- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nssavedconfig

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nssavedconfig": [ {

"textblob":<String_value>

}]}
```

nsservicefunction

Configuration for service Function resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicefunctionname	<String>	Read-write	Name of the service function to be created. Leading character must be a number or letter. Other characters allowed, after the first character, are @ _ - . (period) : (colon) # and space ( ). Minimum length = 1
ingressvlan	<Double>	Read-write	VLAN ID on which the traffic from service function reaches Citrix ADC. Minimum value = 1 Maximum value = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

nssimpleacl

Configuration for simple ACL resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclname	<String>	Read-write	Name for the simple ACL rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the simple ACL rule is created. Minimum length = 1
aclaction	<String>	Read-write	Drop incoming IPv4 packets that match the simple ACL rule. Possible values = DENY
td	<Double>	Read-write	Integer value that uniquely identifies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcip	<String>	Read-write	IP address to match against the source IP address of an incoming IPv4 packet.
destport	<Integer>	Read-write	Port number to match against the destination port number of an incoming IPv4 packet. DestPort is mandatory while setting Protocol. Omitting the port number and protocol creates an all-ports and all protocols simple ACL rule, which matches any port and any protocol. In that case, you cannot create

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			another simple ACL rule specifying a specific port and the same source IPv4 address. Minimum value = 1 Maximum value = 65535
protocol	<String>	Read-write	Protocol to match against the protocol of an incoming IPv4 packet. You must set this parameter if you have set the Destination Port parameter. Possible values = TCP, UDP
ttl	<Double>	Read-write	Number of seconds, in multiples of four, after which the simple ACL rule expires. If you do not want the simple ACL rule to expire, do not specify a TTL value. Minimum value = 4 Maximum value = 2147483647
estsessions	<Boolean>	Read-write	.
hits	<Double>	Read-only	Number of hits for this ACL rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

```

nssimpleacl6

Configuration for simple ACL6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclname	<String>	Read-write	Name for the simple ACL6 rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the simple ACL6 rule is created. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
aclaction	<String>	Read-write	Drop incoming IPv6 packets that match the simple ACL6 rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DENY
srcipv6	<String>	Read-write	IP address to match against the source IP address of an incoming IPv6 packet.
destport	<Integer>	Read-write	Port number to match against the destination port number of an incoming IPv6 packet. DestPort is mandatory while setting Protocol. Omitting the port number and protocol creates an all-ports and all protocol simple ACL6 rule, which matches any port and any protocol. In that case, you cannot create another simple ACL6 rule specifying a specific port and the same source IPv6 address. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65535
protocol	<String>	Read-write	Protocol to match against the protocol of an incoming IPv6 packet. You must set this parameter if you set the Destination Port parameter. Possible values = TCP, UDP
ttl	<Double>	Read-write	Number of seconds, in multiples of four, after which the simple ACL6 rule expires. If you do not want the simple ACL6 rule to expire, do not specify a TTL value. Minimum value = 4 Maximum value = 2147483647
estsessions	<Boolean>	Read-write	.
hits	<Double>	Read-only	Number of hits for this SACL6 rule.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| CLEAR| FLUSH| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nssimpleacl6

HTTP Method:POST

Configuration for tcp parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ws	<String>	Read-write	Enable or disable window scaling. Default value: ENABLED Possible values = ENABLED, DISABLED
wsval	<Double>	Read-write	Factor used to calculate the new window size. This argument is needed only when the window scaling is enabled. Default value: 8 Minimum value = 0 Maximum value = 14
sack	<String>	Read-write	Enable or disable Selective

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ACKnowledgement (SACK). Default value: ENABLED Possible values = ENABLED, DISABLED
learnvsvrmss	<String>	Read-write	Enable or disable maximum segment size (MSS) learning for virtual servers. Default value: DISABLED Possible values = ENABLED, DISABLED
maxburst	<Double>	Read-write	Maximum number of TCP segments allowed in a burst. Default value: 6 Minimum value = 1 Maximum value = 255
initialcwnd	<Double>	Read-write	Initial maximum upper limit on the number of TCP packets that can be outstanding on the TCP link to the server. Default value: 10 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 44
recvbuffsize	<Double>	Read-write	TCP Receive buffer size. Default value: 8190 Minimum value = 8190 Maximum value = 20971520
delayedack	<Double>	Read-write	Timeout for TCP delayed ACK, in milliseconds. Default value: 100 Minimum value = 10 Maximum value = 300
downstaterst	<String>	Read-write	Flag to switch on RST on down services. Default value: DISABLED Possible values = ENABLED, DISABLED
nagle	<String>	Read-write	Enable or disable the Nagle algorithm on TCP connections. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
limitedpersist	<String>	Read-write	Limit the number of persist (zero window) probes. Default value: ENABLED Possible values = ENABLED, DISABLED
oooqsize	<Double>	Read-write	Maximum size of out-of-order packets queue. A value of 0 means no limit. Default value: 300 Minimum value = 0 Maximum value = 65535
ackonpush	<String>	Read-write	Send immediate positive acknowledgement (ACK) on receipt of TCP packets with PUSH flag. Default value: ENABLED Possible values = ENABLED, DISABLED
maxpktpermss	<Double>	Read-write	Maximum number of TCP packets allowed

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			per maximum segment size (MSS). Minimum value = 0 Maximum value = 1460
pktperretx	<Integer>	Read-write	Maximum limit on the number of packets that should be retransmitted on receiving a partial ACK. Default value: 1 Minimum value = 1 Maximum value = 100
minrto	<Integer>	Read-write	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole number if divided by 10). Default value: 1000 Minimum value = 10 Maximum value = 64000
slowstartincr	<Integer>	Read-write	Multiplier that determines the rate at which slow start increases the size of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the TCP transmission window after each acknowledgement of successful transmission. Default value: 2 Minimum value = 1 Maximum value = 100
maxdynserverprobes	<Double>	Read-write	Maximum number of probes that Citrix ADC can send out in 10 milliseconds, to dynamically learn a service. Citrix ADC probes for the existence of the origin in case of wildcard virtual server or services. Default value: 7 Minimum value = 1 Maximum value = 65535
synholdfastgiveup	<Double>	Read-write	Maximum threshold. After crossing this threshold number of outstanding probes for origin, the Citrix ADC reduces the number of connection retries for probe connections.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 1024 Minimum value = 256 Maximum value = 65535
maxsynholdperprobe	<Double>	Read-write	Limit the number of client connections (SYN) waiting for status of single probe. Any new SYN packets will be dropped. Default value: 128 Minimum value = 1 Maximum value = 255
maxsynhold	<Double>	Read-write	Limit the number of client connections (SYN) waiting for status of probe system wide. Any new SYN packets will be dropped. Default value: 16384 Minimum value = 256 Maximum value = 65535
msslearninterval	<Double>	Read-write	Duration, in seconds, to sample the Maximum Segment

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Size (MSS) of the services. The Citrix ADC determines the best MSS to set for the virtual server based on this sampling. The argument to enable maximum segment size (MSS) for virtual servers must be enabled. Default value: 180 Minimum value = 1 Maximum value = 1048576
msslearndelay	<Double>	Read-write	Frequency, in seconds, at which the virtual servers learn the Maximum segment size (MSS) from the services. The argument to enable maximum segment size (MSS) for virtual servers must be enabled. Default value: 3600 Minimum value = 1 Maximum value = 1048576
maxtimewaitconn	<Double>	Read-write	Maximum number of connections to hold in the TCP TIME_WAIT state on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a packet engine. New connections entering TIME_WAIT state are proactively cleaned up. Default value: 7000 Minimum value = 1
kaprobeupdatelastactivity	<String>	Read-write	Update last activity for KA probes. Default value: ENABLED Possible values = ENABLED, DISABLED
maxsynackretx	<Double>	Read-write	When 'syncookie' is disabled in the TCP profile that is bound to the virtual server or service, and the number of TCP SYN+ACK retransmission by Citrix ADC for that virtual server or service crosses this threshold, the Citrix ADC responds by using the TCP SYN-Cookie mechanism. Default value: 100 Minimum value = 100 Maximum value = 1048576

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
synattackdetection	<String>	Read-write	Detect TCP SYN packet flood and send an SNMP trap. Default value: ENABLED Possible values = ENABLED, DISABLED
connflushifnomem	<String>	Read-write	Flush an existing connection if no memory can be obtained for new connection. HALF_CLOSED_AND_IDLE: Flush a connection that is closed by us but not by peer, or failing that, a connection that is past configured idle time. New connection fails if no such connection can be found. FIFO: If no half-closed or idle connection can be found, flush the oldest non-management connection, even if it is active. New connection fails if

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the oldest few connections are management connections. Note: If you enable this setting, you should also consider lowering the zombie timeout and half-close timeout, while setting the Citrix ADC timeout. See Also: connFlushThres argument below. Default value: NSA_CONNFLUSH_NONE Possible values = NONE , HALFCLOSED_AND_IDLE, FIFO
connflushthres	<Double>	Read-write	Flush an existing connection (as configured through -connFlushIfNoMem FIFO) if the system has more than specified number of connections, and a new connection is to be established. Note: This value may be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			rounded down to be a whole multiple of the number of packet engines running. Minimum value = 1
mptcpconcloseonpassivesf	<String>	Read-write	Accept DATA_FIN/ FAST_CLOSE on passive subflow. Default value: ENABLED Possible values = ENABLED, DISABLED
mptcpchecksum	<String>	Read-write	Use MPTCP DSS checksum. Default value: ENABLED Possible values = ENABLED, DISABLED
mptcpsftimeout	<Double>	Read-write	The timeout value in seconds for idle mptcp subflows. If this timeout is not set, idle subflows are cleared after cltTimeout of vserver. Default value: 0 Minimum value = 0 Maximum value = 31536000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mptcpsfreplacetimeout	<Double>	Read-write	The minimum idle time value in seconds for idle mptcp subflows after which the sublow is replaced by new incoming subflow if maximum subflow limit is reached. The priority for replacement is given to those subflow without any transaction. Default value: 10 Minimum value = 0 Maximum value = 31536000
mptcpmaxsf	<Double>	Read-write	Maximum number of subflow connections supported in established state per mptcp connection. Default value: 4 Minimum value = 2 Maximum value = 6
mptcpmaxpendingsf	<Double>	Read-write	Maximum number of subflow connections supported in pending join state per mptcp connection. Default value: 4 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 4
mptcppendingjointhreshold	<Double>	Read-write	Maximum system level pending join connections allowed. Default value: 0 Minimum value = 0 Maximum value = 4294967294
mptcprtostoswitchsf	<Double>	Read-write	Number of RTO's at subflow level, after which MPCTP should start using other subflow. Default value: 2 Minimum value = 1 Maximum value = 6
mptcpusebackupondss	<String>	Read-write	When enabled, if NS receives a DSS on a backup subflow, NS will start using that subflow to send data. And if disabled, NS will continue to transmit on current chosen subflow. In case there is some error on a subflow (like RTO's/RST etc.) then NS can choose a backup subflow irrespective of this tunable.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
tcpmaxretries	<Double>	Read-write	Number of RTO's after which a connection should be freed. Default value: 7 Minimum value = 1 Maximum value = 7
mptcpimmediatesfcloseonfin	<String>	Read-write	Allow subflows to close immediately on FIN before the DATA_FIN exchange is completed at mptcp level. Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpclosemptcpsessiononlastsfclose	<String>	Read-write	Allow to send DATA FIN or FAST CLOSE on mptcp connection while sending FIN or RST on the last subflow. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tcpfastopencookietimeout	<Double>	Read-write	Timeout in seconds after which a new TFO Key is computed for generating TFO Cookie. If zero, the same key is used always. If timeout is less than 120seconds, NS defaults to 120seconds timeout. Default value: 0 Minimum value = 0 Maximum value = 31536000
autosyncookietimeout	<Double>	Read-write	Timeout for the server to function in syncookie mode after the synattack. This is valid if TCP syncookie is disabled on the profile and server acts in non syncookie mode by default. Default value: 30 Minimum value = 7 Maximum value = 65535

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

nstcpprofile

Configuration for TCP profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for a TCP profile. Must begin with a letter, number, or the underscore \(_\) character. Other characters allowed, after the first character, are the hyphen \(-\), period \(.\), hash \(#\), space \(\), at \(@\), colon \(:\), and equal \(=\) characters. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name of a TCP profile cannot be changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks \ (for example, "my tcp profile" or 'my tcp profile'\). Minimum length = 1 Maximum length = 127
ws	<String>	Read-write	Enable or disable window scaling. Default value: DISABLED Possible values = ENABLED, DISABLED
sack	<String>	Read-write	Enable or disable Selective ACKnowledgement (SACK). Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wsval	<Double>	Read-write	Factor used to calculate the new window size. This argument is needed only when window scaling is enabled. Default value: 4 Minimum value = 0 Maximum value = 14
nagle	<String>	Read-write	Enable or disable the Nagle algorithm on TCP connections. Default value: DISABLED Possible values = ENABLED, DISABLED
ackonpush	<String>	Read-write	Send immediate positive acknowledgement (ACK) on receipt of TCP packets with PUSH flag. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mss	<Double>	Read-write	Maximum number of octets to allow in a TCP data segment. Minimum value = 0 Maximum value = 9176
maxburst	<Double>	Read-write	Maximum number of TCP segments allowed in a burst. Default value: 6 Minimum value = 1 Maximum value = 255
initialcwnd	<Double>	Read-write	Initial maximum upper limit on the number of TCP packets that can be outstanding on the TCP link to the server. Default value: 4 Minimum value = 1 Maximum value = 44
delayedack	<Double>	Read-write	Timeout for TCP delayed ACK, in milliseconds. Default value: 100 Minimum value = 10 Maximum value = 300

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
oooqsize	<Double>	Read-write	Maximum size of out-of-order packets queue. A value of 0 means no limit. Default value: 64 Minimum value = 0 Maximum value = 65535
maxpktpermss	<Double>	Read-write	Maximum number of TCP packets allowed per maximum segment size (MSS). Minimum value = 0 Maximum value = 1460
pktperretx	<Double>	Read-write	Maximum limit on the number of packets that should be retransmitted on receiving a partial ACK. Default value: 1 Minimum value = 1 Maximum value = 512
minrto	<Double>	Read-write	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number if divided by 10). Default value: 1000 Minimum value = 10 Maximum value = 64000
slowstartincr	<Double>	Read-write	Multiplier that determines the rate at which slow start increases the size of the TCP transmission window after each acknowledgement of successful transmission. Default value: 2 Minimum value = 1 Maximum value = 100
buffersize	<Double>	Read-write	TCP buffering size, in bytes. Default value: 8190 Minimum value = 8190 Maximum value = 20971520
syncookie	<String>	Read-write	Enable or disable the SYNCOOKIE mechanism for TCP handshake with clients. Disabling SYNCOOKIE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			prevents SYN attack protection on the Citrix ADC. Default value: ENABLED Possible values = ENABLED, DISABLED
kaprobeupdatelastactivity	<String>	Read-write	Update last activity for the connection after receiving keep-alive (KA) probes. Default value: ENABLED Possible values = ENABLED, DISABLED
flavor	<String>	Read-write	Set TCP congestion control algorithm. Default value: Default Possible values = Default, Westwood, BIC, CUBIC, Nile
dynamicreceivebuffering	<String>	Read-write	Enable or disable dynamic receive buffering. When enabled, allows the receive buffer to be adjusted dynamically based on memory and network conditions.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: The buffer size argument must be set for dynamic adjustments to take place. Default value: DISABLED Possible values = ENABLED, DISABLED
ka	<String>	Read-write	Send periodic TCP keep-alive (KA) probes to check if peer is still up. Default value: DISABLED Possible values = ENABLED, DISABLED
kaconnidletime	<Double>	Read-write	Duration, in seconds, for the connection to be idle, before sending a keep-alive (KA) probe. Minimum value = 1 Maximum value = 4095
kamaxprobes	<Double>	Read-write	Number of keep-alive (KA) probes to be sent when not acknowledged, before assuming the peer to be down.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 254
kaprobeinterval	<Double>	Read-write	Time interval, in seconds, before the next keep-alive (KA) probe, if the peer does not respond. Minimum value = 1 Maximum value = 4095
sendbuffsize	<Double>	Read-write	TCP Send Buffer Size. Default value: 8190 Minimum value = 8190 Maximum value = 20971520
mptcp	<String>	Read-write	Enable or disable Multipath TCP. Default value: DISABLED Possible values = ENABLED, DISABLED
establishclientconn	<String>	Read-write	Establishing Client Client connection on First data/ Final-ACK / Automatic.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: AUTOMATIC Possible values = AUTOMATIC, CONN_ESTABLISHED, ON_FIRST_DATA
tcpsegoffload	<String>	Read-write	Offload TCP segmentation to the NIC. If set to AUTOMATIC, TCP segmentation will be offloaded to the NIC, if the NIC supports it. Default value: AUTOMATIC Possible values = AUTOMATIC, DISABLED
rstwindowattenuate	<String>	Read-write	Enable or disable RST window attenuation to protect against spoofing. When enabled, will reply with corrective ACK when a sequence number is invalid. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rstmaxack	<String>	Read-write	Enable or disable acceptance of RST that is out of window yet echoes highest ACK sequence number. Useful only in proxy mode. Default value: DISABLED Possible values = ENABLED, DISABLED
spoofsyndrop	<String>	Read-write	Enable or disable drop of invalid SYN packets to protect against spoofing. When disabled, established connections will be reset when a SYN packet is received. Default value: ENABLED Possible values = ENABLED, DISABLED
ecn	<String>	Read-write	Enable or disable TCP Explicit Congestion Notification. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
mptcpdropdataonpreestsf	<String>	Read-write	Enable or disable silently dropping the data on Pre-Established subflow. When enabled, DSS data packets are dropped silently instead of dropping the connection when data is received on pre established subflow. Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpfastopen	<String>	Read-write	Enable or disable Multipath TCP fastopen. When enabled, DSS data packets are accepted before receiving the third ack of SYN handshake. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mptcpsessiontimeout	<Double>	Read-write	MPTCP session timeout in seconds. If this value is not set, idle MPTCP sessions are flushed after vserver's client idle timeout. Default value: 0 Minimum value = 0 Maximum value = 86400
timestamp	<String>	Read-write	Enable or Disable TCP Timestamp option (RFC 1323). Default value: DISABLED Possible values = ENABLED, DISABLED
dsack	<String>	Read-write	Enable or disable DSACK. Default value: ENABLED Possible values = ENABLED, DISABLED
ackaggregation	<String>	Read-write	Enable or disable ACK Aggregation. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
frto	<String>	Read-write	Enable or disable FRTO (Forward RTO-Recovery). Default value: DISABLED Possible values = ENABLED, DISABLED
maxcwnd	<Double>	Read-write	TCP Maximum Congestion Window. Default value: 524288 Minimum value = 8190 Maximum value = 20971520
fack	<String>	Read-write	Enable or disable FACK (Forward ACK). Default value: DISABLED Possible values = ENABLED, DISABLED
tcpmode	<String>	Read-write	TCP Optimization modes TRANSPARENT / ENDPOINT.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: TRANSPARENT Possible values = TRANSPARENT, ENDPOINT
tcpfastopen	<String>	Read-write	Enable or disable TCP Fastopen. When enabled, NS can receive or send Data in SYN or SYN-ACK packets. Default value: DISABLED Possible values = ENABLED, DISABLED
hystart	<String>	Read-write	Enable or disable CUBIC Hystart. Default value: DISABLED Possible values = ENABLED, DISABLED
dupackthresh	<Double>	Read-write	TCP dupack threshold. Default value: 3 Minimum value = 1 Maximum value = 15
burstratecontrol	<String>	Read-write	TCP Burst Rate Control DISABLED/

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			FIXED/DYNAMIC. FIXED requires a TCP rate to be set. Default value: DISABLED Possible values = DISABLED, FIXED, DYNAMIC
tcprate	<Double>	Read-write	TCP connection payload send rate in Kb/s. Default value: 0 Minimum value = 0 Maximum value = 10000000
rateqmax	<Double>	Read-write	Maximum connection queue size in bytes, when BurstRateControl is used. Default value: 0 Minimum value = 0 Maximum value = 1000000000
drophalfclosedconnontimeout	<String>	Read-write	Silently drop tcp half closed connections on idle timeout. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dropestconnontimeout	<String>	Read-write	Silently drop tcp established connections on idle timeout. Default value: DISABLED Possible values = ENABLED, DISABLED
applyadaptivetcp	<String>	Read-write	Apply Adaptive TCP optimizations. Default value: DISABLED Possible values = ENABLED, DISABLED
tcpfastopencookiesize	<Double>	Read-write	TCP FastOpen Cookie size. This accepts only even numbers. Odd number is trimmed down to nearest even number. Default value: 8 Minimum value = 4 Maximum value = 16
taillossprobe	<String>	Read-write	TCP tail loss probe optimizations.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
refcnt	<Double>	Read-only	Number of entities using this profile.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstcpprofile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstcpprofile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstcpprofile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nstcpprofile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstcpprofile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstcpprofile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nstcpprofile resources in chunks.

nstimeout

Configuration for timeout resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
zombie	<Double>	Read-write	Interval, in seconds, at which the Citrix ADC zombie cleanup process must run. This process cleans up inactive TCP connections. Default value: 120 Minimum value = 1 Maximum value = 600
client	<Double>	Read-write	Client idle timeout (in seconds). If zero, the service-type default value is taken when service is created. Default value: 0 Minimum value = 0 Maximum value = 18000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
server	<Double>	Read-write	Server idle timeout (in seconds). If zero, the service-type default value is taken when service is created. Default value: 0 Minimum value = 0 Maximum value = 18000
httpclient	<Double>	Read-write	Global idle timeout, in seconds, for client connections of HTTP service type. This value is over ridden by the client timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 18000
httpserver	<Double>	Read-write	Global idle timeout, in seconds, for server connections of HTTP service type. This value is over ridden by the server timeout that is configured on individual entities. Default value: 0 Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 18000
tcpclient	<Double>	Read-write	Global idle timeout, in seconds, for non-HTTP client connections of TCP service type. This value is over ridden by the client timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 18000
tcpserver	<Double>	Read-write	Global idle timeout, in seconds, for non-HTTP server connections of TCP service type. This value is over ridden by the server timeout that is configured on entities. Default value: 0 Minimum value = 0 Maximum value = 18000
anyclient	<Double>	Read-write	Global idle timeout, in seconds, for non-TCP client connections. This value is over ridden by the client timeout

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 31536000
anyserver	<Double>	Read-write	Global idle timeout, in seconds, for non TCP server connections. This value is over ridden by the server timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 31536000
anytcpclient	<Double>	Read-write	Global idle timeout, in seconds, for TCP client connections. This value takes precedence over entity level timeout settings (vserver/service). This is applicable only to transport protocol TCP. Default value: 0 Minimum value = 0 Maximum value = 31536000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
anytcpserver	<Double>	Read-write	Global idle timeout, in seconds, for TCP server connections. This value takes precedence over entity level timeout settings (vserver/ service). This is applicable only to transport protocol TCP. Default value: 0 Minimum value = 0 Maximum value = 31536000
halfclose	<Double>	Read-write	Idle timeout, in seconds, for connections that are in TCP half-closed state. Default value: 10 Minimum value = 1 Maximum value = 600
nontcpzombie	<Double>	Read-write	Interval at which the zombie clean-up process for non-TCP connections should run. Inactive IP NAT connections will be cleaned up. Default value: 60 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 600
reducedfintimeout	<Double>	Read-write	Alternative idle timeout, in seconds, for closed TCP NATPCB connections. Default value: 30 Minimum value = 1 Maximum value = 300
reducedrsttimeout	<Double>	Read-write	Timer interval, in seconds, for abruptly terminated TCP NATPCB connections. Default value: 0 Minimum value = 0 Maximum value = 300
newconnidletimeout	<Double>	Read-write	Timer interval, in seconds, for new TCP NATPCB connections on which no data was received. Default value: 4 Minimum value = 1 Maximum value = 120

nstimer

Configuration for Timer resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Timer name. Minimum length = 1
interval	<Integer>	Read-write	The frequency at which the policies bound to this timer are invoked. The minimum value is 20 msec. The maximum value is 20940 in seconds and 349 in minutes. Default value: 5 Minimum value = 1 Maximum value = 20940000
unit	<String>	Read-write	Timer interval unit. Default value: SEC Possible values = SEC, MIN
comment	<String>	Read-write	Comments associated with this timer.
newname	<String>	Read-write	The new name of the timer. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

Response Payload:

```
{ "nstimer": [ { "__count": "#no"} ] }
```

nstimer_autoscalepolicy_binding

Binding object showing the autoscalepolicy that can be bound to nstimer.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the timer policy.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
policyname	<String>	Read-write	The timer policy associated with the timer.
name	<String>	Read-write	Timer name. Minimum length = 1
threshold	<Double>	Read-write	Denotes the threshold. If the rule of the policy in the binding relation evaluates 'threshold size' number of times in 'sample size' to true, then the corresponding action is taken. Its value

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			needs to be less than or equal to the sample size value. Default value: 3 Minimum value = 1 Maximum value = 32
samplesize	<Double>	Read-write	Denotes the sample size. Sample size value of 'x' means that previous '(x - 1)' policy's rule evaluation results and the current evaluation result are present with the binding. For example, sample size of 10 means that there is a state of previous 9 policy evaluation results and also the current policy evaluation result. Default value: 3 Minimum value = 1 Maximum value = 32
vserver	<String>	Read-write	Name of the vserver which provides the context for the rule in timer policy. When not specified it is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			treated as a Global Default context.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/nstimer_autoscalepolicy_binding

HTTP Method:PUT

nstrafficdomain

Configuration for Traffic Domain resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Double>	Read-write	Integer value that uniquely identifies a traffic domain. Minimum value = 1 Maximum value = 4094
aliasname	<String>	Read-write	Name of traffic domain being added. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 31
vmac	<String>	Read-write	Associate the traffic domain with a VMAC address instead of with VLANs. The Citrix ADC then sends the VMAC address of the traffic domain in all responses to ARP queries for network entities in that domain. As a result, the ADC can segregate subsequent incoming traffic for this traffic domain on the basis of the destination MAC address, because the destination MAC address is the VMAC address of the traffic domain. After creating entities on a traffic domain, you can easily manage and monitor them by performing traffic domain level operations. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-only	The state of TrafficDmain. Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

```

nstrafficdomain_binding

Binding object which returns the resources bound to nstrafficdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Double>	Read-write	Integer value that uniquely identifies a traffic domain. Minimum value = 1 Maximum value = 4094
nstrafficdomain_bridgegroup_binding	<nstrafficdomain_bridgegroup_binding[]>	Read-only	bridgegroup that can be bound to nstrafficdomain.
nstrafficdomain_vlan_binding	<nstrafficdomain_vlan_binding[]>	Read-only	vlan that can be bound to nstrafficdomain.
nstrafficdomain_vxlan_binding	<nstrafficdomain_vxlan_binding[]>	Read-only	vxlan that can be bound to nstrafficdomain.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstrafficdomain_binding/td_value<Double>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain_binding": [ {

"td":<Double_value>,

"nstrafficdomain_vlan_binding":<nstrafficdomain_vlan_binding[]_value>,

"nstrafficdomain_vxlan_binding":<nstrafficdomain_vxlan_binding[]_value>,

"nstrafficdomain_bridgegroup_binding":<nstrafficdomain_bridgegroup_binding
[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstrafficdomain_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nstrafficdomain_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain_binding": [ {

"td":<Double_value>,

"nstrafficdomain_vlan_binding":<nstrafficdomain_vlan_binding[]_value>,

"nstrafficdomain_vxlan_binding":<nstrafficdomain_vxlan_binding[]_value>,

"nstrafficdomain_bridgegroup_binding":<nstrafficdomain_bridgegroup_binding
[]_value>

}]}
```

nstrafficdomain_bridgegroup_binding

Binding object showing the bridgegroup that can be bound to nstrafficdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bridgegroup	<Double>	Read-write	ID of the configured bridge to bind to this traffic domain. More than one bridge group can be bound to a traffic domain, but the same bridge group cannot be a part of multiple traffic domains. Minimum value = 1 Maximum value = 1000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Double>	Read-write	Integer value that uniquely identifies a traffic domain. Minimum value = 1 Maximum value = 4094
__count	<Double>	Read-write	count parameter

```

nsvariable

Configuration for variable resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Variable name. This follows the same syntax rules as other expression entity names: It must begin with an alpha character (A-Z or a-z) or an underscore (_). The rest of the characters must be alpha, numeric (0-9) or underscores. It cannot be re or xp (reserved for regular and XPath expressions). It cannot be an expression reserved word (e.g. SYS or HTTP). It cannot be used for an existing expression object (HTTP callout, patset, dataset,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			stringmap, or named expression). Minimum length = 1
type	<String>	Read-write	Specification of the variable type; one of the following: ulong - singleton variable with an unsigned 64-bit value. text(value-max-size) - singleton variable with a text string value. map(text(key-max-size),ulong,max-entries) - map of text string keys to unsigned 64-bit values. map(text(key-max-size),text(value-max-size),max-entries) - map of text string keys to text string values. where value-max-size is a positive integer that is the maximum

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number of bytes in a text string value. key-max-size is a positive integer that is the maximum number of bytes in a text string key. max-entries is a positive integer that is the maximum number of entries in a map variable. For a global singleton text variable, value-max-size <= 64000. For a global map with ulong values, key-max-size <= 64000. For a global map with text values, key-max-size + value-max-size <= 64000. max-entries is a positive integer that is the maximum number of entries in a map variable. This has a theoretical maximum of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			2\^64-1, but in actual use will be much smaller, considering the memory available for use by the map. Example: map(text(10),text(20),100) specifies a map of text string keys (max size 10 bytes) to text string values (max size 20 bytes), with 100 max entries. Minimum length = 1
scope	<String>	Read-write	Scope of the variable: global - (default) one set of values visible across all Packet Engines on a standalone Citrix ADC, an HA pair, or all nodes of a cluster transaction - one value for each request-response transaction (singleton variables only; no expiration).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: global Possible values = global, transaction
iffull	<String>	Read-write	Action to perform if an assignment to a map exceeds its configured max-entries: lru - (default) reuse the least recently used entry in the map. undef - force the assignment to return an undefined (Undef) result to the policy executing the assignment. Default value: lru Possible values = undef, lru
ifvaluetoobig	<String>	Read-write	Action to perform if an value is assigned to a text variable that exceeds its configured max-size, or if a key is used that exceeds its configured max-size:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			truncate - (default) truncate the text string to the first max-size bytes and proceed. undef - force the assignment or expression evaluation to return an undefined (Undef) result to the policy executing the assignment or expression. Default value: truncate Possible values = undef, truncate
ifnovalue	<String>	Read-write	Action to perform if on a variable reference in an expression if the variable is single-valued and uninitialized or if the variable is a map and there is no value for the specified key: init - (default) initialize the single-value variable, or create a map entry

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for the key and the initial value, using the -init value or its default. undef - force the expression evaluation to return an undefined (Undef) result to the policy executing the expression. Default value: init Possible values = undef, init
init	<String>	Read-write	Initialization value for this variable, to which a singleton variable or map entry will be set if it is referenced before an assignment action has assigned it a value. If the singleton variable or map entry already has been assigned a value, setting this parameter will have no effect on that variable value. Default: 0 for ulong, NULL for text.
expires	<Double>	Read-write	Value expiration in seconds. If the value is not referenced

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			within the expiration period it will be deleted. 0 (the default) means no expiration. Minimum value = 0 Maximum value = 31622400
comment	<String>	Read-write	Comments associated with this variable.
referencecount	<Double>	Read-only	The number of references to the variable in expressions and assignments.
__count	<Double>	Read-only	count parameter

Operations

ADD| UPDATE| UNSET| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsvariable

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsvariable?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"nsvariable":{

<b>"name":<String_value>,

</b>"iffull":true,

"ifvaluetoobig":true,

"ifnovalue":true,

"init":true,

"expires":true,

"comment":true
```

```
}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsvariable/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsvariable

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsvariable?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsvariable?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsvariable resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsvariable?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsvariable?**pagesize=#no;pageno=#no**

Use this query-parameter to get the nsvariable resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

Response Payload:

```
{ "nsvariable": [ { "__count": "#no"} ] }
```

nsversion

Configuration for version resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
installedversion	<Boolean>	Read-write	Installed version.
version	<String>	Read-only	Version.
mode	<Double>	Read-only	Kernel mode (KMPE/VMPE).

Operations

(click to see Properties)

GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsversion

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/nsversion?
args=installedversion:<Boolean_value>

Use this query-parameter to get nsversion resources based on additional properties.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "nsversion": [ {

installedversion:<Boolean_value>"version":<String_value>,

"mode":<Double_value>

}]}
```

nsvpxparam

Configuration for "VPX" resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cpuyield	<String>	Read-write	This setting applicable in virtual appliances, is to affect the cpu yield(relinquishing the cpu resources) in any hypervised environment. * There are 3 options for the behavior: 1. YES - Allow the Virtual Appliance to yield its vCPUs periodically, if there is no data traffic.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			2. NO - Virtual Appliance will not yield the vCPU. 3. DEFAULT - Restores the default behaviour, according to the license. * Its behavior in different scenarios: 1. As this setting is node specific only, it will not be propagated to other nodes, when executed on Cluster(CLIP) and HA(Primary). 2. In cluster setup, use '-ownerNode' to specify ID of the cluster node. 3. This setting is a system wide implementation and not granular to vCPUs. 4. No effect on the management PE. Possible values = DEFAULT, YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ownernode	<Double>	Read-write	ID of the cluster node for which you are setting the cpuyield. It can be configured only through the cluster IP address. Default value: 255 Minimum value = 0 Maximum value = 31
__count	<Double>	Read-only	count parameter

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ntpparam

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"ntpparam":{

"authentication":<String_value>,

"trustedkey":<Double[]_value>,

"autokeylogsec":<Double_value>,

"revokelogsec":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ntpparam?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"ntpparam":{

"authentication":true,

"trustedkey":true,

"autokeylogsec":true,

"revokelogsec":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ntpparam

HTTP Method:GET

Request Headers:

"autokeylogsec":<Double_value>,
"revokelogsec":<Double_value>
}]}
```

ntpserver

Configuration for NTP server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
serverip	<String>	Read-write	IP address of the NTP server. Minimum length = 1
servername	<String>	Read-write	Fully qualified domain name of the NTP server.
minpoll	<Double>	Read-write	Minimum time after which the NTP server must poll the NTP messages. In seconds, expressed as a power of 2. Minimum value = 4

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 17
maxpoll	<Double>	Read-write	Maximum time after which the NTP server must poll the NTP messages. In seconds, expressed as a power of 2. Minimum value = 4 Maximum value = 17
autokey	<Boolean>	Read-write	Use the Autokey protocol for key management for this server, with the cryptographic values (for example, symmetric key, host and public certificate files, and sign key) generated by the ntp-keygen utility. To require authentication for communication with the server, you must set either the value of this parameter or the key parameter.
key	<Double>	Read-write	Key to use for encrypting authentication fields. All packets sent to and received from the server must include authentication fields

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			encrypted by using this key. To require authentication for communication with the server, you must set either the value of this parameter or the autokey parameter. Minimum value = 1 Maximum value = 65534
preferredntpserver	<String>	Read-write	Preferred NTP server. The Citrix ADC chooses this NTP server for time synchronization among a set of correctly operating hosts. Default value: NO Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

```

pcpserver

Configuration for server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the PCP server. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore CLI

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my pcpServer" or my pcpServer).
ipaddress	<String>	Read-write	The IP address of the PCP server.
port	<Integer>	Read-write	Port number for the PCP server. Default value: 5351 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
pcpprofile	<String>	Read-write	pcp profile name.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pcpserver

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"pcpserver":{

<b>"name":<String_value>,

</b><b>"ipaddress":<String_value>,

</b>"port":<Integer_value>,
```

```
"pcpprofile":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pcpserver/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pcpserver

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"pcpserver":{

<b>"name":<String_value>,
```

```
</b>"port":<Integer_value>,

"pcpprofile":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pcpserver?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"pcpserver":{

<b>"name":<String_value>,

</b>"port":true,

"pcpprofile":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pcpserver

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pcpserver?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pcpserver?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of pcpserver resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

Policy

Policy

Policy configuration.

