	Read-write	The kcd account details to be used in SSO. Minimum length = 1 Maximum length = 32
rdpclientprofilename	<String>	Read-write	Name of the RDP profile associated with the vserver. Minimum length = 1 Maximum length = 31
windowspluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Win. Possible values = Always, Essential, Never
macpluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Mac.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Always, Essential, Never
linuxpluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Linux. Possible values = Always, Essential, Never
iconwithreceiver	<String>	Read-write	Option to decide whether to show plugin icon along with receiver. Possible values = ON, OFF
alwaysonprofilename	<String>	Read-write	Name of the AlwaysON profile associated with the session action. The builtin profile named none can be used to explicitly disable AlwaysON for the session action. Minimum length = 1 Maximum length = 31
autoproxyurl	<String>	Read-write	URL to auto proxy config file.
advancedclientlessvpnmode	<String>	Read-write	Option to enable/disable Advanced ClientlessVpnMode. Additionaly, it can be set to STRICT to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			block Classic ClientlessVpnMode while in AdvancedClientless Mode. Default value: DISABLED Possible values = ENABLED, DISABLED, STRICT
pcoipprofilename	<String>	Read-write	Name of the PCOIP profile associated with the session action. The builtin profile named none can be used to explicitly disable PCOIP for the session action. Minimum length = 1 Maximum length = 31
fqdnspoofedip	<String>	Read-write	Spoofed IP address range that can be used by client for FQDN based split tunneling. Minimum length = 1
netmask	<String>	Read-write	The netmask for the spoofed ip address. Minimum length = 1
clientidletimeoutwarning	<Integer>	Read-only	The time after which the client gets a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			timeout warning, in minutes.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionaction? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnsessionaction": [ { "__count": "#no"} ] }
```

vpnsessionpolicy

Configuration for VPN session policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new session policy that is applied after the user logs on to Citrix Gateway. Minimum length = 1
rule	<String>	Read-write	Expression, or name of a named expression, specifying the traffic that matches the policy. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Action to be applied by the new session policy if the rule criteria are met. Minimum length = 1
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced) . Possible values = Classic Policy, Advanced Policy
hits	<Integer>	Read-only	Number of hits.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnsessionpolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"action":<String_value>

</b>}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy/ name_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnsessionpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnsessionpolicy":{

<b>"name":<String_value>,

</b>"rule":true,

"action":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnsessionpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy? **view=summary**

Use this query-parameter to get the summary output of vpnsessionpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnsessionpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnsessionpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"builtin":<String[]_value>,

"feature":<String_value>,

"expressiontype":<String_value>,

"hits":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of vpnsessionpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vpnsessionpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,
```

```
"builtin":<String[]_value>,

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnsessionpolicy": [ { "__count": "#no"} ] }
```

vpnsessionpolicy_aaagroup_binding

Binding object showing the aaagroup that can be bound to vpnsessionpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the session policy to display. Minimum length = 1
priority	<Integer>	Read-only	.
activepolicy	<Integer>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy_aaagroup_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ vpnsessionpolicy_aaagroup_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vpnsessionpolicy_aaagroup_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy_aaagroup_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnsessionpolicy_aaagroup_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy_vpnvserver_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ vpnsessionpolicy_vpnvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vpnsessionpolicy_vpnvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy_vpnvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnsessionpolicy_vpnvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vpnsessionpolicy_vpnvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy_vpnvserver_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy_vpnvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vpnsessionpolicy_vpnvserver_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsessionpolicy_vpnvserver_binding/ name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vpnsessionpolicy_vpnvserver_binding": [ { "__count": "#no"} ] }
```

vpnsfconfig

Configuration for Create a StoreFront configuration file resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserver	<String[]>	Read-write	Name of Gateway virtual server.
filename	<String>	Read-only	Path where file was created.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsfconfig

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/vpnsfconfig? **args=vserver: <String_value>**

Use this query-parameter to get vpnsfconfig resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/vpnsfconfig? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/vpnsfconfig? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnsfconfig resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/vpnsfconfig? **view=summary**

Use this query-parameter to get the summary output of vpnsfconfig resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/vpnsfconfig? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnsfconfig resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnsfconfig": [ {

vserver:<String[]_value>"filename":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnsfconfig? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnsfconfig": [ { "__count": "#no"} ] }
```