NAME	DESCRIPTION
policydataset	Configuration for TYPE set
policydataset_binding	Binding object showing the resources that can be bound to policydataset
policydataset_value_binding	Binding object showing the value that can be bound to policydataset
policyevaluation	Configuration for expr evaluation
policyexpression	Configuration for expression
policyhttpcallout	Configuration for HTTP callout
policymap	Configuration for map policy
policyparam	Configuration for policy parameter
policypatset	Configuration for PAT set
policypatset_binding	Binding object showing the resources that can be bound to policypatset
policypatset_pattern_binding	Binding object showing the pattern that can be bound to policypatset
policystringmap	Configuration for string map

NAME	DESCRIPTION
policystringmap_binding	Binding object showing the resources that can be bound to policystringmap
policystringmap_pattern_binding	Binding object showing the pattern that can be bound to policystringmap
policyurlset	Configuration for URL set

policydataset

Configuration for TYPE set resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the dataset. Must not exceed 127 characters. Minimum length = 1
type	<String>	Read-write	Type of value to bind to the dataset. Possible values = ipv4, number, ipv6, ulong, double, mac
indextype	<String>	Read-write	Index type. Possible values = Auto-generated, User-defined
comment	<String>	Read-write	Any comments to preserve information about this dataset.
description	<String>	Read-only	Description of the set.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

```

policyevaluation

Configuration for expr evaluation resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
expression	<String>	Read-write	Expression string. For example: http.req.body(100).contains("this").
action	<String>	Read-write	Rewrite action name. Supported rewrite action types are:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-delete -delete_all -delete_http_header -insert_after -insert_after_all -insert_before -insert_before_all -insert_http_header -replace -replace_all . Minimum length = 1
type	<String>	Read-write	Indicates request or response input packet. Possible values = HTTP_REQ, HTTP_RES, TEXT
input	<String>	Read-write	Text representation of input packet.
pitmodifiedinputdata	<String>	Read-only	Text representation of packet after evaluating expression or rewrite action.
pitboolresult	<Boolean>	Read-only	Result of the expression in bool format.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pitnumresult	<Double>	Read-only	Result of the expression in num format.
pitdoubleresult	<Double>	Read-only	Result of the expression in double format.
pitulongresult	<Double>	Read-only	Result of the expression in unsigned long format.
pitrefresult	<String>	Read-only	Result of the expression in string format.
pitoffsetresult	<Double>	Read-only	Offset of the resultant sting.
pitoffsetresultlen	<Double>	Read-only	Offset length of the resultant sting.
istruncatedrefresult	<Boolean>	Read-only	Identify whether ref result is truncated result.
pitboolevaltime	<Double>	Read-only	Average evaluation time of bool type expression in nanoseconds.
pitnumevaltime	<Double>	Read-only	Average evaluation time of num type expression in nanoseconds.
pitdoubleevaltime	<Double>	Read-only	Average evaluation time of double type expression in nanoseconds.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pitulongevaltime	<Double>	Read-only	Average evaluation time of unsigned long type expression in nanoseconds.
pitrefevaltime	<Double>	Read-only	Average evaluation time of string type expression in nanoseconds.
pitoffsetevaltime	<Double>	Read-only	Average evaluation time in finding offset of the resultant string in the input. Time is in nanoseconds.
pitactionevaltime	<Double>	Read-only	Average evaluation time of rewrite action in nanoseconds.
pitoperationperformerarray	<String[]>	Read-only	Details of the operation Citrix ADC performed at various offsets during applying of rewrite action on input data. Operation can be insertion, modfication or deletion. Possible values = INSERT, MODIFY, DELETE
pitoldoffsetarray	<Double[]>	Read-only	Details of the offsets in the input data at which Citrix ADC either inserted or modified or deleted data during applying of rewrite action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pitnewoffsetarray	<Double[]>	Read-only	Details of the offsets in the output data at which Citrix ADC either inserted or modified or deleted data during applying of rewrite action.
pitoffsetlengtharray	<Integer[]>	Read-only	Details of the lengths of the data which Citrix ADC either inserted or modified or deleted during applying of rewrite action.
pitboolerrorresult	<String>	Read-only	Result of the bool type expression if any error occurs during evaluation. Result will be in string format.
pitnumerrorresult	<String>	Read-only	Result of the num type expression if any error occurs during evaluation. Result will be in string format.
pitdoubleerrorresult	<String>	Read-only	Result of the double type expression if any error occurs during evaluation. Result will be in string format.
pitulongerrorresult	<String>	Read-only	Result of the unsigned long type expression if any error occurs during

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluation. Result will be in string format.
pitreferrorresult	<String>	Read-only	Result of the ref type expression if any error occurs during evaluation. Result will be in string format.
pitoffseterrorresult	<String>	Read-only	Result of the expression if any error occurs in calculating offset. Result will be in string format.
pitactionerrorresult	<String>	Read-only	Result of the action if any error occurs in evaluation. Result will be in string format.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policyevaluation

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policyevaluation?**args=expression:<String_value>,action:<String_value>,type:<String_value>,input:<String_value>,**

Use this query-parameter to get policyevaluation resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policyevaluation?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policyevaluation?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policyevaluation resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policyevaluation?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policyevaluation?**pagesize=#no;pageno=#no**

Use this query-parameter to get the policyevaluation resources in chunks.

policyexpression

Configuration for expression resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name for the expression. Not case

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			sensitive. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Must not begin with 're' or 'xp' or be a word reserved for use as an expression qualifier prefix (such as HTTP) or enumeration value (such as ASCII). Must not be the name of an existing named expression, pattern set, dataset, stringmap, or HTTP callout. Minimum length = 1
value	<String>	Read-write	Expression string. For example: http.req.body(100).contains("this").
description	<String>	Read-write	Description for the expression.
comment	<String>	Read-write	Any comments associated with the expression. Displayed upon viewing the policy expression.
clientsecuritymessage	<String>	Read-write	Message to display if the expression fails.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Allowed for classic end-point check expressions only. Minimum length = 1
type	<String>	Read-write	Type of expression. Can be a classic or default syntax (advanced) expression. Possible values = CLASSIC, ADVANCED
hits	<Double>	Read-only	The total number of hits.
pihits	<Double>	Read-only	The total number of hits.
type1	<String>	Read-only	The type of expression. This is for output only. Possible values = CLASSIC, ADVANCED
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default policy expression.
__count	<Double>	Read-only	count parameter

policyhttpcallout

Configuration for HTTP callout resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the HTTP callout. Not case sensitive. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Must not begin with 're' or 'xp' or be a word reserved for use as an expression qualifier prefix (such as HTTP) or enumeration value (such as ASCII). Must not be the name of an existing named expression, pattern set, dataset, stringmap, or HTTP callout. Minimum length = 1
ipaddress	<String>	Read-write	IP Address of the server (callout agent) to which the callout is sent. Can be an IPv4 or IPv6 address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Mutually exclusive with the Virtual Server parameter. Therefore, you cannot set the <IP Address, Port> and the Virtual Server in the same HTTP callout.
port	<Integer>	Read-write	Server port to which the HTTP callout agent is mapped. Mutually exclusive with the Virtual Server parameter. Therefore, you cannot set the <IP Address, Port> and the Virtual Server in the same HTTP callout. Minimum value = 1
vserver	<String>	Read-write	Name of the load balancing, content switching, or cache redirection virtual server (the callout agent) to which the HTTP callout is sent. The service type of the virtual server must be HTTP. Mutually exclusive with the IP address and port parameters. Therefore, you cannot set the <IP Address, Port> and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the Virtual Server in the same HTTP callout. Minimum length = 1
returntype	<String>	Read-write	Type of data that the target callout agent returns in response to the callout. Available settings function as follows: * TEXT - Treat the returned value as a text string. * NUM - Treat the returned value as a number. * BOOL - Treat the returned value as a Boolean value. Note: You cannot change the return type after it is set. Possible values = BOOL, NUM, TEXT
httpmethod	<String>	Read-write	Method used in the HTTP request that this callout sends. Mutually exclusive with the full HTTP request expression. Possible values = GET, POST

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hostexpr	<String>	Read-write	String expression to configure the Host header. Can contain a literal value (for example, 10.101.10.11) or a derived value (for example, http.req.header("Host")). The literal value can be an IP address or a fully qualified domain name. Mutually exclusive with the full HTTP request expression. Minimum length = 1
urlstemexpr	<String>	Read-write	String expression for generating the URL stem. Can contain a literal string (for example, "/mysite/index.html") or an expression that derives the value (for example, http.req.url). Mutually exclusive with the full HTTP request expression. Minimum length = 1
headers	<String[]>	Read-write	One or more headers to insert into the HTTP request. Each header is specified as "name(expr)", where expr is an expression that is evaluated at

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			runtime to provide the value for the named header. You can configure a maximum of eight headers for an HTTP callout. Mutually exclusive with the full HTTP request expression.
parameters	<String[]>	Read-write	One or more query parameters to insert into the HTTP request URL (for a GET request) or into the request body (for a POST request). Each parameter is specified as "name(expr)", where expr is an expression that is evaluated at run time to provide the value for the named parameter (name=value). The parameter values are URL encoded. Mutually exclusive with the full HTTP request expression.
bodyexpr	<String>	Read-write	An advanced string expression for generating the body of the request. The expression can contain a literal string or an expression that derives the value (for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, client.ip.src). Mutually exclusive with -fullReqExpr. Minimum length = 1
fullreqexpr	<String>	Read-write	Exact HTTP request, in the form of an expression, which the Citrix ADC sends to the callout agent. If you set this parameter, you must not include HTTP method, host expression, URL stem expression, headers, or parameters. The request expression is constrained by the feature for which the callout is used. For example, an HTTP.RES expression cannot be used in a request-time policy bank or in a TCP content switching policy bank. The Citrix ADC does not check the validity of this request. You must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			manually validate the request. Minimum length = 1
scheme	<String>	Read-write	Type of scheme for the callout server. Possible values = http, https
resultexpr	<String>	Read-write	Expression that extracts the callout results from the response sent by the HTTP callout agent. Must be a response based expression, that is, it must begin with HTTP.RES. The operations in this expression must match the return type. For example, if you configure a return type of TEXT, the result expression must be a text based expression. If the return type is NUM, the result expression (resultExpr) must return a numeric value, as in the following example: http.res.body(10000).length. Minimum length = 1
cacheforsecs	<Double>	Read-write	Duration, in seconds, for which the callout response is cached.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The cached responses are stored in an integrated caching content group named "calloutContentGroup". If no duration is configured, the callout responses will not be cached unless normal caching configuration is used to cache them. This parameter takes precedence over any normal caching configuration that would otherwise apply to these responses. Note that the calloutContentGroup definition may not be modified or removed nor may it be used with other cache policies. Minimum value = 1 Maximum value = 31536000
comment	<String>	Read-write	Any comments to preserve information about this HTTP callout.
hits	<Double>	Read-only	Total hits.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefhits	<Double>	Read-only	Total undefs.
svrstate	<String>	Read-only	The state of the service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
effectivestate	<String>	Read-only	The effective state of the service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
undefreason	<String>	Read-only	Reason for last undef. Possible values = Failed to add service, Vserver not found, Not a HTTP or SSL vserver,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Generated callout request is invalid, Content-Length header not found in callout request, Not enough space to put Content-Length value, Config incomplete, Server is DOWN, Creating callout connection failed, No memory to generate callout request packets, No memory to create callout task, No memory to create callout async, Callout request expression undef, No callout response expression, Skipped callout response eval, Callout response pixl init undef, Callout response expression undef
recursivecallout	<Double>	Read-only	Number of recursive callouts.
__count	<Double>	Read-only	count parameter

policymap

Configuration for map policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mappolicyname	<String>	Read-write	Name for the map policy. Must begin with a letter, number, or the underscore (_) character and must consist only of letters, numbers, and the hash (#), period (.), colon (:), space ( ), at (@), equals (=), hyphen (-), and underscore (_) characters. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my map" or 'my map'). Minimum length = 1
sd	<String>	Read-write	Publicly known source domain name. This is the domain name with which a client request arrives at a reverse proxy virtual server for cache redirection. If you specify a source domain, you must specify a target domain. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
su	<String>	Read-write	Source URL. Specify all or part of the source URL, in the following format: /[[prefix] [*]] [.suffix]. Minimum length = 1
td	<String>	Read-write	Target domain name sent to the server. The source domain name is replaced with this domain name. Minimum length = 1
tu	<String>	Read-write	Target URL. Specify the target URL in the following format: /[[prefix] [*]][.suffix]. Minimum length = 1
targetname	<String>	Read-only	The expression string.
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policymap

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"policymap":{

<b>"mappolicyname":<String_value>,

</b><b>"sd":<String_value>,

</b>"su":<String_value>,
```

```
"td":<String_value>,

"tu":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policymap/mappolicyname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policymap

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policymap?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policymap?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policymap resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policymap?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policymap?**pagesize=#no;pageno=#no**

Use this query-parameter to get the policymap resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

policypatset_binding

Binding object which returns the resources bound to policypatset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the pattern set for which to display the detailed information. If a name is not provided, a list of all pattern sets configured on the appliance is shown. Minimum length = 1
policypatset_pattern_binding	<policypatset_pattern_binding[]>	Read-only	pattern that can be bound to policypatset.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policypatset_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "policypatset_binding": [ {

"name":<String_value>,

"policypatset_pattern_binding":<policypatset_pattern_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policypatset_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policypatset_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "policypatset_binding": [ {

"name":<String_value>,

"policypatset_pattern_binding":<policypatset_pattern_binding[]_value>

}]}
```

policypatset_pattern_binding

Binding object showing the pattern that can be bound to policypatset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
String	<String>	Read-write	String of characters that constitutes a pattern. For more information about the characters that can be used, refer to the character set parameter. Note: Minimum length for pattern sets used in rewrite actions of type REPLACE_ALL, DELETE_ALL, INSERT_AFTER_ALL, and INSERT_BEFORE_ALL, is three characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the pattern set to which to bind the string. Minimum length = 1
charset	<String>	Read-write	Character set associated with the characters in the string. Note: UTF-8 characters can be entered directly (if the UI supports it) or can be encoded as a sequence of hexadecimal bytes '\xNN'. For example, the UTF-8 character '?' can be encoded as '\xC3\xBC'. Possible values = ASCII, UTF_8
index	<Double>	Read-write	The index of the string associated with the patset.
__count	<Double>	Read-write	count parameter

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policypatset_pattern_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"policypatset_pattern_binding": [ { "__count": "#no"} ] }
```

policystringmap

Configuration for string map resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name for the string map. Not case sensitive. Must begin with an ASCII letter or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			consist only of ASCII alphanumeric or underscore characters. Must not begin with 're' or 'xp' or be a word reserved for use as an expression qualifier prefix (such as HTTP) or enumeration value (such as ASCII). Must not be the name of an existing named expression, pattern set, dataset, string map, or HTTP callout. Minimum length = 1
comment	<String>	Read-write	Comments associated with the string map.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"policystringmap":{

<b>"name":<String_value>,

</b>"comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"policystringmap":{

<b>"name":<String_value>,

</b>"comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"policystringmap":{

<b>"name":<String_value>,

</b>"comment":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policystringmap resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap?**pagesize=#no;pageno=#no**

Use this query-parameter to get the policystringmap resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "policystringmap": [ {

"name":<String_value>,

"comment":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "policystringmap": [ {

"name":<String_value>,

"comment":<String_value>
```

```
}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap?**count=yes**

HTTP Method:GET

Request Headers:

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "policystringmap_binding": [ {

"name":<String_value>,

"policystringmap_pattern_binding":<policystringmap_pattern_binding[]_value
>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/policystringmap_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "policystringmap_binding": [ {

"name":<String_value>,

"policystringmap_pattern_binding":<policystringmap_pattern_binding[]_value
>

}]}
```

policystringmap_pattern_binding

Binding object showing the pattern that can be bound to policystringmap.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
value	<String>	Read-write	Character string constituting the value associated with the key. This value is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			returned when processed data matches the associated key. Refer to the key parameter for details of the value character set. Minimum length = 1
name	<String>	Read-write	Name of the string map to which to bind the key-value pair. Minimum length = 1
key	<String>	Read-write	Character string constituting the key to be bound to the string map. The key is matched against the data processed by the operation that uses the string map. The default character set is ASCII. UTF-8 characters can be included if the character set is UTF-8. UTF-8 characters can be entered directly (if the UI supports it) or can be encoded as a sequence of hexadecimal bytes '\xNN'. For example, the UTF-8 character '?' can be encoded as '\xC3\xBC'. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-write	count parameter

```

policyurlset

Configuration for URL set resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name of the url set. Not case sensitive. Must begin with an ASCII letter or underscore (_) character and must contain only alphanumeric and underscore characters. Must not be the name of an existing named expression, pattern set, dataset, string map, or HTTP callout. Minimum length = 1 Maximum length = 127
comment	<String>	Read-write	Any comments to preserve information about this url set.
imported	<Boolean>	Read-write	when set, display shows all imported urlsets. Default value: 0
overwrite	<Boolean>	Read-write	Overwrites the existing file. Default value: 0
delimiter	<String>	Read-write	CSV file record delimiter. Default value: 44

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rowseparator	<String>	Read-write	CSV file row separator. Default value: 10
url	<String>	Read-write	URL (protocol, host, path and file name) from where the CSV (comma separated file) file will be imported or exported. Each record/line will one entry within the urlset. The first field contains the URL pattern, subsequent fields contains the metadata, if available. HTTP, HTTPS and FTP protocols are supported. NOTE: The operation fails if the destination HTTPS server requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
interval	<Double>	Read-write	The interval, in seconds, rounded down to the nearest 15 minutes, at which the update of urlset occurs.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 2592000
privateset	<Boolean>	Read-write	Prevent this urlset from being exported. Default value: 0
subdomainexactmatch	<Boolean>	Read-write	Force exact subdomain matching, ex. given an entry 'google.com' in the urlset, a request to 'news.google.com' won't match, if subdomainExactMatch is set. Default value: 0
canaryurl	<String>	Read-write	Add this URL to this urlset. Used for testing when contents of urlset is kept confidential. Minimum length = 1 Maximum length = 2047
patterncount	<Double>	Read-only	Number of patterns in this urlset. Default value: 0
__count	<Double>	Read-only	count parameter

hits	<Double>	Read-only	Total number of hits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pqbinding

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pqbinding?**args=vservername:<String_value>,**

Use this query-parameter to get pqbinding resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pqbinding?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pqbinding?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of pqbinding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pqbinding?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/pqbinding?**pagesize=#no;pageno=#no**

Use this query-parameter to get the pqbinding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "pqbinding": [ {

<b>vservername:<String_value>,</b>"policyname":<String_value>,

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "pqbinding": [ { "__count": "#no"} ] }
```

pqpolicy

Configuration for PQ policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name for the priority queuing policy. Must begin with a letter, number, or the underscore symbol (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), and colon (:) characters. Minimum length = 1
rule	<String>	Read-write	Expression or name of a named expression, against which the request is evaluated. The priority queuing policy is applied if the rule evaluates to true. Note: * On the command line interface, if the expression includes blank spaces, the entire expression must be enclosed in double quotation marks. * If the expression itself includes double quotation marks, you must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you will not have to escape the double quotation marks. * Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'.
priority	<Double>	Read-write	Priority for queuing the request. If server resources are not available for a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			request that matches the configured rule, this option specifies a priority for queuing the request until the server resources are available again. Enter the value of positive_integer as 1, 2 or 3. The highest priority level is 1 and the lowest priority value is 3. Minimum value = 1 Maximum value = 3
weight	<Double>	Read-write	Weight of the priority. Each priority is assigned a weight according to which it is served when server resources are available. The weight for a higher priority request must be set higher than that of a lower priority request. To prevent delays for low-priority requests across multiple priority levels, you can configure weighted queuing for serving requests. The default weights for the priorities

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are: * Gold - Priority 1 - Weight 3 * Silver - Priority 2 - Weight 2 * Bronze - Priority 3 - Weight 1 Specify the weights as 0 through 101. A weight of 0 indicates that the particular priority level should be served only when there are no requests in any of the priority queues. A weight of 101 specifies a weight of infinity. This means that this priority level is served irrespective of the number of clients waiting in other priority queues. Minimum value = 0 Maximum value = 101
qdepth	<Double>	Read-write	Queue depth threshold value.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			When the queue size (number of requests in the queue) on the virtual server to which this policy is bound, increases to the specified qDepth value, subsequent requests are dropped to the lowest priority level. Default value: 0 Minimum value = 0 Maximum value = 4294967294
polqdepth	<Double>	Read-write	Policy queue depth threshold value. When the policy queue size (number of requests in all the queues belonging to this policy) increases to the specified polqDepth value, subsequent requests are dropped to the lowest priority level. Default value: 0 Minimum value = 0 Maximum value = 4294967294
hits	<Double>	Read-only	Total number of hits.
__count	<Double>	Read-only	count parameter

Protocol

Protocol

Protocol Configuration.

NAME	DESCRIPTION
protocolhttpband	Configuration for HTTP request/response band

protocolhttpband

Configuration for HTTP request/response band resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqbandsize	<Integer>	Read-write	Band size, in bytes, for HTTP request band statistics. For example, if you specify a band size of 100 bytes, statistics will be maintained and displayed for the following size ranges: 0 - 99 bytes 100 - 199 bytes 200 - 299 bytes and so on. Default value: 100 Minimum value = 50

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
respbandsize	<Integer>	Read-write	Band size, in bytes, for HTTP response band statistics. For example, if you specify a band size of 100 bytes, statistics will be maintained and displayed for the following size ranges: 0 - 99 bytes 100 - 199 bytes 200 - 299 bytes and so on. Default value: 1024 Minimum value = 50
type	<String>	Read-write	Type of statistics to display. Possible values = REQUEST, RESPONSE
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
bandrange	<Integer>	Read-only	The range of the HTTP request/ response size, in bytes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
numberofbands	<Integer>	Read-only	The total number of http bands.
totalbandsize	<Double[]>	Read-only	The total size of all HTTP requests/ responses in this size range.
avgbandsize	<Double[]>	Read-only	The average size of all HTTP requests/ responses in this size range.
avgbandsizenew	<Double[]>	Read-only	The average size of all HTTP requests/ responses in this size range.
banddata	<Double[]>	Read-only	The total size of all HTTP requests/ responses in this size range, expressed as a percentage of the total size of all HTTP requests/responses.
banddatanew	<Double[]>	Read-only	The total size of all HTTP requests/ responses in this size range, expressed as a percentage of the total size of all HTTP requests/responses.
accesscount	<Double[]>	Read-only	The number of HTTP requests/responses in this size range.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
accessratio	<Double[]>	Read-only	The number of HTTP requests/responses in this size range, expressed as a percentage of the total number of HTTP requests/ responses.
accessrationew	<Double[]>	Read-only	The number of HTTP requests/responses in this size range, expressed as a percentage of the total number of HTTP requests/ responses.
totals	<Integer[]>	Read-only	The total of totalBandSize, avgBandSize, BandData, accessCount, accessRatio respectively.

RDP

Rdp

RDP configuration.

NAME	DESCRIPTION
rdpclientprofile	Configuration for RDP clientprofile
rdpconnections	Configuration for active rdp connections
rdpserverprofile	Configuration for RDP serverprofile

rdpclientprofile

Configuration for RDP clientprofile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the rdp profile. Minimum length = 1
rdpurloverride	<String>	Read-write	This setting determines whether the RDP parameters supplied in the vpn url override those specified in the RDP profile. Default value: ENABLE Possible values = ENABLE, DISABLE
redirectclipboard	<String>	Read-write	This setting corresponds to the Clipboard check box on the Local Resources tab under Options in RDC.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLE Possible values = ENABLE, DISABLE
redirectdrives	<String>	Read-write	This setting corresponds to the selections for Drives under More on the Local Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
redirectprinters	<String>	Read-write	This setting corresponds to the selection in the Printers check box on the Local Resources tab under Options in RDC. Default value: ENABLE Possible values = ENABLE, DISABLE
redirectcomports	<String>	Read-write	This setting corresponds to the selections for comports under More on the Local Resources tab under Options in RDC.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLE Possible values = ENABLE, DISABLE
redirectpnpdevices	<String>	Read-write	This setting corresponds to the selections for pnpdevices under More on the Local Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
keyboardhook	<String>	Read-write	This setting corresponds to the selection in the Keyboard drop-down list on the Local Resources tab under Options in RDC. Default value: InFullScreenMode Possible values = OnLocal, OnRemote, InFullScreenMode
audiocapturemode	<String>	Read-write	This setting corresponds to the selections in the Remote audio area on the Local

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
videoplaybackmode	<String>	Read-write	This setting determines if Remote Desktop Connection (RDC) will use RDP efficient multimedia streaming for video playback. Default value: ENABLE Possible values = ENABLE, DISABLE
multimonitorsupport	<String>	Read-write	Enable/Disable Multiple Monitor Support for Remote Desktop Connection (RDC). Default value: ENABLE Possible values = ENABLE, DISABLE
rdpcookievalidity	<Double>	Read-write	RDP cookie validity period. RDP cookie validity time is applicable for new connection and also for any re-connection that might happen, mostly due to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			network disruption or during fail-over. Default value: 60 Minimum value = 1 Maximum value = 86400
addusernameinrdpfile	<String>	Read-write	Add username in rdp file. Default value: NO Possible values = YES, NO
rdpfilename	<String>	Read-write	RDP file name to be sent to End User. Minimum length = 1
rdphost	<String>	Read-write	Fully-qualified domain name (FQDN) of the RDP Listener. Maximum length = 252
rdplistener	<String>	Read-write	IP address (or) Fully-qualified domain name(FQDN) of the RDP Listener with the port in the format IP:Port (or) FQDN:Port. Maximum length = 255
rdpcustomparams	<String>	Read-write	Option for RDP custom parameters settings (if any). Custom params

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			needs to be separated by ';'. Default value: 0 Minimum length = 1
psk	<String>	Read-write	Pre shared key value. Default value: 0
randomizerdpfilename	<String>	Read-write	Will generate unique filename everytime rdp file is downloaded by appending output of time() function in the format <rdpfileName>_<time>.rdp. This tries to avoid the pop-up for replacement of existing rdp file during each rdp connection launch, hence providing better end-user experience. Default value: NO Possible values = YES, NO
rdplinkattribute	<String>	Read-write	Citrix Gateway allows the configuration of rdpLinkAttribute parameter which can be used to fetch a list of RDP servers(IP/FQDN) that a user can access, from an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Authentication server attribute(Example: LDAP, SAML). Based on the list received, the RDP links will be generated and displayed to the user. Note: The Attribute mentioned in the rdpLinkAttribute should be fetched through corresponding authentication method.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| UPDATE| UNSET| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

```

rdpconnections

Configuration for active rdp connections resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User name for which to display connections. Minimum length = 1
all	<Boolean>	Read-write	Terminate all active rdpconnections.
endpointip	<String>	Read-only	The client IP address.
endpointport	<Integer>	Read-only	The client port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
targetip	<String>	Read-only	The Server IP address.
targetport	<Integer>	Read-only	The server port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
peid	<Double>	Read-only	Core id of the session owner.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

KILL| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

kill

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rdpconnections?**action=kill**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"rdpconnections":{

"username":<String_value>,

"all":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rdpconnections

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rdpconnections?**args=username:<String_value>**

Use this query-parameter to get rdpconnections resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rdpconnections?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rdpconnections?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of rdpconnections resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rdpconnections?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rdpconnections?**pagesize=#no;pageno=#no**

Use this query-parameter to get the rdpconnections resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "rdpconnections": [ {

username:<String_value>"endpointip":<String_value>,

"endpointport":<Integer_value>,

"targetip":<String_value>,

"targetport":<Integer_value>,

"peid":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rdpconnections?**count=yes**

HTTP Method:GET

Request Headers:

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "rdpconnections": [ { "__count": "#no"} ] }
```

rdpserverprofile

Configuration for RDP serverprofile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the rdp server profile. Minimum length = 1 Maximum length = 32
rdpip	<String>	Read-write	IPv4 or IPv6 address of RDP listener. This

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			terminates client RDP connections. Minimum length = 1
rdpport	<Double>	Read-write	TCP port on which the RDP connection is established. Default value: 3389 Minimum value = 1 Maximum value = 65535
psk	<String>	Read-write	Pre shared key value.
rdpredirection	<String>	Read-write	Enable/Disable RDP redirection support. This needs to be enabled in presence of connection broker or session directory with IP cookie(msts cookie) based redirection support. Default value: DISABLE Possible values = ENABLE, DISABLE
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

Responder

Responder

Responder configuration.

NAME	DESCRIPTION
responderaction	Configuration for responder action
responderglobal_binding	Binding object showing the resources that can be bound to responderglobal
responderglobal_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to responderglobal
responderhtmlpage	Configuration for Responder HTML page
responderparam	Configuration for responser parameter
responderpolicy	Configuration for responder policy
responderpolicy_binding	Binding object showing the resources that can be bound to responderpolicy
responderpolicy_crvserver_binding	Binding object showing the crvserver that can be bound to responderpolicy
responderpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to responderpolicy
responderpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to responderpolicy
responderpolicy_responderglobal_binding	Binding object showing the responderglobal that can be bound to responderpolicy

NAME	DESCRIPTION
responderpolicy_responderpolicylabel_binding	Binding object showing the responderpolicylabel that can be bound to responderpolicy
responderpolicylabel	Configuration for responder policy label
responderpolicylabel_binding	Binding object showing the resources that can be bound to responderpolicylabel
responderpolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to responderpolicylabel
responderpolicylabel_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to responderpolicylabel

responderaction

Configuration for responder action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the responder action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			responder policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder action" or 'my responder action').
type	<String>	Read-write	Type of responder action. Available settings function as follows: * respondwith <target> - Respond to the request with the expression specified as the target. * respondwithhtmlpage - Respond to the request with the uploaded HTML page object specified as the target.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* redirect - Redirect the request to the URL specified as the target. * sqlresponse_ok - Send an SQL OK response. * sqlresponse_error - Send an SQL ERROR response. Possible values = noop, respondwith, redirect, respondwithhtmlpage, sqlresponse_ok, sqlresponse_error
target	<String>	Read-write	Expression specifying what to respond with. Typically a URL for redirect policies or a default-syntax expression. In addition to Citrix ADC default-syntax expressions that refer to information in the request, a stringbuilder expression can contain text and HTML, and simple escape codes that define new lines and paragraphs. Enclose each stringbuilder

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression element (either a Citrix ADC default-syntax expression or a string) in double quotation marks. Use the plus (+) character to join the elements. Examples: 1) Respondwith expression that sends an HTTP 1.1 200 OK response: "HTTP/1.1 200 OK\r\n\r\n" 2) Redirect expression that redirects user to the specified web host and appends the request URL to the redirect. "http://backupsite2.com" + HTTP.REQ.URL 3) Respondwith expression that sends an HTTP 1.1 404 Not Found response with the request URL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			included in the response: "HTTP/1.1 404 Not Found\r\n\r\n"+ "HTTP.REQ.URL.HTTP_URL_SAFE" + "does not exist on the web server." The following requirement applies only to the Citrix ADC CLI: Enclose the entire expression in single quotation marks. (Citrix ADC expression elements should be included inside the single quotation marks for the entire expression, but do not need to be enclosed in double quotation marks.).
htmlpage	<String>	Read-write	For respondwithhtmlpage policies, name of the HTML page object to use as the response. You must first import the page object. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bypasssafetycheck	<String>	Read-write	Bypass the safety check, allowing potentially unsafe expressions. An unsafe expression in a response is one that contains references to request elements that might not be present in all requests. If a response refers to a missing request element, an empty string is used instead. Default value: NO Possible values = YES, NO
comment	<String>	Read-write	Comment. Any type of information about this responder action.
responsestatuscode	<Double>	Read-write	HTTP response status code, for example 200, 302, 404, etc. The default value for the redirect action type is 302 and for respondwithhtmlpage is 200. Minimum value = 100 Maximum value = 599

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reasonphrase	<String>	Read-write	Expression specifying the reason phrase of the HTTP response. The reason phrase may be a string literal with quotes or a PI expression. For example: "Invalid URL: " + HTTP.REQ.URL. Minimum length = 1
newname	<String>	Read-write	New name for the responder action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks (for example, "my responder action" or my responder action'). Minimum length = 1
hits	<Double>	Read-only	The number of times the action has been taken.
referencecount	<Double>	Read-only	The number of references to the action.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
__count	<Double>	Read-only	count parameter

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderaction

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

Response Payload:

```
{ "responderglobal_binding": [ {

"responderglobal_responderpolicy_binding":<responderglobal_responderpolicy
_binding[]_value>

}]}
```

responderglobal_responderpolicy_binding

Binding object showing the responderpolicy that can be bound to responderglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the responder policy.
labelname	<String>	Read-write	Name of the policy label to invoke. If the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is policylabel.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
type	<String>	Read-write	Specifies the bind point whose policies you want to display. Available settings function as follows: * REQ_OVERRIDE - Request override.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Binds the policy to the priority request queue. * REQ_DEFAULT - Binds the policy to the default request queue. * OTHERTCP_REQ_OVERRIDE - Binds the policy to the non-HTTP TCP priority request queue. * OTHERTCP_REQ_DEFAULT - Binds the policy to the non-HTTP TCP default request queue.. * SIPUDP_REQ_OVERRIDE - Binds the policy to the SIP UDP priority response queue.. * SIPUDP_REQ_DEFAULT - Binds the policy to the SIP UDP default response queue. * RADIUS_REQ_OVERRIDE - Binds the policy to the RADIUS priority response queue.. * RADIUS_REQ_DEFAULT - Binds the policy to the RADIUS default response queue. * MSSQL_REQ_OVERRIDE - Binds the policy to the Microsoft SQL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			priority response queue.. * MSSQL_REQ_DEFAULT - Binds the policy to the Microsoft SQL default response queue. * MYSQL_REQ_OVERRIDE - Binds the policy to the MySQL priority response queue. * MYSQL_REQ_DEFAULT - Binds the policy to the MySQL default response queue. Possible values = REQ_OVERRIDE, REQ_DEFAULT, OVERRIDE, DEFAULT, OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, SIPUDP_REQ_OVERRIDE, SIPUDP_REQ_DEFAULT, SIPTCP_REQ_OVERRIDE, SIPTCP_REQ_DEFAULT, MSSQL_REQ_OVERRIDE, MSSQL_REQ_DEF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			AULT, MYSQL_REQ_OVERRIDE, MYSQL_REQ_DEFAULT, NAT_REQ_OVERRIDE, NAT_REQ_DEFAULT, DIAMETER_REQ_OVERRIDE, DIAMETER_REQ_DEFAULT, RADIUS_REQ_OVERRIDE, RADIUS_REQ_DEFAULT, DNS_REQ_OVERRIDE, DNS_REQ_DEFAULT
labeltype	<String>	Read-write	Type of invocation, Available settings function as follows: * vserver - Forward the request to the specified virtual server. * policylabel - Invoke the specified policy label. Possible values = vserver, policylabel
numpol	<Double>	Read-only	number of polices bound to label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flowtype	<Double>	Read-only	flowtype of the bound responder policy.
__count	<Double>	Read-only	count parameter

Content-Type:application/json

Response Payload:

```
{ "responderparam": [ {

"undefaction":<String_value>

}]}
```

responderpolicy

Configuration for responder policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the responder policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the responder policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks (for example, "my responder policy" or 'my responder policy').
rule	<String>	Read-write	Expression that the policy uses to determine whether to respond to the specified request.
action	<String>	Read-write	Name of the responder action to perform if the request matches this responder policy. There are also some built-in actions which can be used. These are: * NOOP - Send the request to the protected server instead of responding to it. * RESET - Reset the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DROP - Drop the request without sending a response to the user.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any type of information about this responder policy.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
appflowaction	<String>	Read-write	AppFlow action to invoke for requests that match this policy.
newname	<String>	Read-write	New name for the responder policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder policy" or 'my responder policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of policy UNDEF hits.
__count	<Double>	Read-only	count parameter

ADD| DELETE| UPDATE| UNSET| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicy

responderpolicylabel

Configuration for responder policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the responder policy label. Must begin

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the responder policy label is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder policy label" or my responder policy label').
policylabeltype	<String>	Read-write	Type of responses sent by the policies bound to this policy label. Types are: * HTTP - HTTP responses.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* OTHERTCP - NON-HTTP TCP responses. * SIP_UDP - SIP responses. * RADIUS - RADIUS responses. * MYSQL - SQL responses in MySQL format. * MSSQL - SQL responses in Microsoft SQL format. * NAT - NAT response. Default value: HTTP Possible values = HTTP, OTHERTCP, SIP_UDP, SIP_TCP, MYSQL, MSSQL, NAT, DIAMETER, RADIUS, DNS
comment	<String>	Read-write	Any comments to preserve information about this responder policy label.
newname	<String>	Read-write	New name for the responder policy label. Must begin with a letter, number,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Minimum length = 1
numpol	<Double>	Read-only	number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label to invoke. Available settings function as follows: * vserver - Invoke an unnamed policy label associated with a virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* policylabel - Invoke a user-defined policy label. Possible values = vserver, policylabel
invoke_labelname	<String>	Read-only	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server.
__count	<Double>	Read-only	count parameter

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicylabel_policybinding_binding/labelname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"responderpolicylabel_policybinding_binding": [ { "__count": "#no"} ] }
```

responderpolicylabel_responderpolicy_binding

Binding object showing the responderpolicy that can be bound to responderpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
policyname	<String>	Read-write	Name of the responder policy.
labelname	<String>	Read-write	Name of the responder policy label to which to bind the policy.
invoke_labelname	<String>	Read-write	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label and evaluate the specified policy label.
labeltype	<String>	Read-write	Type of policy label to invoke. Available settings function as follows: * vserver - Invoke an unnamed policy label associated with a virtual server. * policylabel - Invoke a user-defined policy label. Possible values = vserver, policylabel
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/responderpolicylabel_responderpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
```

```
"responderpolicylabel_responderpolicy_binding":{

<b>"labelname":<String_value>,

</b><b>"policyname":<String_value>,

</b><b>"priority":<Double_value>,

</b>"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"invoke_labelname":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicylabel_responderpolicy_binding/labelname_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicylabel_responderpolicy_binding/labelname_value<String>?**args=policyname:<String_value>,priority:<Double_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicylabel_responderpolicy_binding/labelname_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicylabel_responderpolicy_binding/labelname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of responderpolicylabel_responderpolicy_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicylabel_responderpolicy_binding/labelname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the responderpolicylabel_responderpolicy_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicy_responderglobal_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicy_responderglobal_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of responderpolicy_responderglobal_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicy_responderglobal_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the responderpolicy_responderglobal_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "responderpolicy_responderglobal_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"labeltype":<String_value>,

"activepolicy":<Integer_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicy_responderglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicy_responderglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "responderpolicy_responderglobal_binding": [ {

"boundto":<String_value>,

"name":<String_value>,

"priority":<Double_value>,

"labelname":<String_value>,

"gotopriorityexpression":<String_value>,

"labeltype":<String_value>,

"activepolicy":<Integer_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/responderpolicy_responderglobal_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"responderpolicy_responderglobal_binding": [ { "__count": "#no"} ] }
```

responderpolicy_responderpolicylabel_binding

Binding object showing the responderpolicylabel that can be bound to responderpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the responder policy for which to display settings.
priority	<Double>	Read-only	Specifies the priority of the policy.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

Rewrite

Rewrite

Rewrite configuration.

NAME	DESCRIPTION
rewriteaction	Configuration for rewrite action
rewriteglobal_binding	Binding object showing the resources that can be bound to rewriteglobal
rewriteglobal_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to rewriteglobal
rewriteparam	Configuration for rewrite parameter
rewritepolicy	Configuration for rewrite policy
rewritepolicy_binding	Binding object showing the resources that can be bound to rewritepolicy
rewritepolicy_csvserver_binding	Binding object showing the csvserver that can be bound to rewritepolicy

NAME	DESCRIPTION
rewritepolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to rewritepolicy
rewritepolicy_rewriteglobal_binding	Binding object showing the rewriteglobal that can be bound to rewritepolicy
rewritepolicy_rewritepolicylabel_binding	Binding object showing the rewritepolicylabel that can be bound to rewritepolicy
rewritepolicylabel	Configuration for rewrite policy label
rewritepolicylabel_binding	Binding object showing the resources that can be bound to rewritepolicylabel
rewritepolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to rewritepolicylabel
rewritepolicylabel_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to rewritepolicylabel

rewriteaction

Configuration for rewrite action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the user-defined rewrite action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite action" or 'my rewrite action').
type	<String>	Read-write	Type of user-defined rewrite action. The information that you provide for, and the effect of, each type are as follows:: * REPLACE <target> <string_builder_expr>. Replaces the string with the string-builder expression. * REPLACE_ALL <target> <string_builder_expr1> -(pattern|

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			search) <string_builder_expr2>. In the request or response specified by <target>, replaces all occurrences of the string defined by <string_builder_expr1> with the string defined by <string_builder_expr2>. You can use a PCRE-format pattern or the search facility to find the strings to be replaced. * REPLACE_HTTP_RES <string_builder_expr>. Replaces the complete HTTP response with the string defined by the string-builder expression. * REPLACE_SIP_RES <target> - Replaces the complete SIP response with the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			string specified by <target>. * INSERT_HTTP_HEADER <header_string_builder_expr> <contents_string_builder_expr>. Inserts the HTTP header specified by <header_string_builder_expr> and header contents specified by <contents_string_builder_expr>. * DELETE_HTTP_HEADER <target>. Deletes the HTTP header specified by <target>. * CORRUPT_HTTP_HEADER <target>. Replaces the header name of all occurrences of the HTTP header specified by <target> with a corrupted name, so that it will not be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			recognized by the receiver Example: MY_HEADER is changed to MHEY_ADER. * INSERT_BEFORE <string_builder_expr1> <string_builder_expr1>. Finds the string specified in <string_builder_expr1> and inserts the string in <string_builder_expr2> before it. * INSERT_BEFORE_ALL <target> <string_builder_expr1> -(pattern|search) <string_builder_expr2>. In the request or response specified by <target>, locates all occurrences of the string specified in <string_builder_expr1> and inserts the string specified in <string_builder_expr2> before each. You can use a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			PCRE-format pattern or the search facility to find the strings. * INSERT_AFTER <string_builder_expr1> <string_builder_expr2>. Finds the string specified in <string_builder_expr1>, and inserts the string specified in <string_builder_expr2> after it. * INSERT_AFTER_ALL <target> <string_builder_expr1> -(pattern|search) <string_builder_expr>. In the request or response specified by <target>, locates all occurrences of the string specified by <string_builder_expr1> and inserts the string specified by <string_builder_expr2> after each. You can use a PCRE-format pattern or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the search facility to find the strings. * DELETE <target>. Finds and deletes the specified target. * DELETE_ALL <target> -(pattern|search) <string_builder_expr>. In the request or response specified by <target>, locates and deletes all occurrences of the string specified by <string_builder_expr>. You can use a PCRE-format pattern or the search facility to find the strings. * REPLACE_DIAMETER_HEADER_FIELD <target> <field value>. In the request or response modify the header field specified by <target>. Use Diameter.req.flags.SET(<flag>) or Diameter.req.flags.UNSET<flag> as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			'stringbuilderexpression' to set or unset flags. * REPLACE_DNS_HEADER_FIELD <target>. In the request or response modify the header field specified by <target>. * REPLACE_DNS_ANSWER_SECTION <target>. Replace the DNS answer section in the response. This is currently applicable for A and AAAA records only. Use DNS.NEW_RRSET_A ; DNS.NEW_RRSET_AAAA expressions to configure the new answer section . Possible values = noop, delete, insert_http_header, delete_http_header, corrupt_http_header, insert_before, insert_after,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			replace, replace_http_res, delete_all, replace_all, insert_before_all, insert_after_all, clientless_vpn_encode, clientless_vpn_encode_all, clientless_vpn_decode, clientless_vpn_decode_all, insert_sip_header, delete_sip_header, corrupt_sip_header, replace_sip_res, replace_diameter_header_field, replace_dns_header_field, replace_dns_answer_section
target	<String>	Read-write	Expression that specifies which part of the request or response to rewrite. Minimum length = 1
stringbuilderexpr	<String>	Read-write	Expression that specifies the content to insert into the request or response at the specified location, or that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			replaces the specified string.
pattern	<String>	Read-write	DEPRECATED in favor of -search: Pattern that is used to match multiple strings in the request or response. The pattern may be a string literal (without quotes) or a PCRE-format regular expression with a delimiter that consists of any printable ASCII non-alphanumeric character except for the underscore (_) and space ( ) that is not otherwise used in the expression. Example: re~https?://|HTTPS?://~ The preceding regular expression can use the tilde (~) as the delimiter because that character does not appear in the regular expression itself. Used in the INSERT_BEFORE_ALL, INSERT_AFTER_ALL, REPLACE_ALL, and DELETE_ALL action types.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
search	<String>	Read-write	Search facility that is used to match multiple strings in the request or response. Used in the INSERT_BEFORE_ALL, INSERT_AFTER_ALL, REPLACE_ALL, and DELETE_ALL action types. The following search types are supported: * Text ("text(string)") - A literal string. Example: -search text("hello") * Regular expression ("regex(re<delimiter>regular exp<delimiter>)") - Pattern that is used to match multiple strings in the request or response. The pattern may be a PCRE-format regular expression with a delimiter that consists of any printable ASCII non-alphanumeric character except for the underscore (_)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and space ( ) that is not otherwise used in the expression. Example: -search regex(re~\^hello*~) The preceding regular expression can use the tilde (~) as the delimiter because that character does not appear in the regular expression itself. * XPath ("xpath(xp<delimiter>xpath expression<delimiter>)") - An XPath expression to search XML. The delimiter has the same rules as for regex. Example: -search xpath(xp%/a/b%) * JSON ("xpath_json(xp<delimiter>xpath expression<delimiter>)") - An XPath expression to search JSON. The delimiter has the same rules as for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			regex. Example: -search xpath_json(xp%/a/b%) NOTE: JSON searches use the same syntax as XPath searches, but operate on JSON files instead of standard XML files. * HTML ("xpath_html(xp<delimiter>xpath expression<delimiter>)") - An XPath expression to search HTML. The delimiter has the same rules as for regex. Example: -search xpath_html(xp%/html/body%) NOTE: HTML searches use the same syntax as XPath searches, but operate on HTML files instead of standard XML files; HTML 5 rules for the file syntax are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			used; HTML 4 and later are supported. * Patset ("patset(patset)") - A predefined pattern set. Example: -search patset("patset1"). * Datset ("dataset(dataset)") - A predefined dataset. Example: -search dataset("dataset1"). * AVP ("avp(avp number)") - AVP number that is used to match multiple AVPs in a Diameter/ Radius Message. Example: -search avp(999) Note: for all these the TARGET prefix can be used in the replacement expression to specify the text that was selected by the -search parameter, optionally adjusted

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by the -refineSearch parameter. Example: TARGET.BEFORE_STR(",").
bypasssafetycheck	<String>	Read-write	Bypass the safety check and allow unsafe expressions. An unsafe expression is one that contains references to message elements that might not be present in all messages. If an expression refers to a missing request element, an empty string is used instead. Default value: NO Possible values = YES, NO
refinesearch	<String>	Read-write	Specify additional criteria to refine the results of the search. Always starts with the "extend(m,n)" operation, where 'm' specifies number of bytes to the left of selected data and 'n' specifies number of bytes to the right

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of selected data to extend the selected area. You can use refineSearch only on body expressions, and for the INSERT_BEFORE_ALL, INSERT_AFTER_ALL, REPLACE_ALL, and DELETE_ALL action types. Example: -refineSearch 'EXTEND(10, 20).REGEX_SELECT(re~0x[0-9a-zA-Z]+~).
comment	<String>	Read-write	Comment. Can be used to preserve information about this rewrite action.
newname	<String>	Read-write	New name for the rewrite action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite action" or 'my rewrite action'). Minimum length = 1
hits	<Double>	Read-only	The number of times the action has been taken.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Double>	Read-only	The number of references to the action.
description	<String>	Read-only	Description of the action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default rewriteaction.
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "rewriteaction": [ { "__count": "#no"} ] }
```

rewriteglobal_binding

Binding object which returns the resources bound to rewriteglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rewriteglobal_rewrite policy_binding	<rewriteglobal_rewrit epolicy_binding[]>	Read-only	rewritepolicy that can be bound to rewriteglobal.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewriteglobal_binding

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "rewriteglobal_binding": [ {

"rewriteglobal_rewritepolicy_binding":<rewriteglobal_rewritepolicy_binding
[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewriteglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewriteglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "rewriteglobal_binding": [ {

"rewriteglobal_rewritepolicy_binding":<rewriteglobal_rewritepolicy_binding
[]_value>

}]}
```

rewriteglobal_rewritepolicy_binding

Binding object showing the rewritepolicy that can be bound to rewriteglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the rewrite policy.
labelname	<String>	Read-write	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server to which to forward the request of response.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
type	<String>	Read-write	The bindpoint to which to policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RES_DEFAULT, OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, OTHERTCP_RES_OVERRIDE, OTHERTCP_RES_DEFAULT, SIPUDP_REQ_OVERRIDE, SIPUDP_REQ_DEFAULT, SIPUDP_RES_OVERRIDE, SIPUDP_RES_DEFAULT, SIPTCP_REQ_OVERRIDE, SIPTCP_REQ_DEFAULT, SIPTCP_RES_OVERRIDE, SIPTCP_RES_DEFAULT, DIAMETER_REQ_OVERRIDE, DIAMETER_REQ_DEFAULT, DIAMETER_RES_OVERRIDE, DIAMETER_RES_DEFAULT, RADIUS_REQ_OVERRIDE, RADIUS_REQ_DE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			FAULT, RADIUS_RES_OVERRIDE, RADIUS_RES_DEFAULT, DNS_REQ_OVERRIDE, DNS_REQ_DEFAULT, DNS_RES_OVERRIDE, DNS_RES_DEFAULT
labeltype	<String>	Read-write	Type of invocation. Available settings function as follows: * reqvserver - Forward the request to the specified request virtual server. * resvserver - Forward the response to the specified response virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, resvserver, policylabel
flowtype	<Double>	Read-only	flowtype of the bound rewrite policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

rewriteparam

Configuration for rewrite parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			An UNDEF event indicates an error condition in evaluating the expression. Available settings function as follows: * NOREWRITE - Do not modify the message. * RESET - Reset the connection and notify the user's browser, so that the user can resend the request. * DROP - Drop the message without sending a response to the user. Default value: "NOREWRITE"
timeout	<Double>	Read-write	Maximum time in milliseconds to allow for processing all the policies and their selected actions without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed. Note that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			some rewrites may have already been performed. Minimum value = 1 Maximum value = 5000

Operations

```

rewritepolicy

Configuration for rewrite policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the rewrite policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite policy"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or 'my rewrite policy').
rule	<String>	Read-write	Expression against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Name of the rewrite action to perform if the request or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			response matches this rewrite policy. There are also some built-in actions which can be used. These are: * NOREWRITE - Send the request from the client to the server or response from the server to the client without making any changes in the message. * RESET - Resets the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any comments to preserve information about this rewrite policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the rewrite policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my rewrite policy" or 'my rewrite policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of Undef hits.
description	<String>	Read-only	Description of the policy.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default rewritepolicy.
__count	<Double>	Read-only	count parameter

priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of invocation. Available settings function as follows: * reqvserver - Forward the request to the specified request virtual server. * resvserver - Forward the response to the specified response virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, resvserver, policylabel
invoke_labelname	<String>	Read-only	* If labelType is policylabel, name of the policy label to invoke. * If labelType is reqvserver or resvserver, name of the virtual server to which to forward the request or response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
flowtype	<Double>	Read-only	Flowtype of the bound rewrite policy.
description	<String>	Read-only	Description of the policylabel.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default rewritepolicylabel.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| RENAME| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewritepolicylabel

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"rewritepolicylabel":{

<b>"labelname":<String_value>,

</b><b>"transform":<String_value>,

</b>"comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewritepolicylabel/labelname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewritepolicylabel?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"rewritepolicylabel":{

<b>"labelname":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewritepolicylabel

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewritepolicylabel?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewritepolicylabel?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of rewritepolicylabel resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewritepolicylabel?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/rewritepolicylabel?**pagesize=#no;pageno=#no**

Use this query-parameter to get the rewritepolicylabel resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "riseparam": [ {

"directmode":<String_value>,

"indirectmode":<String_value>

}]}
```

riseprofile

Configuration for RISE profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
profilename	<String>	Read-write	Name of the RISE profile. Minimum length = 1 Maximum length = 83
servicename	<String>	Read-only	RISE Service name. Minimum length = 1 Maximum length = 31
deviceid	<String>	Read-only	Device id. Minimum length = 1 Maximum length = 31
slotid	<Double>	Read-only	Slot number of the RISE profile.
slotno	<Double>	Read-only	Slot number of the RISE profile.
vdcid	<Double>	Read-only	RISE vdc id.
vpcid	<Double>	Read-only	RISE vpc id.
ipaddress	<String>	Read-only	RISE ip address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mode	<String>	Read-only	RISE attach mode. Possible values = Direct, Indirect, vPC-Direct
status	<String>	Read-only	RISE status. Possible values = Active, Inactive
vlan	<Double>	Read-only	RISE Vlan id.
vlangroupid	<Double>	Read-only	RISE Vlan Group id.
vlancfgstatus	<String>	Read-only	RISE config status. Possible values = Ok, Invalid
ifnum	<String>	Read-only	RISE Interface number.
issu	<String>	Read-only	RISE issu status. Possible values = InProgress, None
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/riseprofile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/riseprofile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/riseprofile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of riseprofile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/riseprofile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/riseprofile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the riseprofile resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "riseprofile": [ {

```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/riseprofile?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "riseprofile": [ { "__count": "#no"} ] }
```

riseprofile_binding

Binding object which returns the resources bound to riseprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
profilename	<String>	Read-write	Name of the RISE profile. Minimum length = 1 Maximum length = 83

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
riseprofile_interface_binding	<riseprofile_interface_binding[]>	Read-only	interface that can be bound to riseprofile.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/riseprofile_binding/profilename_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "riseprofile_binding": [ {

"profilename":<String_value>,

"riseprofile_interface_binding":<riseprofile_interface_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/riseprofile_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/riseprofile_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

SMPP

Smpp

All the commands associated with SMPP.

NAME	DESCRIPTION
smppparam	Configuration for SMPP configuration parameters
smppuser	Configuration for SMPP user

smppparam

Configuration for SMPP configuration parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientmode	<String>	Read-write	Mode in which the client binds to the ADC. Applicable settings function as follows: * TRANSCEIVER - Client can send and receive messages to and from the message center. * TRANSMITTERONLY - Client can only send messages. * RECEIVERONLY - Client can only receive messages. Default value: TRANSCEIVER Possible values = TRANSCEIVER,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			TRANSMITTERONLY, RECEIVERONLY
msgqueue	<String>	Read-write	Queue SMPP messages if a client that is capable of receiving the destination address messages is not available. Default value: OFF Possible values = ON, OFF
msgqueuesize	<Double>	Read-write	Maximum number of SMPP messages that can be queued. After the limit is reached, the Citrix ADC sends a deliver_sm_resp PDU, with an appropriate error message, to the message center. Default value: 10000
addrton	<Double>	Read-write	Type of Number, such as an international number or a national number, used in the ESME address sent in the bind request. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 256
addrnpi	<Double>	Read-write	Numbering Plan Indicator, such as landline, data, or WAP client, used in the ESME address sent in the bind request. Default value: 0 Minimum value = 0 Maximum value = 256
addrrange	<String>	Read-write	Set of SME addresses, sent in the bind request, serviced by the ESME. Default value: "\\d*"

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppparam

HTTP Method:PUT

Request Headers:

}]}
```

smppuser

Configuration for SMPP user resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	Name of the SMPP user. Must be the same as the user name specified in the SMPP server. Minimum length = 1
password	<String>	Read-write	Password for binding to the SMPP server. Must be the same as the password specified in the SMPP server. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"smppuser":{

<b>"username":<String_value>,

</b>"password":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser/username_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"smppuser":{

<b>"username":<String_value>,

</b>"password":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of smppuser resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser?**pagesize=#no;pageno=#no**

Use this query-parameter to get the smppuser resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "smppuser": [ {

"username":<String_value>,

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser/username_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser/username_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/smppuser/username_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

```

SNMP

SNMP

SNMP(Simple Network Management Protocol) configuration.

NAME	DESCRIPTION
snmpalarm	Configuration for alarm
snmpcommunity	Configuration for community
snmpengineid	Configuration for SNMP engine id
snmpgroup	Configuration for SNMP group
snmpmanager	Configuration for manager
snmpmib	Configuration for SNMP mib
snmpoid	Configuration for SNMP Object Identifier
snmpoption	Configuration for SNMP option
snmptrap	Configuration for snmp trap
snmptrap_binding	Binding object showing the resources that can be bound to snmptrap
snmptrap_snmpuser_binding	Binding object showing the snmpuser that can be bound to snmptrap
snmpuser	Configuration for SNMP user
snmpview	Configuration for view

snmpalarm

Configuration for alarm resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trapname	<String>	Read-write	Name of the SNMP alarm. This parameter is required for identifying the SNMP alarm and cannot be modified. Possible values = CPU-USAGE, AVERAGE-CPU, MEMORY, MGMT-CPU-USAGE, SYNFLOOD, TCP-SYNFLOOD, VSERVER-REQRATE, SERVICE-REQRATE, ENTITY-RXRATE, ENTITY-TXRATE, ENTITY-SYNFLOOD, SERVICE-MAXCLIENTS, HA-STATE-CHANGE, ENTITY-STATE, CONFIG-CHANGE, CONFIG-SAVE, SERVICEGROUP-MEMBER-REQRATE, SERVICEGROUP-MEMBER-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			MAXCLIENTS, MONITOR-RTO-THRESHOLD, LOGIN-FAILURE, SSL-CERT-EXPIRY, FAN-SPEED-LOW, VOLTAGE-LOW, VOLTAGE-HIGH, TEMPERATURE-HIGH, CPU-TEMPERATURE-HIGH, POWER-SUPPLY-FAILURE, DISK-USAGE-HIGH, INTERFACE-THROUGHPUT-LOW, MON_PROBE_FAILED, HA-VERSION-MISMATCH, HA-SYNC-FAILURE, HA-NO-HEARTBEATS, HA-BAD-SECONDARY-STATE, INTERFACE-BW-USAGE, RATE-LIMIT-THRESHOLD-EXCEEDED, ENTITY-NAME-CHANGE, HA-PROP-FAILURE, IP-CONFLICT, PF-RL-RATE-THRESHOLD, PF-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RL-PPS-THRESHOLD, PF-RL-RATE-PKTS-DROPPED, PF-RL-PPS-PKTS-DROPPED, APPFW-START-URL, APPFW-DENY-URL, APPFW-VIOLATIONS-TYPE, APPFW-REFERER-HEADER, APPFW-CSRF-TAG, APPFW-COOKIE, APPFW-FIELD-CONSISTENCY, APPFW-BUFFER-OVERFLOW, APPFW-FIELD-FORMAT, APPFW-SAFE-COMMERCE, APPFW-SAFE-OBJECT, APPFW-SESSION-LIMIT, APPFW-POLICY-HIT, APPFW-XSS, APPFW-XML-XSS, APPFW-SQL, APPFW-XML-SQL, APPFW-XML-ATTACHMENT, APPFW-XML-DOS, APPFW-XML-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VALIDATION, APPFW-XML-WSI, APPFW-XML-SCHEMA-COMPILE, APPFW-XML-SOAP-FAULT, APPFW-NEW-SIGNATURE-ADDED, DNSKEY-EXPIRY, HA-LICENSE-MISMATCH, SSL-CARD-FAILED, SSL-CARD-NORMAL, WARM-RESTART-EVENT, HARD-DISK-DRIVE-ERRORS, COMPACT-FLASH-ERRORS, CALLHOME-UPLOAD-EVENT, 1024KEY-EXCHANGE-RATE, 2048KEY-EXCHANGE-RATE, 4096KEY-EXCHANGE-RATE, SSL-CUR-SESSION-INUSE, CLUSTER-NODE-HEALTH, CLUSTER-NODE-QUORUM, CLUSTER-VERSION-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			MISMATCH, CLUSTER-CCO-CHANGE, CLUSTER-OVS-CHANGE, CLUSTER-SYNC-FAILURE, CLUSTER-PROP-FAILURE, HA-STICKY-PRIMARY, INBAND-PROTOCOL-VERSION-MISMATCH, SSL-CHIP-REINIT, VRID-STATE-CHANGE, PORT-ALLOC-FAILED, LLDP-REMOTE-CHANGE, DUPLICATE-IPV6, PARTITION-CONFIG-EVENT, PARTITION-SWITCHED, LSN-PORTALLOC-FAILED, LSN-PORTQUOTA-EXCEED, LSN-SESSIONQUOTA-EXCEED, LSN-MEM-RECOVERY-KICKEDIN, VSERVER-SPILLOVER, PARTITION-RATE-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LIMIT, POOLED-LICENSE-ONGRACE, POOLED-LICENSE-PARTIAL, CLUSTER-BACKPLANE-HB-MISSING, GSLB-SITE-MEP-FLAP, DNS-MAXNEGCACHE-USAGE, DNS-MAXCACHE-USAGE, NS-LICENSE-EXPIRY, PKT-RATELIMITING-ATTACK, GSLB-SYNC-STATUS-FLIP, URLFILT-DB-UPDATE-STATUS, URLFILT-INIT-SDK
thresholdvalue	<Double>	Read-write	Value for the high threshold. The Citrix ADC generates an SNMP trap message when the value of the attribute associated with the alarm is greater than or equal to the specified high threshold value. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
normalvalue	<Double>	Read-write	Value for the normal threshold. A trap message is generated if the value of the respective attribute falls to or below this value after exceeding the high threshold. Minimum value = 1
time	<Double>	Read-write	Interval, in seconds, at which the Citrix ADC generates SNMP trap messages when the conditions specified in the SNMP alarm are met.Can be specified for the following alarms: SYNFLOOD, HA-VERSION-MISMATCH, HA-SYNC-FAILURE, HA-NO-HEARTBEATS,HA-BAD-SECONDARY-STATE, CLUSTER-NODE-HEALTH, CLUSTER-NODE-QUORUM, CLUSTER-VERSION-MISMATCH, CLUSTER-BKHB-FAILED, PORT-ALLOC-FAILED, COMPACT-FLASH-ERRORS, HARD-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DISK-DRIVE-ERRORS and APPFW traps. Default trap time intervals: SYNFLOOD and APPFW traps = 1sec, PORT-ALLOC-FAILED = 3600sec(1 hour), Other Traps = 86400sec(1 day). Default value: 1
state	<String>	Read-write	Current state of the SNMP alarm. The Citrix ADC generates trap messages only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them. Default value: ENABLED Possible values = ENABLED, DISABLED
severity	<String>	Read-write	Severity level assigned to trap messages generated by this alarm. The severity levels are, in increasing order of severity, Informational, Warning, Minor, Major, and Critical.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This parameter is useful when you want the Citrix ADC to send trap messages to a trap listener on the basis of severity level. Trap messages with a severity level lower than the specified level (in the trap listener entry) are not sent. Default value: Unknown Possible values = Critical, Major, Minor, Warning, Informational
logging	<String>	Read-write	Logging status of the alarm. When logging is enabled, the Citrix ADC logs every trap message that is generated for this alarm. Default value: ENABLED Possible values = ENABLED, DISABLED
timeout	<Double>	Read-only	If DB is enabled and clear config is fired, then to reset

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			timeinterval of alarm, corresponding default time value is needed. This hidden argument holds the default time value for the corresponding alarm.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

UPDATE| UNSET| ENABLE| DISABLE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpalarm

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"snmpalarm":{

<b>"trapname":<String_value>,

</b>"thresholdvalue":<Double_value>,

"normalvalue":<Double_value>,

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "snmpalarm": [ { "__count": "#no"} ] }
```

snmpcommunity

Configuration for community resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
communityname	<String>	Read-write	The SNMP community string. Can consist of 1 to 31 characters that include uppercase and lowercase

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			letters,numbers and special characters. The following requirement applies only to the Citrix ADC CLI: If the string includes one or more spaces, enclose the name in double or single quotation marks (for example, "my string" or 'my string'). Minimum length = 1
permissions	<String>	Read-write	The SNMP V1 or V2 query-type privilege that you want to associate with this SNMP community. Possible values = GET, GET_NEXT, GET_BULK, SET, ALL
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpengineid

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"snmpengineid":{

<b>"engineid":<String_value>,

</b>"ownernode":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpengineid?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"snmpengineid":{

"ownernode":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpengineid

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpengineid?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpengineid?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of snmpengineid resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpengineid?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpengineid?**pagesize=#no;pageno=#no**

Use this query-parameter to get the snmpengineid resources in chunks.

HTTP Method:GET

Request Headers:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "snmpengineid": [ { "__count": "#no"} ] }
```

snmpgroup

Configuration for SNMP group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SNMPv3 group. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the SNMPv3 group. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my name" or 'my name'). Minimum length = 1
securitylevel	<String>	Read-write	Security level required for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			communication between the Citrix ADC and the SNMPv3 users who belong to the group. Specify one of the following options: noAuthNoPriv. Require neither authentication nor encryption. authNoPriv. Require authentication but no encryption. authPriv. Require authentication and encryption. Note: If you specify authentication, you must specify an encryption algorithm when you assign an SNMPv3 user to the group. If you also specify encryption, you must assign both an authentication and an encryption algorithm for each group member. Possible values = noAuthNoPriv,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authNoPriv, authPriv
readviewname	<String>	Read-write	Name of the configured SNMPv3 view that you want to bind to this SNMPv3 group. An SNMPv3 user bound to this group can access the subtrees that are bound to this SNMPv3 view as type INCLUDED, but cannot access the ones that are type EXCLUDED. If the Citrix ADC has multiple SNMPv3 view entries with the same name, all such entries are associated with the SNMPv3 group. Minimum length = 1
storagetype	<String>	Read-only	The storage type for this group. Possible values = volatile, nonVolatile
status	<String>	Read-only	The status of this group. Possible values = active
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "snmpgroup": [ { "__count": "#no"} ] }
```

snmpmanager

Configuration for manager resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the SNMP manager. Can be an IPv4 or IPv6 address. You can instead specify an IPv4 network address or IPv6 network prefix if you want the Citrix ADC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to respond to SNMP queries from any device on the specified network. Alternatively, instead of an IPv4 address, you can specify a host name that has been assigned to an SNMP manager. If you do so, you must add a DNS name server that resolves the host name of the SNMP manager to its IP address. Note: The Citrix ADC does not support host names for SNMP managers that have IPv6 addresses. Minimum length = 1 Maximum length = 255
netmask	<String>	Read-write	Subnet mask associated with an IPv4 network address. If the IP address specifies the address or host name of a specific host, accept the default value of 255.255.255.255.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domainresolveretry	<Integer>	Read-write	Amount of time, in seconds, for which the Citrix ADC waits before sending another DNS query to resolve the host name of the SNMP manager if the last query failed. This parameter is valid for host-name based SNMP managers only. After a query succeeds, the TTL determines the wait time. Default value: 5 Minimum value = 5 Maximum value = 20939
ip	<String>	Read-only	The resolved IP address of the hostname manager.
domain	<String>	Read-only	IP address of manager. It will be zero for hostname manager.
__count	<Double>	Read-only	count parameter

snmpmib

Configuration for SNMP mib resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
contact	<String>	Read-write	Name of the administrator for this Citrix ADC. Along with the name, you can include information on how to contact this person, such as a phone number or an email address. Can consist of 1 to 127 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the information includes one or more spaces, enclose it in double or single quotation marks (for example, "my contact" or 'my contact'). Default value: "WebMaster (default)" Minimum length = 1
name	<String>	Read-write	Name for this Citrix ADC. Can consist of 1 to 127 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the Citrix ADC appliance. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my name" or 'my name'). Default value: "Citrix ADC" Minimum length = 1
location	<String>	Read-write	Physical location of the Citrix ADC. For example, you can specify building name, lab number, and rack number. Can consist of 1 to 127 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the location includes one or more spaces, enclose it in double or single quotation marks (for example, "my location" or 'my location'). Default value: "POP (default)" Minimum length = 1
customid	<String>	Read-write	Custom identification number for the Citrix ADC. Can consist of 1 to 127 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a custom identification that helps identify the Citrix ADC appliance. The following requirement applies only to the Citrix ADC CLI: If the ID includes one or more spaces, enclose it in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			double or single quotation marks (for example, "my ID" or 'my ID'). Default value: "Default" Minimum length = 1
ownernode	<Double>	Read-write	ID of the cluster node for which we are setting the mib. This is a mandatory argument to set snmp mib on CLIP. Default value: -1 Minimum value = 0 Maximum value = 31
sysdesc	<String>	Read-only	The description of the system.
sysuptime	<Double>	Read-only	The UP time of the system in 100th of a second.
sysservices	<Double>	Read-only	The services offered by the system.
sysoid	<String>	Read-only	The OID of the system's management system.
__count	<Double>	Read-only	count parameter

GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpoid

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpoid?**args=entitytype:<String_value>,name:<String_value>**

Use this query-parameter to get snmpoid resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpoid?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpoid?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of snmpoid resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpoid?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpoid?**pagesize=#no;pageno=#no**

Use this query-parameter to get the snmpoid resources in chunks.

HTTP Method:GET

Request Headers:

```

snmpoption

Configuration for SNMP option resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
snmpset	<String>	Read-write	Accept SNMP SET requests sent to the Citrix ADC, and allow SNMP managers to write values to MIB objects that are configured for write access.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
snmptraplogging	<String>	Read-write	Log any SNMP trap events (for SNMP alarms in which logging is enabled) even if no trap listeners are configured. With the default setting, SNMP trap events are logged if at least one trap listener is configured on the appliance. Default value: DISABLED Possible values = ENABLED, DISABLED
partitionnameintrap	<String>	Read-write	Send partition name as a varbind in traps. By default the partition names are not sent as a varbind. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
snmptraploggingl evel	<String>	Read-write	Audit log level of SNMP trap logs. The default value is INFORMATIONAL. Default value: INFORMATIONAL Possible values = EMERGENCY, ALERT, CRITICAL, ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG

snmptrap

Configuration for snmp trap resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trapclass	<String>	Read-write	Type of trap messages that the Citrix ADC sends to the trap listener: Generic or the enterprise-specific messages defined in the MIB file.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = generic, specific
trapdestination	<String>	Read-write	IPv4 or the IPv6 address of the trap listener to which the Citrix ADC is to send SNMP trap messages. Minimum length = 1
version	<String>	Read-write	SNMP version, which determines the format of trap messages sent to the trap listener. This setting must match the setting on the trap listener. Otherwise, the listener drops the trap messages. Default value: V2 Possible values = V1, V2, V3
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4094
destport	<Integer>	Read-write	UDP port at which the trap listener listens for trap messages. This setting must match the setting on the trap listener. Otherwise, the listener drops the trap messages. Default value: 162 Minimum value = 1 Maximum value = 65534
communityname	<String>	Read-write	Password (string) sent with the trap messages, so that the trap listener can authenticate them. Can include 1 to 31 uppercase or lowercase letters, numbers, and hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) characters. You must specify the same community string on the trap listener

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			device. Otherwise, the trap listener drops the trap messages. The following requirement applies only to the Citrix ADC CLI: If the string includes one or more spaces, enclose the name in double or single quotation marks (for example, "my string" or 'my string').
srcip	<String>	Read-write	IPv4 or IPv6 address that the Citrix ADC inserts as the source IP address in all SNMP trap messages that it sends to this trap listener. By default this is the appliance's NSIP or NSIP6 address, but you can specify an IPv4 MIP or SNIP/ SNIP6 address. In cluster setup, the default value is the individual node's NSIP, but it can be set to CLIP or Striped SNIP address. In non

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			default partition, this parameter must be set to the SNIP/ SNIP6 address. Minimum length = 1
severity	<String>	Read-write	Severity level at or above which the Citrix ADC sends trap messages to this trap listener. The severity levels, in increasing order of severity, are Informational, Warning, Minor, Major, Critical. This parameter can be set for trap listeners of type SPECIFIC only. The default is to send all levels of trap messages. Important: Trap messages are not assigned severity levels unless you specify severity levels when configuring SNMP alarms. Default value: Unknown Possible values = Critical, Major, Minor, Warning, Informational

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
allpartitions	<String>	Read-write	Send traps of all partitions to this destination. Default value: DISABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Response Payload:

```
{ "snmptrap_snmpuser_binding": [ { "__count": "#no"} ] }
```

snmpuser

Configuration for SNMP user resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SNMPv3 user. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my user" or 'my user'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
group	<String>	Read-write	Name of the configured SNMPv3 group to which to bind this SNMPv3 user. The access rights (bound SNMPv3 views) and security level set for this group are assigned to this user. Minimum length = 1
authtype	<String>	Read-write	Authentication algorithm used by the Citrix ADC and the SNMPv3 user for authenticating the communication between them. You must specify the same authentication algorithm when you configure the SNMPv3 user in the SNMP manager. Possible values = MD5, SHA
authpasswd	<String>	Read-write	Plain-text pass phrase to be used by the authentication algorithm specified by the authType (Authentication Type) parameter. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI: If the pass phrase includes one or more spaces, enclose it in double or single quotation marks (for example, "my phrase" or 'my phrase'). Minimum length = 8
privtype	<String>	Read-write	Encryption algorithm used by the Citrix ADC and the SNMPv3 user for encrypting the communication between them. You must specify the same encryption algorithm when you configure the SNMPv3 user in the SNMP manager. Possible values = DES, AES

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
privpasswd	<String>	Read-write	Encryption key to be used by the encryption algorithm specified by the privType (Encryption Type) parameter. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI: If the key includes one or more spaces, enclose it in double or single quotation marks (for example, "my key" or 'my key'). Minimum length = 8
engineid	<String>	Read-only	The context engine ID of the user.
storagetype	<String>	Read-only	The storage type for this user.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = volatile, nonVolatile
status	<String>	Read-only	The status of this user. Possible values = active
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpuser

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"snmpuser":{

<b>"name":<String_value>,

</b><b>"group":<String_value>,

</b>"authtype":<String_value>,

"authpasswd":<String_value>,

"privtype":<String_value>,

"privpasswd":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpuser/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpuser

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"snmpuser":{

<b>"name":<String_value>,

</b>"group":<String_value>,

"authtype":<String_value>,

"authpasswd":<String_value>,

"privtype":<String_value>,

"privpasswd":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpuser?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"snmpuser":{

<b>"name":<String_value>,

</b>"authtype":true,

"privtype":true,

"authpasswd":true,

"privpasswd":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpuser

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpuser?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpuser?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of snmpuser resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpuser?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/snmpuser?**pagesize=#no;pageno=#no**

Use this query-parameter to get the snmpuser resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "snmpuser": [ {

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "snmpuser": [ { "__count": "#no"} ] }
```

snmpview

Configuration for view resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SNMPv3 view. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the SNMPv3 view.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my view" or 'my view'). Minimum length = 1
subtree	<String>	Read-write	A particular branch (subtree) of the MIB tree that you want to associate with this SNMPv3 view. You must specify the subtree as an SNMP OID. Minimum length = 1
type	<String>	Read-write	Include or exclude the subtree, specified by the subtree parameter, in or from this view. This setting can be useful when you have included a subtree, such as A, in an SNMPv3 view and you want to exclude a specific subtree of A, such as B, from the SNMPv3 view.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = included, excluded
storagetype	<String>	Read-only	The storage type for this view. Possible values = volatile, nonVolatile
status	<String>	Read-only	The status of this view. Possible values = active
__count	<Double>	Read-only	count parameter

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"spilloverpolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"action":<String_value>,

"comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unset

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy?**action=unset**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"spilloverpolicy":{

<b>"name":<String_value>,

</b>"comment":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

rename

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy?**action=rename**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"spilloverpolicy":{

<b>"name":<String_value>,

</b><b>"newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of spilloverpolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the spilloverpolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

"undefhits":<Double_value>,

"comment":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "spilloverpolicy": [ { "__count": "#no"} ] }
```

spilloverpolicy_binding

Binding object which returns the resources bound to spilloverpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the spillover policy.
spilloverpolicy_gslbvserver_binding	<spilloverpolicy_gslbvserver_binding[]>	Read-only	gslbvserver that can be bound to spilloverpolicy.
spilloverpolicy_csvserver_binding	<spilloverpolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to spilloverpolicy.
spilloverpolicy_lbvserver_binding	<spilloverpolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to spilloverpolicy.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "spilloverpolicy_binding": [ {

"name":<String_value>,

"spilloverpolicy_csvserver_binding":<spilloverpolicy_csvserver_binding[]_v
alue>,

"spilloverpolicy_lbvserver_binding":<spilloverpolicy_lbvserver_binding[]_v
alue>,

"spilloverpolicy_gslbvserver_binding":<spilloverpolicy_gslbvserver_binding
[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/spilloverpolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "spilloverpolicy_binding": [ {

"name":<String_value>,

"spilloverpolicy_csvserver_binding":<spilloverpolicy_csvserver_binding[]_value>,

"spilloverpolicy_lbvserver_binding":<spilloverpolicy_lbvserver_binding[]_value>,

"spilloverpolicy_gslbvserver_binding":<spilloverpolicy_gslbvserver_binding[]_value>