vpnstoreinfo

Configuration for Store information for a URL resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
url	<String>	Read-write	StoreFront URL to be scanned.
storeserverstatus	<String>	Read-only	Availability of the server for TCP connections.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = UP, DOWN
storeserverissf	<String>	Read-only	Indicates if the server being scanned is running StoreFront. Possible values = YES, NO
storeapisupport	<String>	Read-only	Indicates StoreFront API support status. Possible values = YES, NO
storelist	<String>	Read-only	List of available stores return by StoreFront API.
storestatus	<String>	Read-only	Availability of the specified StoreFront store. Possible values = UP, DOWN
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnstoreinfo": [ { "__count": "#no"} ] }
```

vpntrafficaction

Configuration for VPN traffic action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the traffic action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after a traffic action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
qual	<String>	Read-write	Protocol, either HTTP or TCP, to be used with the action. Possible values = http, tcp
apptimeout	<Integer>	Read-write	Maximum amount of time, in minutes, a user can stay logged on to the web application. Minimum value = 1 Maximum value = 715827

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sso	<String>	Read-write	Provide single sign-on to the web application. NOTE : Authentication mechanisms like Basic-authentication require the user credentials to be sent in plaintext which is not secure if the server is running on HTTP (instead of HTTPS). Possible values = ON, OFF
hdx	<String>	Read-write	Provide hdx proxy to the ICA traffic. Possible values = ON, OFF
formssoaction	<String>	Read-write	Name of the form-based single sign-on profile. Form-based single sign-on allows users to log on one time to all protected applications in your network, instead of requiring them to log on separately to access each one.
fta	<String>	Read-write	Specify file type association, which is a list of file

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			extensions that users are allowed to open. Possible values = ON, OFF
wanscaler	<String>	Read-write	Use the Repeater Plug-in to optimize network traffic. Possible values = ON, OFF
kcdaccount	<String>	Read-write	Kerberos constrained delegation account name. Default value: "Default" Minimum length = 1 Maximum length = 32
samlssoprofile	<String>	Read-write	Profile to be used for doing SAML SSO to remote relying party. Minimum length = 1
proxy	<String>	Read-write	IP address and Port of the proxy server to be used for HTTP access for this request. Minimum length = 1
userexpression	<String>	Read-write	expression that will be evaluated to obtain username for SingleSignOn.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 256
passwdexpression	<String>	Read-write	expression that will be evaluated to obtain password for SingleSignOn. Maximum length = 256
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

vpntrafficpolicy

Configuration for VPN traffic policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the traffic policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression, or name of a named expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Action to apply to traffic that matches the policy. Minimum length = 1
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced). Possible values = Classic Policy, Advanced Policy
hits	<Integer>	Read-only	Number of hits.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpntrafficpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy? **view=summary**

Use this query-parameter to get the summary output of vpntrafficpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpntrafficpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpntrafficpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"expressiontype":<String_value>,

"hits":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy/ name_value<String> **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of vpntrafficpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vpntrafficpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"expressiontype":<String_value>,

"hits":<Integer_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpntrafficpolicy": [ { "__count": "#no"} ] }
```

vpntrafficpolicy_aaagroup_binding

Binding object showing the aaagroup that can be bound to vpntrafficpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the traffic policy for which to display detailed information. Minimum length = 1
activepolicy	<Integer>	Read-only	.
priority	<Integer>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy_aaagroup_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ vpntrafficpolicy_aaagroup_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vpntrafficpolicy_aaagroup_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy_aaagroup_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpntrafficpolicy_aaagroup_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vpntrafficpolicy_aaagroup_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"activepolicy":<Integer_value>,

"priority":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy_aaagroup_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vpntrafficpolicy_aaagroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

vpnurl

Configuration for VPN URL resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
urlname	<String>	Read-write	Name of the bookmark link. Minimum length = 1
linkname	<String>	Read-write	Description of the bookmark link. The description appears in the Access Interface. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
actualurl	<String>	Read-write	Web address for the bookmark link. Minimum length = 1
vservername	<String>	Read-write	Name of the associated LB/CS vserver.
clientlessaccess	<String>	Read-write	If clientless access to the resource hosting the link is allowed, also use clientless access for the bookmarked web address in the Secure Client Access based session. Allows single sign-on and other HTTP processing on Citrix Gateway for HTTPS resources. Default value: OFF Possible values = ON, OFF
comment	<String>	Read-write	Any comments associated with the bookmark link.
iconurl	<String>	Read-write	URL to fetch icon file for displaying this resource.
ssotype	<String>	Read-write	Single sign on type for unified gateway. Possible values = unifiedgateway, selfauth, samlauth