}]}
```

spilloverpolicy_csvserver_binding

Binding object showing the csvserver that can be bound to spilloverpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The name of the entity to which the policy is bound.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the spillover policy.
priority	<Double>	Read-only	Specifies the priority of the policy.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
activepolicy	<Double>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

sslservicegroup_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslservicegroup
sslservicegroup_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslservicegroup
sslvserver	Configuration for SSL virtual server

NAME	DESCRIPTION
sslvserver_binding	Binding object showing the resources that can be bound to sslvserver
sslvserver_ecccurve_binding	Binding object showing the ecccurve that can be bound to sslvserver
sslvserver_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslvserver
sslvserver_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslvserver
sslvserver_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslvserver
sslvserver_sslpolicy_binding	Binding object showing the sslpolicy that can be bound to sslvserver
sslwrapkey	Configuration for WRAP key

sslaction

Configuration for SSL action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SSL action. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. Cannot be changed after the action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
clientauth	<String>	Read-write	Perform client certificate authentication. Possible values = DOCLIENTAUTH, NOCLIENTAUTH
clientcertverification	<String>	Read-write	Client certificate verification is mandatory or optional. Default value: Mandatory Possible values = Mandatory, Optional
ssllogprofile	<String>	Read-write	The name of the ssllogprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
clientcert	<String>	Read-write	Insert the entire client certificate into the HTTP header of the request being sent to the web server. The certificate is inserted in ASCII (PEM) format. Possible values = ENABLED, DISABLED
certheader	<String>	Read-write	Name of the header into which to insert the client certificate.
clientcertserialnumber	<String>	Read-write	Insert the entire client serial number into the HTTP header of the request being sent to the web server. Possible values = ENABLED, DISABLED
certserialheader	<String>	Read-write	Name of the header into which to insert the client serial number.
clientcertsubject	<String>	Read-write	Insert the client certificate subject, also known as the distinguished name

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(DN), into the HTTP header of the request being sent to the web server. Possible values = ENABLED, DISABLED
certsubjectheader	<String>	Read-write	Name of the header into which to insert the client certificate subject.
clientcerthash	<String>	Read-write	Insert the certificate's signature into the HTTP header of the request being sent to the web server. The signature is the value extracted directly from the X.509 certificate signature field. All X.509 certificates contain a signature field. Possible values = ENABLED, DISABLED
certhashheader	<String>	Read-write	Name of the header into which to insert the client certificate signature (hash).
clientcertfingerprint	<String>	Read-write	Insert the certificate's fingerprint into the HTTP header of the request being sent to the web server. The fingerprint is derived by computing the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified hash value (SHA256, for example) of the DER-encoding of the client certificate. Possible values = ENABLED, DISABLED
certfingerprintheader	<String>	Read-write	Name of the header into which to insert the client certificate fingerprint.
certfingerprintdigest	<String>	Read-write	Digest algorithm used to compute the fingerprint of the client certificate. Possible values = SHA1, SHA224, SHA256, SHA384, SHA512
clientcertissuer	<String>	Read-write	Insert the certificate issuer details into the HTTP header of the request being sent to the web server. Possible values = ENABLED, DISABLED
certissuerheader	<String>	Read-write	Name of the header into which to insert the client certificate issuer details.
sessionid	<String>	Read-write	Insert the SSL session ID into the HTTP header of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			request being sent to the web server. Every SSL connection that the client and the Citrix ADC share has a unique ID that identifies the specific connection. Possible values = ENABLED, DISABLED
sessionidheader	<String>	Read-write	Name of the header into which to insert the Session ID.
cipher	<String>	Read-write	Insert the cipher suite that the client and the Citrix ADC negotiated for the SSL session into the HTTP header of the request being sent to the web server. The appliance inserts the cipher-suite name, SSL protocol, export or non-export string, and cipher strength bit, depending on the type of browser connecting to the SSL virtual server or service (for example, Cipher-Suite: RC4-MD5 SSLv3 Non-Export 128-bit).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
cipherheader	<String>	Read-write	Name of the header into which to insert the name of the cipher suite.
clientcertnotbefore	<String>	Read-write	Insert the date from which the certificate is valid into the HTTP header of the request being sent to the web server. Every certificate is configured with the date and time from which it is valid. Possible values = ENABLED, DISABLED
certnotbeforeheader	<String>	Read-write	Name of the header into which to insert the date and time from which the certificate is valid.
clientcertnotafter	<String>	Read-write	Insert the date of expiry of the certificate into the HTTP header of the request being sent to the web server. Every certificate is configured with the date and time at which the certificate expires.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
certnotafterheader	<String>	Read-write	Name of the header into which to insert the certificate's expiry date.
owasupport	<String>	Read-write	If the appliance is in front of an Outlook Web Access (OWA) server, insert a special header field, FRONT-END-HTTPS: ON, into the HTTP requests going to the OWA server. This header communicates to the server that the transaction is HTTPS and not HTTP. Possible values = ENABLED, DISABLED
forward	<String>	Read-write	This action takes an argument a vserver name, to this vserver one will be able to forward all the packets. Minimum length = 1 Maximum length = 127
cacertgrpname	<String>	Read-write	This action will allow to pick CA(s) from

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the specific CA group, to verify the client certificate. Minimum length = 1 Maximum length = 31
hits	<Double>	Read-only	The number of times the action has been taken.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Double>	Read-only	The number of references to the action.
description	<String>	Read-only	Description of the action.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

sslcert

Configuration for cerificate resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certfile	<String>	Read-write	Name for and, optionally, path to the generated certificate file. /nsconfig/ssl/ is the default path. Maximum length = 63
reqfile	<String>	Read-write	Name for and, optionally, path to the certificate-signing request (CSR). /nsconfig/ssl/ is the default path. Maximum length = 63

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certtype	<String>	Read-write	Type of certificate to generate. Specify one of the following: * ROOT_CERT - Self-signed Root-CA certificate. You must specify the key file name. The generated Root-CA certificate can be used for signing end-user client or server certificates or to create Intermediate-CA certificates. * INTM_CERT - Intermediate-CA certificate. * CLNT_CERT - End-user client certificate used for client authentication. * SRVR_CERT - SSL server certificate used on SSL servers for end-to-end encryption. Possible values = ROOT_CERT, INTM_CERT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CLNT_CERT, SRVR_CERT
keyfile	<String>	Read-write	Name for and, optionally, path to the private key. You can either use an existing RSA or DSA key that you own or create a new private key on the Citrix ADC. This file is required only when creating a self-signed Root-CA certificate. The key file is stored in the /nsconfig/ssl directory by default. If the input key specified is an encrypted key, you are prompted to enter the PEM pass phrase that was used for encrypting the key. Maximum length = 63
keyform	<String>	Read-write	Format in which the key is stored on the appliance. Default value: PEM Possible values = DER, PEM
pempassphrase	<String>	Read-write	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 31
days	<Double>	Read-write	Number of days for which the certificate will be valid, beginning with the time and day (system time) of creation. Default value: 365 Minimum value = 1 Maximum value = 3650
subjectaltname	<String>	Read-write	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). Names include: 1. Email addresses 2. IP addresses 3. URIs

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			4. DNS names (This is usually also provided as the Common Name RDN within the Subject field of the main certificate.) 5. directory names (alternative Distinguished Names to that given in the Subject). Minimum length = 1
certform	<String>	Read-write	Format in which the certificate is stored on the appliance. Default value: PEM Possible values = DER, PEM
cacert	<String>	Read-write	Name of the CA certificate file that issues and signs the Intermediate-CA certificate or the end-user client and server certificates. Maximum length = 63
cacertform	<String>	Read-write	Format of the CA certificate. Default value: PEM

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DER, PEM
cakey	<String>	Read-write	Private key, associated with the CA certificate that is used to sign the Intermediate-CA certificate or the end-user client and server certificate. If the CA key file is password protected, the user is prompted to enter the pass phrase that was used to encrypt the key. Maximum length = 63
cakeyform	<String>	Read-write	Format for the CA certificate. Default value: PEM Possible values = DER, PEM
caserial	<String>	Read-write	Serial number file maintained for the CA certificate. This file contains the serial number of the next certificate to be issued or signed by the CA. If the specified file does not exist, a new file is created, with /nsconfig/ssl/ as the default path. If you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			do not specify a proper path for the existing serial file, a new serial file is created. This might change the certificate serial numbers assigned by the CA certificate to each of the certificates it signs. Maximum length = 63

Operations

(click to see Properties)

CREATE

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

create

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcert?**action=create**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslcert":{

<b>"certfile":<String_value>,

</b><b>"reqfile":<String_value>,

</b><b>"certtype":<String_value>,

</b>"keyfile":<String_value>,

"keyform":<String_value>,

"pempassphrase":<String_value>,

"days":<Double_value>,

"subjectaltname":<String_value>,

"cacert":<String_value>,

"cacertform":<String_value>,
```

```
"cakey":<String_value>,

"cakeyform":<String_value>,

"caserial":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

sslcertbundle

Configuration for Imported Certbundle resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported certificate bundle. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the certificate bundle to be imported or exported. For example, http://www.example.com/cert_bundle_file. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
inuse	<String>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertbundle?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertbundle?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcertbundle resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertbundle?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertbundle?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertbundle resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertbundle": [ {

"name":<String_value>,

"inuse":<String_value>,

"src":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertbundle?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertbundle": [ { "__count": "#no"} ] }
```

sslcertchain

Configuration for CERT Chain resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkeyname	<String>	Read-write	Name of the Certificate. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcertchain resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertchain resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertchain": [ {

"certkeyname":<String_value>,

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain/certkeyname_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain/certkeyname_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain/certkeyname_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertchain": [ {

"certkeyname":<String_value>,

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain?**count=yes**

HTTP Method:GET

Request Headers:

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain_binding/certkeyname_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertchain_binding": [ {

"certkeyname":<String_value>,

"sslcertchain_sslcertkey_binding":<sslcertchain_sslcertkey_binding[]_value
>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertchain_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertchain_binding": [ {
```

```
"certkeyname":<String_value>,

"sslcertchain_sslcertkey_binding":<sslcertchain_sslcertkey_binding[]_value
>

}]}
```

sslcertchain_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslcertchain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linkcertkeyname	<String>	Read-write	Name of the Linked Certificate. Minimum length = 1
certkeyname	<String>	Read-write	Name of the Certificate. Minimum length = 1
isca	<Boolean>	Read-only	Used to find if certificate is a CA.
islinked	<Boolean>	Read-only	Used to find if certificate is linked.
addsubject	<Boolean>	Read-only	Used to find if certificate is linked.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

sslcertkey

Configuration for certificate key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkey	<String>	Read-write	Name for the certificate and private-key pair. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my cert" or 'my cert'). Minimum length = 1
cert	<String>	Read-write	Name of and, optionally, path to the X509 certificate file that is used to form the certificate-key pair. The certificate file should be present on the appliance's hard-disk drive or solid-state drive. Storing a certificate in any location other than the default might cause inconsistency in a high availability setup. /nsconfig/ssl/ is the default path. Minimum length = 1
key	<String>	Read-write	Name of and, optionally, path to the private-key file that is used to form the certificate-key pair. The certificate file should be present on the appliance's hard-disk drive or solid-state drive. Storing a certificate in any location other than the default might cause inconsistency in a high availability

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			setup. /nsconfig/ssl/ is the default path. Minimum length = 1
password	<Boolean>	Read-write	Passphrase that was used to encrypt the private-key. Use this option to load encrypted private-keys in PEM format.
fipskey	<String>	Read-write	Name of the FIPS key that was created inside the Hardware Security Module (HSM) of a FIPS appliance, or a key that was imported into the HSM. Minimum length = 1
hsmkey	<String>	Read-write	Name of the HSM key that was created in the External Hardware Security Module (HSM) of a FIPS appliance. Minimum length = 1
inform	<String>	Read-write	Input format of the certificate and the private-key files. The three formats supported by the appliance are: PEM - Privacy Enhanced Mail DER - Distinguished Encoding Rule

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			PFX - Personal Information Exchange. Default value: PEM Possible values = DER, PEM, PFX
passplain	<String>	Read-write	Pass phrase used to encrypt the private-key. Required when adding an encrypted private-key in PEM format. Minimum length = 1
expirymonitor	<String>	Read-write	Issue an alert when the certificate is about to expire. Possible values = ENABLED, DISABLED
notificationperiod	<Double>	Read-write	Time, in number of days, before certificate expiration, at which to generate an alert that the certificate is about to expire. Minimum value = 10 Maximum value = 100
bundle	<String>	Read-write	Parse the certificate chain as a single file after linking the server certificate to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			its issuer's certificate within the file. Default value: NO Possible values = YES, NO
deletefromdevice	<Boolean>	Read-write	Delete cert/key file from file system.
linkcertkeyname	<String>	Read-write	Name of the Certificate Authority certificate-key pair to which to link a certificate-key pair. Minimum length = 1
nodomaincheck	<Boolean>	Read-write	Override the check for matching domain names during a certificate update operation.
ocspstaplingcache	<Boolean>	Read-write	Clear cached ocspStapling response in certkey.
signaturealg	<String>	Read-only	Signature algorithm.
certificatetype	<String[]>	Read-only	Specifies whether the certificate is of type root-CA, intermediate-CA, server, client, or client and server. Possible values = ROOT_CERT, INTM_CERT, CLNT_CERT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SRVR_CERT, UNKNOWN_CERT
serial	<String>	Read-only	Serial number.
issuer	<String>	Read-only	Issuer name.
clientcertnotbefore	<String>	Read-only	Not-Before date.
clientcertnotafter	<String>	Read-only	Not-After date.
daystoexpiration	<Integer>	Read-only	Days remaining for the certificate to expire.
subject	<String>	Read-only	Subject name.
publickey	<String>	Read-only	Public key algorithm.
publickeysize	<Integer>	Read-only	Size of the public key.
version	<Integer>	Read-only	Version.
priority	<Double>	Read-only	ocsp priority.
status	<String>	Read-only	Status of the certificate. Possible values = Valid, Not yet valid, Expired
passcrypt	<String>	Read-only	Passcrypt. Minimum length = 1
data	<Double>	Read-only	Vserver Id.
servicename	<String>	Read-only	Service name to which the certificate key pair is bound.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ocspresponsestatus	<String>	Read-only	Ocsp response status of the certificate. Possible values = NONE, EXPIRED, VALID
__count	<Double>	Read-only	count parameter

```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

link

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?**action=link**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>,

</b><b>"linkcertkeyname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

unlink

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?**action=unlink**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

change

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?**action=update**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>,

</b>"cert":<String_value>,

"key":<String_value>,

"password":<Boolean_value>,

"fipskey":<String_value>,

"inform":<String_value>,

"passplain":<String_value>,

"nodomaincheck":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

clear

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?**action=clear**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>"certkey":<String_value>,

</b>"ocspstaplingcache":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcertkey resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

```

sslcertkey_binding

Binding object which returns the resources bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkey	<String>	Read-write	Name of the certificate-key pair for which to show detailed information. Minimum length = 1
sslcertkey_crldistribution_binding	<sslcertkey_crldistribution_binding[]>	Read-only	crldistribution that can be bound to sslcertkey.
sslcertkey_sslvserver_binding	<sslcertkey_sslvserver_binding[]>	Read-only	sslvserver that can be bound to sslcertkey.
sslcertkey_sslocspresponder_binding	<sslcertkey_sslocspresponder_binding[]>	Read-only	sslocspresponder that can be bound to sslcertkey.
sslcertkey_service_binding	<sslcertkey_service_binding[]>	Read-only	service that can be bound to sslcertkey.
sslcertkey_sslprofile_binding	<sslcertkey_sslprofile_binding[]>	Read-only	sslprofile that can be bound to sslcertkey.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_binding/certkey_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertkey_binding": [ {
```

```
"certkey":<String_value>,

"sslcertkey_sslprofile_binding":<sslcertkey_sslprofile_binding[]_value>,

"sslcertkey_sslocspresponder_binding":<sslcertkey_sslocspresponder_binding
[]_value>,

"sslcertkey_service_binding":<sslcertkey_service_binding[]_value>,

"sslcertkey_crldistribution_binding":<sslcertkey_crldistribution_binding[]
_value>,

"sslcertkey_sslvserver_binding":<sslcertkey_sslvserver_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertkey_binding": [ {

"certkey":<String_value>,

"sslcertkey_sslprofile_binding":<sslcertkey_sslprofile_binding[]_value>,

"sslcertkey_sslocspresponder_binding":<sslcertkey_sslocspresponder_binding
[]_value>,

"sslcertkey_service_binding":<sslcertkey_service_binding[]_value>,

"sslcertkey_crldistribution_binding":<sslcertkey_crldistribution_binding[]
_value>,

"sslcertkey_sslvserver_binding":<sslcertkey_sslvserver_binding[]_value>

}]}
```

sslcertkey_crldistribution_binding

Binding object showing the crldistribution that can be bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	The certificate-key pair being unbound is a Certificate Authority (CA) certificate. If you choose this option, the certificate-key pair is unbound from the list of CA certificates that were bound to the specified SSL virtual

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			server or SSL service.
issuer	<String>	Read-write	Issuer name.
certkey	<String>	Read-write	Name of the certificate-key pair. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_crldistribution_binding/certkey_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_crldistribution_binding/certkey_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcertkey_crldistribution_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_crldistribution_binding/certkey_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey_crldistribution_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertkey_crldistribution_binding": [ {

"ca":<Boolean_value>,

"issuer":<String_value>,

"certkey":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_crldistribution_binding

Query-parameters:

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"sslcertkey_crldistribution_binding": [ { "__count": "#no"} ] }
```

sslcertkey_service_binding

Binding object showing the service that can be bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The name of the SSL service group to which the certificate-key pair needs to be bound. Use the "add servicegroup" command to create this service. Minimum length = 1
ca	<Boolean>	Read-write	The certificate-key pair being unbound is a Certificate Authority (CA) certificate. If you choose this option, the certificate-key pair is unbound from the list of CA certificates that were bound to the specified SSL virtual server or SSL service.
service	<Boolean>	Read-write	Bind the certificate to the named SSL service or service group.
servicename	<String>	Read-write	Service name to which the certificate key pair is bound.
certkey	<String>	Read-write	Name of the certificate-key pair. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
version	<Integer>	Read-only	Version.
data	<Double>	Read-only	Vserver Id.
__count	<Double>	Read-only	count parameter

Operations

{"sslcertkey_sslocspresponder_binding": [ { "__count": "#no"} ] }
```

sslcertkey_sslprofile_binding

Binding object showing the sslprofile that can be bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	The certificate-key pair being unbound is a Certificate Authority (CA) certificate. If you choose this option, the certificate-key pair is unbound from the list of CA certificates that were bound to the specified SSL virtual server or SSL service.
sslprofile	<String>	Read-write	SSL profile name to which the certificate key pair is bound.
certkey	<String>	Read-write	Name of the certificate-key pair. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_sslprofile_binding/certkey_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_sslprofile_binding/certkey_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcertkey_sslprofile_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_sslprofile_binding/certkey_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey_sslprofile_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertkey_sslprofile_binding": [ {

"ca":<Boolean_value>,

"sslprofile":<String_value>,

"certkey":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_sslprofile_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcertkey_sslprofile_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcertkey_sslprofile_binding": [ {

"ca":<Boolean_value>,

sslcertreq

Configuration for certificate request resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqfile	<String>	Read-write	Name for and, optionally, path to the certificate signing request (CSR). /nsconfig/ssl/ is the default path. Maximum length = 63
keyfile	<String>	Read-write	Name of and, optionally, path to the private key used to create the certificate signing request, which then becomes part of the certificate-key pair. The private key can be either an RSA or a DSA key. The key must be present in the appliance's local storage. /nsconfig/ssl is the default path. Maximum length = 63
subjectaltname	<String>	Read-write	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Names" (SAN). Names include: 1. Email addresses 2. IP addresses 3. URIs 4. DNS names (this is usually also provided as the Common Name RDN within the Subject field of the main certificate.) 5. Directory names (alternative Distinguished Names to that given in the Subject). Minimum length = 1
fipskeyname	<String>	Read-write	Name of the FIPS key used to create the certificate signing request. FIPS keys are created inside the Hardware Security Module of the FIPS card. Minimum length = 1 Maximum length = 31
keyform	<String>	Read-write	Format in which the key is stored on the appliance.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: PEM Possible values = DER, PEM
pempassphrase	<String>	Read-write	. Minimum length = 1 Maximum length = 31
countryname	<String>	Read-write	Two letter ISO code for your country. For example, US for United States. Minimum length = 2 Maximum length = 2
statename	<String>	Read-write	Full name of the state or province where your organization is located. Do not abbreviate. Minimum length = 1
organizationname	<String>	Read-write	Name of the organization that will use this certificate. The organization name (corporation, limited partnership, university, or government agency) must be registered with some authority at the national, state, or city level. Use the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			legal name under which the organization is registered. Do not abbreviate the organization name and do not use the following characters in the name: Angle brackets (< >) tilde (~), exclamation mark, at (@), pound (#), zero (0), caret (\^), asterisk (*), forward slash (/), square brackets ([ ]), question mark (?). Minimum length = 1
organizationunitname	<String>	Read-write	Name of the division or section in the organization that will use the certificate. Minimum length = 1
localityname	<String>	Read-write	Name of the city or town in which your organization's head office is located. Minimum length = 1
commonname	<String>	Read-write	Fully qualified domain name for the company or web site. The common name

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must match the name used by DNS servers to do a DNS lookup of your server. Most browsers use this information for authenticating the server's certificate during the SSL handshake. If the server name in the URL does not match the common name as given in the server certificate, the browser terminates the SSL handshake or prompts the user with a warning message. Do not use wildcard characters, such as asterisk (*) or question mark (?), and do not use an IP address as the common name. The common name must not contain the protocol specifier <http://> or <https://>. Minimum length = 1
emailaddress	<String>	Read-write	Contact person's e-mail address. This address is publically displayed as part of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the certificate. Provide an e-mail address that is monitored by an administrator who can be contacted about the certificate. Minimum length = 1
challengepassword	<String>	Read-write	Pass phrase, embedded in the certificate signing request that is shared only between the client or server requesting the certificate and the SSL certificate issuer (typically the certificate authority). This pass phrase can be used to authenticate a client or server that is requesting a certificate from the certificate authority. Minimum length = 4
companyname	<String>	Read-write	Additional name for the company or web site. Minimum length = 1
digestmethod	<String>	Read-write	Digest algorithm used in creating CSR. Possible values = SHA1, SHA256

Operations

"companyname":<String_value>,
"digestmethod":<String_value>
}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

sslcipher

Configuration for cipher resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphergroupname	<String>	Read-write	Name for the user-defined cipher group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the cipher group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my ciphergroup" or 'my ciphergroup'). Minimum length = 1
ciphgrpalias	<String>	Read-write	The individual cipher name(s), a user-defined cipher group, or a system predefined cipher alias that will be added to the predefined cipher alias that will be added to the group cipherGroupName. If a cipher alias or a cipher group is specified, all the individual ciphers in the cipher alias or group will be added to the user-defined cipher group. Minimum length = 1
ciphername	<String>	Read-write	Cipher name.
cipherpriority	<Double>	Read-write	This indicates priority assigned to the particular cipher. Minimum value = 1
sslprofile	<String>	Read-write	Name of the profile to which cipher is attached.
__count	<Double>	Read-only	count parameter

GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslciphersuite

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslciphersuite?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslciphersuite?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslciphersuite resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslciphersuite?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslciphersuite?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslciphersuite resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslciphersuite": [ {

"ciphername":<String_value>,

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcipher_sslprofile_binding/ciphergroupname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcipher_sslprofile_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcipher_sslprofile_binding/ciphergroupname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcipher_sslprofile_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcipher_sslprofile_binding": [ {

"cipherpriority":<Double_value>,

"ciphgrpals":<String_value>,

"description":<String_value>,

"sslprofile":<String_value>,

"ciphergroupname":<String_value>,

"cipheroperation":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcipher_sslprofile_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcipher_sslprofile_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcipher_sslprofile_binding": [ {

"cipherpriority":<Double_value>,

"ciphgrpals":<String_value>,

"description":<String_value>,

"sslprofile":<String_value>,

"ciphergroupname":<String_value>,

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcipher_sslprofile_binding/ciphergroupname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"sslcipher_sslprofile_binding": [ { "__count": "#no"} ] }
```

sslcipher_sslvserver_binding

Binding object showing the sslvserver that can be bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherpriority	<Double>	Read-write	Priority of the cipher to be added. Minimum value = 1 Maximum value = 1000
ciphgrpals	<String>	Read-write	A cipher-suite can consist of an individual cipher name, the system predefined cipher-alias name, or user defined cipher-group name. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserver	<Boolean>	Read-write	Select the -vServer flag when the cipher operation is performed on an SSL virtual server. Note: By default the bind ssl cipher command internally assumes the flag of -vServer argument. Hence, while working with the SSL vserver, you need not specify this flag.
vservername	<String>	Read-write	The name of the SSL virtual server to which the cipher-suite is to be bound. Minimum length = 1
ciphergroupname	<String>	Read-write	Name of the user-defined cipher group. Minimum length = 1
cipheroperation	<String>	Read-write	The operation that is performed when adding the cipher-suite. Possible cipher operations are: ADD - Appends the given cipher-suite to the existing one configured for the virtual server. REM - Removes the given cipher-suite from the existing one configured for the virtual server. ORD - Overrides the current

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configured cipher-suite for the virtual server with the given cipher-suite. Default value: 0 Possible values = ADD, REM, ORD

Operations

(click to see Properties)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

sslcrl

Configuration for Certificate Revocation List resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crlname	<String>	Read-write	Name for the Certificate Revocation List (CRL). Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CRL is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my crl" or 'my crl'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crlpath	<String>	Read-write	Path to the CRL file. /var/netscaler/ssl/ is the default path. Minimum length = 1
inform	<String>	Read-write	Input format of the CRL file. The two formats supported on the appliance are: PEM - Privacy Enhanced Mail. DER - Distinguished Encoding Rule. Default value: PEM Possible values = DER, PEM
refresh	<String>	Read-write	Set CRL auto refresh. Possible values = ENABLED, DISABLED
cacert	<String>	Read-write	CA certificate that has issued the CRL. Required if CRL Auto Refresh is selected. Install the CA certificate on the appliance before adding the CRL. Minimum length = 1
method	<String>	Read-write	Method for CRL refresh. If LDAP is selected, specify the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			method, CA certificate, base DN, port, and LDAP server name. If HTTP is selected, specify the CA certificate, method, URL, and port. Cannot be changed after a CRL is added. Possible values = HTTP, LDAP
server	<String>	Read-write	IP address of the LDAP server from which to fetch the CRLs. Minimum length = 1
url	<String>	Read-write	URL of the CRL distribution point.
port	<Integer>	Read-write	Port for the LDAP server. Minimum value = 1
basedn	<String>	Read-write	Base distinguished name (DN), which is used in an LDAP search to search for a CRL. Citrix recommends searching for the Base DN instead of the Issuer Name from the CA certificate, because the Issuer Name field might not exactly match the LDAP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			directory structure's DN. Minimum length = 1
scope	<String>	Read-write	Extent of the search operation on the LDAP server. Available settings function as follows: One - One level below Base DN. Base - Exactly the same level as Base DN. Default value: One Possible values = Base, One
interval	<String>	Read-write	CRL refresh interval. Use the NONE setting to unset this parameter. Possible values = MONTHLY, WEEKLY, DAILY, NONE
day	<Integer>	Read-write	Day on which to refresh the CRL, or, if the Interval parameter is not set, the number of days after which to refresh the CRL. If Interval is set to MONTHLY, specify the date. If Interval is set to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			WEEKLY, specify the day of the week (for example, Sun=0 and Sat=6). This parameter is not applicable if the Interval is set to DAILY. Minimum value = 0 Maximum value = 31
time	<String>	Read-write	Time, in hours (1-24) and minutes (1-60), at which to refresh the CRL.
binddn	<String>	Read-write	Bind distinguished name (DN) to be used to access the CRL object in the LDAP repository if access to the LDAP repository is restricted or anonymous access is not allowed. Minimum length = 1
password	<String>	Read-write	Password to access the CRL in the LDAP repository if access to the LDAP repository is restricted or anonymous access is not allowed. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
binary	<String>	Read-write	Set the LDAP-based CRL retrieval mode to binary. Default value: NO Possible values = YES, NO
cacertfile	<String>	Read-write	Name of and, optionally, path to the CA certificate file. /nsconfig/ssl/ is the default path. Maximum length = 63
cakeyfile	<String>	Read-write	Name of and, optionally, path to the CA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
indexfile	<String>	Read-write	Name of and, optionally, path to the file containing the serial numbers of all the certificates that are revoked. Revoked certificates are appended to the file. /nsconfig/ssl/ is the default path. Maximum length = 63
revoke	<String>	Read-write	Name of and, optionally, path to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate to be revoked. /nsconfig/ssl/ is the default path. Maximum length = 63
gencrl	<String>	Read-write	Name of and, optionally, path to the CRL file to be generated. The list of certificates that have been revoked is obtained from the index file. /nsconfig/ssl/ is the default path. Maximum length = 63
flags	<Integer>	Read-only	CRL status flag.
lastupdatetime	<Integer>	Read-only	Last CRL refresh time.
version	<Integer>	Read-only	CRL version.
signaturealgo	<String>	Read-only	Signature algorithm.
issuer	<String>	Read-only	Issuer name.
lastupdate	<String>	Read-only	Last update time.
nextupdate	<String>	Read-only	Next update time.
daystoexpiration	<Integer>	Read-only	Number of days remaining for the CRL to expire.
__count	<Double>	Read-only	count parameter

sslcrlfile

Configuration for Imported crl files resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported CRL file. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name to the CRL file to be imported. For example, http://www.example.com/crl_file. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

IMPORT| DELETE| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Import

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrlfile?**action=Import**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslcrlfile":{

<b>"name":<String_value>,

</b><b>"src":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrlfile

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrlfile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrlfile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrlfile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcrlfile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrlfile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrlfile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcrlfile resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrl_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcrl_binding": [ {

"crlname":<String_value>,
```

```
"sslcrl_serialnumber_binding":<sslcrl_serialnumber_binding[]_value>

}]}
```

sslcrl_serialnumber_binding

Binding object showing the serialnumber that can be bound to sslcrl.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
number	<String>	Read-write	Certificate Serial number.
crlname	<String>	Read-write	Name of the CRL for which to show detailed information. Minimum length = 1
date	<String>	Read-only	Certificate Revocation date.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrl_serialnumber_binding/crlname_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrl_serialnumber_binding/crlname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcrl_serialnumber_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrl_serialnumber_binding/crlname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcrl_serialnumber_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcrl_serialnumber_binding": [ {

"number":<String_value>,

"crlname":<String_value>,

"date":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrl_serialnumber_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrl_serialnumber_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcrl_serialnumber_binding": [ {

"number":<String_value>,

"crlname":<String_value>,

"date":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcrl_serialnumber_binding/crlname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"sslcrl_serialnumber_binding": [ { "__count": "#no"} ] }
```

ssldhfile

Configuration for dh imported file resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported DH file. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the DH file to be imported. For example, http://www.example.com/dh_file. NOTE: The import fails if the file is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
__count	<Double>	Read-only	count parameter

Operations

IMPORT| DELETE| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Import

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ssldhfile?**action=Import**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"ssldhfile":{

<b>"name":<String_value>,

</b><b>"src":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ssldhfile

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ssldhfile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ssldhfile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ssldhfile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of ssldhfile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ssldhfile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ssldhfile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the ssldhfile resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "ssldhfile": [ {

"name":<String_value>,

"src":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ssldhfile?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "ssldhfile": [ { "__count": "#no"} ] }
```

ssldhparam

Configuration for dh Parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dhfile	<String>	Read-write	Name of and, optionally, path to the DH key file. /nsconfig/ssl/ is the default path. Maximum length = 63
bits	<Double>	Read-write	Size, in bits, of the DH key being generated. Minimum value = 512

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 2048
gen	<String>	Read-write	Random number required for generating the DH key. Required as part of the DH key generation algorithm. Default value: 2 Possible values = 2, 5

Operations

(click to see Properties)

CREATE

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

create

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/ssldhparam?**action=create**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"ssldhparam":{

<b>"dhfile":<String_value>,

</b>"bits":<Double_value>,

"gen":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

ssldsakey

Configuration for dsa key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyfile	<String>	Read-write	Name for and, optionally, path to the DSA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
bits	<Double>	Read-write	Size, in bits, of the DSA key. Minimum value = 512 Maximum value = 2048
keyform	<String>	Read-write	Format in which the DSA key file is stored on the appliance. Default value: PEM Possible values = DER, PEM
des	<Boolean>	Read-write	Encrypt the generated DSA key by using the DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that will be used to encrypt the key.
des3	<Boolean>	Read-write	Encrypt the generated DSA key

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by using the Triple-DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that will be used to encrypt the key.
aes256	<Boolean>	Read-write	Encrypt the generated DSA key by using the AES algorithm.
password	<String>	Read-write	Pass phrase to use for encryption if DES or DES3 option is selected. Minimum length = 1 Maximum length = 31
pkcs8	<Boolean>	Read-write	Create the private key in PKCS#8 format.

"aes256":<Boolean_value>,

"password":<String_value>,

"pkcs8":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

ssldtlsprofile

Configuration for DTLS profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DTLS profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),equals sign (=), and hyphen (-)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			characters. Cannot be changed after the profile is created. Minimum length = 1 Maximum length = 127
pmtudiscovery	<String>	Read-write	Source for the maximum record size value. If ENABLED, the value is taken from the PMTU table. If DISABLED, the value is taken from the profile. Default value: DISABLED Possible values = ENABLED, DISABLED
maxrecordsize	<Double>	Read-write	Maximum size of records that can be sent if PMTU is disabled. Default value: 1459 Minimum value = 250 Maximum value = 1459
maxretrytime	<Double>	Read-write	Wait for the specified time, in seconds, before resending the request.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 3
helloverifyrequest	<String>	Read-write	Send a Hello Verify request to validate the client. Default value: DISABLED Possible values = ENABLED, DISABLED
terminatesession	<String>	Read-write	Terminate the session if the message authentication code (MAC) of the client and server do not match. Default value: DISABLED Possible values = ENABLED, DISABLED
maxpacketsize	<Double>	Read-write	Maximum number of packets to reassemble. This value helps protect against a fragmented packet attack. Default value: 120 Minimum value = 0 Maximum value = 86400
__count	<Double>	Read-only	count parameter

sslfips

Configuration for fips resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
inithsm	<String>	Read-write	FIPS initialization level. The appliance currently supports Level-2 (FIPS 140-2). Possible values = Level-2
sopassword	<String>	Read-write	Security officer password that will be in effect after you have configured the HSM. Minimum length = 1
oldsopassword	<String>	Read-write	Old password for the security officer. Minimum length = 1
userpassword	<String>	Read-write	The Hardware Security Module's (HSM) User password. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hsmlabel	<String>	Read-write	Label to identify the Hardware Security Module (HSM). Minimum length = 1
fipsfw	<String>	Read-write	Path to the FIPS firmware file. Minimum length = 1
erasedata	<String>	Read-only	Erase data. Default value: FIPS_ERASE Minimum length = 1
serial	<Integer>	Read-only	FIPS card serial number.
majorversion	<Integer>	Read-only	Firmware major version.
minorversion	<Integer>	Read-only	Firmware minor version.
fipshwmajorversion	<Integer>	Read-only	FIPS card hardware major version.
fipshwminorversion	<Integer>	Read-only	FIPS card hardware minor version.
fipshwversionstring	<String>	Read-only	FIPS card hardware extended version string.
flashmemorytotal	<Integer>	Read-only	Total size of the flash memory on card.
flashmemoryfree	<Integer>	Read-only	Total size of free flash memory.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sramtotal	<Integer>	Read-only	Total size of the SRAM memory on card.
sramfree	<Integer>	Read-only	Total size of free SRAM memory.
status	<Integer>	Read-only	Status.
flag	<Integer>	Read-only	Internal Flags.
serialno	<String>	Read-only	FIPS card serial number.
model	<String>	Read-only	FIPS card model info.
state	<Integer>	Read-only	FIPS card state.
firmwarereleasedate	<String>	Read-only	FIPS card firmware revision date.
coresmax	<Integer>	Read-only	Maximum number of crypto cores present in the FIPS card.
coresenabled	<Integer>	Read-only	Number of crypto cores enabled in the FIPS card.