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
applicationtype	<String>	Read-write	The type of application this VPN URL represents. Possible values are CVPN/SaaS/VPN. Possible values = CVPN, VPN, SaaS
samlssoprofile	<String>	Read-write	Profile to be used for doing SAML SSO.
appjson	<String>	Read-write	To store the template details in the json format.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnurl **HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnurl":{

<b>"urlname":<String_value>,

</b><b>"linkname":<String_value>,

</b><b>"actualurl":<String_value>,

</b>"vservername":<String_value>,

"clientlessaccess":<String_value>,

"comment":<String_value>,
```

```
"iconurl":<String_value>,

"ssotype":<String_value>,

"applicationtype":<String_value>,

"samlssoprofile":<String_value>,

"appjson":<String_value>

}}
```

Response: HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnurl/ urlname_value<String> **HTTP Method:** DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnurl **HTTP Method:** PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnurl":{

<b>"urlname":<String_value>,

</b>"linkname":<String_value>,

"actualurl":<String_value>,

"vservername":<String_value>,

"clientlessaccess":<String_value>,

"comment":<String_value>,

"iconurl":<String_value>,

"ssotype":<String_value>,

"applicationtype":<String_value>,

"samlssoprofile":<String_value>,

"appjson":<String_value>

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnurl? **action=unset HTTP Method:** POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vpnurl":{

<b>"urlname":<String_value>,

</b>"vservername":true,

"clientlessaccess":true,

"comment":true,

"iconurl":true,

"ssotype":true,

"applicationtype":true,

"samlssoprofile":true,

"appjson":true

}}
```

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnurl **Query-parameters: attrs** http:// <netscaler-ip-address> /nitro/v1/config/vpnurl? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter http:// <netscaler-ip-address> /nitro/v1/config/vpnurl? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnurl resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view http:// <netscaler-ip-address> /nitro/v1/config/vpnurl? **view=summary**

Use this query-parameter to get the summary output of vpnurl resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnurl? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnurl resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnurl": [ {

"urlname":<String_value>,

"linkname":<String_value>,

"vservername":<String_value>,

"actualurl":<String_value>,

"appjson":<String_value>,

"_nextgenapiresource":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnurl? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnurl": [ { "__count": "#no"} ] }
```

vpnurlaction

Configuration for VPN url action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the bookmark link. Minimum length = 1
linkname	<String>	Read-write	Description of the bookmark link. The description appears in the Access Interface. Minimum length = 1
actualurl	<String>	Read-write	Web address for the bookmark link. Minimum length = 1
vservername	<String>	Read-write	Name of the associated vserver to handle selfAuth SSO.
clientlessaccess	<String>	Read-write	If clientless access to the resource hosting the link is allowed, also use clientless access for the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bookmarked web address in the Secure Client Access based session. Allows single sign-on and other HTTP processing on NetScaler Gateway for HTTPS resources. Default value: OFF Possible values = ON, OFF
comment	<String>	Read-write	Any comments associated with the bookmark link.
iconurl	<String>	Read-write	URL to fetch icon file for displaying this resource.
ssotype	<String>	Read-write	Single sign on type for unified gateway. Possible values = unifiedgateway, selfauth, samlauth
applicationtype	<String>	Read-write	The type of application this VPN URL represents. Possible values are CVPN/SaaS/VPN. Possible values = CVPN, VPN, SaaS
samlssoprofile	<String>	Read-write	Profile to be used for doing SAML SSO.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the vpn urlAction. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the NetScaler CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vpnurl action" or 'my vpnurl action'). Minimum length = 1
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

vpnurlpolicy

Configuration for VPN url policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new urlPolicy. Minimum length = 1
rule	<String>	Read-write	Expression, or name of a named expression, specifying the traffic that matches the policy. The following requirements apply only to the NetScaler CLI: * If the expression includes one or more spaces, enclose the entire expression in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Action to be applied by the new urlPolicy if the rule criteria are met. Minimum length = 1
comment	<String>	Read-write	Any comments to preserve information about this policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the vpn urlPolicy. Must begin with a letter, number, or the underscore

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the NetScaler CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my vpnurl policy" or 'my vpnurl policy'). Minimum length = 1
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefhits	<Integer>	Read-only	The number of times the policy evaluation resulted in undefined processing.
_nextgenapiresource	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vpnurlpolicy": [ { "__count": "#no"} ] }
```