Operations

sslfipskey

Configuration for FIPS key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fipskeyname	<String>	Read-write	Name for the FIPS key. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the FIPS key is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my fipskey" or 'my fipskey'). Minimum length = 1
keytype	<String>	Read-write	Only RSA key and ECDSA Key are supported. Default value: RSA Possible values = RSA, ECDSA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
exponent	<String>	Read-write	Exponent value for the FIPS key to be created. Available values function as follows: 3=3 (hexadecimal) F4=10001 (hexadecimal). Default value: 3 Possible values = 3, F4
modulus	<Double>	Read-write	Modulus, in multiples of 64, of the FIPS key to be created. Minimum value = 0 Maximum value = 4096
curve	<String>	Read-write	Only p_256 (prime256v1) and P_384 (secp384r1) are supported. Default value: P_256 Possible values = P_256, P_384
key	<String>	Read-write	Name of and, optionally, path to the key file to be imported. /nsconfig/ssl/ is the default path.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
inform	<String>	Read-write	Input format of the key file. Available formats are: SIM - Secure Information Management; select when importing a FIPS key. If the external FIPS key is encrypted, first decrypt it, and then import it. PEM - Privacy Enhanced Mail; select when importing a non-FIPS key. Default value: SIM Possible values = SIM, DER, PEM
wrapkeyname	<String>	Read-write	Name of the wrap key to use for importing the key. Required for importing a non-FIPS key. Minimum length = 1
iv	<String>	Read-write	Initialization Vector (IV) to use for importing the key. Required for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			importing a non-FIPS key. Minimum length = 1
size	<Double>	Read-only	Size.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

CREATE| DELETE| IMPORT| EXPORT| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

create

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey?**action=create**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslfipskey":{

<b>"fipskeyname":<String_value>,

</b><b>"keytype":<String_value>,

</b>"exponent":<String_value>,

"modulus":<Double_value>,

"curve":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey/fipskeyname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

Import

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey?**action=Import**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslfipskey":{

<b>"fipskeyname":<String_value>,

</b><b>"key":<String_value>,

</b>"inform":<String_value>,

"wrapkeyname":<String_value>,

"iv":<String_value>,

"exponent":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

export

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey?**action=export**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslfipskey":{

<b>"fipskeyname":<String_value>,

</b><b>"key":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslfipskey resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslfipskey resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipskey?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslfipskey": [ { "__count": "#no"} ] }
```

sslfipssimsource

Configuration for FIPsSIM source resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
targetsecret	<String>	Read-write	Name of and, optionally, path to the target FIPS appliance's secret data. /nsconfig/ssl/ is the default path. Minimum length = 1
sourcesecret	<String>	Read-write	Name for and, optionally, path to the source FIPS appliance's secret data. /nsconfig/ssl/ is the default path. Minimum length = 1
certfile	<String>	Read-write	Name for and, optionally, path to the source FIPS appliance's certificate file. /nsconfig/ssl/ is the default path. Minimum length = 1

Operations

(click to see Properties)

ENABLE| INIT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

enable

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipssimsource?**action=enable**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslfipssimsource":{

<b>"targetsecret":<String_value>,

</b><b>"sourcesecret":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

init

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslfipssimsource?**action=init**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslfipssimsource":{

<b>"certfile":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

sslfipssimtarget

Configuration for FIPS SIM Target resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyvector	<String>	Read-write	Name of and, optionally, path to the target FIPS appliance's key vector. /nsconfig/ssl/ is the default path. Minimum length = 1
sourcesecret	<String>	Read-write	Name of and, optionally, path to the source FIPS appliance's secret data. /nsconfig/ssl/ is the default path. Minimum length = 1
certfile	<String>	Read-write	Name of and, optionally, path to the source FIPS appliance's certificate file. /nsconfig/ssl/ is the default path. Minimum length = 1
targetsecret	<String>	Read-write	Name for and, optionally, path to the target FIPS appliance's secret data. The default input path for the secret data is /nsconfig/ssl/.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1

```
{ "sslglobal_binding": [ {

"sslglobal_sslpolicy_binding":<sslglobal_sslpolicy_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslglobal_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslglobal_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslglobal_binding": [ {

"sslglobal_sslpolicy_binding":<sslglobal_sslpolicy_binding[]_value>

}]}
```

sslglobal_sslpolicy_binding

Binding object showing the sslpolicy that can be bound to sslglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policy binding.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	The name for the SSL policy.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * USE_INVOCATION_RESULT - Applicable if this policy invokes

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current policy label performs a NEXT. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label. Default value: "END"
type	<String>	Read-write	Global bind point to which the policy is bound. Possible values = CONTROL_OVERRIDE, CONTROL_DEFAU

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			LT, DATA_OVERRIDE, DATA_DEFAULT
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server, service, or policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority.
labeltype	<String>	Read-write	Type of policy label to invoke. Specify virtual server for a policy label associated with a virtual server, or policy label for a user-defined policy label. Possible values = vserver, service, policylabel
__count	<Double>	Read-write	count parameter

Operations

```

sslhsmkey

Configuration for HSM key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hsmkeyname	<String>	Read-write	. Minimum length = 1
hsmtype	<String>	Read-write	Type of HSM. Default value: THALES Possible values = THALES, SAFENET, KEYVAULT
key	<String>	Read-write	Name of the key. optionally, for Thales, path to the HSM key file; /var/opt/nfast/kmdata/local/ is the default path. Applies when HSMTYPE is THALES or KEYVAULT. Maximum length = 63
serialnum	<String>	Read-write	Serial number of the partition on which the key is present.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Applies only to SafeNet HSM. Maximum length = 16
password	<String>	Read-write	Password for a partition. Applies only to SafeNet HSM. Minimum length = 1
keystore	<String>	Read-write	Name of keystore object representing HSM where key is stored. For example, name of keyvault object or azurekeyvault authentication object. Applies only to KEYVAULT type HSM. Minimum length = 1
state	<String>	Read-only	Current state of key. Possible values = Created, Access Token Unavailable, Unauthorized, Does not exist, Unreachable, Marked down, Key operations successful, Key operations failed, Key operation throttled
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

sslkeyfile

Configuration for Imported ssl key files resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported key file. Must begin with an ASCII alphanumeric or underscore(_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the key file to be imported. For example, http://www.example.com/key_file. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
password	<String>	Read-write	.
__count	<Double>	Read-only	count parameter

sslocspresponder

Configuration for OCSP responser resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the OCSP responder. Cannot begin with a hash (#) or space character and must contain

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only ASCII alphanumeric, underscore (_), hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the responder is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder" or 'my responder'). Minimum length = 1 Maximum length = 127
url	<String>	Read-write	URL of the OCSP responder. Minimum length = 1 Maximum length = 127
cache	<String>	Read-write	Enable caching of responses. Caching of responses received from the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OCSP responder enables faster responses to the clients and reduces the load on the OCSP responder. Default value: DISABLED Possible values = ENABLED, DISABLED
cachetimeout	<Double>	Read-write	Timeout for caching the OCSP response. After the timeout, the Citrix ADC sends a fresh request to the OCSP responder for the certificate status. If a timeout is not specified, the timeout provided in the OCSP response applies. Default value: 1 Minimum value = 1 Maximum value = 43200
batchingdepth	<Double>	Read-write	Number of client certificates to batch together into one OCSP request. Batching avoids overloading the OCSP responder. A value of 1 signifies that each request is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			queried independently. For a value greater than 1, specify a timeout (batching delay) to avoid inordinately delaying the processing of a single certificate. Minimum value = 1 Maximum value = 8
batchingdelay	<Double>	Read-write	Maximum time, in milliseconds, to wait to accumulate OCSP requests to batch. Does not apply if the Batching Depth is 1. Minimum value = 1 Maximum value = 10000
resptimeout	<Double>	Read-write	Time, in milliseconds, to wait for an OCSP response. When this time elapses, an error message appears or the transaction is forwarded, depending on the settings on the virtual server. Includes Batching Delay time. Minimum value = 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 120000
ocspurlresolvetimeout	<Double>	Read-write	Time, in milliseconds, to wait for an OCSP URL Resolution. When this time elapses, an error message appears or the transaction is forwarded, depending on the settings on the virtual server. Minimum value = 100 Maximum value = 2000
respondercert	<String>	Read-write	. Minimum length = 1
trustresponder	<Boolean>	Read-write	A certificate to use to validate OCSP responses. Alternatively, if -trustResponder is specified, no verification will be done on the reponse. If both are omitted, only the response times (producedAt, lastUpdate, nextUpdate) will be verified.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
producedattimeskew	<Double>	Read-write	Time, in seconds, for which the Citrix ADC waits before considering the response as invalid. The response is considered invalid if the Produced At time stamp in the OCSP response exceeds or precedes the current Citrix ADC clock time by the amount of time specified. Default value: 300 Minimum value = 0 Maximum value = 86400
signingcert	<String>	Read-write	Certificate-key pair that is used to sign OCSP requests. If this parameter is not set, the requests are not signed. Minimum length = 1
usenonce	<String>	Read-write	Enable the OCSP nonce extension, which is designed to prevent replay attacks. Possible values = YES, NO
insertclientcert	<String>	Read-write	Include the complete client certificate in the OCSP request.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
httpmethod	<String>	Read-write	HTTP method used to send ocsp request. POST is the default httpmethod. If request length is > 255, POST wil be used even if GET is set as httpMethod. Default value: POST Possible values = GET, POST
ocspaiarefcount	<Double>	Read-only	No of CA certs referencing this AIA responder.
ocspipaddrstr	<String>	Read-only	DNS resolved IP address.
port	<Integer>	Read-only	Port number on which OCSP Server listens. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
__count	<Double>	Read-only	count parameter

Operations

```

sslparameter

Configuration for SSL parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
quantumsize	<String>	Read-write	Amount of data to collect before the data is pushed to the crypto hardware for encryption. For large downloads, a larger quantum size better utilizes the crypto resources. Default value: 8192 Possible values = 4096, 8192, 16384
crlmemorysizemb	<Double>	Read-write	Maximum memory size to use for certificate revocation lists (CRLs). This parameter reserves memory for a CRL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			but sets a limit to the maximum memory that the CRLs loaded on the appliance can consume. Default value: 256 Minimum value = 10 Maximum value = 1024
strictcachecks	<String>	Read-write	Enable strict CA certificate checks on the appliance. Default value: NO Possible values = YES, NO
ssltriggertimeout	<Double>	Read-write	Time, in milliseconds, after which encryption is triggered for transactions that are not tracked on the Citrix ADC because their length is not known. There can be a delay of up to 10ms from the specified timeout value before the packet is pushed into the queue. Default value: 100 Minimum value = 1 Maximum value = 200

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sendclosenotify	<String>	Read-write	Send an SSL Close-Notify message to the client at the end of a transaction. Default value: YES Possible values = YES, NO
encrypttriggerpktcount	<Double>	Read-write	Maximum number of queued packets after which encryption is triggered. Use this setting for SSL transactions that send small packets from server to Citrix ADC. Default value: 45 Minimum value = 10 Maximum value = 50
denysslreneg	<String>	Read-write	Deny renegotiation in specified circumstances. Available settings function as follows: * NO - Allow SSL renegotiation. * FRONTEND_CLIENT - Deny secure and nonsecure SSL renegotiation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			initiated by the client. * FRONTEND_CLIENTSERVER - Deny secure and nonsecure SSL renegotiation initiated by the client or the Citrix ADC during policy-based client authentication. * ALL - Deny all secure and nonsecure SSL renegotiation. * NONSECURE - Deny nonsecure SSL renegotiation. Allows only clients that support RFC 5746. Default value: ALL Possible values = NO, FRONTEND_CLIENT, FRONTEND_CLIENTSERVER, ALL, NONSECURE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
insertionencoding	<String>	Read-write	Encoding method used to insert the subject or issuer's name in HTTP requests to servers. Default value: Unicode Possible values = Unicode, UTF-8
ocspcachesize	<Double>	Read-write	Size, per packet engine, in megabytes, of the OCSP cache. A maximum of 10% of the packet engine memory can be assigned. Because the maximum allowed packet engine memory is 4GB, the maximum value that can be assigned to the OCSP cache is approximately 410 MB. Default value: 10 Minimum value = 0 Maximum value = 512
pushflag	<Double>	Read-write	Insert PUSH flag into decrypted, encrypted, or all records. If the PUSH flag is set to a value other than 0, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			buffered records are forwarded on the basis of the value of the PUSH flag. Available settings function as follows: 0 - Auto (PUSH flag is not set.) 1 - Insert PUSH flag into every decrypted record. 2 -Insert PUSH flag into every encrypted record. 3 - Insert PUSH flag into every decrypted and encrypted record. Minimum value = 0 Maximum value = 3
dropreqwithnohostheader	<String>	Read-write	Host header check for SNI enabled sessions. If this check is enabled and the HTTP request does not contain the host header for SNI enabled sessions, the request is dropped. Also, please note that when the check is disabled, the request will not be dropped even if there is a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			mis-match between SNI and HTTP host-header. Default value: NO Possible values = YES, NO
pushenctriggertimeout	<Double>	Read-write	PUSH encryption trigger timeout value. The timeout value is applied only if you set the Push Encryption Trigger parameter to Timer in the SSL virtual server settings. Default value: 1 Minimum value = 1 Maximum value = 200
cryptodevdisablelimit	<Double>	Read-write	Limit to the number of disabled SSL chips after which the ADC restarts. A value of zero implies that the ADC does not automatically restart. Default value: 0
undefactioncontrol	<String>	Read-write	Name of the undefined built-in control action: CLIENTAUTH, NOCLIENTAUTH, NOOP, RESET, or DROP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: "CLIENTAUTH"
undefactiondata	<String>	Read-write	Name of the undefined built-in data action: NOOP, RESET or DROP. Default value: "NOOP"
defaultprofile	<String>	Read-write	Global parameter used to enable default profile feature. Default value: DISABLED Possible values = ENABLED, DISABLED
softwarecryptothreshold	<Double>	Read-write	Citrix ADC CPU utilization threshold (in percentage) beyond which crypto operations are not done in software. A value of zero implies that CPU is not utilized for doing crypto in software. Default value: 0 Minimum value = 0 Maximum value = 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hybridfipsmode	<String>	Read-write	When this mode is enabled, system will use additional crypto hardware to accelerate symmetric crypto operations. Default value: DISABLED Possible values = ENABLED, DISABLED
sigdigesttype	<String[]>	Read-write	Signature Digest Algorithms that are supported by appliance. Default value is "ALL" and it will enable the following algorithms depending on the platform. On VPX: ECDSA-SHA1 ECDSA-SHA224 ECDSA-SHA256 ECDSA-SHA384 ECDSA-SHA512 RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-SHA512 DSA-SHA1 DSA-SHA224 DSA-SHA256 DSA-SHA384 DSA-SHA512

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			On MPX with Nitrox-III and coleto cards: RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-SHA512 ECDSA-SHA1 ECDSA-SHA224 ECDSA-SHA256 ECDSA-SHA384 ECDSA-SHA512 Others: RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-SHA512. Note:ALL doesnot include RSA-MD5 for any platform. Default value: ALL Possible values = ALL, RSA-MD5, RSA-SHA1, RSA-SHA224, RSA-SHA256, RSA-SHA384, RSA-SHA512, DSA-SHA1, DSA-SHA224, DSA-SHA256, DSA-SHA384, DSA-SHA512, ECDSA-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SHA1, ECDSA-SHA224, ECDSA-SHA256, ECDSA-SHA384, ECDSA-SHA512
sslierrorcache	<String>	Read-write	Enable or disable dynamically learning and caching the learned information to make the subsequent interception or bypass decision. When enabled, NS does the lookup of this cached data to do early bypass. Default value: DISABLED Possible values = ENABLED, DISABLED
sslimaxerrorcachemem	<Double>	Read-write	Specify the maximum memory that can be used for caching the learned data. This memory is used as a LRU cache so that the old entries gets replaced with new entry once the set memory limit is fully utilised. A value of 0 decides the limit automatically.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 4294967294
insertcertspace	<String>	Read-write	To insert space between lines in the certificate header of request. Default value: YES Possible values = YES, NO
ndcppcompliancecertcheck	<String>	Read-write	Applies when the Citrix ADC appliance acts as a client (back-end connection). Settings apply as follows: YES - During certificate verification, ignore the common name if SAN is present in the certificate. NO - Do not ignore common name. Default value: NO Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
svctls1112disable	<String>	Read-only	Disable TLS 1.1 and 1.2 for dynamic and VPN created services. Default value: NO Possible values = YES, NO
montls1112disable	<String>	Read-only	Disable TLS 1.1 and 1.2 for secure (https) monitors bound to SSL_BRIDGE services. Default value: NO Possible values = YES, NO

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

sslpkcs12

Configuration for pkcs12 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
outfile	<String>	Read-write	Name for and, optionally, path to, the output file that contains the certificate and the private key after converting from PKCS#12 to PEM format. /nsconfig/ssl/ is the default path. If importing, the certificate-key pair is stored in PEM format. If exporting, the certificate-key

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			pair is stored in PKCS#12 format. Maximum length = 63
Import	<Boolean>	Read-write	Convert the certificate and private-key from PKCS#12 format to PEM format.
pkcs12file	<String>	Read-write	Name for and, optionally, path to, the PKCS#12 file. If importing, specify the input file name that contains the certificate and the private key in PKCS#12 format. If exporting, specify the output file name that contains the certificate and the private key after converting from PEM to PKCS#12 format. /nsconfig/ssl/ is the default path. During the import operation, if the key is encrypted, you are prompted to enter the pass phrase used for encrypting the key.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 63
des	<Boolean>	Read-write	Encrypt the private key by using the DES algorithm in CBC mode during the import operation. On the command line, you are prompted to enter the pass phrase.
des3	<Boolean>	Read-write	Encrypt the private key by using the Triple-DES algorithm in EDE CBC mode (168-bit key) during the import operation. On the command line, you are prompted to enter the pass phrase.
aes256	<Boolean>	Read-write	Encrypt the private key by using the AES algorithm (256-bit key) during the import operation. On the command line, you are prompted to enter the pass phrase.
export	<Boolean>	Read-write	Convert the certificate and private key from PEM format to PKCS#12 format. On the command line, you are prompted to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enter the pass phrase.
certfile	<String>	Read-write	Certificate file to be converted from PEM to PKCS#12 format. Maximum length = 63
keyfile	<String>	Read-write	Name of the private key file to be converted from PEM to PKCS#12 format. If the key file is encrypted, you are prompted to enter the pass phrase used for encrypting the key. Maximum length = 63
password	<String>	Read-write	. Minimum length = 1 Maximum length = 31
pempassphrase	<String>	Read-write	. Minimum length = 1 Maximum length = 31

sslpolicy

Configuration for SSL policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new SSL policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If the expression itself includes double quotation marks, escape the quotations by using the character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
reqaction	<String>	Read-write	The name of the action to be performed on the request. Refer to 'add ssl action' command to add a new action. Builtin actions like NOOP, RESET, DROP, CLIENTAUTH and NOCLIENTAUTH are also allowed. Minimum length = 1
action	<String>	Read-write	Name of the built-in or user-defined action to perform on the request. Available built-in actions are NOOP, RESET, DROP, CLIENTAUTH, NOCLIENTAUTH,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			INTERCEPT AND BYPASS.
undefaction	<String>	Read-write	Name of the action to be performed when the result of rule evaluation is undefined. Possible values for control policies: CLIENTAUTH, NOCLIENTAUTH, NOOP, RESET, DROP. Possible values for data policies: NOOP, RESET, DROP and BYPASS.
comment	<String>	Read-write	Any comments associated with this policy.
hits	<Double>	Read-only	Number of hits for this policy.
undefhits	<Double>	Read-only	Number of Undef hits.
description	<String>	Read-only	Description of the policy.
policytype	<String>	Read-only	. Possible values = Classic Policy, Advanced Policy
__count	<Double>	Read-only	count parameter

"comment":<String_value>,

"policytype":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslpolicy": [ { "__count": "#no"} ] }
```

sslpolicylabel

Configuration for SSL policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the SSL policy label. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy label is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks (for example, "my label" or 'my label').
type	<String>	Read-write	Type of policies that the policy label can contain. Possible values = CONTROL, DATA
numpol	<Double>	Read-only	Number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
policyname	<String>	Read-only	Name of the SSL policy to bind to the policy label.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-only	Invoke flag.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke_labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
flowtype	<Double>	Read-only	Flowtype of the bound SSL policy.
description	<String>	Read-only	Description of the policylabel.
__count	<Double>	Read-only	count parameter

Operations

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicylabel

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslpolicylabel":{

<b>"labelname":<String_value>,

</b><b>"type":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicylabel/labelname_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicylabel

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicylabel?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicylabel?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslpolicylabel resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicylabel?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicylabel?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslpolicylabel resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"sslpolicy_csvserver_binding": [ { "__count": "#no"} ] }
```

sslpolicy_lbvserver_binding

Binding object showing the lbvserver that can be bound to sslpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the SSL policy for which to display detailed information. Minimum length = 1
priority	<Double>	Read-only	.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicy_lbvserver_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicy_lbvserver_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslpolicy_lbvserver_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslpolicy_lbvserver_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslpolicy_lbvserver_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

sslprofile

Configuration for SSL profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SSL profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
sslprofiletype	<String>	Read-write	Type of profile. Front end profiles apply to the entity that receives requests from a client. Backend profiles apply to the entity that sends client requests to a server. Default value: FrontEnd Possible values = BackEnd, FrontEnd
ssllogprofile	<String>	Read-write	The name of the ssllogprofile. Minimum length = 1 Maximum length = 127
dhcount	<Double>	Read-write	Number of interactions, between the client and the Citrix ADC, after which the DH private-public pair is regenerated. A value of zero (0) specifies infinite use (no refresh). This parameter is not applicable when configuring a backend profile. Allowed DH count

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			values are 0 and >= 500. Minimum value = 0 Maximum value = 65534
dh	<String>	Read-write	State of Diffie-Hellman (DH) key exchange. This parameter is not applicable when configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
dhfile	<String>	Read-write	The file name and path for the DH parameter. Minimum length = 1
ersa	<String>	Read-write	State of Ephemeral RSA (eRSA) key exchange. Ephemeral RSA allows clients that support only export ciphers to communicate with the secure server even if the server certificate does not support export clients. The

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted. It is reused at a later date when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when the appliance restarts. This parameter is not applicable when configuring a backend profile. Default value: ENABLED Possible values = ENABLED, DISABLED
ersacount	<Double>	Read-write	The refresh count for the re-generation of RSA public-key and private-key pair. Minimum value = 0 Maximum value = 65534

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Double>	Read-write	The Session timeout value in seconds. Minimum value = 0 Maximum value = 4294967294
cipherredirect	<String>	Read-write	State of Cipher Redirect. If this parameter is set to ENABLED, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a cipher mismatch between

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the virtual server or service and the client. This parameter is not applicable when configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-write	The redirect URL to be used with the Cipher Redirect feature.
clientauth	<String>	Read-write	State of client authentication. In service-based SSL offload, the service terminates the SSL handshake if the SSL client does not provide a valid certificate. This parameter is not applicable when configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientcert	<String>	Read-write	The rule for client certificate requirement in client authentication. Possible values = Mandatory, Optional
dhkeyexpsizelimit	<String>	Read-write	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Default value: DISABLED Possible values = ENABLED, DISABLED
sslredirect	<String>	Read-write	State of HTTPS redirects for the SSL service. For an SSL session, if the client browser receives a redirect message, the browser tries to connect to the new location. However, the secure SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			session breaks if the object has moved from a secure site (https://) to an unsecure site (http://). Typically, a warning message appears on the screen, prompting the user to continue or disconnect. If SSL Redirect is ENABLED, the redirect message is automatically converted from http:// to https:// and the SSL session does not break. This parameter is not applicable when configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-write	State of the port rewrite while performing HTTPS redirect. If this parameter is set to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ENABLED, and the URL from the server does not contain the standard port, the port is rewritten to the standard. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL profile. Default value: DISABLED Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL profile. Default value: ENABLED Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL profile. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL profile. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL profile. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the virtual server and service-based offload. SNI helps to enable SSL encryption on multiple domains on a single virtual server or service if the domains are controlled by the same organization and share the same second-level domain

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL handshake with the client, the OCSP-based server certificate status is sent to the client

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			during the handshake. DISABLED: The appliance does not check the status of the server certificate. . Default value: DISABLED Possible values = ENABLED, DISABLED
serverauth	<String>	Read-write	State of server authentication support for the SSL Backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
commonname	<String>	Read-write	Name to be checked against the CommonName (CN) field in the server certificate bound to the SSL server. Minimum length = 1
pushenctrigger	<String>	Read-write	Trigger encryption on the basis of the PUSH flag value. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ALWAYS - Any PUSH packet triggers encryption. * IGNORE - Ignore PUSH packet for triggering encryption. * MERGE - For a consecutive sequence of PUSH packets, the last PUSH packet triggers encryption. * TIMER - PUSH packet triggering encryption is delayed by the time defined in the set ssl parameter command or in the Change Advanced SSL Settings dialog box. Possible values = Always, Merge, Ignore, Timer
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cleartextport	<Integer>	Read-write	Port on which clear-text data is sent by the appliance to the server. Do not specify this parameter for SSL offloading with end-to-end encryption. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
insertionencoding	<String>	Read-write	Encoding method used to insert the subject or issuer's name in HTTP requests to servers. Default value: Unicode Possible values = Unicode, UTF-8
denysslreneg	<String>	Read-write	Deny renegotiation in specified circumstances. Available settings function as follows: * NO - Allow SSL renegotiation. * FRONTEND_CLIENT - Deny secure and nonsecure SSL renegotiation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			initiated by the client. * FRONTEND_CLIENTSERVER - Deny secure and nonsecure SSL renegotiation initiated by the client or the Citrix ADC during policy-based client authentication. * ALL - Deny all secure and nonsecure SSL renegotiation. * NONSECURE - Deny nonsecure SSL renegotiation. Allows only clients that support RFC 5746. Default value: ALL Possible values = NO, FRONTEND_CLIENT, FRONTEND_CLIENTSERVER, ALL, NONSECURE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
quantumsize	<String>	Read-write	Amount of data to collect before the data is pushed to the crypto hardware for encryption. For large downloads, a larger quantum size better utilizes the crypto resources. Default value: 8192 Possible values = 4096, 8192, 16384
strictcachecks	<String>	Read-write	Enable strict CA certificate checks on the appliance. Default value: NO Possible values = YES, NO
encrypttriggerpktcount	<Double>	Read-write	Maximum number of queued packets after which encryption is triggered. Use this setting for SSL transactions that send small packets from server to Citrix ADC. Default value: 45 Minimum value = 10 Maximum value = 50
pushflag	<Double>	Read-write	Insert PUSH flag into decrypted, encrypted, or all

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			records. If the PUSH flag is set to a value other than 0, the buffered records are forwarded on the basis of the value of the PUSH flag. Available settings function as follows: 0 - Auto (PUSH flag is not set.) 1 - Insert PUSH flag into every decrypted record. 2 -Insert PUSH flag into every encrypted record. 3 - Insert PUSH flag into every decrypted and encrypted record. Minimum value = 0 Maximum value = 3
dropreqwithnohostheader	<String>	Read-write	Host header check for SNI enabled sessions. If this check is enabled and the HTTP request does not contain the host header for SNI enabled sessions, the request is dropped. Also, please note that when the check is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			disabled, the request will not be dropped even if there is a mis-match between SNI and HTTP host-header. Default value: NO Possible values = YES, NO
pushenctriggertimeout	<Double>	Read-write	PUSH encryption trigger timeout value. The timeout value is applied only if you set the Push Encryption Trigger parameter to Timer in the SSL virtual server settings. Default value: 1 Minimum value = 1 Maximum value = 200
ssltriggertimeout	<Double>	Read-write	Time, in milliseconds, after which encryption is triggered for transactions that are not tracked on the Citrix ADC because their length is not known. There can be a delay of up to 10ms from the specified timeout value before the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packet is pushed into the queue. Default value: 100 Minimum value = 1 Maximum value = 200
clientauthuseboundcachain	<String>	Read-write	Certficates bound on the VIP are used for validating the client cert. Certficates came along with client cert are not used for validating the client cert. Default value: DISABLED Possible values = ENABLED, DISABLED
sslinterception	<String>	Read-write	Enable or disable transparent interception of SSL sessions. Default value: DISABLED Possible values = ENABLED, DISABLED
sslireneg	<String>	Read-write	Enable or disable triggering the client renegotiation when renegotiation request

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is received from the origin server. Default value: ENABLED Possible values = ENABLED, DISABLED
ssliocspcheck	<String>	Read-write	Enable or disable OCSP check for origin server certificate. Default value: ENABLED Possible values = ENABLED, DISABLED
sslimaxsessperserver	<Double>	Read-write	Maximum ssl session to be cached per dynamic origin server. A unique ssl session is created for each SNI received from the client on ClientHello and the matching session is used for server session reuse. Default value: 10 Minimum value = 1 Maximum value = 1000
sessionticket	<String>	Read-write	This option enables the use of session

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			tickets, as per the RFC 5077. Default value: DISABLED Possible values = ENABLED, DISABLED
sessionticketlifetime	<Double>	Read-write	This option sets the life time of session tickets issued by NS in secs. Default value: 300 Minimum value = 0 Maximum value = 172800
sessionticketkeyrefresh	<String>	Read-write	This option enables the use of session tickets, as per the RFC 5077. Default value: ENABLED Possible values = ENABLED, DISABLED
sessionticketkeydata	<String>	Read-write	Session ticket enc/dec key , admin can set it.
sessionkeylifetime	<Double>	Read-write	This option sets the life time of symm key used to generate session tickets

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			issued by NS in secs. Default value: 3000 Minimum value = 600 Maximum value = 86400
prevsessionkeylifetime	<Double>	Read-write	This option sets the life time of symm key used to generate session tickets issued by NS in secs. Default value: 0 Minimum value = 0 Maximum value = 172800
hsts	<String>	Read-write	State of HSTS protocol support for the SSL profile. Using HSTS, a server can enforce the use of an HTTPS connection for all communication with a client. Default value: DISABLED Possible values = ENABLED, DISABLED
maxage	<Double>	Read-write	Set the maximum time, in seconds, in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the strict transport security (STS) header during which the client must send only HTTPS requests to the server. Default value: 0 Minimum value = 0 Maximum value = 4294967294
includesubdomains	<String>	Read-write	Enable HSTS for subdomains. If set to Yes, a client must send only HTTPS requests for subdomains. Default value: NO Possible values = YES, NO
preload	<String>	Read-write	Flag indicates the consent of the site owner to have their domain preloaded. Default value: NO Possible values = YES, NO
skipclientcertpolicycheck	<String>	Read-write	This flag controls the processing of X509 certificate policies. If this option is Enabled, then the policy check in Client authentication will be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			skipped. This option can be used only when Client Authentication is Enabled and ClientCert is set to Mandatory. Default value: DISABLED Possible values = ENABLED, DISABLED
zerorttearlydata	<String>	Read-write	State of TLS 1.3 0-RTT early data support for the SSL Virtual Server. This setting only has an effect if resumption is enabled, as early data cannot be sent along with an initial handshake. Early application data has significantly different security properties - in particular there is no guarantee that the data cannot be replayed. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tls13sessionticketsperauthcontext	<Double>	Read-write	Number of tickets the SSL Virtual Server will issue anytime TLS 1.3 is negotiated, ticket-based resumption is enabled, and either (1) a handshake completes or (2) post-handhsake client auth completes. This value can be increased to enable clients to open multiple parallel connections using a fresh ticket for each connection. No tickets are sent if resumption is disabled. Default value: 1 Minimum value = 1 Maximum value = 10
dhekeyexchangewithpsk	<String>	Read-write	Whether or not the SSL Virtual Server will require a DHE key exchange to occur when a PSK is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			accepted during a TLS 1.3 resumption handshake. A DHE key exchange ensures forward secrecy even in the event that ticket keys are compromised, at the expense of an additional round trip and resources required to carry out the DHE key exchange. If disabled, a DHE key exchange will be performed when a PSK is accepted but only if requested by the client. If enabled, the server will require a DHE key exchange when a PSK is accepted regardless of whether the client supports combined PSK-DHE key exchange. This setting only has an effect when resumption is enabled.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
ciphername	<String>	Read-write	The cipher group/ alias/individual cipher configuration.
cipherpriority	<Double>	Read-write	cipher priority. Minimum value = 1
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer entity certificate during TLS1.2 handshake is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
nonfipsciphers	<String>	Read-only	State of usage of ciphers that are not FIPS approved. Valid only for an SSL service bound with a FIPS key and certificate. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
snicert	<Boolean>	Read-only	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
skipcaname	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke	<Boolean>	Read-only	Invoke flag. This attribute is relevant only for ADVANCED policies.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel
service	<Double>	Read-only	Service.
sslpfobjecttype	<Double>	Read-only	Internal flag to indicate what type of object binds this profile: monitor or service.
ssliverifyservercertforreuse	<String>	Read-only	Verify the origin server's certificate before reusing the front-end SSL session. Making it hidden since we always verify for now. Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslprofile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslprofile resources in chunks.

```

sslprofile_binding

Binding object which returns the resources bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the SSL profile for which to show detailed information. Minimum length = 1 Maximum length = 127
sslprofile_sslcipher_binding	<sslprofile_sslcipher_binding[]>	Read-only	sslcipher that can be bound to sslprofile.
sslprofile_ecccurve_binding	<sslprofile_ecccurve_binding[]>	Read-only	ecccurve that can be bound to sslprofile.
sslprofile_sslvserver_binding	<sslprofile_sslvserver_binding[]>	Read-only	sslvserver that can be bound to sslprofile.
sslprofile_sslciphersuite_binding	<sslprofile_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslprofile.
sslprofile_sslcertkey_binding	<sslprofile_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslprofile.

Operations

(click to see Properties)

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_binding/name_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslprofile_binding": [ {

"name":<String_value>,

"sslprofile_ecccurve_binding":<sslprofile_ecccurve_binding[]_value>,

"sslprofile_sslcertkey_binding":<sslprofile_sslcertkey_binding[]_value>,

"sslprofile_sslciphersuite_binding":<sslprofile_sslciphersuite_binding[]_value>,

"sslprofile_sslvserver_binding":<sslprofile_sslvserver_binding[]_value>,

"sslprofile_sslcipher_binding":<sslprofile_sslcipher_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslprofile_binding": [ {

"name":<String_value>,

"sslprofile_ecccurve_binding":<sslprofile_ecccurve_binding[]_value>,

"sslprofile_sslcertkey_binding":<sslprofile_sslcertkey_binding[]_value>,

"sslprofile_sslciphersuite_binding":<sslprofile_sslciphersuite_binding[]_value>,

"sslprofile_sslvserver_binding":<sslprofile_sslvserver_binding[]_value>,

"sslprofile_sslcipher_binding":<sslprofile_sslcipher_binding[]_value>

}]}
```

sslprofile_ecccurve_binding

Binding object showing the ecccurve that can be bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherpriority	<Double>	Read-write	Priority of the cipher binding. Minimum value = 1 Maximum value = 1000
name	<String>	Read-write	Name of the SSL profile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
ecccurvename	<String>	Read-write	Named ECC curve bound to vserver/ service. Possible values = ALL, P_224, P_256, P_384, P_521
__count	<Double>	Read-write	count parameter

Operations

{"sslprofile_sslciphersuite_binding": [ { "__count": "#no"} ] }
```

sslprofile_sslcipher_binding

Binding object showing the sslcipher that can be bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphername	<String>	Read-write	Name of the cipher. Minimum length = 1
cipheraliasname	<String>	Read-write	The name of the cipher group/alias/ individual cipheri bindings.
cipherpriority	<Double>	Read-write	cipher priority. Minimum value = 1
name	<String>	Read-write	Name of the SSL profile. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
description	<String>	Read-write	The cipher suite description.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/sslprofile_sslcipher_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"sslprofile_sslcipher_binding":{

<b>"name":<String_value>,

</b>"ciphername":<String_value>,

"cipherpriority":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_sslcipher_binding/name_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_sslcipher_binding/name_value<String>?**args=ciphername:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_sslcipher_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_sslcipher_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslprofile_sslcipher_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_sslcipher_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslprofile_sslcipher_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslprofile_sslcipher_binding": [ {

"ciphername":<String_value>,

"cipheraliasname":<String_value>,

"cipherpriority":<Double_value>,

"name":<String_value>,

"description":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_sslcipher_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslprofile_sslcipher_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

```

sslrsakey

Configuration for RSA key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyfile	<String>	Read-write	Name for and, optionally, path to the RSA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
bits	<Double>	Read-write	Size, in bits, of the RSA key. Minimum value = 512 Maximum value = 4096

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
exponent	<String>	Read-write	Public exponent for the RSA key. The exponent is part of the cipher algorithm and is required for creating the RSA key. Default value: F4 Possible values = 3, F4
keyform	<String>	Read-write	Format in which the RSA key file is stored on the appliance. Default value: PEM Possible values = DER, PEM
des	<Boolean>	Read-write	Encrypt the generated RSA key by using the DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
des3	<Boolean>	Read-write	Encrypt the generated RSA key by using the Triple-DES algorithm. On the command line, you are prompted to enter the pass phrase (password)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that is used to encrypt the key.
aes256	<Boolean>	Read-write	Encrypt the generated RSA key by using the AES algorithm.
password	<String>	Read-write	Pass phrase to use for encryption if DES or DES3 option is selected. Minimum length = 1 Maximum length = 31
pkcs8	<Boolean>	Read-write	Create the private key in PKCS#8 format.

Operations

(click to see Properties)

CREATE

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

create

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslrsakey?**action=create**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslrsakey":{

<b>"keyfile":<String_value>,

</b><b>"bits":<Double_value>,

</b>"exponent":<String_value>,

"keyform":<String_value>,

"des":<Boolean_value>,

"des3":<Boolean_value>,
```

```
"aes256":<Boolean_value>,

"password":<String_value>,

"pkcs8":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

sslservice

Configuration for SSL service resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name of the SSL service. Minimum length = 1
dh	<String>	Read-write	State of Diffie-Hellman (DH) key exchange. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dhfile	<String>	Read-write	Name for and, optionally, path to the PEM-format DH parameter file to be installed. /nsconfig/ssl/ is the default path. This parameter is not applicable when configuring a backend service. Minimum length = 1
dhcount	<Double>	Read-write	Number of interactions, between the client and the Citrix ADC, after which the DH private-public pair is regenerated. A value of zero (0) specifies infinite use (no refresh). This parameter is not applicable when configuring a backend service. Allowed DH count values are 0 and >= 500. Minimum value = 0 Maximum value = 65534
dhkeyexpsizelimit	<String>	Read-write	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Default value: DISABLED Possible values = ENABLED, DISABLED
ersa	<String>	Read-write	State of Ephemeral RSA (eRSA) key exchange. Ephemeral RSA allows clients that support only export ciphers to communicate with the secure server even if the server certificate does not support export clients. The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted. It is reused at a later date when another export cipher is bound to an SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or TCP-based SSL virtual server or service. The eRSA key is deleted when the appliance restarts. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
ersacount	<Double>	Read-write	Refresh count for regeneration of RSA public-key and private-key pair. Zero (0) specifies infinite usage (no refresh). This parameter is not applicable when configuring a backend service. Minimum value = 0 Maximum value = 65534
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Double>	Read-write	Time, in seconds, for which to keep the session active. Any session resumption request received after the timeout period will require a fresh SSL handshake and establishment of a new SSL session. Default value: 300 Minimum value = 0 Maximum value = 4294967294
cipherredirect	<String>	Read-write	State of Cipher Redirect. If this parameter is set to ENABLED, you can configure an SSL virtual server or service to display meaningful error

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			messages if the SSL handshake fails because of a cipher mismatch between the virtual server or service and the client. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-write	URL of the page to which to redirect the client in case of a cipher mismatch. Typically, this page has a clear explanation of the error or an alternative location that the transaction can continue from. This parameter is not applicable when configuring a backend service.
sslv2redirect	<String>	Read-write	State of SSLv2 Redirect. If this parameter is set to ENABLED, you can configure an SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			virtual server or service to display meaningful error messages if the SSL handshake fails because of a protocol version mismatch between the virtual server or service and the client. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
sslv2url	<String>	Read-write	URL of the page to which to redirect the client in case of a protocol version mismatch. Typically, this page has a clear explanation of the error or an alternative location that the transaction can continue from. This parameter is not applicable when configuring a backend service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientauth	<String>	Read-write	State of client authentication. In service-based SSL offload, the service terminates the SSL handshake if the SSL client does not provide a valid certificate. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
clientcert	<String>	Read-write	Type of client authentication. If this parameter is set to MANDATORY, the appliance terminates the SSL handshake if the SSL client does not provide a valid certificate. With the OPTIONAL setting, the appliance requests a certificate from the SSL clients but proceeds with the SSL transaction even if the client presents an invalid certificate.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			This parameter is not applicable when configuring a backend SSL service. Caution: Define proper access control policies before changing this setting to Optional. Possible values = Mandatory, Optional
sslredirect	<String>	Read-write	State of HTTPS redirects for the SSL service. For an SSL session, if the client browser receives a redirect message, the browser tries to connect to the new location. However, the secure SSL session breaks if the object has moved from a secure site (https://) to an unsecure site (http://). Typically, a warning message appears on the screen, prompting

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the user to continue or disconnect. If SSL Redirect is ENABLED, the redirect message is automatically converted from http:// to https:// and the SSL session does not break. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-write	State of the port rewrite while performing HTTPS redirect. If this parameter is set to ENABLED, and the URL from the server does not contain the standard port, the port is rewritten to the standard. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
ssl2	<String>	Read-write	State of SSLv2 protocol support for the SSL service. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL service. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the virtual server and service-based offload. SNI helps to enable SSL encryption on multiple domains on a single virtual server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL handshake with the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			client, the OCSP-based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. . Default value: DISABLED Possible values = ENABLED, DISABLED
serverauth	<String>	Read-write	State of server authentication support for the SSL service. Default value: DISABLED Possible values = ENABLED, DISABLED
commonname	<String>	Read-write	Name to be checked against the CommonName (CN) field in the server certificate bound to the SSL server. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pushenctrigger	<String>	Read-write	Trigger encryption on the basis of the PUSH flag value. Available settings function as follows: * ALWAYS - Any PUSH packet triggers encryption. * IGNORE - Ignore PUSH packet for triggering encryption. * MERGE - For a consecutive sequence of PUSH packets, the last PUSH packet triggers encryption. * TIMER - PUSH packet triggering encryption is delayed by the time defined in the set ssl parameter command or in the Change Advanced SSL Settings dialog box. Possible values = Always, Merge, Ignore, Timer

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
dtlsprofilename	<String>	Read-write	Name of the DTLS profile that contains DTLS settings for the service. Minimum length = 1 Maximum length = 127
sslprofile	<String>	Read-write	Name of the SSL profile that contains SSL settings for the service. Minimum length = 1 Maximum length = 127
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer's certificate during TLS1.2 handshake is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
nonfipsciphers	<String>	Read-only	The state of usage of non FIPS approved ciphers. Default value: DISABLED Possible values = ENABLED, DISABLED
service	<Double>	Read-only	.
skipcaname	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
dtlsflag	<Boolean>	Read-only	The flag is used to indicate whether DTLS is set or not.
__count	<Double>	Read-only	count parameter

Operations

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslservice resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservice resources in chunks.

HTTP Method:GET

Request Headers:

sslservicegroup

Configuration for SSL service group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the SSL service group for which to set advanced configuration. Minimum length = 1
sslprofile	<String>	Read-write	Name of the SSL profile that contains SSL settings for the Service Group. Minimum length = 1 Maximum length = 127
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Double>	Read-write	Time, in seconds, for which to keep the session active. Any

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			session resumption request received after the timeout period will require a fresh SSL handshake and establishment of a new SSL session. Default value: 300 Minimum value = 0 Maximum value = 4294967294
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL service group. Default value: ENABLED Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL service group. Default value: ENABLED Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SSL service group. Default value: ENABLED Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL service group. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL service group. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the service. SNI helps to enable SSL encryption on multiple domains on a single virtual server or service if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL handshake with the client, the OCSP-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. Default value: DISABLED Possible values = ENABLED, DISABLED
serverauth	<String>	Read-write	State of server authentication support for the SSL service group. Default value: DISABLED Possible values = ENABLED, DISABLED
commonname	<String>	Read-write	Name to be checked against the CommonName (CN) field in the server certificate bound to the SSL server. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer's certificate is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
dh	<String>	Read-only	The state of DH key exchange support for the SSL service group. Possible values = ENABLED, DISABLED
dhfile	<String>	Read-only	The file name and path for the DH parameter.
dhcount	<Double>	Read-only	The refresh count for the re-generation of DH public-key and private-key from the DH parameter.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 65534
dhkeyexpsizelimit	<String>	Read-only	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Possible values = ENABLED, DISABLED
ersa	<String>	Read-only	The state of Ephemeral RSA key exchange support for the SSL service group.Ephemeral RSA is used for export ciphers. Possible values = ENABLED, DISABLED
ersacount	<Double>	Read-only	The refresh count for the re-generation of RSA public-key and private-key pair. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65534
cipherredirect	<String>	Read-only	The state of Cipher Redirect feature. Cipher Redirect feature can be used to provide more readable information to SSL clients about mismatch in ciphers between the client and the SSL vserver. Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-only	The redirect URL to be used with the Cipher Redirect feature.
sslv2redirect	<String>	Read-only	The state of SSLv2 Redirect feature.SSLv2 Redirect feature can be used to provide more readable information to SSL client about non-support of SSLv2 protocol on the SSL vserver. Possible values = ENABLED, DISABLED
sslv2url	<String>	Read-only	The redirect URL to be used with SSLv2 Redirect feature.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientauth	<String>	Read-only	The state of Client-Authentication support for the SSL service group. Possible values = ENABLED, DISABLED
clientcert	<String>	Read-only	The rule for client certificate requirement in client authentication. Possible values = Mandatory, Optional
sslredirect	<String>	Read-only	The state of HTTPS redirects for the SSL service group. This is required for the proper functioning of the redirect messages from the server. The redirect message from the server provides the new location for the moved object. This is contained in the HTTP header field: Location, e.g. Location: http://www.moved.org/here.html For the SSL session, if the client browser receives

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this message, the browser will try to connect to the new location. This will break the secure SSL session, as the object has moved from a secure site (https://) to an un-secure one (http://). Generally browsers flash a warning message on the screen and prompt the user, either to continue or disconnect. The above feature, when enabled will automatically convert all such http:// redirect message to https://. This will not break the client SSL session. Note: The set ssl service command can be used for configuring a front-end SSL service for service based SSL Off-Loading, or a backend SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service for backend-encryption setup. Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-only	The state of port-rewrite feature. Possible values = ENABLED, DISABLED
nonfipsciphers	<String>	Read-only	The state of usage of non FIPS approved ciphers. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl2	<String>	Read-only	The state of SSLv2 protocol support for the SSL service group. Possible values = ENABLED, DISABLED
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
cleartextport	<Integer>	Read-only	The port on the back-end web-servers where the clear-text data is sent by system. Use this setting for the wildcard IP based SSL Acceleration configuration (*:443). Minimum value = 0 Maximum value = 65534 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
servicename	<String>	Read-only	The service name.
ca	<Boolean>	Read-only	CA certificate.
snicert	<Boolean>	Read-only	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservicegroup

HTTP Method:PUT

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/sslservicegroup_ecccurve_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
```

```
"sslservicegroup_ecccurve_binding":{

<b>"servicegroupname":<String_value>,

</b>"ecccurvename":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservicegroup_ecccurve_binding/servicegroupname_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservicegroup_ecccurve_binding/servicegroupname_value<String>?**args=ecccurvename:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservicegroup_ecccurve_binding/servicegroupname_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservicegroup_ecccurve_binding/servicegroupname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslservicegroup_ecccurve_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservicegroup_ecccurve_binding/servicegroupname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservicegroup_ecccurve_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

Content-Type:application/json

Response Payload:

```
{"sslservicegroup_ecccurve_binding": [ { "__count": "#no"} ] }
```

sslservicegroup_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The name of the SSL service to which the SSL policy needs to be bound. Minimum length = 1
ca	<Boolean>	Read-write	CA certificate.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crlcheck	<String>	Read-write	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
certkeyname	<String>	Read-write	The name of the certificate bound to the SSL service group.
snicert	<Boolean>	Read-write	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
ocspcheck	<String>	Read-write	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

sslservice_ecccurve_binding

Binding object showing the ecccurve that can be bound to sslservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ecccurvename	<String>	Read-write	Named ECC curve bound to service/ vserver. Possible values = ALL, P_224, P_256, P_384, P_521
servicename	<String>	Read-write	Name of the SSL service for which to set advanced configuration. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/sslservice_ecccurve_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"sslservice_ecccurve_binding":{

<b>"servicename":<String_value>,

</b>"ecccurvename":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice_ecccurve_binding/servicename_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice_ecccurve_binding/servicename_value<String>?**args=ecccurvename:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice_ecccurve_binding/servicename_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice_ecccurve_binding/servicename_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslservice_ecccurve_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice_ecccurve_binding/servicename_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservice_ecccurve_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslservice_ecccurve_binding": [ {

"ecccurvename":<String_value>,

"servicename":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice_ecccurve_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice_ecccurve_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslservice_ecccurve_binding": [ {

"ecccurvename":<String_value>,

"servicename":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslservice_ecccurve_binding/servicename_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"sslservice_ecccurve_binding": [ { "__count": "#no"} ] }
```

sslservice_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	CA certificate.
crlcheck	<String>	Read-write	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
servicename	<String>	Read-write	Name of the SSL service for which to set advanced configuration. Minimum length = 1
certkeyname	<String>	Read-write	The certificate key pair binding.
skipcaname	<Boolean>	Read-write	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			client while requesting for client certificate in a SSL handshake.
snicert	<Boolean>	Read-write	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
ocspcheck	<String>	Read-write	Rule to use for the OCSP responder associated with the CA certificate during client authentication. If MANDATORY is specified, deny all SSL clients if the OCSP check fails because of connectivity issues with the remote OCSP server, or any other reason that prevents the OCSP check. With the OPTIONAL setting, allow SSL clients even if the OCSP check fails except when the client certificate is revoked. Possible values = Mandatory, Optional
cleartextport	<Integer>	Read-only	The clearTextPort settings. Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65534 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
__count	<Double>	Read-only	count parameter

sslservice_sslpolicy_binding

Binding object showing the sslpolicy that can be bound to sslservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policies bound to this SSL service. Minimum value = 0 Maximum value = 65534
policyname	<String>	Read-write	The SSL policy binding.
labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE.
servicename	<String>	Read-write	Name of the SSL service for which to set advanced configuration. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag. This attribute is relevant only for ADVANCED policies.
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = vserver, service, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
polinherit	<Double>	Read-only	Whether the bound policy is a inherited policy or not. Minimum value = 0 Maximum value = 254
__count	<Double>	Read-only	count parameter

```

sslvserver

Configuration for SSL virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	Name of the SSL virtual server for which to set advanced configuration.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
cleartextport	<Integer>	Read-write	Port on which clear-text data is sent by the appliance to the server. Do not specify this parameter for SSL offloading with end-to-end encryption. Default value: 0 Minimum value = 0 Maximum value = 65534
dh	<String>	Read-write	State of Diffie-Hellman (DH) key exchange. Default value: DISABLED Possible values = ENABLED, DISABLED
dhfile	<String>	Read-write	Name of and, optionally, path to the DH parameter file, in PEM format, to be installed. /nsconfig/ssl/ is the default path. Minimum length = 1
dhcount	<Double>	Read-write	Number of interactions, between the client and the Citrix ADC, after which the DH

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			private-public pair is regenerated. A value of zero (0) specifies infinite use (no refresh). Minimum value = 0 Maximum value = 65534
dhkeyexpsizelimit	<String>	Read-write	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Default value: DISABLED Possible values = ENABLED, DISABLED
ersa	<String>	Read-write	State of Ephemeral RSA (eRSA) key exchange. Ephemeral RSA allows clients that support only export ciphers to communicate with the secure server even if the server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate does not support export clients. The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted. It is reused at a later date when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when the appliance restarts. Default value: ENABLED Possible values = ENABLED, DISABLED
ersacount	<Double>	Read-write	Refresh count for regeneration of the RSA public-key and private-key pair. Zero (0) specifies infinite usage (no refresh). Minimum value = 0 Maximum value = 65534

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Double>	Read-write	Time, in seconds, for which to keep the session active. Any session resumption request received after the timeout period will require a fresh SSL handshake and establishment of a new SSL session. Default value: 120 Minimum value = 0 Maximum value = 4294967294

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherredirect	<String>	Read-write	State of Cipher Redirect. If cipher redirect is enabled, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a cipher mismatch between the virtual server or service and the client. Default value: DISABLED Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-write	The redirect URL to be used with the Cipher Redirect feature.
sslv2redirect	<String>	Read-write	State of SSLv2 Redirect. If SSLv2 redirect is enabled, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a protocol version mismatch between the virtual server or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service and the client. Default value: DISABLED Possible values = ENABLED, DISABLED
sslv2url	<String>	Read-write	URL of the page to which to redirect the client in case of a protocol version mismatch. Typically, this page has a clear explanation of the error or an alternative location that the transaction can continue from.
clientauth	<String>	Read-write	State of client authentication. If client authentication is enabled, the virtual server terminates the SSL handshake if the SSL client does not provide a valid certificate. Default value: DISABLED Possible values = ENABLED, DISABLED
clientcert	<String>	Read-write	Type of client authentication. If this parameter is set to MANDATORY, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			appliance terminates the SSL handshake if the SSL client does not provide a valid certificate. With the OPTIONAL setting, the appliance requests a certificate from the SSL clients but proceeds with the SSL transaction even if the client presents an invalid certificate. Caution: Define proper access control policies before changing this setting to Optional. Possible values = Mandatory, Optional
sslredirect	<String>	Read-write	State of HTTPS redirects for the SSL virtual server. For an SSL session, if the client browser receives a redirect message, the browser tries to connect to the new location. However, the secure SSL session breaks if the object has moved from a secure site (https://) to an unsecure site

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(http://). Typically, a warning message appears on the screen, prompting the user to continue or disconnect. If SSL Redirect is ENABLED, the redirect message is automatically converted from http:// to https:// and the SSL session does not break. Default value: DISABLED Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-write	State of the port rewrite while performing HTTPS redirect. If this parameter is ENABLED and the URL from the server does not contain the standard port, the port is rewritten to the standard. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
ssl2	<String>	Read-write	State of SSLv2 protocol support for the SSL Virtual Server. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL Virtual Server. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the virtual server and service-based offload. SNI helps to enable SSL encryption on multiple domains on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a single virtual server or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			handshake with the client, the OCSP-based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. . Default value: DISABLED Possible values = ENABLED, DISABLED
pushenctrigger	<String>	Read-write	Trigger encryption on the basis of the PUSH flag value. Available settings function as follows: * ALWAYS - Any PUSH packet triggers encryption. * IGNORE - Ignore PUSH packet for triggering encryption. * MERGE - For a consecutive sequence of PUSH packets, the last

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			PUSH packet triggers encryption. * TIMER - PUSH packet triggering encryption is delayed by the time defined in the set ssl parameter command or in the Change Advanced SSL Settings dialog box. Possible values = Always, Merge, Ignore, Timer
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
dtlsprofilename	<String>	Read-write	Name of the DTLS profile whose settings are to be applied to the virtual server. Minimum length = 1 Maximum length = 127
sslprofile	<String>	Read-write	Name of the SSL profile that contains

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL settings for the virtual server. Minimum length = 1 Maximum length = 127
hsts	<String>	Read-write	State of HSTS protocol support for the SSL Virtual Server. Using HSTS, a server can enforce the use of an HTTPS connection for all communication with a client. Default value: DISABLED Possible values = ENABLED, DISABLED
maxage	<Double>	Read-write	Set the maximum time, in seconds, in the strict transport security (STS) header during which the client must send only HTTPS requests to the server. Default value: 0 Minimum value = 0 Maximum value = 4294967294
includesubdomains	<String>	Read-write	Enable HSTS for subdomains. If set to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Yes, a client must send only HTTPS requests for subdomains. Default value: NO Possible values = YES, NO
preload	<String>	Read-write	Flag indicates the consent of the site owner to have their domain preloaded. Default value: NO Possible values = YES, NO
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer entity certificate during TLS1.2 handshake is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
zerorttearlydata	<String>	Read-write	State of TLS 1.3 0-RTT early data support for the SSL Virtual Server. This setting only has an effect if resumption is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enabled, as early data cannot be sent along with an initial handshake. Early application data has significantly different security properties - in particular there is no guarantee that the data cannot be replayed. Default value: DISABLED Possible values = ENABLED, DISABLED
tls13sessionticketsperauthcontext	<Double>	Read-write	Number of tickets the SSL Virtual Server will issue anytime TLS 1.3 is negotiated, ticket-based resumption is enabled, and either (1) a handshake completes or (2) post-handhsake client auth completes. This value can be increased to enable clients to open multiple parallel connections using a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			fresh ticket for each connection. No tickets are sent if resumption is disabled. Default value: 1 Minimum value = 1 Maximum value = 10
dhekeyexchangewithpsk	<String>	Read-write	Whether or not the SSL Virtual Server will require a DHE key exchange to occur when a PSK is accepted during a TLS 1.3 resumption handshake. A DHE key exchange ensures forward secrecy even in the event that ticket keys are compromised, at the expense of an additional round trip and resources required to carry out the DHE key exchange. If disabled, a DHE key exchange will be performed when a PSK is accepted

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			but only if requested by the client. If enabled, the server will require a DHE key exchange when a PSK is accepted regardless of whether the client supports combined PSK-DHE key exchange. This setting only has an effect when resumption is enabled. Default value: NO Possible values = YES, NO
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
nonfipsciphers	<String>	Read-only	The state of usage of non FIPS approved ciphers. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
service	<Double>	Read-only	Service. Minimum value = 0 Maximum value = 65534
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
ca	<Boolean>	Read-only	CA certificate.
snicert	<Boolean>	Read-only	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
skipcaname	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
dtlsflag	<Boolean>	Read-only	The flag is used to indicate whether DTLS is set or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

sslvserver_binding

Binding object which returns the resources bound to sslvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	Name of the SSL virtual server for which to show detailed information. Minimum length = 1
sslvserver_sslcipher_binding	<sslvserver_sslcipher_binding[]>	Read-only	sslcipher that can be bound to sslvserver.
sslvserver_ecccurve_binding	<sslvserver_ecccurve_binding[]>	Read-only	ecccurve that can be bound to sslvserver.
sslvserver_sslpolicy_binding	<sslvserver_sslpolicy_binding[]>	Read-only	sslpolicy that can be bound to sslvserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslvserver_sslcertkey_binding	<sslvserver_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslvserver.
sslvserver_sslciphersuite_binding	<sslvserver_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslvserver.

Operations

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslvserver_binding/vservername_value<String>

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslvserver_binding": [ {

"vservername":<String_value>,

"sslvserver_sslciphersuite_binding":<sslvserver_sslciphersuite_binding[]_value>,

"sslvserver_ecccurve_binding":<sslvserver_ecccurve_binding[]_value>,

"sslvserver_sslpolicy_binding":<sslvserver_sslpolicy_binding[]_value>,

"sslvserver_sslcertkey_binding":<sslvserver_sslcertkey_binding[]_value>,

"sslvserver_sslcipher_binding":<sslvserver_sslcipher_binding[]_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslvserver_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslvserver_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslvserver_binding": [ {

"vservername":<String_value>,

"sslvserver_sslciphersuite_binding":<sslvserver_sslciphersuite_binding[]_value>,

sslvserver_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	CA certificate.
crlcheck	<String>	Read-write	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
vservername	<String>	Read-write	Name of the SSL virtual server. Minimum length = 1
certkeyname	<String>	Read-write	The name of the certificate key pair binding.
skipcaname	<Boolean>	Read-write	The flag is used to indicate whether this particular CA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
snicert	<Boolean>	Read-write	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
ocspcheck	<String>	Read-write	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
cleartextport	<Integer>	Read-only	Port on which clear-text data is sent by the appliance to the server. Do not specify this parameter for SSL offloading with end-to-end encryption. Default value: 0 Minimum value = 0 Maximum value = 65534
__count	<Double>	Read-only	count parameter

Response Payload:

```
{"sslvserver_sslcipher_binding": [ { "__count": "#no"} ] }
```

sslvserver_sslpolicy_binding

Binding object showing the sslpolicy that can be bound to sslvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policies bound to this SSL service. Minimum value = 0 Maximum value = 65534
policyname	<String>	Read-write	The name of the SSL policy binding.
labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE.
vservername	<String>	Read-write	Name of the SSL virtual server. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag. This attribute is relevant only for ADVANCED policies.
type	<String>	Read-write	Bind point to which to bind the policy. Possible Values: REQUEST, INTERCEPT_REQ and CLIENTHELLO_REQ. These bindpoints mean: 1. REQUEST: Policy evaluation will be done at appplication above SSL. This bindpoint is default and is used for actions based on clientauth and client cert. 2. INTERCEPT_REQ: Policy evaluation will be done during SSL handshake to decide whether to intercept or not. Actions allowed with this type are: INTERCEPT, BYPASS and RESET. 3. CLIENTHELLO_RE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Q: Policy evaluation will be done during handling of Client Hello Request. Action allowed with this type is: RESET, FORWARD and PICKCACERTGRP. Default value: REQUEST Possible values = INTERCEPT_REQ, REQUEST, CLIENTHELLO_REQ
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = vserver, service, policylabel
polinherit	<Double>	Read-only	Whether the bound policy is a inherited policy or not. Minimum value = 0 Maximum value = 254
__count	<Double>	Read-only	count parameter

Operations

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/sslvserver_sslpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
```

```
"sslvserver_sslpolicy_binding":{

<b>"vservername":<String_value>,

</b>"policyname":<String_value>,

"priority":<Double_value>,

"gotopriorityexpression":<String_value>,

"invoke":<Boolean_value>,

"labeltype":<String_value>,

"labelname":<String_value>,

"type":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslvserver_sslpolicy_binding/vservername_value<String>

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslvserver_sslpolicy_binding/vservername_value<String>?**args=policyname:<String_value>,priority:<Double_value>,type:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslvserver_sslpolicy_binding/vservername_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslvserver_sslpolicy_binding/vservername_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslvserver_sslpolicy_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslvserver_sslpolicy_binding/vservername_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslvserver_sslpolicy_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcacertgroup_sslcertkey_binding/cacertgroupname_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcacertgroup_sslcertkey_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcacertgroup_sslcertkey_binding/cacertgroupname_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcacertgroup_sslcertkey_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup_sslcertkey_binding": [ {

"cacertgroupname":<String_value>,

"certkeyname":<String_value>,

"crlcheck":<String_value>,

"ocspcheck":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcacertgroup_sslcertkey_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcacertgroup_sslcertkey_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup_sslcertkey_binding": [ {

"cacertgroupname":<String_value>,

"certkeyname":<String_value>,

"crlcheck":<String_value>,

"ocspcheck":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslcacertgroup_sslcertkey_binding/cacertgroupname_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"sslcacertgroup_sslcertkey_binding": [ { "__count": "#no"} ] }
```

sslecdsakey

Configuration for ecdsa key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyfile	<String>	Read-write	Name for and, optionally, path to the ECDSA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
curve	<String>	Read-write	Curve id to generate ECDSA key. Only P_256 and P_384 are supported. Default value: FIPSEXP_F4 Possible values = P_256, P_384
keyform	<String>	Read-write	Format in which the ECDSA key file is stored on the appliance. Default value: PEM Possible values = DER, PEM

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
des	<Boolean>	Read-write	Encrypt the generated ECDSA key by using the DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
des3	<Boolean>	Read-write	Encrypt the generated ECDSA key by using the Triple-DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
aes256	<Boolean>	Read-write	Encrypt the generated ECDSA key by using the AES algorithm.
password	<String>	Read-write	Pass phrase to use for encryption if DES or DES3 option is selected. Minimum length = 1 Maximum length = 31
pkcs8	<Boolean>	Read-write	Create the private key in PKCS#8 format.

Operations

(click to see Properties)

CREATE

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

create

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/sslecdsakey?**action=create**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"sslecdsakey":{

<b>"keyfile":<String_value>,

</b><b>"curve":<String_value>,

</b>"keyform":<String_value>,

"des":<Boolean_value>,

"des3":<Boolean_value>,

"aes256":<Boolean_value>,

"password":<String_value>,

"pkcs8":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

ssllogprofile

Configuration for SSL logging Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the ssllogprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
ssllogclauth	<String>	Read-write	log all SSL ClAuth events. Default value: DISABLED Possible values = ENABLED, DISABLED
ssllogclauthfailures	<String>	Read-write	log all SSL ClAuth error events. Default value: DISABLED Possible values = ENABLED, DISABLED
ssllogghs	<String>	Read-write	log all SSL HS events. Default value: DISABLED Possible values = ENABLED, DISABLED
ssllogghsfailures	<String>	Read-write	log all SSL HS error events. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

Request Payload:

```
{"vpnalwaysonprofile":{

<b>"name":<String_value>,

</b>"networkaccessonvpnfailure":true,

"clientcontrol":true,

"locationbasedvpn":true

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnalwaysonprofile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnalwaysonprofile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnalwaysonprofile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnalwaysonprofile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnalwaysonprofile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnalwaysonprofile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnalwaysonprofile resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnalwaysonprofile": [ { "__count": "#no"} ] }
```

vpnclientlessaccesspolicy

Configuration for Clientless VPN rewrite policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the new clientless access policy. Minimum length = 1
rule	<String>	Read-write	Expression, or name of a named expression, specifying the traffic that matches the policy. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
profilename	<String>	Read-write	Name of the profile to invoke for the clientless access.
undefaction	<String>	Read-only	The UNDEF action.
hits	<Double>	Read-only	The number of times the policy evaluated to true.
undefhits	<Double>	Read-only	The number of times the policy evaluation resulted in undefined processing.
description	<String>	Read-only	Description of the clientless access policy.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default vpnclientlessrwpolicy .
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnclientlessaccesspolicy

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"vpnclientlessaccesspolicy":{

<b>"name":<String_value>,

</b><b>"rule":<String_value>,

</b><b>"profilename":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnclientlessaccesspolicy/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

update

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnclientlessaccesspolicy

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"vpnclientlessaccesspolicy":{

<b>"name":<String_value>,

</b>"rule":<String_value>,

"profilename":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnclientlessaccesspolicy

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnclientlessaccesspolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnclientlessaccesspolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnclientlessaccesspolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnclientlessaccesspolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnclientlessaccesspolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnclientlessaccesspolicy resources in chunks.

vpnclientlessaccessprofile

Configuration for Clientless VPN rewrite profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
profilename	<String>	Read-write	Name for the Citrix Gateway clientless access profile. Must begin with an ASCII alphabetic or underscore (_) character, and must consist only of ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my profile" or 'my profile'). Minimum length = 1
urlrewritepolicylabel	<String>	Read-write	Name of the configured URL rewrite policy label. If you do not specify a policy label name, then URLs are not rewritten. Minimum length = 1
javascriptrewritepolicylabel	<String>	Read-write	Name of the configured JavaScript rewrite policy label. If you do not specify a policy label name, then JAVA scripts are not rewritten. Minimum length = 1
reqhdrrewritepolicylabel	<String>	Read-write	Name of the configured Request rewrite policy label. If you do not specify a policy label name, then requests are not rewritten. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reshdrrewritepolicylabel	<String>	Read-write	Name of the configured Response rewrite policy label. Minimum length = 1
regexforfindingurlinjavascript	<String>	Read-write	Name of the pattern set that contains the regular expressions, which match the URL in Java script. Minimum length = 1
regexforfindingurlincss	<String>	Read-write	Name of the pattern set that contains the regular expressions, which match the URL in the CSS. Minimum length = 1
regexforfindingurlinxcomponent	<String>	Read-write	Name of the pattern set that contains the regular expressions, which match the URL in X Component. Minimum length = 1
regexforfindingurlinxml	<String>	Read-write	Name of the pattern set that contains the regular expressions, which match the URL in XML. Minimum length = 1
regexforfindingcustomurls	<String>	Read-write	Name of the pattern set that contains the regular expressions, which match the URLs in the custom content type other

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			than HTML, CSS, XML, XCOMP, and JavaScript. The custom content type should be included in the patset ns_cvpn_custom_content_types. Minimum length = 1
clientconsumedcookies	<String>	Read-write	Specify the name of the pattern set containing the names of the cookies, which are allowed between the client and the server. If a pattern set is not specified, Citrix Gateway does not allow any cookies between the client and the server. A cookie that is not specified in the pattern set is handled by Citrix Gateway on behalf of the client. Minimum length = 1
requirepersistentcookie	<String>	Read-write	Specify whether a persistent session cookie is set and accepted for clientless access. If this parameter is set to ON, COM objects, such as MSOffice, which are invoked by the browser can

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			access the files using clientless access. Use caution because the persistent cookie is stored on the disk. Default value: OFF Possible values = ON, OFF
cssrewritepolicylabel	<String>	Read-only	The configured CSS rewrite policylabel. Minimum length = 1
xmlrewritepolicylabel	<String>	Read-only	The configured XML rewrite policylabel. Minimum length = 1
xcomponentrewritepolicylabel	<String>	Read-only	The configured X-Component rewrite policylabel. Minimum length = 1
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default vpnclientlessrwprofile.
description	<String>	Read-only	Description of the clientless access profile.

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnclientlessaccessprofile

vpnformssoaction

Configuration for Form sso action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the form based single sign-on profile. Minimum length = 1
actionurl	<String>	Read-write	Root-relative URL to which the completed form is submitted. Minimum length = 1
userfield	<String>	Read-write	Name of the form field in which the user types in the user ID. Minimum length = 1
passwdfield	<String>	Read-write	Name of the form field in which the user types in the password. Minimum length = 1
ssosuccessrule	<String>	Read-write	Expression that defines the criteria for SSO success. Expression such as checking for cookie in the response is a common example.
namevaluepair	<String>	Read-write	Other name-value pair attributes to send to the server, in addition to sending the user name and password. Value names are separated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by an ampersand (;), such as in name1=value1;name2=value2.
responsesize	<Double>	Read-write	Maximum number of bytes to allow in the response size. Specifies the number of bytes in the response to be parsed for extracting the forms. Default value: 8096
nvtype	<String>	Read-write	How to process the name-value pair. Available settings function as follows: * STATIC - The administrator-configured values are used. * DYNAMIC - The response is parsed, the form is extracted, and then submitted. Default value: DYNAMIC Possible values = STATIC, DYNAMIC
submitmethod	<String>	Read-write	HTTP method (GET or POST) used by the single sign-on form to send the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			logon credentials to the logon server. Default value: GET Possible values = GET, POST
__count	<Double>	Read-only	count parameter

vpnglobal_appcontroller_binding

Binding object showing the appcontroller that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or other value specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
appcontroller	<String>	Read-write	Configured App Controller server.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnglobal_appcontroller_binding

vpnglobal_authenticationldappolicy_binding

Binding object showing the authenticationldappolicy that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the policy's priority. The lower the priority number, the higher the policy's priority. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
policyname	<String>	Read-write	The name of the policy.
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression or other value specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
secondary	<Boolean>	Read-write	Bind the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only to a primary authentication server but also to a secondary authentication server. User groups are aggregated across both authentication servers. The user name must be exactly the same on both authentication servers, but the authentication servers can require different passwords.
groupextraction	<Boolean>	Read-write	Bind the Authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server, and this will only be called it primary and/or secondary authentication has succeeded.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnglobal_authenticationldappolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
"vpnglobal_authenticationldappolicy_binding":{
"policyname":<String_value>,
"priority":<Double_value>,
"secondary":<Boolean_value>,
"groupextraction":<Boolean_value>,
"gotopriorityexpression":<String_value>
}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_authenticationldappolicy_binding

Query-parameters:

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

GET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

vpnglobal_domain_binding

Binding object showing the domain that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
intranetdomain	<String>	Read-write	The conflicting intranet domain name.
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression or other value specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnglobal_domain_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{
```

```
"vpnglobal_domain_binding":{

"intranetdomain":<String_value>,

"gotopriorityexpression":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_domain_binding

Query-parameters:

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnglobal_sslcertkey_binding

vpnglobal_staserver_binding

Binding object showing the staserver that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
staserver	<String>	Read-write	Configured Secure Ticketing Authority (STA) server.
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression or other value specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
staaddresstype	<String>	Read-write	Type of the STA server address(ipv4/v6). Possible values = IPV4, IPV6
stastate	<String>	Read-only	State of the STA Server. If Authority ID is set then STA Server is UP else DOWN. Possible values = UP, DOWN
staauthid	<String>	Read-only	Authority ID of the STA Server. Authority ID is used to match incoming STA Tickets in the SOCKS/CGP protocol with the right STA Server.
__count	<Double>	Read-only	count parameter

vpnglobal_vpnclientlessaccesspolicy_binding

Binding object showing the vpnclientlessaccesspolicy that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the policy's priority. The lower the priority number, the higher the policy's priority. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
globalbindtype	<String>	Read-write	. Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	The name of the policy.
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression or other value specifying the priority of the next policy which will get evaluated if the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			current policy rule evaluates to TRUE.
secondary	<Boolean>	Read-write	Bind the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only to a primary authentication server but also to a secondary authentication server. User groups are aggregated across both authentication servers. The user name must be exactly the same on both authentication servers, but the authentication servers can require different passwords.
type	<String>	Read-write	Bindpoint to which the policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT
groupextraction	<Boolean>	Read-write	Bind the Authentication policy to a tertiary chain which will be used

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only for group extraction. The user will not authenticate against this server, and this will only be called it primary and/or secondary authentication has succeeded.
__count	<Double>	Read-write	count parameter

```

vpnglobal_vpnnexthopserver_binding

Binding object showing the vpnnexthopserver that can be bound to vpnglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. An expression or other value specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
nexthopserver	<String>	Read-write	The name of the next hop server bound to vpn global.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnglobal_vpnnexthopserver_binding

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnglobal_vpnurl_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

"vpnglobal_vpnurl_binding":{

"urlname":<String_value>,

"gotopriorityexpression":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_vpnurl_binding

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_vpnurl_binding?**args=urlname:<String_value>**

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_vpnurl_binding

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_vpnurl_binding?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vpnglobal_vpnurl_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_vpnurl_binding?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnglobal_vpnurl_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnglobal_vpnurl_binding": [ {
```

```
"urlname":<String_value>,

"gotopriorityexpression":<String_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_vpnurl_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_vpnurl_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnglobal_vpnurl_binding": [ {

"urlname":<String_value>,

"gotopriorityexpression":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnglobal_vpnurl_binding?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnglobal_vpnurl_binding": [ { "__count": "#no"} ] }
```

vpnicaconnection

Configuration for active ica connections resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User name for which to display connections. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
transproto	<String>	Read-write	Transport type for the existing Existing ICA conenction. Possible values = TCP, UDP
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
all	<Boolean>	Read-write	Terminate all active icaconnections.
domain	<String>	Read-only	The domain name.
srcip	<String>	Read-only	The client IP address.
srcport	<Integer>	Read-only	The client port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
destip	<String>	Read-only	The CPS server IP address.
destport	<Integer>	Read-only	The CPS server port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
peid	<Double>	Read-only	Core id of the session owner.
__count	<Double>	Read-only	count parameter

vpnintranetapplication

Configuration for SSLVPN intranet application resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
intranetapplication	<String>	Read-write	Name of the intranet application. Minimum length = 1 Maximum length = 31
protocol	<String>	Read-write	Protocol used by the intranet application. If protocol is set to BOTH, TCP and UDP traffic is allowed. Possible values = TCP, UDP, ANY

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
destip	<String>	Read-write	Destination IP address, IP range, or host name of the intranet application. This address is the server IP address. Minimum length = 1
netmask	<String>	Read-write	Destination subnet mask for the intranet application.
iprange	<String>	Read-write	If you have multiple servers in your network, such as web, email, and file shares, configure an intranet application that includes the IP range for all the network applications. This allows users to access all the intranet applications contained in the IP address range. Minimum length = 1
hostname	<String>	Read-write	Name of the host for which to configure interception. The names are resolved during interception when users log on with the Citrix Gateway Plug-in. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientapplication	<String[]>	Read-write	Names of the client applications, such as PuTTY and Xshell. Minimum length = 1
spoofiip	<String>	Read-write	IP address that the intranet application will use to route the connection through the virtual adapter. Default value: ON Possible values = ON, OFF
destport	<String>	Read-write	Destination TCP or UDP port number for the intranet application. Use a hyphen to specify a range of port numbers, for example 90-95. Minimum length = 1
interception	<String>	Read-write	Interception mode for the intranet application or resource. Correct value depends on the type of client software used to make connections. If the interception mode is set to TRANSPARENT, users connect with the Citrix Gateway Plug-in for Windows. With the PROXY setting, users

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connect with the Citrix Gateway Plug-in for Java. Possible values = PROXY, TRANSPARENT
srcip	<String>	Read-write	Source IP address. Required if interception mode is set to PROXY. Default is the loopback address, 127.0.0.1. Minimum length = 1
srcport	<Integer>	Read-write	Source port for the application for which the Citrix Gateway virtual server proxies the traffic. If users are connecting from a device that uses the Citrix Gateway Plug-in for Java, applications must be configured manually by using the source IP address and TCP port values specified in the intranet application profile. If a port value is not set, the destination port value is used. Minimum value = 1
ipaddress	<String>	Read-only	The IP address for the application. This address is the real