vpnurlpolicy_aaagroup_binding

Binding object showing the aaagroup that can be bound to vpnurlpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new urlPolicy. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Integer>	Read-only	.
activepolicy	<Integer>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *` Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnurlpolicy_aaagroup_binding/ name_value<String> **Query-parameters: filter** http:// <netscaler-ip-address> /nitro/v1/config/ vpnurlpolicy_aaagroup_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vpnurlpolicy_aaagroup_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination http:// <netscaler-ip-address> /nitro/v1/config/vpnurlpolicy_aaagroup_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnurlpolicy_aaagroup_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vpnurlpolicy_aaagroup_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnurlpolicy_aaagroup_binding **HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters: bulkbindings http:// <netscaler-ip-address> /nitro/v1/config/vpnurlpolicy_aaagroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vpnurlpolicy_aaagroup_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Integer_value>,

"activepolicy":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vpnurlpolicy_aaagroup_binding/name_value<String> ? **count=yes HTTP Method:** GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response: HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vpnurlpolicy_aaagroup_binding": [ { "__count": "#no"} ] }
```

vpnurlpolicy_aaauser_binding

Binding object showing the aaauser that can be bound to vpnurlpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION

vpnvserver

Configuration for VPN virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Citrix Gateway virtual server. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the virtual server is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my server" or 'my server'). Minimum length = 1
servicetype	<String>	Read-write	Protocol used by the Citrix Gateway virtual server. Default value: SSL Possible values = SSL, DTLS, HTTP_QUIC
ipv46	<String>	Read-write	IPv4 or IPv6 address of the Citrix Gateway virtual server. Usually a public IP address. User devices send

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connection requests to this IP address. Minimum length = 1
range	<Integer>	Read-write	Range of Citrix Gateway virtual server IP addresses. The consecutively numbered range of IP addresses begins with the address specified by the IP Address parameter. In the configuration utility, select Network VServer to enter a range. Default value: 1 Minimum value = 1
port	<Integer>	Read-write	TCP port on which the virtual server listens. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
ipset	<String>	Read-write	The list of IPv4/IPv6 addresses bound to ipset would form a part of listening service on the current vpn vserver. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	State of the virtual server. If the virtual server is disabled, requests are not processed. Default value: ENABLED Possible values = ENABLED, DISABLED
authentication	<String>	Read-write	Require authentication for users connecting to Citrix Gateway. Default value: ON Possible values = ON, OFF
doublehop	<String>	Read-write	Use the Citrix Gateway appliance in a double-hop configuration. A double-hop deployment provides an extra layer of security for the internal network by using three firewalls to divide the DMZ into two stages. Such a deployment can have one appliance in the DMZ and one appliance in the secure network.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
maxaaausers	<Integer>	Read-write	Maximum number of concurrent user sessions allowed on this virtual server. The actual number of users allowed to log on to this virtual server depends on the total number of user licenses.
icaonly	<String>	Read-write	- When set to ON, it implies Basic mode where the user can log on using either Citrix Receiver or a browser and get access to the published apps configured at the XenApp/XenDEsktop environment pointed out by the WIHome parameter. Users are not allowed to connect using the Citrix Gateway Plug-in and end point scans cannot be configured. Number of users that can log in and access the apps are not limited

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by the license in this mode. - When set to OFF, it implies Smart Access mode where the user can log on using either Citrix Receiver or a browser or a Citrix Gateway Plug-in. The admin can configure end point scans to be run on the client systems and then use the results to control access to the published apps. In this mode, the client can connect to the gateway in other client modes namely VPN and CVPN. Number of users that can log in and access the resources are limited by the CCU licenses in this mode. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
icaproxysessionmigration	<String>	Read-write	This option determines if an existing ICA Proxy session is transferred when the user logs on from another device. Default value: OFF Possible values = ON, OFF
dtls	<String>	Read-write	This option starts/stops the turn service on the vserver. Default value: ON Possible values = ON, OFF
loginonce	<String>	Read-write	This option enables/disables seamless SSO for this Vserver. Default value: OFF Possible values = ON, OFF
advancedepa	<String>	Read-write	This option tells whether advanced EPA is enabled on this virtual server. Default value: OFF Possible values = ON, OFF
devicecert	<String>	Read-write	Indicates whether device certificate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			check as a part of EPA is on or off. Default value: OFF Possible values = ON, OFF
certkeynames	<String>	Read-write	Name of the certificate key that was bound to the corresponding SSL virtual server as the Certificate Authority for the device certificate. Minimum length = 1 Maximum length = 127
downstateflush	<String>	Read-write	Close existing connections when the virtual server is marked DOWN, which means the server might have timed out. Disconnecting existing connections frees resources and in certain cases speeds recovery of overloaded load balancing setups. Enable this setting on servers in which the connections can safely be closed when they are marked DOWN. Do not enable DOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			state flush on servers that must complete their transactions. Default value: ENABLED Possible values = ENABLED, DISABLED
listenpolicy	<String>	Read-write	String specifying the listen policy for the Citrix Gateway virtual server. Can be either a named expression or an expression. The Citrix Gateway virtual server processes only the traffic for which the expression evaluates to true. Default value: "none"
listenpriority	<Integer>	Read-write	Integer specifying the priority of the listen policy. A higher number specifies a lower priority. If a request matches the listen policies of more than one virtual server, the virtual server whose listen policy has the highest priority (the lowest priority

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number) accepts the request. Default value: 101 Minimum value = 0 Maximum value = 100
tcpprofilename	<String>	Read-write	Name of the TCP profile to assign to this virtual server. Minimum length = 1 Maximum length = 127
httpprofilename	<String>	Read-write	Name of the HTTP profile to assign to this virtual server. Default value: "nshttp_default_strict_validation" Minimum length = 1 Maximum length = 127
comment	<String>	Read-write	Any comments associated with the virtual server.
appflowlog	<String>	Read-write	Log AppFlow records that contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. Also

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			log records that contain application-level information, such as HTTP web addresses, HTTP request methods and response status codes, server response time, and latency. Default value: ENABLED Possible values = ENABLED, DISABLED
icmpvsrresponse	<String>	Read-write	Criterion for responding to PING requests sent to this virtual server. If this parameter is set to ACTIVE, respond only if the virtual server is available. With the PASSIVE setting, respond even if the virtual server is not available. Default value: PASSIVE Possible values = PASSIVE, ACTIVE
rhistate	<String>	Read-write	A host route is injected according to the setting on the virtual servers.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If set to PASSIVE on all the virtual servers that share the IP address, the appliance always injects the hostroute. * If set to ACTIVE on all the virtual servers that share the IP address, the appliance injects even if one virtual server is UP. * If set to ACTIVE on some virtual servers and PASSIVE on the others, the appliance injects even if one virtual server set to ACTIVE is UP. Default value: PASSIVE Possible values = PASSIVE, ACTIVE
netprofile	<String>	Read-write	The name of the network profile. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cginfrahomepageredirect	<String>	Read-write	When client requests ShareFile resources and Citrix Gateway detects that the user is unauthenticated or the user session has expired, disabling this option takes the user to the originally requested ShareFile resource after authentication (instead of taking the user to the default VPN home page). Default value: ENABLED Possible values = ENABLED, DISABLED
secureprivateaccess	<String>	Read-write	Configure secure private access. Default value: DISABLED Possible values = ENABLED, DISABLED
accessrestrictedpageredirect	<String>	Read-write	By default, an access restricted page hosted on secure private access CDN is displayed when a restricted app is accessed. The setting can be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			changed to NS to display the access restricted page hosted on the gateway or OFF to not display any access restricted page. Default value: CDN Possible values = CDN, NS, OFF
maxloginattempts	<Integer>	Read-write	Maximum number of logon attempts. Minimum value = 1 Maximum value = 255
failedlogintimeout	<Integer>	Read-write	Number of minutes an account will be locked if user exceeds maximum permissible attempts. Minimum value = 1