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			application server IP address.
__count	<Double>	Read-only	count parameter

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnnexthopserver

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnnexthopserver?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnnexthopserver?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnnexthopserver resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnnexthopserver?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnnexthopserver?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnnexthopserver resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

vpnparameter

Configuration for VPN parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpport	<Integer[]>	Read-write	Destination port numbers other than port 80, added as a comma-separated list. Traffic to these ports is processed as HTTP traffic, which allows functionality, such as HTTP authorization and single sign-on to a web application to work. Minimum value = 1
winsip	<String>	Read-write	WINS server IP address to add to Citrix Gateway for name resolution. Minimum length = 1
dnsvservername	<String>	Read-write	Name of the DNS virtual server for the user session. Minimum length = 1
splitdns	<String>	Read-write	Route the DNS requests to the local DNS server configured on the user device, or Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Gateway (remote), or both. Possible values = LOCAL, REMOTE, BOTH
icauseraccounting	<String>	Read-write	The name of the radiusPolicy to use for RADIUS user accounting info on the session.
sesstimeout	<Double>	Read-write	Number of minutes after which the session times out. Default value: 30 Minimum value = 1 Maximum value = 65535
clientsecurity	<String>	Read-write	Specify the client security check for the user device to permit a Citrix Gateway session. The web address or IP address is not included in the expression for the client security check.
clientsecuritygroup	<String>	Read-write	The client security group that will be assigned on failure of the client security check. Users can in general be organized into Groups. In this case, the Client

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Security Group may have a more restrictive security policy. Minimum length = 1
clientsecuritymessage	<String>	Read-write	The client security message that will be displayed on failure of the client security check. Minimum length = 1 Maximum length = 127
clientsecuritylog	<String>	Read-write	Specifies whether or not to display all failed Client Security scans to the end user. Default value: OFF Possible values = ON, OFF
smartgroup	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Minimum length = 1 Maximum length = 64
splittunnel	<String>	Read-write	Send, through the tunnel, traffic only for intranet applications that are defined in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Citrix Gateway. Route all other traffic directly to the Internet. The OFF setting routes all traffic through Citrix Gateway. With the REVERSE setting, intranet applications define the network traffic that is not intercepted. All network traffic directed to internal IP addresses bypasses the VPN tunnel, while other traffic goes through Citrix Gateway. Reverse split tunneling can be used to log all non-local LAN traffic. For example, if users have a home network and are logged on through the Citrix Gateway Plug-in, network traffic destined to a printer or another device within the home network is not intercepted. Default value: OFF Possible values = ON, OFF, REVERSE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
locallanaccess	<String>	Read-write	Set local LAN access. If split tunneling is OFF, and you set local LAN access to ON, the local client can route traffic to its local interface. When the local area network switch is specified, this combination of switches is useful. The client can allow local LAN access to devices that commonly have non-routable addresses, such as local printers or local file servers. Default value: OFF Possible values = ON, OFF
rfc1918	<String>	Read-write	As defined in the local area network, allow only the following local area network addresses to bypass the VPN tunnel when the local LAN access feature is enabled: * 10.*.*.*, * 172.16.*.*, * 192.168.*.*. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
spoofiip	<String>	Read-write	Indicate whether or not the application requires IP spoofing, which routes the connection to the intranet application through the virtual adapter. Default value: ON Possible values = ON, OFF
killconnections	<String>	Read-write	Specify whether the Citrix Gateway Plug-in should disconnect all preexisting connections, such as the connections existing before the user logged on to Citrix Gateway, and prevent new incoming connections on the Citrix Gateway Plug-in for Windows and MAC when the user is connected to Citrix Gateway and split tunneling is disabled. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
transparentintercepti on	<String>	Read-write	Allow access to network resources by using a single IP address and subnet mask or a range of IP addresses. The OFF setting sets the mode to proxy, in which you configure destination and source IP addresses and port numbers. If you are using the Citrix Gateway Plug-in for Windows, set this parameter to ON, in which the mode is set to transparent. If you are using the Citrix Gateway Plug-in for Java, set this parameter to OFF. Default value: OFF Possible values = ON, OFF
windowsclienttype	<String>	Read-write	The Windows client type. Choose between two types of Windows Client a) Application Agent - which always runs in the task bar as a standalone application and also has a supporting service which runs

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			permanently when installed b) Activex Control - ActiveX control run by Microsoft Internet Explorer. Default value: AGENT Possible values = AGENT, PLUGIN
defaultauthorizationaction	<String>	Read-write	Specify the network resources that users have access to when they log on to the internal network. The default setting for authorization is to deny access to all network resources. Citrix recommends using the default global setting and then creating authorization policies to define the network resources users can access. If you set the default authorization policy to DENY, you must explicitly authorize access to any network resource, which improves security.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DENY Possible values = ALLOW, DENY
authorizationgroup	<String>	Read-write	Comma-separated list of groups in which the user is placed when none of the groups that the user is a part of is configured on Citrix Gateway. The authorization policy can be bound to these groups to control access to the resources. Minimum length = 1
clientidletimeout	<Double>	Read-write	Time, in minutes, after which to time out the user session if Citrix Gateway does not detect mouse or keyboard activity. Minimum value = 1 Maximum value = 9999
proxy	<String>	Read-write	Set options to apply proxy for accessing the internal resources. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* BROWSER - Proxy settings are configured only in Internet Explorer and Firefox browsers. * NS - Proxy settings are configured on the Citrix ADC. * OFF - Proxy settings are not configured. Possible values = BROWSER, NS, OFF
allprotocolproxy	<String>	Read-write	IP address of the proxy server to use for all protocols supported by Citrix Gateway. Minimum length = 1
httpproxy	<String>	Read-write	IP address of the proxy server to be used for HTTP access for all subsequent connections to the internal network. Minimum length = 1
ftpproxy	<String>	Read-write	IP address of the proxy server to be used for FTP access for all subsequent

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connections to the internal network. Minimum length = 1
socksproxy	<String>	Read-write	IP address of the proxy server to be used for SOCKS access for all subsequent connections to the internal network. Minimum length = 1
gopherproxy	<String>	Read-write	IP address of the proxy server to be used for GOPHER access for all subsequent connections to the internal network. Minimum length = 1
sslproxy	<String>	Read-write	IP address of the proxy server to be used for SSL access for all subsequent connections to the internal network. Minimum length = 1
proxyexception	<String>	Read-write	Proxy exception string that will be configured in the browser for bypassing the previously configured proxies. Allowed only if proxy type is Browser. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
proxylocalbypass	<String>	Read-write	Bypass proxy server for local addresses option in Internet Explorer and Firefox proxy server settings. Default value: DISABLED Possible values = ENABLED, DISABLED
clientcleanupprompt	<String>	Read-write	Prompt for client-side cache clean-up when a client-initiated session closes. Default value: ON Possible values = ON, OFF
forcecleanup	<String[]>	Read-write	Force cache clean-up when the user closes a session. You can specify all, none, or any combination of the client-side items. Possible values = none, all, cookie, addressbar, plugin, filesystemapplicatio n, application, applicationdata, clientcertificate, autocomplete, cache

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientoptions	<String[]>	Read-write	Display only the configured menu options when you select the "Configure Citrix Gateway" option in the Citrix Gateway Plug-in's system tray icon for Windows. Possible values = none, all, services, filetransfer, configuration
clientconfiguration	<String[]>	Read-write	Allow users to change client Debug logging level in Configuration tab of the Citrix Gateway Plug-in for Windows. Possible values = none, trace
sso	<String>	Read-write	Set single sign-on (SSO) for the session. When the user accesses a server, the user's logon credentials are passed to the server for authentication. NOTE : Authentication mechanisms like Basic-authentication require the user credentials to be sent in plaintext which is not secure

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			if the server is running on HTTP (instead of HTTPS). By default, Single Sign On is not attempted to a Public IP. Default value: OFF Possible values = ON, OFF
ssocredential	<String>	Read-write	Specify whether to use the primary or secondary authentication credentials for single sign-on to the server. Default value: PRIMARY Possible values = PRIMARY, SECONDARY
windowsautologon	<String>	Read-write	Enable or disable the Windows Auto Logon for the session. If a VPN session is established after this setting is enabled, the user is automatically logged on by using Windows credentials after the system is restarted. Default value: OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ON, OFF
usemip	<String>	Read-write	Enable or disable the use of a unique IP address alias, or a mapped IP address, as the client IP address for each client session. Allow Citrix Gateway to use the mapped IP address as an intranet IP address when all other IP addresses are not available. When IP pooling is configured and the mapped IP is used as an intranet IP address, the mapped IP address is used when an intranet IP address cannot be assigned. Default value: NS Possible values = NS, OFF
useiip	<String>	Read-write	Define IP address pool options. Available settings function as follows: * SPILLOVER - When an address pool is configured

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and the mapped IP is used as an intranet IP address, the mapped IP address is used when an intranet IP address cannot be assigned. * NOSPILLOVER - When intranet IP addresses are enabled and the mapped IP address is not used, the Transfer Login page appears for users who have used all available intranet IP addresses. * OFF - Address pool is not configured. Default value: NOSPILLOVER Possible values = NOSPILLOVER, SPILLOVER, OFF
clientdebug	<String>	Read-write	Set the trace level on Citrix Gateway. Technical support technicians use these debug logs for in-depth debugging and troubleshooting

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			purposes. Available settings function as follows: * DEBUG - Detailed debug messages are collected and written into the specified file. * STATS - Application audit level error messages and debug statistic counters are written into the specified file. * EVENTS - Application audit-level error messages are written into the specified file. * OFF - Only critical events are logged into the Windows Application Log. Default value: OFF Possible values = debug, stats, events, OFF
loginscript	<String>	Read-write	Path to the logon script that is run when a session is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			established. Separate multiple scripts by using comma. A "$" in the path signifies that the word following the "$" is an environment variable. Minimum length = 1
logoutscript	<String>	Read-write	Path to the logout script. Separate multiple scripts by using comma. A "$" in the path signifies that the word following the "$" is an environment variable. Minimum length = 1
homepage	<String>	Read-write	Web address of the home page that appears when users log on. Otherwise, users receive the default home page for Citrix Gateway, which is the Access Interface.
icaproxy	<String>	Read-write	Enable ICA proxy to configure secure Internet access to servers running Citrix XenApp or XenDesktop by using Citrix Receiver instead of the Citrix Gateway Plug-in.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: OFF Possible values = ON, OFF
wihome	<String>	Read-write	Web address of the Web Interface server, such as http://<ipAddress>/Citrix/XenApp, or Receiver for Web, which enumerates the virtualized resources, such as XenApp, XenDesktop, and cloud applications. This web address is used as the home page in ICA proxy mode. If Client Choices is ON, you must configure this setting. Because the user can choose between FullClient and ICAProxy, the user may see a different home page. An Internet web site may appear if the user gets the FullClient option, or a Web Interface site if the user gets the ICAProxy option. If

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the setting is not configured, the XenApp option does not appear as a client choice.
wihomeaddresstype	<String>	Read-write	Type of the wihome address(IPV4/V6). Possible values = IPV4, IPV6
citrixreceiverhome	<String>	Read-write	Web address for the Citrix Receiver home page. Configure Citrix Gateway so that when users log on to the appliance, the Citrix Gateway Plug-in opens a web browser that allows single sign-on to the Citrix Receiver home page.
wiportalmode	<String>	Read-write	Layout on the Access Interface. The COMPACT value indicates the use of small icons. Possible values = NORMAL, COMPACT
clientchoices	<String>	Read-write	Provide users with multiple logon options. With client choices, users have the option of logging on by using the Citrix Gateway Plug-in for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Windows, Citrix Gateway Plug-in for Java, the Web Interface, or clientless access from one location. Depending on how Citrix Gateway is configured, users are presented with up to three icons for logon choices. The most common are the Citrix Gateway Plug-in for Windows, Web Interface, and clientless access. Default value: OFF Possible values = ON, OFF
epaclienttype	<String>	Read-write	Choose between two types of End point Windows Client a) Application Agent - which always runs in the task bar as a standalone application and also has a supporting service which runs permanently when installed b) Activex Control - ActiveX control run

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by Microsoft Internet Explorer. Possible values = AGENT, PLUGIN
iipdnssuffix	<String>	Read-write	An intranet IP DNS suffix. When a user logs on to Citrix Gateway and is assigned an IP address, a DNS record for the user name and IP address combination is added to the Citrix Gateway DNS cache. You can configure a DNS suffix to append to the user name when the DNS record is added to the cache. You can reach to the host from where the user is logged on by using the user's name, which can be easier to remember than an IP address. When the user logs off from Citrix Gateway, the record is removed from the DNS cache. Minimum length = 1
forcedtimeout	<Double>	Read-write	Force a disconnection from the Citrix Gateway Plug-in with Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Gateway after a specified number of minutes. If the session closes, the user must log on again. Minimum value = 1 Maximum value = 65535
forcedtimeoutwarning	<Double>	Read-write	Number of minutes to warn a user before the user session is disconnected. Minimum value = 1 Maximum value = 255
ntdomain	<String>	Read-write	Single sign-on domain to use for single sign-on to applications in the internal network. This setting can be overwritten by the domain that users specify at the time of logon or by the domain that the authentication server returns. Minimum length = 1 Maximum length = 32
clientlessvpnmode	<String>	Read-write	Enable clientless access for web, XenApp or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			XenDesktop, and FileShare resources without installing the Citrix Gateway Plug-in. Available settings function as follows: * ON - Allow only clientless access. * OFF - Allow clientless access after users log on with the Citrix Gateway Plug-in. * DISABLED - Do not allow clientless access. Default value: OFF Possible values = ON, OFF, DISABLED
clientlessmodeurlencoding	<String>	Read-write	When clientless access is enabled, you can choose to encode the addresses of internal web applications or to leave the address as clear text. Available settings function as follows: * OPAQUE - Use standard encoding mechanisms to make the domain and protocol part of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the resource unclear to users. * TRANSPARENT - Do not encode the web address and make it visible to users. * ENCRYPT - Allow the domain and protocol to be encrypted using a session key. When the web address is encrypted, the URL is different for each user session for the same web resource. If users bookmark the encoded web address, save it in the web browser and then log off, they cannot connect to the web address when they log on and use the bookmark. If users save the encrypted bookmark in the Access Interface during their session, the bookmark works each time the user logs on.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: OPAQUE Possible values = TRANSPARENT, OPAQUE, ENCRYPT
clientlesspersistentcookie	<String>	Read-write	State of persistent cookies in clientless access mode. Persistent cookies are required for accessing certain features of SharePoint, such as opening and editing Microsoft Word, Excel, and PowerPoint documents hosted on the SharePoint server. A persistent cookie remains on the user device and is sent with each HTTP request. Citrix Gateway encrypts the persistent cookie before sending it to the plug-in on the user device, and refreshes the cookie periodically as long as the session exists. The cookie becomes stale if the session ends. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ALLOW - Enable persistent cookies. Users can open and edit Microsoft documents stored in SharePoint. * DENY - Disable persistent cookies. Users cannot open and edit Microsoft documents stored in SharePoint. * PROMPT - Prompt users to allow or deny persistent cookies during the session. Persistent cookies are not required for clientless access if users do not connect to SharePoint. Default value: DENY Possible values = ALLOW, DENY, PROMPT
emailhome	<String>	Read-write	Web address for the web-based email, such as Outlook Web Access.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
allowedlogingroups	<String>	Read-write	Specify groups that have permission to log on to Citrix Gateway. Users who do not belong to this group or groups are denied access even if they have valid credentials. Minimum length = 1 Maximum length = 511
encryptcsecexp	<String>	Read-write	Enable encryption of client security expressions. Default value: ENABLED Possible values = ENABLED, DISABLED
apptokentimeout	<Double>	Read-write	The timeout value in seconds for tokens to access XenMobile applications. Default value: 100 Minimum value = 1 Maximum value = 255
mdxtokentimeout	<Double>	Read-write	Validity of MDX Token in minutes. This token is used for mdx services to access backend and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			valid HEAD and GET request. Default value: 10 Minimum value = 1 Maximum value = 1440
uitheme	<String>	Read-write	Set VPN UI Theme to Green-Bubble, Caxton or Custom; default is Caxton. Possible values = DEFAULT, GREENBUBBLE, CUSTOM
securebrowse	<String>	Read-write	Allow users to connect through Citrix Gateway to network resources from iOS and Android mobile devices with Citrix Receiver. Users do not need to establish a full VPN tunnel to access resources in the secure network. Default value: ENABLED Possible values = ENABLED, DISABLED
storefronturl	<String>	Read-write	Web address for StoreFront to be used in this session

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for enumeration of resources from XenApp or XenDesktop. Minimum length = 1 Maximum length = 255
kcdaccount	<String>	Read-write	The KCD account details to be used in SSO.
clientversions	<String>	Read-write	checkversion api. Minimum length = 1 Maximum length = 100
rdpclientprofilename	<String>	Read-write	Name of the RDP profile associated with the vserver. Minimum length = 1 Maximum length = 127
windowspluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Win. Default value: Always Possible values = Always, Essential, Never
macpluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Mac.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: Always Possible values = Always, Essential, Never
linuxpluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Linux. Default value: Always Possible values = Always, Essential, Never
iconwithreceiver	<String>	Read-write	Option to decide whether to show plugin icon along with receiver icon. Default value: OFF Possible values = ON, OFF
userdomains	<String>	Read-write	List of user domains specified as comma seperated value.
icasessiontimeout	<String>	Read-write	Enable or disable ica session timeout. If enabled and in case AAA session gets terminated, ICA connections associated with that will also get terminated.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: OFF Possible values = ON, OFF
alwaysonprofilename	<String>	Read-write	Name of the AlwaysON profile. The builtin profile named none can be used to explicitly disable AlwaysON. Minimum length = 1 Maximum length = 127
autoproxyurl	<String>	Read-write	URL to auto proxy config file.
advancedclientlessvpnmode	<String>	Read-write	Option to enable/disable Advanced ClientlessVpnMode. Default value: DISABLED Possible values = ENABLED, DISABLED
pcoipprofilename	<String>	Read-write	Name of the PCOIP profile. Minimum length = 1 Maximum length = 127
backendserversni	<String>	Read-write	enables sni extension for backend server handshakes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
backendcertvalidation	<String>	Read-write	enables backend server certificate validation. Default value: DISABLED Possible values = ENABLED, DISABLED
fqdnspoofedip	<String>	Read-write	Spoofed IP address range that can be used by client for FQDN based split tunneling. Minimum length = 1
netmask	<String>	Read-write	The netmask for the spoofed ip address. Minimum length = 1
name	<String>	Read-only	The VPN name.
clientidletimeoutwarning	<Double>	Read-only	The time after which the client gets a timeout warning, in minutes.
vpnsessionpolicybindtype	<String>	Read-only	Indicates current bind type (Classic/ Advanced) for VPN session policy across all bind entities.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: Advanced Policy Possible values = Classic Policy, Advanced Policy
vpnsessionpolicycount	<Double>	Read-only	Count of VPN session policies across all bind entities.

Operations

(click to see Properties)

UPDATE| UNSET| GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

vpnpcoipconnection

Configuration for PCoIP connection resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User name for the PCOIP connections. Minimum length = 1
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
all	<Boolean>	Read-write	All active pcoip connections.
srcip	<String>	Read-only	The client IP address.
srcport	<Integer>	Read-only	The client port. Range 1 - 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* in CLI is represented as 65535 in NITRO API
destip	<String>	Read-only	The VDA IP address.
destport	<Integer>	Read-only	The VDA server port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
peid	<Double>	Read-only	Core id of the session owner.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

KILL| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

kill

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnpcoipconnection?**action=kill**

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"vpnpcoipconnection":{

"username":<String_value>,

"all":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnpcoipconnection

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnpcoipconnection?**args=username:<String_value>,nodeid:<Double_value>**

Use this query-parameter to get vpnpcoipconnection resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnpcoipconnection?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnpcoipconnection?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnpcoipconnection resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnpcoipconnection?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnpcoipconnection?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnpcoipconnection resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnpcoipconnection": [ {

username:<String_value>,nodeid:<Double_value>"srcip":<String_value>,

"srcport":<Integer_value>,

"destip":<String_value>,

"destport":<Integer_value>,

"peid":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnpcoipconnection?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnpcoipconnection": [ { "__count": "#no"} ] }
```

vpnpcoipprofile

Configuration for PCoIP session profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	name of PCoIP profile. Minimum length = 1
conserverurl	<String>	Read-write	Connection server URL.
icvverification	<String>	Read-write	ICV verification for PCOIP transport packets. Default value: DISABLED Possible values = ENABLED, DISABLED
sessionidletimeout	<Double>	Read-write	PCOIP Idle Session timeout. Default value: 180 Minimum value = 30 Maximum value = 240

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

```

vpnportaltheme

Configuration for portaltheme resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the uitheme. Minimum length = 1
basetheme	<String>	Read-write	. Minimum length = 1 Possible values = Default, Greenbubble, X1, RfWebUI
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme

HTTP Method:POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{"vpnportaltheme":{

<b>"name":<String_value>,

</b><b>"basetheme":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

delete

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme/name_value<String>

HTTP Method:DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnportaltheme resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnportaltheme resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnportaltheme": [ {

"name":<String_value>,

"basetheme":<String_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnportaltheme/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

vpnsamlssoprofile

Configuration for SAML sso action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new saml single sign-on profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after an SSO action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
samlsigningcertname	<String>	Read-write	Name of the signing authority as given in the SAML server's SSL certificate. Minimum length = 1
assertionconsumerserviceurl	<String>	Read-write	URL to which the assertion is to be sent. Minimum length = 1
relaystaterule	<String>	Read-write	Expression to extract relaystate to be sent along with assertion. Evaluation of this expression should return TEXT content. This is typically a target url to which user is redirected after the recipient validates SAML token.
sendpassword	<String>	Read-write	Option to send password in assertion. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
samlissuername	<String>	Read-write	The name to be used in requests sent from Citrix ADC to IdP to uniquely identify Citrix ADC. Minimum length = 1
signaturealg	<String>	Read-write	Algorithm to be used to sign/verify SAML transactions. Default value: RSA-SHA256 Possible values = RSA-SHA1, RSA-SHA256
digestmethod	<String>	Read-write	Algorithm to be used to compute/verify digest for SAML transactions. Default value: SHA256 Possible values = SHA1, SHA256
audience	<String>	Read-write	Audience for which assertion sent by IdP is applicable. This is typically entity name or url that represents ServiceProvider.
nameidformat	<String>	Read-write	Format of Name Identifier sent in Assertion. Default value: transient

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Unspecified, emailAddress, X509SubjectName, WindowsDomainQualifiedName, kerberos, entity, persistent, transient
nameidexpr	<String>	Read-write	Expression that will be evaluated to obtain NameIdentifier to be sent in assertion. Maximum length = 128
attribute1	<String>	Read-write	Name of attribute1 that needs to be sent in SAML Assertion.
attribute1expr	<String>	Read-write	Expression that will be evaluated to obtain attribute1's value to be sent in Assertion. Maximum length = 128
attribute1friendlyname	<String>	Read-write	User-Friendly Name of attribute1 that needs to be sent in SAML Assertion.
attribute1format	<String>	Read-write	Format of Attribute1 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute2	<String>	Read-write	Name of attribute2 that needs to be sent in SAML Assertion.
attribute2expr	<String>	Read-write	Expression that will be evaluated to obtain attribute2's value to be sent in Assertion. Maximum length = 128
attribute2friendlyname	<String>	Read-write	User-Friendly Name of attribute2 that needs to be sent in SAML Assertion.
attribute2format	<String>	Read-write	Format of Attribute2 to be sent in Assertion. Possible values = URI, Basic
attribute3	<String>	Read-write	Name of attribute3 that needs to be sent in SAML Assertion.
attribute3expr	<String>	Read-write	Expression that will be evaluated to obtain attribute3's value to be sent in Assertion. Maximum length = 128
attribute3friendlyname	<String>	Read-write	User-Friendly Name of attribute3 that needs to be sent in SAML Assertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute3format	<String>	Read-write	Format of Attribute3 to be sent in Assertion. Possible values = URI, Basic
attribute4	<String>	Read-write	Name of attribute4 that needs to be sent in SAML Assertion.
attribute4expr	<String>	Read-write	Expression that will be evaluated to obtain attribute4's value to be sent in Assertion. Maximum length = 128
attribute4friendlyname	<String>	Read-write	User-Friendly Name of attribute4 that needs to be sent in SAML Assertion.
attribute4format	<String>	Read-write	Format of Attribute4 to be sent in Assertion. Possible values = URI, Basic
attribute5	<String>	Read-write	Name of attribute5 that needs to be sent in SAML Assertion.
attribute5expr	<String>	Read-write	Expression that will be evaluated to obtain attribute5's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute5friendlyname	<String>	Read-write	User-Friendly Name of attribute5 that needs to be sent in SAML Assertion.
attribute5format	<String>	Read-write	Format of Attribute5 to be sent in Assertion. Possible values = URI, Basic
attribute6	<String>	Read-write	Name of attribute6 that needs to be sent in SAML Assertion.
attribute6expr	<String>	Read-write	Expression that will be evaluated to obtain attribute6's value to be sent in Assertion. Maximum length = 128
attribute6friendlyname	<String>	Read-write	User-Friendly Name of attribute6 that needs to be sent in SAML Assertion.
attribute6format	<String>	Read-write	Format of Attribute6 to be sent in Assertion. Possible values = URI, Basic
attribute7	<String>	Read-write	Name of attribute7 that needs to be sent in SAML Assertion.
attribute7expr	<String>	Read-write	Expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain attribute7's value to be sent in Assertion. Maximum length = 128
attribute7friendlyname	<String>	Read-write	User-Friendly Name of attribute7 that needs to be sent in SAML Assertion.
attribute7format	<String>	Read-write	Format of Attribute7 to be sent in Assertion. Possible values = URI, Basic
attribute8	<String>	Read-write	Name of attribute8 that needs to be sent in SAML Assertion.
attribute8expr	<String>	Read-write	Expression that will be evaluated to obtain attribute8's value to be sent in Assertion. Maximum length = 128
attribute8friendlyname	<String>	Read-write	User-Friendly Name of attribute8 that needs to be sent in SAML Assertion.
attribute8format	<String>	Read-write	Format of Attribute8 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute9	<String>	Read-write	Name of attribute9 that needs to be sent in SAML Assertion.
attribute9expr	<String>	Read-write	Expression that will be evaluated to obtain attribute9's value to be sent in Assertion. Maximum length = 128
attribute9friendlyname	<String>	Read-write	User-Friendly Name of attribute9 that needs to be sent in SAML Assertion.
attribute9format	<String>	Read-write	Format of Attribute9 to be sent in Assertion. Possible values = URI, Basic
attribute10	<String>	Read-write	Name of attribute10 that needs to be sent in SAML Assertion.
attribute10expr	<String>	Read-write	Expression that will be evaluated to obtain attribute10's value to be sent in Assertion. Maximum length = 128
attribute10friendlyname	<String>	Read-write	User-Friendly Name of attribute10 that needs to be sent in SAML Assertion.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute10format	<String>	Read-write	Format of Attribute10 to be sent in Assertion. Possible values = URI, Basic
attribute11	<String>	Read-write	Name of attribute11 that needs to be sent in SAML Assertion.
attribute11expr	<String>	Read-write	Expression that will be evaluated to obtain attribute11's value to be sent in Assertion. Maximum length = 128
attribute11friendlyname	<String>	Read-write	User-Friendly Name of attribute11 that needs to be sent in SAML Assertion.
attribute11format	<String>	Read-write	Format of Attribute11 to be sent in Assertion. Possible values = URI, Basic
attribute12	<String>	Read-write	Name of attribute12 that needs to be sent in SAML Assertion.
attribute12expr	<String>	Read-write	Expression that will be evaluated to obtain attribute12's value to be sent in Assertion. Maximum length = 128

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute12friendlyname	<String>	Read-write	User-Friendly Name of attribute12 that needs to be sent in SAML Assertion.
attribute12format	<String>	Read-write	Format of Attribute12 to be sent in Assertion. Possible values = URI, Basic
attribute13	<String>	Read-write	Name of attribute13 that needs to be sent in SAML Assertion.
attribute13expr	<String>	Read-write	Expression that will be evaluated to obtain attribute13's value to be sent in Assertion. Maximum length = 128
attribute13friendlyname	<String>	Read-write	User-Friendly Name of attribute13 that needs to be sent in SAML Assertion.
attribute13format	<String>	Read-write	Format of Attribute13 to be sent in Assertion. Possible values = URI, Basic
attribute14	<String>	Read-write	Name of attribute14 that needs to be sent in SAML Assertion.
attribute14expr	<String>	Read-write	Expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain attribute14's value to be sent in Assertion. Maximum length = 128
attribute14friendlyname	<String>	Read-write	User-Friendly Name of attribute14 that needs to be sent in SAML Assertion.
attribute14format	<String>	Read-write	Format of Attribute14 to be sent in Assertion. Possible values = URI, Basic
attribute15	<String>	Read-write	Name of attribute15 that needs to be sent in SAML Assertion.
attribute15expr	<String>	Read-write	Expression that will be evaluated to obtain attribute15's value to be sent in Assertion. Maximum length = 128
attribute15friendlyname	<String>	Read-write	User-Friendly Name of attribute15 that needs to be sent in SAML Assertion.
attribute15format	<String>	Read-write	Format of Attribute15 to be sent in Assertion. Possible values = URI, Basic

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
attribute16	<String>	Read-write	Name of attribute16 that needs to be sent in SAML Assertion.
attribute16expr	<String>	Read-write	Expression that will be evaluated to obtain attribute16's value to be sent in Assertion. Maximum length = 128
attribute16friendlyname	<String>	Read-write	User-Friendly Name of attribute16 that needs to be sent in SAML Assertion.
attribute16format	<String>	Read-write	Format of Attribute16 to be sent in Assertion. Possible values = URI, Basic
encryptassertion	<String>	Read-write	Option to encrypt assertion when Citrix ADC sends one. Default value: OFF Possible values = ON, OFF
samlspcertname	<String>	Read-write	Name of the SSL certificate of peer/ receving party using which Assertion is encrypted. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
encryptionalgorithm	<String>	Read-write	Algorithm to be used to encrypt SAML assertion. Default value: AES256 Possible values = DES3, AES128, AES192, AES256
skewtime	<Double>	Read-write	This option specifies the number of minutes on either side of current time that the assertion would be valid. For example, if skewTime is 10, then assertion would be valid from (current time - 10) min to (current time + 10) min, ie 20min in all. Default value: 5
signassertion	<String>	Read-write	Option to sign portions of assertion when Citrix ADC IDP sends one. Based on the user selection, either Assertion or Response or Both or none can be signed. Default value: ASSERTION Possible values = NONE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ASSERTION, RESPONSE, BOTH
signatureservice	<String>	Read-write	Name of the service in cloud used to sign the data. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsamlssoprofile

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsamlssoprofile?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsamlssoprofile?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnsamlssoprofile resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsamlssoprofile?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsamlssoprofile?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnsamlssoprofile resources in chunks.

vpnsessionaction

Configuration for VPN session action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Citrix Gateway profile (action). Must begin with an ASCII alphabetic or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			consist only of ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
useraccounting	<String>	Read-write	The name of the radiusPolicy to use for RADIUS user accounting info on the session.
httpport	<Integer[]>	Read-write	Destination port numbers other than port 80, added as a comma-separated list. Traffic to these ports is processed as HTTP traffic, which allows functionality,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			such as HTTP authorization and single sign-on to a web application to work. Minimum value = 1
winsip	<String>	Read-write	WINS server IP address to add to Citrix Gateway for name resolution.
dnsvservername	<String>	Read-write	Name of the DNS virtual server for the user session. Minimum length = 1
splitdns	<String>	Read-write	Route the DNS requests to the local DNS server configured on the user device, or Citrix Gateway (remote), or both. Possible values = LOCAL, REMOTE, BOTH
sesstimeout	<Double>	Read-write	Number of minutes after which the session times out. Minimum value = 1
clientsecurity	<String>	Read-write	Specify the client security check for the user device to permit a Citrix Gateway session. The web address or IP address is not included in the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression for the client security check.
clientsecuritygroup	<String>	Read-write	The client security group that will be assigned on failure of the client security check. Users can in general be organized into Groups. In this case, the Client Security Group may have a more restrictive security policy. Minimum length = 1
clientsecuritymessage	<String>	Read-write	The client security message that will be displayed on failure of the client security check. Minimum length = 1 Maximum length = 127
clientsecuritylog	<String>	Read-write	Set the logging of client security checks. Possible values = ON, OFF
splittunnel	<String>	Read-write	Send, through the tunnel, traffic only for intranet applications that are defined in Citrix Gateway. Route all other traffic directly to the Internet. The OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			setting routes all traffic through Citrix Gateway. With the REVERSE setting, intranet applications define the network traffic that is not intercepted. All network traffic directed to internal IP addresses bypasses the VPN tunnel, while other traffic goes through Citrix Gateway. Reverse split tunneling can be used to log all non-local LAN traffic. For example, if users have a home network and are logged on through the Citrix Gateway Plug-in, network traffic destined to a printer or another device within the home network is not intercepted. Possible values = ON, OFF, REVERSE
locallanaccess	<String>	Read-write	Set local LAN access. If split tunneling is OFF, and you set local LAN access to ON, the local client can route traffic to its local interface. When the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			local area network switch is specified, this combination of switches is useful. The client can allow local LAN access to devices that commonly have non-routable addresses, such as local printers or local file servers. Possible values = ON, OFF
rfc1918	<String>	Read-write	As defined in the local area network, allow only the following local area network addresses to bypass the VPN tunnel when the local LAN access feature is enabled: * 10.*.*.*, * 172.16.*.*, * 192.168.*.*. Possible values = ON, OFF
spoofiip	<String>	Read-write	IP address that the intranet application uses to route the connection through the virtual adapter. Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
killconnections	<String>	Read-write	Specify whether the Citrix Gateway Plug-in should disconnect all preexisting connections, such as the connections existing before the user logged on to Citrix Gateway, and prevent new incoming connections on the Citrix Gateway Plug-in for Windows and MAC when the user is connected to Citrix Gateway and split tunneling is disabled. Possible values = ON, OFF
transparentintercepti on	<String>	Read-write	Allow access to network resources by using a single IP address and subnet mask or a range of IP addresses. The OFF setting sets the mode to proxy, in which you configure destination and source IP addresses and port numbers. If you are using the Citrix Gateway Plug-in for Windows, set this parameter to ON, in which the mode is set to transparent. If you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are using the Citrix Gateway Plug-in for Java, set this parameter to OFF. Possible values = ON, OFF
windowsclienttype	<String>	Read-write	Choose between two types of Windows Client a) Application Agent - which always runs in the task bar as a standalone application and also has a supporting service which runs permanently when installed b) Activex Control - ActiveX control run by Microsoft Internet Explorer. Possible values = AGENT, PLUGIN
defaultauthorizationaction	<String>	Read-write	Specify the network resources that users have access to when they log on to the internal network. The default setting for authorization is to deny access to all network resources. Citrix recommends using the default

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			global setting and then creating authorization policies to define the network resources users can access. If you set the default authorization policy to DENY, you must explicitly authorize access to any network resource, which improves security. Possible values = ALLOW, DENY
authorizationgroup	<String>	Read-write	Comma-separated list of groups in which the user is placed when none of the groups that the user is a part of is configured on Citrix Gateway. The authorization policy can be bound to these groups to control access to the resources. Minimum length = 1
smartgroup	<String>	Read-write	This is the default group that is chosen when the authentication succeeds in addition to extracted groups. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 64
clientidletimeout	<Double>	Read-write	Time, in minutes, after which to time out the user session if Citrix Gateway does not detect mouse or keyboard activity. Minimum value = 1 Maximum value = 9999
proxy	<String>	Read-write	Set options to apply proxy for accessing the internal resources. Available settings function as follows: * BROWSER - Proxy settings are configured only in Internet Explorer and Firefox browsers. * NS - Proxy settings are configured on the Citrix ADC. * OFF - Proxy settings are not configured.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = BROWSER, NS, OFF
allprotocolproxy	<String>	Read-write	IP address of the proxy server to use for all protocols supported by Citrix Gateway. Minimum length = 1
httpproxy	<String>	Read-write	IP address of the proxy server to be used for HTTP access for all subsequent connections to the internal network. Minimum length = 1
ftpproxy	<String>	Read-write	IP address of the proxy server to be used for FTP access for all subsequent connections to the internal network. Minimum length = 1
socksproxy	<String>	Read-write	IP address of the proxy server to be used for SOCKS access for all subsequent connections to the internal network. Minimum length = 1
gopherproxy	<String>	Read-write	IP address of the proxy server to be used for GOPHER access for all