l2conn	<String>	Read-write	Use Layer 2 parameters (channel number, MAC address, and VLAN ID) in addition to the 4-tuple (<source IP>:<source port>::<destination IP>:<destination port>) that is used to identify a connection. Allows multiple TCP and non-TCP connections with the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			same 4-tuple to coexist on the Citrix ADC. Possible values = ON, OFF
deploymenttype	<String>	Read-write	. Default value: 5 Possible values = NONE, ICA_WEBINTERFACE, ICA_STOREFRONT, MOBILITY
rdpserverprofilename	<String>	Read-write	Name of the RDP server profile associated with the vserver. Minimum length = 1 Maximum length = 31
windowsepapluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Win. Possible values = Always, Essential, Never
linuxepapluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Linux. Possible values = Always, Essential, Never

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
macepapluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Mac. Possible values = Always, Essential, Never
logoutonsmartcardremoval	<String>	Read-write	Option to VPN plugin behavior when smartcard or its reader is removed. Default value: OFF Possible values = ON, OFF
userdomains	<String>	Read-write	List of user domains specified as comma seperated value.
authnprofile	<String>	Read-write	Authentication Profile entity on virtual server. This entity can be used to offload authentication to AAA vserver for multi-factor(nFactor) authentication.
vserverfqdn	<String>	Read-write	Fully qualified domain name for a VPN virtual server. This is used during StoreFront configuration generation.
gslbsitefqdn	<String>	Read-write	Fully qualified domain name of the SPA site. This is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			used for Secure Private Access configuration.
pcoipvserverprofilename	<String>	Read-write	Name of the PCoIP vserver profile associated with the vserver. Minimum length = 1 Maximum length = 31
samesite	<String>	Read-write	SameSite attribute value for Cookies generated in VPN context. This attribute value will be appended only for the cookies which are specified in the builtin patset ns_cookies_samesite. Possible values = None, LAX, STRICT
quicprofilename	<String>	Read-write	Name of the QUIC profile to assign to this virtual server. Minimum length = 1 Maximum length = 127
deviceposture	<String>	Read-write	Enable device posture. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
wasmmodule	<String>	Read-write	Name of the WASM module to assign to this virtual server.
newname	<String>	Read-write	New name for the Citrix Gateway virtual server. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my server" or 'my server'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ip	<String>	Read-only	The Virtual IP address of the VPN virtual server.
value	<String>	Read-only	Indicates whether or not the certificate is bound or if SSL offload is disabled. Possible values = Certkey/ Certkeybundle/Vault not bound/Cert-store not usable, SSL feature disabled
type	<String>	Read-only	The type of virtual server; for example, CONTENT based or ADDRESS based. Possible values = CONTENT, ADDRESS
curstate	<String>	Read-only	The current state of the virtual server, as UP, DOWN, BUSY, and so on. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Unknown, DISABLED
status	<Integer>	Read-only	Whether or not this virtual server responds to ARPs and whether or not round-robin selection is temporarily in effect.
cachetype	<String>	Read-only	Virtual server cache type. The options are: TRANSPARENT, REVERSE, and FORWARD. Possible values = TRANSPARENT, REVERSE, FORWARD
redirect	<String>	Read-only	The cache redirect policy. The valid redirect policies are: l. CACHE - Directs all requests to the cache. 2. POLICY - Applies cache redirection policy to determine whether the request should be directed to the cache or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			origin. This is the default setting. 3. ORIGIN - Directs all requests to the origin server. Possible values = CACHE, POLICY, ORIGIN
precedence	<String>	Read-only	This argument is used only when configuring content switching on the specified virtual server. This is applicable only if both the URL and RULE-based policies have been configured on the same virtual server. It specifies the type of policy (URL or RULE) that takes precedence on the content switching virtual server. The default setting is RULE. l URL - In this case, the incoming request is matched against the URL-based policies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			before the rule-based policies. l RULE - In this case, the incoming request is matched against the rule-based policies before the URL-based policies. For all URL-based policies, the precedence hierarchy is: 1. Domain and exact URL 2. Domain, prefix, and suffix 3. Domain and suffix 4. Domain and prefix 5. Domain only 6. Exact URL 7. Prefix and suffix 8. Suffix only 9. Prefix only 10. Default.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = RULE, URL
redirecturl	<String>	Read-only	The URL where traffic is redirected if the virtual server in system becomes unavailable. WARNING! Make sure that the domain you specify in the URL does not match the domain specified in the -d domainName argument of the ###add cs policy### command. If the same domain is specified in both arguments, the request will be continuously redirected to the same unavailable virtual server in the system. If so, the user may not get the requested content.
curaaausers	<Integer>	Read-only	The number of current users logged on to this virtual server.
curtotalusers	<Integer>	Read-only	The total number of current users connected through this virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-only	The domain name of the server for which a service needs to be added. If the IP address has been specified, the domain name does not need to be specified.
rule	<String>	Read-only	The name of the rule, or expression, if any, that policy for the VPN server is to use. Rules are combinations of expressions. Expressions are simple conditions, such as a test for equality, applied to operands, such as a URL string or an IP address. Expression syntax is described in the Installation and Configuration Guide. The default rule is true. Minimum length = 1
servicename	<String>	Read-only	The name of the service, if any, to which the virtual server policy is bound.
weight	<Integer>	Read-only	Weight for this service, if any. This weight is used when the system performs load balancing,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			giving greater priority to a specific service. It is useful when the services bound to a virtual server are of different capacity.
cachevserver	<String>	Read-only	The name of the default target cache virtual server, if any, to which requests are redirected.
backupvserver	<String>	Read-only	The name of the backup VPN virtual server for this VPN virtual server.
clttimeout	<Integer>	Read-only	The idle time, if any, in seconds after which the client connection is terminated.
somethod	<String>	Read-only	VPN client applications are allocated from a block of intranet IP addresses. That block may be exhausted after a certain number of connections. This switch specifies the method used to determine whether or not a new connection will spill over, or exhaust,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the allocated block of intranet IP addresses for that application. Possible values are CONNECTION or DYNAMICCONNECTION. CONNECTION means that a static integer value is the hard limit for the spillover threshold. The spillover threshold is described below. DYNAMICCONNECTION means that the spillover threshold is set according to the maximum number of connections defined for the VPN virtual server. Possible values = CONNECTION, DYNAMICCONNECTION, BANDWIDTH,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			HEALTH, LLMQUOTA, NONE
sothreshold	<Integer>	Read-only	VPN client applications are allocated from a block of intranet IP addresses. That block may be exhausted after a certain number of connections. The value of this option is the number of client connections after which the mapped IP address is used as the client source IP address instead of an address from the allocated block of intranet IP addresses.
sopersistence	<String>	Read-only	Whether or not cookie-based site persistance is enabled for this VPN vserver. Possible values are 'ConnectionProxy', HTTPRedirect, or NONE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
sopersistencetimeout	<Integer>	Read-only	The timeout, if any, for cookie-based site persistance of this VPN vserver.
usemip	<String>	Read-only	Deprecated. See 'map' below. Possible values = ENABLED, DISABLED
map	<String>	Read-only	Whether or not mapped IP addresses are ON or OFF. Mapped IP addresses are source IP addresses for the virtual servers running on the Citrix ADC. Mapped IP addresses are used by the system to connect to the backend servers. Possible values = ON, OFF
bindpoint	<String>	Read-only	Bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, ICA_REQUEST,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OTHERTCP_REQUEST, AAA_REQUEST, AAA_RESPONSE
disableprimaryondown	<String>	Read-only	Tells whether traffic will continue reaching backup virtual servers even after the primary virtual server comes UP from DOWN state. Possible values = ENABLED, DISABLED
secondary	<Boolean>	Read-only	Binds the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only via a primary authentication method but also via a secondary authentication method. User groups are aggregated across both. The user name must be exactly the same for both authentication methods, but they can require different passwords.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupextraction	<Boolean>	Read-only	Binds the authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server, and this will only be called if primary and/or secondary authentication has succeeded.
epaprofileoptional	<Boolean>	Read-only	Mark the EPA profile optional for preauthentication EPA profile. User would be shown a logon page even if the EPA profile fails to evaluate.