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			subsequent connections to the internal network. Minimum length = 1
sslproxy	<String>	Read-write	IP address of the proxy server to be used for SSL access for all subsequent connections to the internal network. Minimum length = 1
proxyexception	<String>	Read-write	Proxy exception string that will be configured in the browser for bypassing the previously configured proxies. Allowed only if proxy type is Browser. Minimum length = 1
proxylocalbypass	<String>	Read-write	Bypass proxy server for local addresses option in Internet Explorer and Firefox proxy server settings. Possible values = ENABLED, DISABLED
clientcleanupprompt	<String>	Read-write	Prompt for client-side cache clean-up when a client-initiated session closes. Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
forcecleanup	<String[]>	Read-write	Force cache clean-up when the user closes a session. You can specify all, none, or any combination of the client-side items. Possible values = none, all, cookie, addressbar, plugin, filesystemapplicatio n, application, applicationdata, clientcertificate, autocomplete, cache
clientoptions	<String>	Read-write	Display only the configured menu options when you select the "Configure Citrix Gateway" option in the Citrix Gateway Plug-in system tray icon for Windows. Possible values = none, all, services, filetransfer, configuration
clientconfiguration	<String[]>	Read-write	Allow users to change client Debug logging level in Configuration tab of the Citrix Gateway Plug-in for Windows.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = none, trace
sso	<String>	Read-write	Set single sign-on (SSO) for the session. When the user accesses a server, the user's logon credentials are passed to the server for authentication. NOTE : Authentication mechanisms like Basic-authentication require the user credentials to be sent in plaintext which is not secure if the server is running on HTTP (instead of HTTPS). By default, Single Sign On is not attempted to a Public IP. Possible values = ON, OFF
ssocredential	<String>	Read-write	Specify whether to use the primary or secondary authentication credentials for single sign-on to the server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = PRIMARY, SECONDARY
windowsautologon	<String>	Read-write	Enable or disable the Windows Auto Logon for the session. If a VPN session is established after this setting is enabled, the user is automatically logged on by using Windows credentials after the system is restarted. Possible values = ON, OFF
usemip	<String>	Read-write	Enable or disable the use of a unique IP address alias, or a mapped IP address, as the client IP address for each client session. Allow Citrix Gateway to use the mapped IP address as an intranet IP address when all other IP addresses are not available. When IP pooling is configured and the mapped IP is used as an intranet IP address, the mapped IP address is used when an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			intranet IP address cannot be assigned. Possible values = NS, OFF
useiip	<String>	Read-write	Define IP address pool options. Available settings function as follows: * SPILLOVER - When an address pool is configured and the mapped IP is used as an intranet IP address, the mapped IP address is used when an intranet IP address cannot be assigned. * NOSPILLOVER - When intranet IP addresses are enabled and the mapped IP address is not used, the Transfer Login page appears for users who have used all available intranet IP addresses. * OFF - Address pool is not configured.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NOSPILLOVER, SPILLOVER, OFF
clientdebug	<String>	Read-write	Set the trace level on Citrix Gateway. Technical support technicians use these debug logs for in-depth debugging and troubleshooting purposes. Available settings function as follows: * DEBUG - Detailed debug messages are collected and written into the specified file. * STATS - Application audit level error messages and debug statistic counters are written into the specified file. * EVENTS - Application audit-level error messages are written into the specified file. * OFF - Only critical events are logged

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			into the Windows Application Log. Possible values = debug, stats, events, OFF
loginscript	<String>	Read-write	Path to the logon script that is run when a session is established. Separate multiple scripts by using comma. A "$" in the path signifies that the word following the "$" is an environment variable. Minimum length = 1
logoutscript	<String>	Read-write	Path to the logout script. Separate multiple scripts by using comma. A "$" in the path signifies that the word following the "$" is an environment variable. Minimum length = 1
homepage	<String>	Read-write	Web address of the home page that appears when users log on. Otherwise, users receive the default home page for Citrix Gateway, which is the Access Interface.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
icaproxy	<String>	Read-write	Enable ICA proxy to configure secure Internet access to servers running Citrix XenApp or XenDesktop by using Citrix Receiver instead of the Citrix Gateway Plug-in. Possible values = ON, OFF
wihome	<String>	Read-write	Web address of the Web Interface server, such as http://<ipAddress>/Citrix/XenApp, or Receiver for Web, which enumerates the virtualized resources, such as XenApp, XenDesktop, and cloud applications. This web address is used as the home page in ICA proxy mode. If Client Choices is ON, you must configure this setting. Because the user can choose between FullClient and ICAProxy, the user may see a different home page. An Internet web site may

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			appear if the user gets the FullClient option, or a Web Interface site if the user gets the ICAProxy option. If the setting is not configured, the XenApp option does not appear as a client choice.
wihomeaddresstype	<String>	Read-write	Type of the wihome address(IPV4/V6). Possible values = IPV4, IPV6
citrixreceiverhome	<String>	Read-write	Web address for the Citrix Receiver home page. Configure Citrix Gateway so that when users log on to the appliance, the Citrix Gateway Plug-in opens a web browser that allows single sign-on to the Citrix Receiver home page.
wiportalmode	<String>	Read-write	Layout on the Access Interface. The COMPACT value indicates the use of small icons. Possible values = NORMAL, COMPACT

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientchoices	<String>	Read-write	Provide users with multiple logon options. With client choices, users have the option of logging on by using the Citrix Gateway Plug-in for Windows, Citrix Gateway Plug-in for Java, the Web Interface, or clientless access from one location. Depending on how Citrix Gateway is configured, users are presented with up to three icons for logon choices. The most common are the Citrix Gateway Plug-in for Windows, Web Interface, and clientless access. Possible values = ON, OFF
epaclienttype	<String>	Read-write	Choose between two types of End point Windows Client a) Application Agent - which always runs in the task bar as a standalone application and also has a supporting service which runs

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			permanently when installed b) Activex Control - ActiveX control run by Microsoft Internet Explorer. Possible values = AGENT, PLUGIN
iipdnssuffix	<String>	Read-write	An intranet IP DNS suffix. When a user logs on to Citrix Gateway and is assigned an IP address, a DNS record for the user name and IP address combination is added to the Citrix Gateway DNS cache. You can configure a DNS suffix to append to the user name when the DNS record is added to the cache. You can reach to the host from where the user is logged on by using the user's name, which can be easier to remember than an IP address. When the user logs off from Citrix Gateway, the record is removed from the DNS cache.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
forcedtimeout	<Double>	Read-write	Force a disconnection from the Citrix Gateway Plug-in with Citrix Gateway after a specified number of minutes. If the session closes, the user must log on again. Minimum value = 1 Maximum value = 65535
forcedtimeoutwarning	<Double>	Read-write	Number of minutes to warn a user before the user session is disconnected. Minimum value = 1 Maximum value = 255
ntdomain	<String>	Read-write	Single sign-on domain to use for single sign-on to applications in the internal network. This setting can be overwritten by the domain that users specify at the time of logon or by the domain that the authentication server returns. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 32
clientlessvpnmode	<String>	Read-write	Enable clientless access for web, XenApp or XenDesktop, and FileShare resources without installing the Citrix Gateway Plug-in. Available settings function as follows: * ON - Allow only clientless access. * OFF - Allow clientless access after users log on with the Citrix Gateway Plug-in. * DISABLED - Do not allow clientless access. Possible values = ON, OFF, DISABLED
emailhome	<String>	Read-write	Web address for the web-based email, such as Outlook Web Access.
clientlessmodeurlencoding	<String>	Read-write	When clientless access is enabled, you can choose to encode the addresses of internal web applications or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to leave the address as clear text. Available settings function as follows: * OPAQUE - Use standard encoding mechanisms to make the domain and protocol part of the resource unclear to users. * CLEAR - Do not encode the web address and make it visible to users. * ENCRYPT - Allow the domain and protocol to be encrypted using a session key. When the web address is encrypted, the URL is different for each user session for the same web resource. If users bookmark the encoded web address, save it in the web browser and then log off, they cannot connect to the web address when they log on and use the bookmark. If users

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			save the encrypted bookmark in the Access Interface during their session, the bookmark works each time the user logs on. Possible values = TRANSPARENT, OPAQUE, ENCRYPT
clientlesspersistentcookie	<String>	Read-write	State of persistent cookies in clientless access mode. Persistent cookies are required for accessing certain features of SharePoint, such as opening and editing Microsoft Word, Excel, and PowerPoint documents hosted on the SharePoint server. A persistent cookie remains on the user device and is sent with each HTTP request. Citrix Gateway encrypts the persistent cookie before sending it to the plug-in on the user device, and refreshes the cookie periodically as long as the session

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			exists. The cookie becomes stale if the session ends. Available settings function as follows: * ALLOW - Enable persistent cookies. Users can open and edit Microsoft documents stored in SharePoint. * DENY - Disable persistent cookies. Users cannot open and edit Microsoft documents stored in SharePoint. * PROMPT - Prompt users to allow or deny persistent cookies during the session. Persistent cookies are not required for clientless access if users do not connect to SharePoint. Possible values = ALLOW, DENY, PROMPT
allowedlogingroups	<String>	Read-write	Specify groups that have permission to log on to Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Gateway. Users who do not belong to this group or groups are denied access even if they have valid credentials. Minimum length = 1 Maximum length = 511
securebrowse	<String>	Read-write	Allow users to connect through Citrix Gateway to network resources from iOS and Android mobile devices with Citrix Receiver. Users do not need to establish a full VPN tunnel to access resources in the secure network. Possible values = ENABLED, DISABLED
storefronturl	<String>	Read-write	Web address for StoreFront to be used in this session for enumeration of resources from XenApp or XenDesktop. Minimum length = 1 Maximum length = 255

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sfgatewayauthtype	<String>	Read-write	The authentication type configured for the Citrix Gateway on StoreFront. Possible values = domain, RSA, domainAndRSA, SMS, smartCard, sfAuth, sfAuthAndRSA
kcdaccount	<String>	Read-write	The kcd account details to be used in SSO. Minimum length = 1 Maximum length = 32
rdpclientprofilename	<String>	Read-write	Name of the RDP profile associated with the vserver. Minimum length = 1 Maximum length = 31
windowspluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Win. Possible values = Always, Essential, Never
macpluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Mac.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Always, Essential, Never
linuxpluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Linux. Possible values = Always, Essential, Never
iconwithreceiver	<String>	Read-write	Option to decide whether to show plugin icon along with receiver. Possible values = ON, OFF
alwaysonprofilename	<String>	Read-write	Name of the AlwaysON profile associated with the session action. The builtin profile named none can be used to explicitly disable AlwaysON for the session action. Minimum length = 1 Maximum length = 31
autoproxyurl	<String>	Read-write	URL to auto proxy config file.
advancedclientlessvpnmode	<String>	Read-write	Option to enable/disable Advanced ClientlessVpnMode.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
pcoipprofilename	<String>	Read-write	Name of the PCOIP profile associated with the session action. The builtin profile named none can be used to explicitly disable PCOIP for the session action. Minimum length = 1 Maximum length = 31
fqdnspoofedip	<String>	Read-write	Spoofed IP address range that can be used by client for FQDN based split tunneling. Minimum length = 1
netmask	<String>	Read-write	The netmask for the spoofed ip address. Minimum length = 1
clientidletimeoutwarning	<Double>	Read-only	The time after which the client gets a timeout warning, in minutes.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

vpnsessionpolicy

Configuration for VPN session policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new session policy that is applied after the user logs on to Citrix Gateway. Minimum length = 1
rule	<String>	Read-write	Expression, or name of a named expression, specifying the traffic that matches the policy. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Action to be applied by the new session policy if the rule criteria are met. Minimum length = 1
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced) . Possible values = Classic Policy, Advanced Policy
hits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnsessionpolicy resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnsessionpolicy resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnsessionpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"expressiontype":<String_value>,

"hits":<Double_value>

}]}
```

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy/name_value<String>

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy/name_value<String>?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy/name_value<String>?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnsessionpolicy": [ {

"name":<String_value>,

"rule":<String_value>,

"action":<String_value>,

"expressiontype":<String_value>,

"hits":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnsessionpolicy": [ { "__count": "#no"} ] }
```

vpnsessionpolicy_aaagroup_binding

Binding object showing the aaagroup that can be bound to vpnsessionpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the session policy to display. Minimum length = 1
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy_aaagroup_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy_aaagroup_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vpnsessionpolicy_aaagroup_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsessionpolicy_aaagroup_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnsessionpolicy_aaagroup_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnsessionpolicy_aaagroup_binding": [ {

"boundto":<String_value>,

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsfconfig?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnsfconfig resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsfconfig?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsfconfig?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnsfconfig resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnsfconfig": [ {

vserver:<String[]_value>"filename":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnsfconfig?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnsfconfig": [ { "__count": "#no"} ] }
```

vpnstoreinfo

Configuration for Store information for a URL resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
url	<String>	Read-write	StoreFront URL to be scanned.
storeserverstatus	<String>	Read-only	Availability of the server for TCP connections. Possible values = UP, DOWN
storeserverissf	<String>	Read-only	Indicates if the server being scanned is running StoreFront. Possible values = YES, NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
storeapisupport	<String>	Read-only	Indicates StoreFront API support status. Possible values = YES, NO
storelist	<String>	Read-only	List of available stores return by StoreFront API.
storestatus	<String>	Read-only	Availability of the specified StoreFront store. Possible values = UP, DOWN
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnstoreinfo

Query-parameters:

args

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnstoreinfo?**args=url:<String_value>,**

Use this query-parameter to get vpnstoreinfo resources based on additional properties.

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnstoreinfo?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnstoreinfo?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnstoreinfo resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnstoreinfo?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnstoreinfo?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnstoreinfo resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpnstoreinfo": [ {

<b>url:<String_value>,</b>"storeserverstatus":<String_value>,

"storeserverissf":<String_value>,

"storeapisupport":<String_value>,

"storelist":<String_value>,

"storestatus":<String_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnstoreinfo?**args=url:<String_value>,;count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

```
{ "vpnstoreinfo": [ { "__count": "#no"} ] }
```

vpntrafficaction

Configuration for VPN traffic action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the traffic action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be changed after a traffic action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
qual	<String>	Read-write	Protocol, either HTTP or TCP, to be used with the action. Possible values = http, tcp
apptimeout	<Double>	Read-write	Maximum amount of time, in minutes, a user can stay logged on to the web application. Minimum value = 1 Maximum value = 715827
sso	<String>	Read-write	Provide single sign-on to the web application.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NOTE : Authentication mechanisms like Basic-authentication require the user credentials to be sent in plaintext which is not secure if the server is running on HTTP (instead of HTTPS). Possible values = ON, OFF
hdx	<String>	Read-write	Provide hdx proxy to the ICA traffic. Possible values = ON, OFF
formssoaction	<String>	Read-write	Name of the form-based single sign-on profile. Form-based single sign-on allows users to log on one time to all protected applications in your network, instead of requiring them to log on separately to access each one.
fta	<String>	Read-write	Specify file type association, which is a list of file extensions that users are allowed to open. Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wanscaler	<String>	Read-write	Use the Repeater Plug-in to optimize network traffic. Possible values = ON, OFF
kcdaccount	<String>	Read-write	Kerberos constrained delegation account name. Default value: "Default" Minimum length = 1 Maximum length = 32
samlssoprofile	<String>	Read-write	Profile to be used for doing SAML SSO to remote relying party. Minimum length = 1
proxy	<String>	Read-write	IP address and Port of the proxy server to be used for HTTP access for this request. Minimum length = 1
userexpression	<String>	Read-write	expression that will be evaluated to obtain username for SingleSignOn. Maximum length = 256
passwdexpression	<String>	Read-write	expression that will be evaluated to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			obtain password for SingleSignOn. Maximum length = 256
__count	<Double>	Read-only	count parameter

vpntrafficpolicy

Configuration for VPN traffic policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the traffic policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression, or name of a named expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Action to apply to traffic that matches the policy. Minimum length = 1
expressiontype	<String>	Read-only	Type of policy (Classic/Advanced). Possible values = Classic Policy, Advanced Policy
hits	<Double>	Read-only	Number of hits.
__count	<Double>	Read-only	count parameter

{ "vpntrafficpolicy_aaagroup_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpntrafficpolicy_aaagroup_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpntrafficpolicy_aaagroup_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpntrafficpolicy_aaagroup_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpntrafficpolicy_aaagroup_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"vpntrafficpolicy_aaagroup_binding": [ { "__count": "#no"} ] }
```

vpntrafficpolicy_aaauser_binding

Binding object showing the aaauser that can be bound to vpntrafficpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the traffic policy for which to display detailed information. Minimum length = 1
boundto	<String>	Read-write	The entity name to which policy is bound.
priority	<Double>	Read-only	.
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpntrafficpolicy_aaauser_binding/name_value<String>

Query-parameters:

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpntrafficpolicy_aaauser_binding/name_value<String>?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vpntrafficpolicy_aaauser_binding resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpntrafficpolicy_aaauser_binding/name_value<String>?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpntrafficpolicy_aaauser_binding resources in chunks.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{ "vpntrafficpolicy_aaauser_binding": [ {

"name":<String_value>,

"boundto":<String_value>,

"priority":<Double_value>,

"activepolicy":<Double_value>

}]}
```

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpntrafficpolicy_aaauser_binding

Query-parameters:

bulkbindings

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpntrafficpolicy_aaauser_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

{ "vpnurl": [ { "__count": "#no"} ] }
```

vpnvserver

Configuration for VPN virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the Citrix Gateway virtual server. Must begin with an ASCII alphabetic or underscore (_) character, and must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Can be changed after the virtual server is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my server" or 'my server'). Minimum length = 1
servicetype	<String>	Read-write	Protocol used by the Citrix Gateway virtual server. Default value: SSL Possible values = SSL
ipv46	<String>	Read-write	IPv4 or IPv6 address of the Citrix Gateway virtual server. Usually a public IP address. User

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			devices send connection requests to this IP address. Minimum length = 1
range	<Double>	Read-write	Range of Citrix Gateway virtual server IP addresses. The consecutively numbered range of IP addresses begins with the address specified by the IP Address parameter. In the configuration utility, select Network VServer to enter a range. Default value: 1 Minimum value = 1
port	<Integer>	Read-write	TCP port on which the virtual server listens. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
ipset	<String>	Read-write	The list of IPv4/IPv6 addresses bound to ipset would form a part of listening service on the current vpn vserver. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	State of the virtual server. If the virtual server is disabled, requests are not processed. Default value: ENABLED Possible values = ENABLED, DISABLED
authentication	<String>	Read-write	Require authentication for users connecting to Citrix Gateway. Default value: ON Possible values = ON, OFF
doublehop	<String>	Read-write	Use the Citrix Gateway appliance in a double-hop configuration. A double-hop deployment provides an extra layer of security for the internal network by using three firewalls to divide the DMZ into two stages. Such a deployment can have one appliance in the DMZ and one appliance in the secure network.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
maxaaausers	<Double>	Read-write	Maximum number of concurrent user sessions allowed on this virtual server. The actual number of users allowed to log on to this virtual server depends on the total number of user licenses.
icaonly	<String>	Read-write	- When set to ON, it implies Basic mode where the user can log on using either Citrix Receiver or a browser and get access to the published apps configured at the XenApp/XenDEsktop environment pointed out by the WIHome parameter. Users are not allowed to connect using the Citrix Gateway Plug-in and end point scans cannot be configured. Number of users that can log in and access the apps are not limited

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by the license in this mode. - When set to OFF, it implies Smart Access mode where the user can log on using either Citrix Receiver or a browser or a Citrix Gateway Plug-in. The admin can configure end point scans to be run on the client systems and then use the results to control access to the published apps. In this mode, the client can connect to the gateway in other client modes namely VPN and CVPN. Number of users that can log in and access the resources are limited by the CCU licenses in this mode. Default value: OFF Possible values = ON, OFF

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
icaproxysessionmigration	<String>	Read-write	This option determines if an existing ICA Proxy session is transferred when the user logs on from another device. Default value: OFF Possible values = ON, OFF
dtls	<String>	Read-write	This option starts/stops the turn service on the vserver. Default value: ON Possible values = ON, OFF
loginonce	<String>	Read-write	This option enables/disables seamless SSO for this Vserver. Default value: OFF Possible values = ON, OFF
advancedepa	<String>	Read-write	This option tells whether advanced EPA is enabled on this virtual server. Default value: OFF Possible values = ON, OFF
devicecert	<String>	Read-write	Indicates whether device certificate

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			check as a part of EPA is on or off. Default value: OFF Possible values = ON, OFF
certkeynames	<String>	Read-write	Name of the certificate key that was bound to the corresponding SSL virtual server as the Certificate Authority for the device certificate. Minimum length = 1 Maximum length = 127
downstateflush	<String>	Read-write	Close existing connections when the virtual server is marked DOWN, which means the server might have timed out. Disconnecting existing connections frees resources and in certain cases speeds recovery of overloaded load balancing setups. Enable this setting on servers in which the connections can safely be closed when they are marked DOWN. Do not enable DOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			state flush on servers that must complete their transactions. Default value: ENABLED Possible values = ENABLED, DISABLED
listenpolicy	<String>	Read-write	String specifying the listen policy for the Citrix Gateway virtual server. Can be either a named expression or an expression. The Citrix Gateway virtual server processes only the traffic for which the expression evaluates to true. Default value: "none"
listenpriority	<Double>	Read-write	Integer specifying the priority of the listen policy. A higher number specifies a lower priority. If a request matches the listen policies of more than one virtual server, the virtual server whose listen policy has the highest priority (the lowest priority

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number) accepts the request. Default value: 101 Minimum value = 0 Maximum value = 100
tcpprofilename	<String>	Read-write	Name of the TCP profile to assign to this virtual server. Minimum length = 1 Maximum length = 127
httpprofilename	<String>	Read-write	Name of the HTTP profile to assign to this virtual server. Default value: "nshttp_default_strict_validation" Minimum length = 1 Maximum length = 127
comment	<String>	Read-write	Any comments associated with the virtual server.
appflowlog	<String>	Read-write	Log AppFlow records that contain standard NetFlow or IPFIX information, such as time stamps for the beginning and end of a flow, packet count, and byte count. Also

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			log records that contain application-level information, such as HTTP web addresses, HTTP request methods and response status codes, server response time, and latency. Default value: ENABLED Possible values = ENABLED, DISABLED
icmpvsrresponse	<String>	Read-write	Criterion for responding to PING requests sent to this virtual server. If this parameter is set to ACTIVE, respond only if the virtual server is available. With the PASSIVE setting, respond even if the virtual server is not available. Default value: PASSIVE Possible values = PASSIVE, ACTIVE
rhistate	<String>	Read-write	A host route is injected according to the setting on the virtual servers.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If set to PASSIVE on all the virtual servers that share the IP address, the appliance always injects the hostroute. * If set to ACTIVE on all the virtual servers that share the IP address, the appliance injects even if one virtual server is UP. * If set to ACTIVE on some virtual servers and PASSIVE on the others, the appliance injects even if one virtual server set to ACTIVE is UP. Default value: PASSIVE Possible values = PASSIVE, ACTIVE
netprofile	<String>	Read-write	The name of the network profile. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cginfrahomepageredirect	<String>	Read-write	When client requests ShareFile resources and Citrix Gateway detects that the user is unauthenticated or the user session has expired, disabling this option takes the user to the originally requested ShareFile resource after authentication (instead of taking the user to the default VPN home page). Default value: ENABLED Possible values = ENABLED, DISABLED
maxloginattempts	<Double>	Read-write	Maximum number of logon attempts. Minimum value = 1 Maximum value = 255
failedlogintimeout	<Double>	Read-write	Number of minutes an account will be locked if user exceeds maximum permissible attempts. Minimum value = 1
l2conn	<String>	Read-write	Use Layer 2 parameters (channel number, MAC address, and VLAN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ID) in addition to the 4-tuple (<source IP>:<source port>::<destination IP>:<destination port>) that is used to identify a connection. Allows multiple TCP and non-TCP connections with the same 4-tuple to coexist on the Citrix ADC. Possible values = ON, OFF
deploymenttype	<String>	Read-write	. Default value: 5 Possible values = NONE, ICA_WEBINTERFACE, ICA_STOREFRONT, MOBILITY, WIONNS
rdpserverprofilename	<String>	Read-write	Name of the RDP server profile associated with the vserver. Minimum length = 1 Maximum length = 31
windowsepapluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Win.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Always, Essential, Never
linuxepapluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Linux. Possible values = Always, Essential, Never
macepapluginupgrade	<String>	Read-write	Option to set plugin upgrade behaviour for Mac. Possible values = Always, Essential, Never
logoutonsmartcardremoval	<String>	Read-write	Option to VPN plugin behavior when smartcard or its reader is removed. Default value: OFF Possible values = ON, OFF
userdomains	<String>	Read-write	List of user domains specified as comma seperated value.
authnprofile	<String>	Read-write	Authentication Profile entity on virtual server. This entity can be used to offload authentication to AAA vserver for multi-factor(nFactor) authentication.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserverfqdn	<String>	Read-write	Fully qualified domain name for a VPN virtual server. This is used during StoreFront configuration generation.
pcoipvserverprofilename	<String>	Read-write	Name of the PCoIP vserver profile associated with the vserver. Minimum length = 1 Maximum length = 31
newname	<String>	Read-write	New name for the Citrix Gateway virtual server. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my server" or 'my server'). Minimum length = 1
ip	<String>	Read-only	The Virtual IP address of the VPN virtual server.
value	<String>	Read-only	Indicates whether or not the certificate is bound or if SSL offload is disabled. Possible values = Certkey not bound, SSL feature disabled
type	<String>	Read-only	The type of virtual server; for example, CONTENT based or ADDRESS based. Possible values = CONTENT, ADDRESS
curstate	<String>	Read-only	The current state of the virtual server, as UP, DOWN, BUSY, and so on. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
status	<Integer>	Read-only	Whether or not this virtual server responds to ARPs and whether or not round-robin selection is temporarily in effect.
cachetype	<String>	Read-only	Virtual server cache type. The options are: TRANSPARENT, REVERSE, and FORWARD. Possible values = TRANSPARENT, REVERSE, FORWARD
redirect	<String>	Read-only	The cache redirect policy. The valid redirect policies are: l. CACHE - Directs all requests to the cache. 2. POLICY - Applies cache redirection policy to determine whether the request should be directed

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to the cache or origin. This is the default setting. 3. ORIGIN - Directs all requests to the origin server. Possible values = CACHE, POLICY, ORIGIN
precedence	<String>	Read-only	This argument is used only when configuring content switching on the specified virtual server. This is applicable only if both the URL and RULE-based policies have been configured on the same virtual server. It specifies the type of policy (URL or RULE) that takes precedence on the content switching virtual server. The default setting is RULE. l URL - In this case, the incoming request is matched against the URL-based policies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			before the rule-based policies. l RULE - In this case, the incoming request is matched against the rule-based policies before the URL-based policies. For all URL-based policies, the precedence hierarchy is: 1. Domain and exact URL 2. Domain, prefix, and suffix 3. Domain and suffix 4. Domain and prefix 5. Domain only 6. Exact URL 7. Prefix and suffix 8. Suffix only 9. Prefix only 10. Default.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = RULE, URL
redirecturl	<String>	Read-only	The URL where traffic is redirected if the virtual server in system becomes unavailable. WARNING! Make sure that the domain you specify in the URL does not match the domain specified in the -d domainName argument of the ###add cs policy### command. If the same domain is specified in both arguments, the request will be continuously redirected to the same unavailable virtual server in the system. If so, the user may not get the requested content.
curaaausers	<Double>	Read-only	The number of current users logged on to this virtual server.
curtotalusers	<Double>	Read-only	The total number of current users connected through this virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
domain	<String>	Read-only	The domain name of the server for which a service needs to be added. If the IP address has been specified, the domain name does not need to be specified.
rule	<String>	Read-only	The name of the rule, or expression, if any, that policy for the VPN server is to use. Rules are combinations of expressions. Expressions are simple conditions, such as a test for equality, applied to operands, such as a URL string or an IP address. Expression syntax is described in the Installation and Configuration Guide. The default rule is true. Minimum length = 1
servicename	<String>	Read-only	The name of the service, if any, to which the virtual server policy is bound.
weight	<Double>	Read-only	Weight for this service, if any. This weight is used when the system performs load balancing,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			giving greater priority to a specific service. It is useful when the services bound to a virtual server are of different capacity.
cachevserver	<String>	Read-only	The name of the default target cache virtual server, if any, to which requests are redirected.
backupvserver	<String>	Read-only	The name of the backup VPN virtual server for this VPN virtual server.
clttimeout	<Double>	Read-only	The idle time, if any, in seconds after which the client connection is terminated.
somethod	<String>	Read-only	VPN client applications are allocated from a block of intranet IP addresses. That block may be exhausted after a certain number of connections. This switch specifies the method used to determine whether or not a new connection will spill over, or exhaust,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the allocated block of intranet IP addresses for that application. Possible values are CONNECTION or DYNAMICCONNECTION. CONNECTION means that a static integer value is the hard limit for the spillover threshold. The spillover threshold is described below. DYNAMICCONNECTION means that the spillover threshold is set according to the maximum number of connections defined for the VPN virtual server. Possible values = CONNECTION, DYNAMICCONNECTION,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			BANDWIDTH, HEALTH, NONE
sothreshold	<Double>	Read-only	VPN client applications are allocated from a block of intranet IP addresses. That block may be exhausted after a certain number of connections. The value of this option is the number of client connections after which the mapped IP address is used as the client source IP address instead of an address from the allocated block of intranet IP addresses.
sopersistence	<String>	Read-only	Whether or not cookie-based site persistance is enabled for this VPN vserver. Possible values are 'ConnectionProxy', HTTPRedirect, or NONE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
sopersistencetimeout	<Double>	Read-only	The timeout, if any, for cookie-based site persistance of this VPN vserver.
usemip	<String>	Read-only	Deprecated. See 'map' below. Possible values = ENABLED, DISABLED
map	<String>	Read-only	Whether or not mapped IP addresses are ON or OFF. Mapped IP addresses are source IP addresses for the virtual servers running on the Citrix ADC. Mapped IP addresses are used by the system to connect to the backend servers. Possible values = ON, OFF
bindpoint	<String>	Read-only	Bindpoint to which the policy is bound. Possible values = REQUEST, RESPONSE, ICA_REQUEST,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OTHERTCP_REQUEST
disableprimaryondown	<String>	Read-only	Tells whether traffic will continue reaching backup virtual servers even after the primary virtual server comes UP from DOWN state. Possible values = ENABLED, DISABLED
secondary	<Boolean>	Read-only	Binds the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only via a primary authentication method but also via a secondary authentication method. User groups are aggregated across both. The user name must be exactly the same for both authentication methods, but they can require different passwords.
groupextraction	<Boolean>	Read-only	Binds the authentication policy to a tertiary chain

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which will be used only for group extraction. The user will not authenticate against this server, and this will only be called if primary and/or secondary authentication has succeeded.
epaprofileoptional	<Boolean>	Read-only	Mark the EPA profile optional for preauthentication EPA profile. User would be shown a logon page even if the EPA profile fails to evaluate.
ngname	<String>	Read-only	Node group devno to which this authentication virtual sever belongs.
csvserver	<String>	Read-only	Name of the CS vserver to which the VPN vserver is bound.
analyticsprofile	<String>	Read-only	Name of the analytics profile bound to the VPN Vserver.
nodefaultbindings	<String>	Read-only	to determine if the configuration will have default ssl CIPHER and ECC curve bindings.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
response	<String>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD| DELETE| UPDATE| UNSET| ENABLE| DISABLE| RENAME| CHECK| GET (ALL)| GET| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:` *

Mandatory parameters are marked in redand placeholder content is marked in <green>.

get (all)

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnvserver

Query-parameters:

attrs

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnvserver?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnvserver?**filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vpnvserver resources configured on Citrix ADC. Filtering can be done on any of the properties of the resource.

view

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnvserver?**view=summary**

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnvserver?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vpnvserver resources in chunks.

vpnvserver_aaapreauthenticationpolicy_binding

Binding object showing the aaapreauthenticationpolicy that can be bound to vpnvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the policy's priority. The lower the number, the higher the priority. Policies are evaluated in the order of their priority

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			numbers. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			every successive policy, and therefore a priority number of 85 does not exist in the policy label.
policy	<String>	Read-write	The name of the policy, if any, bound to the VPN virtual server.
groupextraction	<Boolean>	Read-write	Binds the authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server, and this will only be called if primary and/or secondary authentication has succeeded.
name	<String>	Read-write	Name of the virtual server. Minimum length = 1
secondary	<Boolean>	Read-write	Binds the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only via a primary authentication method but also via a secondary

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			authentication method. User groups are aggregated across both. The user name must be exactly the same for both authentication methods, but they can require different passwords.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applies only to rewrite and cache policies. If you do not set this parameter, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnvserver_aaapreauthenticationpolicy_binding

}]}
```

count

URL:http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/vpnvserver_appflowpolicy_binding/name_value<String>?**count=yes**

HTTP Method:GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Accept:application/json

Response:

HTTP Status Code on Success: 200 OK HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for Citrix ADC specific errors). The response payload provides details of the error**Response Headers:**

Content-Type:application/json

Response Payload:

```
{"vpnvserver_appflowpolicy_binding": [ { "__count": "#no"} ] }
```

vpnvserver_auditnslogpolicy_binding

Binding object showing the auditnslogpolicy that can be bound to vpnvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the policy's priority. The lower the number, the higher the priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
policy	<String>	Read-write	The name of the policy, if any, bound to the VPN virtual server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
groupextraction	<Boolean>	Read-write	Binds the authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server, and this will only be called if primary and/or secondary authentication has succeeded.
name	<String>	Read-write	Name of the virtual server. Minimum length = 1
secondary	<Boolean>	Read-write	Binds the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only via a primary authentication method but also via a secondary authentication method. User groups are aggregated across both. The user name must be exactly the same for both authentication methods, but they can require different passwords.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applies only to rewrite and cache policies. If you do not set this parameter, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnvserver_auditnslogpolicy_binding

{"vpnvserver_authenticationoauthidppolicy_binding": [ { "__count":
"#no"} ] }
```

vpnvserver_authenticationcertpolicy_binding

Binding object showing the authenticationcertpolicy that can be bound to vpnvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the policy's priority. The lower the number, the higher the priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
policy	<String>	Read-write	The name of the policy, if any, bound to the VPN virtual server.
groupextraction	<Boolean>	Read-write	Binds the authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server, and this will only be called if primary and/or secondary authentication has succeeded.
name	<String>	Read-write	Name of the virtual server. Minimum length = 1
secondary	<Boolean>	Read-write	Binds the authentication policy as the secondary policy to use in a two-factor

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configuration. A user must then authenticate not only via a primary authentication method but also via a secondary authentication method. User groups are aggregated across both. The user name must be exactly the same for both authentication methods, but they can require different passwords.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applies only to rewrite and cache policies. If you do not set this parameter, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
acttype	<Double>	Read-only	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".
- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnvserver_authenticationcertpolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:

```
{

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and this will only be called if primary and/or secondary authentication has succeeded.
name	<String>	Read-write	Name of the virtual server. Minimum length = 1
secondary	<Boolean>	Read-write	Binds the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only via a primary authentication method but also via a secondary authentication method. User groups are aggregated across both. The user name must be exactly the same for both authentication methods, but they can require different passwords.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applies only to rewrite and cache policies. If you do not set this parameter, the policy is bound to REQ_DEFAULT or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnvserver_authenticationlocalpolicy_binding

HTTP Method:PUT

Response Payload:

```
{"vpnvserver_authenticationpolicy_binding": [ { "__count": "#no"} ] }
```

vpnvserver_authenticationradiuspolicy_binding

Binding object showing the authenticationradiuspolicy that can be bound to vpnvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the policy's priority. The lower the number, the higher the priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE. Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			85 does not exist in the policy label.
policy	<String>	Read-write	The name of the policy, if any, bound to the VPN virtual server.
groupextraction	<Boolean>	Read-write	Binds the authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server, and this will only be called if primary and/or secondary authentication has succeeded.
name	<String>	Read-write	Name of the virtual server. Minimum length = 1
secondary	<Boolean>	Read-write	Binds the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only via a primary authentication method but also via a secondary authentication method. User groups are aggregated

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			across both. The user name must be exactly the same for both authentication methods, but they can require different passwords.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applies only to rewrite and cache policies. If you do not set this parameter, the policy is bound to REQ_DEFAULT or RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER:<username>

  X-NITRO-PASS:<password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

Response Payload:

```
{"vpnvserver_authenticationsamlpolicy_binding": [ { "__count": "#no"} ] }
```

vpnvserver_authenticationtacacspolicy_binding

Binding object showing the authenticationtacacspolicy that can be bound to vpnvserver.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Integer specifying the policy's priority. The lower the number, the higher the priority. Policies are evaluated in the order of their priority numbers. Maximum value for default syntax policies is 2147483647 and for classic policies is 64000. Minimum value = 0 Maximum value = 2147483647
gotopriorityexpression	<String>	Read-write	Applicable only to advance vpn session policy. Expression or other value specifying the next policy to evaluate if the current policy evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Specify one of the following values: * NEXT - Evaluate the policy with the next higher priority number. * END - End policy evaluation. * An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: * If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. * If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. * If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: * The expression is invalid. * The expression evaluates to a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			priority number that is numerically lower than the current policy's priority. * The expression evaluates to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label.
policy	<String>	Read-write	The name of the policy, if any, bound to the VPN virtual server.
groupextraction	<Boolean>	Read-write	Binds the authentication policy to a tertiary chain which will be used only for group extraction. The user will not authenticate against this server,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and this will only be called if primary and/or secondary authentication has succeeded.
name	<String>	Read-write	Name of the virtual server. Minimum length = 1
secondary	<Boolean>	Read-write	Binds the authentication policy as the secondary policy to use in a two-factor configuration. A user must then authenticate not only via a primary authentication method but also via a secondary authentication method. User groups are aggregated across both. The user name must be exactly the same for both authentication methods, but they can require different passwords.
bindpoint	<String>	Read-write	Bind point to which to bind the policy. Applies only to rewrite and cache policies. If you do not set this parameter, the policy is bound to REQ_DEFAULT or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RES_DEFAULT, depending on whether the policy rule is a response-time or a request-time expression. Possible values = REQUEST, RESPONSE, ICA_REQUEST, OTHERTCP_REQUEST
acttype	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

ADD:| DELETE:| GET| GET (ALL)| COUNT

Some options that you can use for each operations:

- **Getting warnings in response:**NITRO allows you to get warnings in an operation by specifying the "warning" query parameter as "yes". For example, to get warnings while connecting to the Citrix ADC appliance, the URL is as follows:

  http://<Citrix-ADC-IP-address(NSIP)>/nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code "209 X-NITRO-WARNING".

- **Authenticated access for individual NITRO operations:**NITRO allows you to logon to the Citrix ADC appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER:<username>

X-NITRO-PASS:<password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue>

`*Note:`*

Mandatory parameters are marked in redand placeholder content is marked in <green>.

add

URL:http://<Citrix-ADC-IP-address(NSIP)/nitro/v1/config/vpnvserver_authenticationtacacspolicy_binding

HTTP Method:PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN=<tokenvalue> Content-Type:application/json

Request Payload:
