- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vlan_interface_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{
"vlan_interface_binding":{
<b>      "id":<Double_value>,
</b>      "ifnum":<String_value>,
      "tagged":<Boolean_value>,
      "ownergroup":<String_value>
}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_interface_binding/ id_value<Double>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/vlan_interface_binding/ id_value<Double> ?**args=ifnum: <String_value> ,tagged: <Boolean_value> ,ownergroup: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_interface_binding/ id_value<Double>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/vlan_interface_binding/ id_value<Double> ?**filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vlan_interface_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/vlan_interface_binding/ id_value<Double> ?**pagesize=#no;pageno=#no**

Use this query-parameter to get the vlan_interface_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vlan_interface_binding": [ {

      "ownergroup":<String_value>,

      "id":<Double_value>,

      "ifnum":<String_value>,

      "tagged":<Boolean_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_interface_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/vlan_interface_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vlan_interface_binding": [ {

      "ownergroup":<String_value>,

      "id":<Double_value>,

      "ifnum":<String_value>,

      "tagged":<Boolean_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vlan_interface_binding/ id_value<Double> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vlan_interface_binding": [ { "__count": "#no"} ] }
```

vlan_linkset_binding

Binding object showing the linkset that can be bound to vlan.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ownergroup	<String>	Read-write	The owner node group in a Cluster for this vlan. Default value: DEFAULT_NG Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Specifies the virtual LAN ID. Minimum value = 1 Maximum value = 4094
ifnum	<String>	Read-write	The interface to be bound to the VLAN, specified in slot/port notation (for example, 1/3). Minimum length = 1
tagged	<Boolean>	Read-write	Make the interface an 802.1q tagged interface. Packets sent on this interface on this VLAN have an additional 4-byte 802.1q tag, which identifies the VLAN. To use 802.1q tagging, you must also configure the switch connected to the appliance's interfaces.
__count	<Double>	Read-write	count parameter

Operations

vrid

Configuration for Virtual Router ID resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer that uniquely identifies the VMAC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address. The generic VMAC address is in the form of 00:00:5e:00:01:<VRID>. For example, if you add a VRID with a value of 60 and bind it to an interface, the resulting VMAC address is 00:00:5e:00:01:3c, where 3c is the hexadecimal representation of 60. Minimum value = 1 Maximum value = 255
priority	<Double>	Read-write	Base priority (BP), in an active-active mode configuration, which ordinarily determines the master VIP address. Default value: 255 Minimum value = 0 Maximum value = 255
preemption	<String>	Read-write	In an active-active mode configuration, make a backup VIP address the master if its priority becomes higher than that of a master VIP address

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			bound to this VMAC address. If you disable pre-emption while a backup VIP address is the master, the backup VIP address remains master until the original master VIP's priority becomes higher than that of the current master. Default value: ENABLED Possible values = ENABLED, DISABLED
sharing	<String>	Read-write	In an active-active mode configuration, enable the backup VIP address to process any traffic instead of dropping it. Default value: DISABLED Possible values = ENABLED, DISABLED
tracking	<String>	Read-write	The effective priority (EP) value, relative to the base priority (BP) value in an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			active-active mode configuration. When EP is set to a value other than None, it is EP, not BP, which determines the master VIP address. Available settings function as follows: * NONE - No tracking. EP = BP * ALL - If the status of all virtual servers is UP, EP = BP. Otherwise, EP = 0. * ONE - If the status of at least one virtual server is UP, EP = BP. Otherwise, EP = 0. * PROGRESSIVE - If the status of all virtual servers is UP, EP = BP. If the status of all virtual servers is DOWN, EP = 0. Otherwise EP = BP (1 - K/N), where N is the total number of virtual servers associated with the VIP address and K is the number of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			virtual servers for which the status is DOWN. Default: NONE. Default value: NONE Possible values = NONE, ONE, ALL, PROGRESSIVE
ownernode	<Double>	Read-write	In a cluster setup, assign a cluster node as the owner of this VMAC address for IP based VRRP configuration. If no owner is configured, owner node is displayed as ALL and one node is dynamically elected as the owner. Minimum value = 0 Maximum value = 31
trackifnumpriority	<Double>	Read-write	Priority by which the Effective priority will be reduced if any of the tracked interfaces goes down in an active-active configuration. Default value: 0 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 255
preemptiondelaytimer	<Double>	Read-write	Preemption delay time, in seconds, in an active-active configuration. If any high priority node will come in network, it will wait for these many seconds before becoming master. Default value: 0 Minimum value = 1 Maximum value = 36000
all	<Boolean>	Read-write	Remove all the configured VMAC addresses from the Citrix ADC.
ifaces	<String>	Read-only	Interfaces bound to this VRID.
type	<String>	Read-only	Indicates whether this VRID entry was added manually or dynamically. When you manually add a VRID entry, the value for this parameter is STATIC. Otherwise, it is DYNAMIC. Possible values = STATIC, DYNAMIC

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
effectivepriority	<Double>	Read-only	The effective priority of this VRID.
flags	<Double>	Read-only	Flags.
ipaddress	<String>	Read-only	The IP address bound to the VRID.
state	<Double>	Read-only	State of this VRID.
operationalownernode	<Double>	Read-only	Run time owner node of the vrid. Minimum value = 0 Maximum value = 31
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vrid":{

<b>      "id":<Double_value>,

</b>      "priority":<Double_value>,

      "preemption":<String_value>,
```

```
        "sharing":<String_value>,

        "tracking":<String_value>,

        "ownernode":<Double_value>,

        "trackifnumpriority":<Double_value>,

        "preemptiondelaytimer":<Double_value>

  }}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid/ id_value<Double>

Query-parameters:

args=all: <Boolean_value>
update
URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
  {"vrid":{
```

```
<b>      "id":<Double_value>,

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error
get (all)
URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/vrid? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/vrid? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of vrid resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/vrid? **view=summary**

Use this query-parameter to get the summary output of vrid resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/vrid? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vrid resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

```

vrid6

Configuration for Virtual Router ID for IPv6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer value that uniquely identifies a VMAC6 address. Minimum value = 1 Maximum value = 255
priority	<Double>	Read-write	Base priority (BP), in an active-active mode configuration, which ordinarily determines the master VIP address. Default value: 255 Minimum value = 0 Maximum value = 255
preemption	<String>	Read-write	In an active-active mode configuration, make a backup VIP address the master if its priority becomes higher than that of a master VIP address bound to this VMAC address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If you disable pre-emption while a backup VIP address is the master, the backup VIP address remains master until the original master VIP's priority becomes higher than that of the current master. Default value: ENABLED Possible values = ENABLED, DISABLED
sharing	<String>	Read-write	In an active-active mode configuration, enable the backup VIP address to process any traffic instead of dropping it. Default value: DISABLED Possible values = ENABLED, DISABLED
tracking	<String>	Read-write	The effective priority (EP) value, relative to the base priority (BP) value in an active-active mode configuration. When

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			EP is set to a value other than None, it is EP, not BP, which determines the master VIP address. Available settings function as follows: * NONE - No tracking. EP = BP * ALL - If the status of all virtual servers is UP, EP = BP. Otherwise, EP = 0. * ONE - If the status of at least one virtual server is UP, EP = BP. Otherwise, EP = 0. * PROGRESSIVE - If the status of all virtual servers is UP, EP = BP. If the status of all virtual servers is DOWN, EP = 0. Otherwise EP = BP (1 - K/N), where N is the total number of virtual servers associated with the VIP address and K is the number of virtual servers for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which the status is DOWN. Default: NONE. Default value: NONE Possible values = NONE, ONE, ALL, PROGRESSIVE
preemptiondelaytimer	<Double>	Read-write	Preemption delay time in seconds, in an active-active configuration. If any high priority node will come in network, it will wait for these many seconds before becoming master. Default value: 0 Minimum value = 1 Maximum value = 36000
trackifnumpriority	<Double>	Read-write	Priority by which the Effective priority will be reduced if any of the tracked interfaces goes down in an active-active configuration. Default value: 0 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 255
ownernode	<Double>	Read-write	In a cluster setup, assign a cluster node as the owner of this VMAC address for IP based VRRP configuration. If no owner is configured, ow ner node is displayed as ALL and one node is dynamically elected as the owner. Minimum value = 0 Maximum value = 31
all	<Boolean>	Read-write	Remove all configured VMAC6 addresses from the Citrix ADC.
ifaces	<String>	Read-only	Interfaces bound to this VRID.
ifnum	<String>	Read-only	Interfaces to bind to the VMAC6, specified in (slot/port) notation (for example, 1/2).Use spaces to separate multiple entries.
type	<String>	Read-only	Type (static or dynamic) of this VRID.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = STATIC, DYNAMIC
state	<Double>	Read-only	State of this VRID.
flags	<Double>	Read-only	Flags.
ipaddress	<String>	Read-only	The IP address bound to the VRID6.
effectivepriority	<Double>	Read-only	The effective priority of this VRID.
operationalownernode	<Double>	Read-only	Run time owner node of the vrid. Minimum value = 0 Maximum value = 31
__count	<Double>	Read-only	count parameter

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_binding/ id_value<Double>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vrid6_binding": [ {

      "id":<Double_value>,

      "vrid6_nsip6_binding":<vrid6_nsip6_binding[]_value>,

      "vrid6_nsip_binding":<vrid6_nsip_binding[]_value>,

      "vrid6_channel_binding":<vrid6_channel_binding[]_value>,

      "vrid6_interface_binding":<vrid6_interface_binding[]_value>,

      "vrid6_trackinterface_binding":<vrid6_trackinterface_binding[]_value
>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/vrid6_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vrid6_binding": [ {

      "id":<Double_value>,

      "vrid6_nsip6_binding":<vrid6_nsip6_binding[]_value>,

- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vrid6_channel_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"vrid6_channel_binding":{

<b>      "id":<Double_value>,

</b>      "ifnum":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Double>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Double> ? **args=ifnum: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Double>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Double> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vrid6_channel_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Double> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vrid6_channel_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vrid6_channel_binding": [ {
```

```
        "id":<Double_value>,

        "ifnum":<String_value>,

        "flags":<Double_value>,

        "vlan":<Double_value>

  }]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vrid6_channel_binding": [ {

      "id":<Double_value>,

      "ifnum":<String_value>,

      "flags":<Double_value>,

      "vlan":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid6_channel_binding/ id_value<Double> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vrid6_channel_binding": [ { "__count": "#no"} ] }
```

vrid6_interface_binding

Binding object showing the interface that can be bound to vrid6.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer value that uniquely identifies a VMAC6 address. Minimum value = 1 Maximum value = 255
ifnum	<String>	Read-write	Interfaces to bind to the VMAC6, specified in (slot/port) notation (for example, 1/2).Use spaces to separate multiple entries.
flags	<Double>	Read-only	Flags.
vlan	<Double>	Read-only	The VLAN in which this VRID resides.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vridparam

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vridparam":{
      "sendtomaster":<String_value>,
      "hellointerval":<Double_value>,
      "deadinterval":<Double_value>
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vridparam? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"vridparam":{
      "sendtomaster":true,
```

```
        "hellointerval":true,

        "deadinterval":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vridparam

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vridparam": [ {

        "sendtomaster":<String_value>,
```

```
        "hellointerval":<Double_value>,

        "deadinterval":<Double_value>

  }]}
```

vrid_binding

Binding object which returns the resources bound to vrid.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer value that uniquely identifies the VMAC address. Minimum value = 1 Maximum value = 255
vrid_trackinterface_binding	<vrid_trackinterface_binding[]>	Read-only	trackinterface that can be bound to vrid.
vrid_nsip6_binding	<vrid_nsip6_binding[]>	Read-only	nsip6 that can be bound to vrid.
vrid_interface_binding	<vrid_interface_binding[]>	Read-only	interface that can be bound to vrid.
vrid_channel_binding	<vrid_channel_binding[]>	Read-only	channel that can be bound to vrid.
vrid_nsip_binding	<vrid_nsip_binding[]>	Read-only	nsip that can be bound to vrid.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_binding/ id_value<Double>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vrid_binding": [ {

      "id":<Double_value>,

      "vrid_nsip6_binding":<vrid_nsip6_binding[]_value>,

      "vrid_nsip_binding":<vrid_nsip_binding[]_value>,

      "vrid_interface_binding":<vrid_interface_binding[]_value>,

      "vrid_channel_binding":<vrid_channel_binding[]_value>,

      "vrid_trackinterface_binding":<vrid_trackinterface_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/vrid_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vrid_binding": [ {

      "id":<Double_value>,

      "vrid_nsip6_binding":<vrid_nsip6_binding[]_value>,

      "vrid_nsip_binding":<vrid_nsip_binding[]_value>,

      "vrid_interface_binding":<vrid_interface_binding[]_value>,

      "vrid_channel_binding":<vrid_channel_binding[]_value>,

      "vrid_trackinterface_binding":<vrid_trackinterface_binding[]_value>

}]}
```

vrid_channel_binding

Binding object showing the channel that can be bound to vrid.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer that uniquely identifies the VMAC address. The generic VMAC address is in the form of 00:00:5e:00:01:<VRID>. For example, if you add a VRID with a value of 60 and bind it to an interface, the resulting VMAC address is 00:00:5e:00:01:3c, where 3c is the hexadecimal representation of 60. Minimum value = 1 Maximum value = 255
ifnum	<String>	Read-write	Interfaces to bind to the VMAC, specified in (slot/port) notation (for example, 1/2).Use spaces to separate multiple entries.
flags	<Double>	Read-only	Flags.
vlan	<Double>	Read-only	The VLAN in which this VRID resides.
__count	<Double>	Read-only	count parameter

        "flags":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_nsip_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/vrid_nsip_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vrid_nsip_binding": [ {

      "id":<Double_value>,

      "ipaddress":<String_value>,

      "flags":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_nsip_binding/ id_value<Double> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vrid_nsip_binding": [ { "__count": "#no"} ] }
```

vrid_trackinterface_binding

Binding object showing the trackinterface that can be bound to vrid.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	Integer that uniquely identifies the VMAC address. The generic VMAC address is in the form of 00:00:5e:00:01:<VRID>. For example, if you add a VRID with a value of 60 and bind it to an interface, the resulting VMAC address is 00:00:5e:00:01:3c, where 3c is the hexadecimal representation of 60. Minimum value = 1 Maximum value = 255
trackifnum	<String>	Read-write	Interfaces which need to be tracked for this vrID.
flags	<Double>	Read-only	Flags.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD

- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vrid_trackinterface_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"vrid_trackinterface_binding":{

<b>      "id":<Double_value>,

</b>      "trackifnum":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding/ id_value<Double>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding/ id_value<Double> ? **args=trackifnum: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding/ id_value<Double>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding/ id_value<Double> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vrid_trackinterface_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding/ id_value<Double> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vrid_trackinterface_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vrid_trackinterface_binding": [ {

      "id":<Double_value>,

      "trackifnum":<String_value>,

      "flags":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vrid_trackinterface_binding": [ {

      "id":<Double_value>,

      "trackifnum":<String_value>,

      "flags":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vrid_trackinterface_binding/ id_value<Double> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vrid_trackinterface_binding": [ { "__count": "#no"} ] }
```

vxlan

Configuration for "VXLAN" resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	A positive integer, which is also called VXLAN Network Identifier (VNI), that uniquely identifies a VXLAN. Minimum value = 1 Maximum value = 16777215
vlan	<Double>	Read-write	ID of VLANs whose traffic is allowed over this VXLAN. If you do not specify any VLAN IDs, the Citrix ADC allows traffic of all VLANs that are not part of any other VXLANs. Minimum value = 2 Maximum value = 4094
port	<Integer>	Read-write	Specifies UDP destination port for VXLAN packets. Default value: 4789 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65534
dynamicrouting	<String>	Read-write	Enable dynamic routing on this VXLAN. Default value: DISABLED Possible values = ENABLED, DISABLED
ipv6dynamicrouting	<String>	Read-write	Enable all IPv6 dynamic routing protocols on this VXLAN. Note: For the ENABLED setting to work, you must configure IPv6 dynamic routing protocols from the VTYSH command line. Default value: DISABLED Possible values = ENABLED, DISABLED
type	<String>	Read-write	VXLAN encapsulation type. VXLAN, VXLANGPE. Default value: VXLAN

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = VXLAN, VXLANGPE
protocol	<String>	Read-write	VXLAN-GPE next protocol. RESERVED, IPv4, IPv6, ETHERNET, NSH. Default value: ETHERNET Possible values = IPv4, IPv6, ETHERNET, NSH
innervlantagging	<String>	Read-write	Specifies whether Citrix ADC should generate VXLAN packets with inner VLAN tag. Default value: DISABLED Possible values = ENABLED, DISABLED
td	<Double>	Read-only	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-only	The Partition to which this vxlan is bound. Minimum length = 1
__count	<Double>	Read-only	count parameter

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vxlanvlanmap_binding": [ {

      "name":<String_value>,

      "vxlanvlanmap_vxlan_binding":<vxlanvlanmap_vxlan_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vxlanvlanmap_binding": [ {

      "name":<String_value>,

      "vxlanvlanmap_vxlan_binding":<vxlanvlanmap_vxlan_binding[]_value>

}]}
```

vxlanvlanmap_vxlan_binding

Binding object showing the vxlan that can be bound to vxlanvlanmap.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the mapping table. Minimum length = 1
vxlan	<Double>	Read-write	The VXLAN assigned to the vlan inside the cloud. Minimum value = 1 Maximum value = 16777215
vlan	<String[]>	Read-write	The vlan id or the range of vlan ids in the on-premise network. Minimum length = 1 Maximum length = 4094
__count	<Double>	Read-write	count parameter

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/vxlanvlanmap_vxlan_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"vxlanvlanmap_vxlan_binding":{

<b>      "name":<String_value>,

</b>      "vxlan":<Double_value>,

      "vlan":<String[]_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_vxlan_binding/ name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_vxlan_binding/ name_value<String> ? **args=vxlan: <Double_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_vxlan_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_vxlan_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vxlanvlanmap_vxlan_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_vxlan_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vxlanvlanmap_vxlan_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vxlanvlanmap_vxlan_binding": [ {

      "name":<String_value>,

      "vxlan":<Double_value>,

      "vlan":<String[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_vxlan_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_vxlan_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vxlanvlanmap_vxlan_binding": [ {

      "name":<String_value>,

      "vxlan":<Double_value>,

      "vlan":<String[]_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlanvlanmap_vxlan_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vxlanvlanmap_vxlan_binding": [ { "__count": "#no"} ] }
```

vxlan_binding

Binding object which returns the resources bound to vxlan.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
id	<Double>	Read-write	A positive integer, which is also called VXLAN Network Identifier (VNI), that uniquely identifies a VXLAN. Minimum value = 1 Maximum value = 16777215
vxlan_iptunnel_binding	<vxlan_iptunnel_binding[]>	Read-only	iptunnel that can be bound to vxlan.
vxlan_nsip_binding	<vxlan_nsip_binding[]>	Read-only	nsip that can be bound to vxlan.
vxlan_srcip_binding	<vxlan_srcip_binding[]>	Read-only	srcip that can be bound to vxlan.
vxlan_nsip6_binding	<vxlan_nsip6_binding[]>	Read-only	nsip6 that can be bound to vxlan.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_binding/ id_value<Double>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "vxlan_binding": [ {

      "id":<Double_value>,

      "vxlan_nsip6_binding":<vxlan_nsip6_binding[]_value>,

      "vxlan_nsip_binding":<vxlan_nsip_binding[]_value>,

```

```
"vxlan_srcip_binding":{

<b>      "id":<Double_value>,

</b>      "srcip":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_srcip_binding/ id_value<Double>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/vxlan_srcip_binding/ id_value<Double> ?
args=srcip: <String_value>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_srcip_binding/ id_value<Double>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/vxlan_srcip_binding/ id_value<Double> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of vxlan_srcip_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/vxlan_srcip_binding/ id_value<Double> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the vxlan_srcip_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vxlan_srcip_binding": [ {

      "id":<Double_value>,

      "srcip":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_srcip_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/vxlan_srcip_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "vxlan_srcip_binding": [ {

      "id":<Double_value>,

      "srcip":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/vxlan_srcip_binding/ id_value<Double> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"vxlan_srcip_binding": [ { "__count": "#no"} ] }
```

Configuration for ACL entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclname	<String>	Read-write	Name for the extended ACL rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclaction	<String>	Read-write	Action to perform on incoming IPv4 packets that match the extended ACL rule. Available settings function as follows: * ALLOW - The Citrix ADC processes the packet. * BRIDGE - The Citrix ADC bridges the packet to the destination without processing it. * DENY - The Citrix ADC drops the packet. Possible values = BRIDGE, DENY, ALLOW
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4094
srcip	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipval	<String>	Read-write	IP address or range of IP addresses to match against the source IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example:10.102.29.30-10.102.29.189.
srcport	<Boolean>	Read-write	Port number or range of port numbers to match

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			against the source port number of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Port number or range of port numbers to match against the source port number of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Maximum length = 65535
destip	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an incoming IPv4 packet. In the command line interface, separate the range with a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen. For example: 10.102.29.30-10.102.29.189.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipval	<String>	Read-write	IP address or range of IP addresses to match against the destination IP address of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: The destination port can be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Port number or range of port numbers to match against the destination port number of an incoming IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols. Maximum length = 65535
ttl	<Double>	Read-write	Number of seconds, in multiples of four, after which the extended ACL rule expires. If you do not want the extended

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ACL rule to expire, do not specify a TTL value. Minimum value = 1 Maximum value = 2147483647
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an incoming IPv4 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"
protocol	<String>	Read-write	Protocol to match against the protocol of an incoming IPv4 packet. Possible values = ICMP, IGMP, TCP, EGP, IGP, ARGUS, UDP, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, ICMPV6, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-IGNORE, Mobility-Header, UDPLite
protocolnumber	<Double>	Read-write	Protocol to match against the protocol of an incoming IPv4 packet. Minimum value = 1 Maximum value = 255
vlan	<Double>	Read-write	ID of the VLAN. The Citrix ADC applies the ACL rule only to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the incoming packets of the specified VLAN. If you do not specify a VLAN ID, the appliance applies the ACL rule to the incoming packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN. The Citrix ADC applies the ACL rule only to the incoming packets of the specified VXLAN. If you do not specify a VXLAN ID, the appliance applies the ACL rule to the incoming packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC applies the ACL rule only to the incoming packets from the specified interface. If you do not specify any value, the appliance applies the ACL rule to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			incoming packets of all interfaces.
established	<Boolean>	Read-write	Allow only incoming TCP packets that have the ACK or RST bit set, if the action set for the ACL rule is ALLOW and these packets match the other conditions in the ACL rule.
icmptype	<Double>	Read-write	ICMP Message type to match against the message type of an incoming ICMP packet. For example, to block DESTINATION UNREACHABLE messages, you must specify 3 as the ICMP type. Note: This parameter can be specified only for the ICMP protocol. Minimum value = 0 Maximum value = 65536
icmpcode	<Double>	Read-write	Code of a particular ICMP message type to match against the ICMP code of an incoming ICMP packet. For example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to block DESTINATION HOST UNREACHABLE messages, specify 3 as the ICMP type and 1 as the ICMP code. If you set this parameter, you must set the ICMP Type parameter. Minimum value = 0 Maximum value = 65536
priority	<Double>	Read-write	Priority for the extended ACL rule that determines the order in which it is evaluated relative to the other extended ACL rules. If you do not specify priorities while creating extended ACL rules, the ACL rules are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 100000
state	<String>	Read-write	Enable or disable the extended ACL rule. After you apply the extended ACL rules,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the Citrix ADC compares incoming packets against the enabled extended ACL rules. Default value: ENABLED Possible values = ENABLED, DISABLED
logstate	<String>	Read-write	Enable or disable logging of events related to the extended ACL rule. The log messages are stored in the configured syslog or auditlog server. Default value: DISABLED Possible values = ENABLED, DISABLED
ratelimit	<Double>	Read-write	Maximum number of log messages to be generated per second. If you set this parameter, you must enable the Log State parameter. Default value: 100 Minimum value = 1 Maximum value = 10000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the acl ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster . Default value: CLASSIC Possible values = CLASSIC, DFD
dfdhash	<String>	Read-write	Specifies the type hashmethod to be applied, to steer the packet to the FP of the packet. Possible values = SIP-SPORT-DIP-DPORT, SIP, DIP, SIP-DIP, SIP-SPORT, DIP-DPORT
stateful	<String>	Read-write	If stateful option is enabled, transparent sessions are created for the traffic hitting

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this ACL and not hitting any other features like LB, INAT etc. . Default value: NO Possible values = YES, NO
newname	<String>	Read-write	New name for the extended ACL rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
hits	<Double>	Read-only	The hits of this ACL.
kernelstate	<String>	Read-only	The commit status of the ACL. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED, SFAPPLIED61, SFNOTAPPLIED61

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclassociate	<String[]>	Read-only	ACL linked. Possible values = NAT, FORWARDINGSESSION, NAT64, LSN
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- RENAME
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **args=aclname: <String_value> ,type: <String_value>**

Use this query-parameter to get nsacl resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsacl resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **view=summary**

Use this query-parameter to get the summary output of nsacl resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsacl? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsacl resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

nsacl6

Configuration for ACL6 entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
acl6name	<String>	Read-write	Name for the ACL6 rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
acl6action	<String>	Read-write	Action to perform on the incoming IPv6 packets that match the ACL6 rule. Available settings function as follows:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ALLOW - The Citrix ADC processes the packet. * BRIDGE - The Citrix ADC bridges the packet to the destination without processing it. * DENY - The Citrix ADC drops the packet. Possible values = BRIDGE, DENY, ALLOW
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
srcipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an incoming IPv6

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			packet. In the command line interface, separate the range with a hyphen.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipv6val	<String>	Read-write	Source IPv6 address (range).
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an incoming IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Source port (range).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 65535
destipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an incoming IPv6 packet. In the command line interface, separate the range with a hyphen.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipv6val	<String>	Read-write	Destination IPv6 address (range).
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an incoming IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Destination port (range). Maximum length = 65535
ttl	<Double>	Read-write	Time to expire this ACL6 (in seconds). Minimum value = 1 Maximum value = 2147483647
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an incoming IPv6 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
protocol	<String>	Read-write	Protocol, identified by protocol name, to match against the protocol of an incoming IPv6 packet. Possible values = ICMPV6, TCP, UDP, ICMP, IGMP, EGP, IGP, ARGUS, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IGNORE, Mobility-Header, UDPLite
protocolnumber	<Double>	Read-write	Protocol, identified by protocol number, to match against the protocol of an incoming IPv6 packet. Minimum value = 1 Maximum value = 255
vlan	<Double>	Read-write	ID of the VLAN. The Citrix ADC applies the ACL6 rule only to the incoming packets on the specified VLAN. If you do not specify a VLAN ID, the appliance applies the ACL6 rule to the incoming packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN. The Citrix ADC applies the ACL6 rule only to the incoming packets on the specified VXLAN. If you do not specify a VXLAN ID, the appliance applies the ACL6 rule to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			incoming packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC applies the ACL6 rule only to the incoming packets from the specified interface. If you do not specify any value, the appliance applies the ACL6 rule to the incoming packets from all interfaces.
established	<Boolean>	Read-write	Allow only incoming TCP packets that have the ACK or RST bit set if the action set for the ACL6 rule is ALLOW and these packets match the other conditions in the ACL6 rule.
icmptype	<Double>	Read-write	ICMP Message type to match against the message type of an incoming IPv6 ICMP packet. For example, to block DESTINATION UNREACHABLE messages, you must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specify 3 as the ICMP type. Note: This parameter can be specified only for the ICMP protocol. Minimum value = 0 Maximum value = 65536
icmpcode	<Double>	Read-write	Code of a particular ICMP message type to match against the ICMP code of an incoming IPv6 ICMP packet. For example, to block DESTINATION HOST UNREACHABLE messages, specify 3 as the ICMP type and 1 as the ICMP code. If you set this parameter, you must set the ICMP Type parameter. Minimum value = 0 Maximum value = 65536
priority	<Double>	Read-write	Priority for the ACL6 rule, which determines the order in which it is evaluated relative to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the other ACL6 rules. If you do not specify priorities while creating ACL6 rules, the ACL6 rules are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 81920
state	<String>	Read-write	State of the ACL6. Default value: ENABLED Possible values = ENABLED, DISABLED
type	<String>	Read-write	Type of the acl6 ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: CLASSIC Possible values = CLASSIC, DFD
dfdhash	<String>	Read-write	Specifies the type of hashmethod to be applied, to steer the packet to the FP of the packet. Possible values = SIP-SPORT-DIP-DPORT, SIP, DIP, SIP-DIP, SIP-SPORT, DIP-DPORT
dfdprefix	<Double>	Read-write	hashprefix to be applied to SIP/DIP to generate rsshash FP.eg 128 => hash calculated on the complete IP. Default value: 128 Minimum value = 1 Maximum value = 128
stateful	<String>	Read-write	If stateful option is enabled, transparent sessions are created for the traffic hitting this ACL6 and not hitting any other features like LB, INAT etc. .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
logstate	<String>	Read-write	Enable or disable logging of events related to the ACL6 rule. The log messages are stored in the configured syslog or auditlog server. Default value: DISABLED Possible values = ENABLED, DISABLED
ratelimit	<Double>	Read-write	Maximum number of log messages to be generated per second. If you set this parameter, you must enable the Log State parameter. Default value: 100 Minimum value = 1 Maximum value = 10000
aclaction	<String>	Read-write	Action associated with the ACL6. Possible values = BRIDGE, DENY, ALLOW

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the ACL6 rule. Must begin with an ASCII alphabetic or underscore \(_\) character, and must contain only ASCII alphanumeric, underscore, hash \(#\), period \(.\), space, colon \(:\), at \(@\), equals \(=\), and hyphen \(-\) characters. Minimum length = 1
kernelstate	<String>	Read-only	Commit status of the ACL6. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED
hits	<Double>	Read-only	Number of hits of this ACL6.
aclassociate	<String[]>	Read-only	ACL6 linked. Possible values = NAT, FORWARDINGSESSION, NAT64, LSN
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- RENAME
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl6

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl6

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **args=acl6name: <String_value> ,type: <String_value>**

Use this query-parameter to get nsacl6 resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsacl6 resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **view=summary**

Use this query-parameter to get the summary output of nsacl6 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsacl6 resources in chunks.

HTTP Method: GET

Request Headers:

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl6/ acl6name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsacl6/ acl6name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsacl6/ acl6name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nsacl6 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsacl6": [ {

```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacl6? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsacl6": [ { "__count": "#no"} ] }
```

nsacls

Configuration for ACL entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the acl ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: CLASSIC Possible values = CLASSIC, DFD

Operations

(click to see Properties)

- RENUMBER
- CLEAR
- APPLY

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: `*

Mandatory parameters are marked in red and placeholder content is marked in green

RENUMBER

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacls? **action=renumber**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsacls":{

      "type":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacls? **action=clear**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsacls":{
      "type":<String_value>
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

APPLY

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsacls? **action=apply**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsacls":{
      "type":<String_value>
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nsacls6

Configuration for ACL6 entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of the acl ,default will be CLASSIC. Available options as follows: * CLASSIC - specifies the regular extended acls. * DFD - cluster specific acls,specifies hashmethod for steering of the packet in cluster . Default value: CLASSIC Possible values = CLASSIC, DFD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsappflowcollector":{

<b>      "name":<String_value>,

</b><b>      "ipaddress":<String_value>,

</b>      "port":<Integer_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsappflowcollector resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **view=summary**

Use this query-parameter to get the summary output of nsappflowcollector resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsappflowcollector resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsappflowcollector": [ {

      "name":<String_value>,

      "ipaddress":<String_value>,

      "port":<Integer_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of nsappflowcollector resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsappflowcollector": [ {

      "name":<String_value>,

      "ipaddress":<String_value>,

      "port":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsappflowcollector? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsappflowcollector": [ { "__count": "#no"} ] }
```

nsappflowparam

Configuration for appflowParam resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
templaterefresh	<Double>	Read-write	IPFIX template refresh interval (in seconds). Default value: 600 Minimum value = 60 Maximum value = 3600
udppmtu	<Double>	Read-write	MTU to be used for IPFIX UDP packets. Default value: 1472 Minimum value = 128 Maximum value = 1472
httpurl	<String>	Read-write	Enable AppFlow HTTP URL logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpcookie	<String>	Read-write	Enable AppFlow HTTP cookie logging.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
httpreferer	<String>	Read-write	Enable AppFlow HTTP referer logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpmethod	<String>	Read-write	Enable AppFlow HTTP method logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httphost	<String>	Read-write	Enable AppFlow HTTP host logging. Default value: DISABLED Possible values = ENABLED, DISABLED
httpuseragent	<String>	Read-write	Enable AppFlow HTTP user-agent logging.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
clienttrafficonly	<String>	Read-write	Control whether AppFlow records should be generated only for client-side traffic. Default value: NO Possible values = YES, NO

Response Payload:

```
{ "nsaptlicense": [ { "__count": "#no"} ] }
```

nsassignment

Configuration for assignment resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the assignment. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the assignment is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my assignment" or my assignment).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
variable	<String>	Read-write	Left hand side of the assigment, of the form $variable-name (for a singleton variabled) or $variable-name[key-expression], where key-expression is an expression that evaluates to a text string and provides the key to select a map entry.
set	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and assigned to the left hand variable.
Add	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and added to the left hand variable.
sub	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and subtracted from the left hand variable.
append	<String>	Read-write	Right hand side of the assignment. The expression is evaluated and appended to the left hand variable.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clear	<Boolean>	Read-write	Clear the variable value. Deallocates a text value, and for a map, the text key.
comment	<String>	Read-write	Comment. Can be used to preserve information about this rewrite action.
newname	<String>	Read-write	New name for the assignment. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks (for example, "my assignment" or my assignment). Minimum length = 1
hits	<Double>	Read-only	The number of times the action has been taken.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Double>	Read-only	The number of references to the action.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- UPDATE
- UNSET
- DELETE
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsassignment

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsassignment":{

<b>      "name":<String_value>,

</b><b>      "variable":<String_value>,
```

```
</b>      "set":<String_value>,

      "Add":<String_value>,

      "sub":<String_value>,

      "append":<String_value>,

      "clear":<Boolean_value>,

      "comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsassignment

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsassignment":{

<b>      "name":<String_value>,

</b>      "variable":<String_value>,
```

```
        "set":<String_value>,

        "Add":<String_value>,

        "sub":<String_value>,

        "append":<String_value>,

        "clear":<Boolean_value>,

        "comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsassignment? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsassignment":{

<b>      "name":<String_value>,

</b>      "comment":true
```

```
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsassignment/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsassignment? **action=rename**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsassignment":{

<b>      "name":<String_value>,
```

```
</b><b>      "newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsassignment

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsassignment? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsassignment? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsassignment resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsassignment? **view=summary**

Use this query-parameter to get the summary output of nsassignment resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsassignment? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsassignment resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsassignment": [ {

      "name":<String_value>,

      "variable":<String_value>,

      "set":<String_value>,

      "Add":<String_value>,

      "sub":<String_value>,

      "append":<String_value>,

      "clear":<Boolean_value>,

      "hits":<Double_value>,

      "undefhits":<Double_value>,
```

```
        "referencecount":<Double_value>,

        "comment":<String_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsassignment/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsassignment/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsassignment/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of nsassignment resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

nsconfig

Configuration for system config resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
force	<Boolean>	Read-write	Configurations will be cleared without prompting for confirmation.
level	<String>	Read-write	Types of configurations to be cleared. * basic: Clears all configurations except the following: - NSIP, default route (gateway), static routes, MIPs, and SNIPs - Network settings (DG, VLAN, RHI and DNS settings) - Cluster settings - HA node definitions - Feature and mode settings - nsroot password

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* extended: Clears the same configurations as the 'basic' option. In addition, it clears the feature and mode settings. * full: Clears all configurations except NSIP, default route, and interface settings. Note: When you clear the configurations through the cluster IP address, by specifying the level as 'full', the cluster is deleted and all cluster nodes become standalone appliances. The 'basic' and 'extended' levels are propagated to the cluster nodes. Possible values = basic, extended, full
rbaconfig	<String>	Read-write	RBA configurations and TACACS policies bound to system global will not be cleared if RBA is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			set to NO.This option is applicable only for BASIC level of clear configuration.Default is YES, which will clear rba configurations. Default value: YES Possible values = YES, NO
ipaddress	<String>	Read-write	IP address of the Citrix ADC. Commonly referred to as NSIP address. This parameter is mandatory to bring up the appliance. Minimum length = 1
netmask	<String>	Read-write	Netmask corresponding to the IP address. This parameter is mandatory to bring up the appliance.
nsvlan	<Double>	Read-write	VLAN (NSVLAN) for the subnet on which the IP address resides. Minimum value = 2 Maximum value = 4094
ifnum	<String[]>	Read-write	Interfaces of the appliances that must be bound to the NSVLAN.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
tagged	<String>	Read-write	Specifies that the interfaces will be added as 802.1q tagged interfaces. Packets sent on these interface on this VLAN will have an additional 4-byte 802.1q tag which identifies the VLAN. To use 802.1q tagging, the switch connected to the appliance's interfaces must also be configured for tagging. Default value: YES Possible values = YES, NO
httpport	<Integer[]>	Read-write	The HTTP ports on the Web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1
maxconn	<Double>	Read-write	The maximum number of connections that will

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			be made from the system to the web server(s) attached to it. The value entered here is applied globally to all attached servers. Minimum value = 0 Maximum value = 4294967294
maxreq	<Double>	Read-write	The maximum number of requests that the system can pass on a particular connection between the system and a server attached to it. Setting this value to 0 allows an unlimited number of requests to be passed. Minimum value = 0 Maximum value = 65535
cip	<String>	Read-write	The option to control (enable or disable) the insertion of the actual client IP address into the HTTP header request passed from the client to one, some, or all servers attached to the system.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The passed address can then be accessed through a minor modification to the server. l If cipHeader is specified, it will be used as the client IP header. l If it is not specified, then the value that has been set by the set ns config CLI command will be used as the client IP header. Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	The text that will be used as the client IP header. Minimum length = 1
cookieversion	<String>	Read-write	The version of the cookie inserted by system. Possible values = 0, 1
securecookie	<String>	Read-write	enable/disable secure flag for persistence cookie.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
pmtumin	<Double>	Read-write	The minimum Path MTU. Default value: 576 Minimum value = 168 Maximum value = 1500
pmtutimeout	<Double>	Read-write	The timeout value in minutes. Default value: 10 Minimum value = 1 Maximum value = 1440
ftpportrange	<String>	Read-write	Port range configured for FTP services. Minimum length = 1024 Maximum length = 64000
crportrange	<String>	Read-write	Port range for cache redirection services. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 65535
timezone	<String>	Read-write	Name of the timezone. Default value: CoordinatedUniversalTime Minimum length = 1 Maximum length = 64
grantquotamaxclient	<Double>	Read-write	The percentage of shared quota to be granted at a time for maxClient. Default value: 10 Minimum value = 0 Maximum value = 100
exclusivequotamaxclient	<Double>	Read-write	The percentage of maxClient to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
grantquotaspillover	<Double>	Read-write	The percentage of shared quota to be granted at a time for spillover. Default value: 10

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 100
exclusivequotaspillover	<Double>	Read-write	The percentage of max limit to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
all	<Boolean>	Read-write	Use this option to do saveconfig for all partitions.
config1	<String>	Read-write	Location of the configurations.
config2	<String>	Read-write	Location of the configurations.
outtype	<String>	Read-write	Format to display the difference in configurations. Possible values = cli, xml
template	<Boolean>	Read-write	File that contains the commands to be compared.
ignoredevicespecific	<Boolean>	Read-write	Suppress device specific differences.
weakpassword	<Boolean>	Read-write	Option to list all weak passwords (not adhering to strong password

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			requirements). Takes config file as input, if no input specified, running configuration is considered. Command => query ns config -weakpassword / query ns config -weakpassword / nsconfig/ns.conf.
changedpassword	<Boolean>	Read-write	Option to list all passwords changed which would not work when downgraded to older releases. Takes config file as input, if no input specified, running configuration is considered. Command => query ns config -changedpassword / query ns config -changedpassword / nsconfig/ns.conf.
config	<String>	Read-write	configuration File to be used to find weak passwords, if not specified, running config is taken as input.
message	<String>	Read-only	.
mappedip	<String>	Read-only	Mapped IP Address of the System. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
range	<Double>	Read-only	The range of Mapped IP addresses to be configured. Minimum value = 1
systemtype	<String>	Read-only	The type of the System. Possible Values: Standalone, HA, Cluster. Possible values = Stand-alone, HA, Cluster
primaryip	<String>	Read-only	HA Master Node IP address.
primaryip6	<String>	Read-only	.
flags	<Double>	Read-only	The flags for this entry.
lastconfigchangedtime	<String>	Read-only	Time when the configuration was last modified.
lastconfigsavetime	<String>	Read-only	Time when the configuration was last saved through savensconfig.
currentsytemtime	<String>	Read-only	current system time in date format.
systemtime	<Double>	Read-only	current system time.
configchanged	<Boolean>	Read-only	returns True if configuration has changed since last saved config.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
response	<String>	Read-only	.

Operations

(click to see Properties)

- CLEAR
- UPDATE
- UNSET
- SAVE
- GET (ALL)
- DIFF

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *`

Mandatory parameters are marked in red and placeholder content is marked in green

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsconfig? **action=clear**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsconfig":{

      "force":<Boolean_value>,

<b>      "level":<String_value>,

</b>      "rbaconfig":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsconfig

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsconfig":{

      "ipaddress":<String_value>,

      "netmask":<String_value>,

      "nsvlan":<Double_value>,

      "ifnum":<String[]_value>,

      "tagged":<String_value>,

      "httpport":<Integer[]_value>,

      "maxconn":<Double_value>,

      "maxreq":<Double_value>,

      "cip":<String_value>,

      "cipheader":<String_value>,

link	<Boolean>	Read-write	Display link information if available.
filtername	<Boolean>	Read-write	Display name instead of IP for local entities.
detail	<String[]>	Read-write	Specify display options for the connection table. * LINK - Displays the linked PCB (Protocol Control Block).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* NAME - Displays along with the service name. * CONNFAILOVER - Displays PCB with connection failover. * FULL - Displays all available details. Possible values = LINK, NAME, CONNFAILOVER, FULL, NNM, FULL+
listen	<Boolean>	Read-write	Display listening services only.
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
sourceip	<String>	Read-only	Source IP of the connection.
sourceport	<Integer>	Read-only	Source port of the connection. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
destip	<String>	Read-only	Destination IP of the connection.
destport	<Integer>	Read-only	Destination port of the connection. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
svctype	<String>	Read-only	Protocol supported by the connection. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP, HTTPSVR, HTTPCLIENT, NAT, HA, AAA, SINCTCP, VPN AFTP, MONITORS, SSLVPN UDP, SINCUDP, RIP, UDP CLNT, SASP, RPCCLNTS, ROUTE, AUDIT, STA HTTP, STA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL, DNS RESOLVE, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, ICA, RADIUS, RADIUSListener, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, QUIC, TFTP_DATA, USER_TCP, USER_SSL_TCP, MONGO, MONGO_TLS
idletime	<Integer>	Read-only	Time since last activity was detected on the connection.
state	<String>	Read-only	Current TCP/IP state of the connection. Possible values = CLOSED, LISTEN, SYN_SENT, SYN_RECEIVED, ESTABLISHED, CLOSE_WAIT, FIN_WAIT_1, CLOSING, LAST_ACK, FIN_WAIT_2, TIME_WAIT, NA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linksourceip	<String>	Read-only	Source IP of the link connection.
linksourceport	<Integer>	Read-only	Source port of the link connection. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
linkdestip	<String>	Read-only	Destination IP of the link connection.
linkdestport	<Integer>	Read-only	Destination port of the link connection. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
linkservicetype	<String>	Read-only	Protocol supported by the link connection. Possible values = HTTP, FTP, TCP, UDP, SSL, SSL_BRIDGE, SSL_TCP, NNTP, RPCSVR, DNS, ADNS, SNMP, RTSP, DHCPRA, ANY, SIP_UDP, SIP_TCP, SIP_SSL, DNS_TCP, ADNS_TCP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			HTTPSVR, HTTPCLIENT, NAT, HA, AAA, SINCTCP, VPN AFTP, MONITORS, SSLVPN UDP, SINCUDP, RIP, UDP CLNT, SASP, RPCCLNTS, ROUTE, AUDIT, STA HTTP, STA SSL, DNS RESOLVE, RDP, MYSQL, MSSQL, DIAMETER, SSL_DIAMETER, TFTP, ORACLE, ICA, RADIUS, RADIUSListener, SMPP, PPTP, GRE, SYSLOGTCP, SYSLOGUDP, FIX, SSL_FIX, QUIC, TFTP_DATA, USER_TCP, USER_SSL_TCP, MONGO, MONGO_TLS
linkidletime	<Integer>	Read-only	Time since last activity was detected on link connection.
linkstate	<String>	Read-only	TCP/IP current state of link connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = CLOSED, LISTEN, SYN_SENT, SYN_RECEIVED, ESTABLISHED, CLOSE_WAIT, FIN_WAIT_1, CLOSING, LAST_ACK, FIN_WAIT_2, TIME_WAIT, NA
entityname	<String>	Read-only	Citrix ADC entity name for the connection.
linkentityname	<String>	Read-only	Citrix ADC entity name for link connection.
connid	<Double>	Read-only	Unique transaction number for the connection.
linkconnid	<Double>	Read-only	Unique transaction number for the peer connection.
connproperties	<String[]>	Read-only	flags used to store connection properties like client, server etc. Possible values = LINK, HASLINK, CLIENT, SERVER, NNM, MPTCP, SUBFLOW

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
optionflags	<String[]>	Read-only	flags used to store TCP options like Sack, WS. Possible values = sack, timstmp, ws
nswsvalue	<Double>	Read-only	Citrix ADC window scaling value.
peerwsvalue	<Double>	Read-only	peer window scaling value.
mss	<Integer>	Read-only	Client side MSS for the connection - used in server SYN.
retxretrycnt	<Integer>	Read-only	Retransmission retry count for the connection.
rcvwnd	<Integer>	Read-only	Received Advertised Window for the connection.
advwnd	<Integer>	Read-only	Sent advertised window for the connection.
sndcwnd	<Integer>	Read-only	sent congestion window for the connection.
iss	<Double>	Read-only	Initial send sequence number for the connection.
irs	<Double>	Read-only	Initial receive sequence number for the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rcvnxt	<Integer>	Read-only	next expecting seq number for the connection.
maxack	<Integer>	Read-only	current running max ack sent for the connection.
sndnxt	<Integer>	Read-only	next bytes seq number for the connection.
sndunack	<Integer>	Read-only	Most recently received ACK for the connection.
httpendseq	<Integer>	Read-only	HTTP parsing tracking seq number for the connection.
httpstate	<String>	Read-only	HTTP Protocol state for the connection. Possible values = INITIALIZED, CONTENT_LENGTH, CHUNKED, WAIT_FINAL_ACK, UNKNOWN, DONE, WAIT_FIN
trcount	<Integer>	Read-only	Max reuests allowed per connection.
priority	<String>	Read-only	priority of the connection. Possible values = SC Priority, Priority queue1, priority queue2, priority queue3, DoS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Priority, Surge Priority
httpreqver	<String>	Read-only	current HTTP request version on the connection. Possible values = HTTP_1_0, HTTP_1_1, HTTP_0_9, RTSP_1_0, SIP_2_0, VPN_ICA_SOCKS, VPN_ICA_CGP, HTTP_2_0, HTTP_2_0_DIREC T
httprequest	<String>	Read-only	current HTTP request type on the connection. Possible values = OPTIONS, GET, HEAD, POST, PUT, DELETE, TRACE, TRACK, CONNECT, RPCCONNECT
httprspcode	<Integer>	Read-only	current response type on the connection.
rttsmoothed	<Integer>	Read-only	smoothed RTT value of the connection.
rttvariance	<Integer>	Read-only	RTT variance for the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
outoforderpkts	<Integer>	Read-only	held packets on the connection.
linkoptionflag	<String[]>	Read-only	Link connection's TCP option flag for Sack and WS. Possible values = sack, timstmp, ws
linknswsvalue	<Double>	Read-only	Link connection-s Citrix ADC window scaling value.
linkpeerwsvalue	<Double>	Read-only	Link connection-s peer Citrix ADC window scaling value.
targetnodeidnnm	<Integer>	Read-only	NNM connection target node ID.
sourcenodeidnnm	<Integer>	Read-only	NNM connection source node ID.
channelidnnm	<Double>	Read-only	NNM connection channel ID.
msgversionnnm	<Double>	Read-only	nnm message version.
td	<Double>	Read-only	Traffic Domain Id.
maxrcvbuf	<Integer>	Read-only	Maximum receive window that application advertizes to peer.
linkmaxrcvbuf	<Integer>	Read-only	Maximum receive window that application

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			advertizes to peer in linked connection.
rxqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC receive buffer. This includes bytes being processed / policy related data / stored in application buffer.
linkrxqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC receive buffer for linked connection. This includes bytes being processed / policy related data / stored in application buffer.
maxsndbuf	<Integer>	Read-only	Maximum send window that application can process and send.
linkmaxsndbuf	<Integer>	Read-only	Maximum send window that application can process and send in linked connection.
txqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC send buffer. This includes both inflight and queued bytes in Citrix ADC.
linktxqsize	<Integer>	Read-only	Total number of bytes in Citrix ADC send buffer for linked

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connection. This includes both inflight and queued bytes in Citrix ADC.
flavor	<String>	Read-only	TCP congestion control algorithm. Possible values = Default, Westwood, BIC, CUBIC, Nile
linkflavor	<String>	Read-only	TCP congestion control algorithm for a linked connection. Possible values = Default, Westwood, BIC, CUBIC, Nile
bwestimate	<Integer>	Read-only	TCP Bandwidth Estimate.
linkbwestimate	<Integer>	Read-only	TCP Bandwidth Estimate for a linked connection.
rttmin	<Integer>	Read-only	Minimum Round Trip Time for the connection.
linkrttmin	<Integer>	Read-only	Minimum Round Trip Time for linked connection.
name	<String>	Read-only	Name of TCP profile attached to the connection. Minimum length = 1 Maximum length = 127

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linkname	<String>	Read-only	Name of TCP profile attached to the connection. Minimum length = 1 Maximum length = 127
tcpmode	<String>	Read-only	TCP Optimization modes TRANSPARENT / ENDPOINT. Possible values = TRANSPARENT, ENDPOINT
linktcpmode	<String>	Read-only	TCP Optimization modes TRANSPARENT / ENDPOINT for linked connection. Possible values = TRANSPARENT, ENDPOINT
realtimertt	<Integer>	Read-only	Real Time / Instantaneous round trip time.
linkrealtimertt	<Integer>	Read-only	Real Time / Instantaneous round trip time for linked connection.
sndbuf	<Integer>	Read-only	send buffer size.
linksndbuf	<Integer>	Read-only	Send buffer size for linked connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nsbtcpwaitq	<Integer>	Read-only	Number of packets in TCP wait queue.
linknsbtcpwaitq	<Integer>	Read-only	Number of packets in wait queue for linked connection.
nsbretxq	<Integer>	Read-only	Number of packets in retransmission queue.
linknsbretxq	<Integer>	Read-only	Number of packets in retransmission queue for linked connection.
sackblocks	<Integer>	Read-only	Number of sack blocks attached to the connection.
linksackblocks	<Integer>	Read-only	Number of sack blocks attached in linked connection.
congstate	<String>	Read-only	TCP congestion state. Possible values = open, recovery, loss, reneg, partial_ACK, retx_lost
linkcongstate	<String>	Read-only	TCP congestion state for a linked connection. Possible values = open, recovery, loss, reneg,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			partial_ACK, retx_lost
sndrecoverle	<Double>	Read-only	Sequence Number denoting end of fast recovery.
linksndrecoverle	<Double>	Read-only	Sequence Number denoting end of fast recovery for linked connection.
creditsinbytes	<Integer>	Read-only	Connections current credits in Bytes/ms.
linkcredits	<Integer>	Read-only	Link connections current credits in Bytes/ms.
rateinbytes	<Double>	Read-only	Connections current rate in Bytes/ms.
linkrateinbytes	<Double>	Read-only	Link connections current rate in Bytes/ms.
rateschedulerqueue	<Double>	Read-only	Bytes that are queued in the rate scheduler for this connection.
linkrateschedulerqueue	<Double>	Read-only	Bytes that are queued in the rate scheduler for link connection.
burstratecontrol	<String>	Read-only	TCP Burst Rate Control DISABLED/FIXED/DYNAMIC.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DISABLED, FIXED, DYNAMIC
linkburstratecontrol	<String>	Read-only	TCP Burst Rate Control DISABLED/ FIXED/DYNAMIC. Possible values = DISABLED, FIXED, DYNAMIC
cqabifavg	<Double>	Read-only	Average bytes in flight over maxburst.
cqathruputavg	<Double>	Read-only	Average instantaneous throughput over maxburst.
cqarcvwndavg	<Double>	Read-only	Average receive window over maxburst.
cqaiai1mspct	<Double>	Read-only	Percentage of inter arriaval samples for 1ms over maxburst.
cqaiai2mspct	<Double>	Read-only	Percentage of inter arriaval samples for 2ms over maxburst.
cqasamples	<Double>	Read-only	Number of ACK samples over maxburst.
cqaiaisamples	<Double>	Read-only	Number of samples considered for calculating inter arrival interval over maxburst.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cqanetclass	<String>	Read-only	Network type name. Maximum length = 49
cqaccl	<Double>	Read-only	Connection congestion level. Minimum value = 0 Maximum value = 100
cqacsq	<Double>	Read-only	Connectiontion signal quality level. Minimum value = 0 Maximum value = 100
cqaiaiavg	<Double>	Read-only	Average inter arriaval interval over maxburst.
cqaisiavg	<Double>	Read-only	Average inter send interval over maxburst.
cqarcvwndmin	<Double>	Read-only	Minimum receive window over maxburst.
cqaretxcorr	<Double>	Read-only	Number of retransmission due to noise over maxburst.
cqaretxcong	<Double>	Read-only	Number of retransmission due to congestion over maxburst.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cqaretxpackets	<Double>	Read-only	Number of retransmission over maxburst.
cqaloaddelayavg	<Double>	Read-only	Average load delay over maxburst.
cqanoisedelayavg	<Double>	Read-only	Average noise delay over maxburst.
cqarttmax	<Double>	Read-only	Maximum RTT sample over maxburst in ms.
cqarttmin	<Double>	Read-only	Minimum RTT sample over maxburst in ms.
cqarttavg	<Double>	Read-only	Minimum RTT sample over maxburst in ms.
adaptivetcpprofname	<String>	Read-only	Name of the Adaptive-TCP profile currently assigned to the connection. Minimum length = 1 Maximum length = 127
outoforderblocks	<Integer>	Read-only	held packets on the connection.
outoforderflushedcount	<Integer>	Read-only	held packets on the connection.
outoforderbytes	<Integer>	Read-only	held packets on the connection.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **args=filterexpression: <String_value> ,link: <Boolean_value> ,filtername: <Boolean_value> ,detail: <String _value> ,listen: <Boolean_value> ,nodeid: <Double_value>**

Use this query-parameter to get nsconnectiontable resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsconnectiontable resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **view=summary**

Use this query-parameter to get the summary output of nsconnectiontable resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsconnectiontable resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsconnectiontable? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsconnectiontable": [ { "__count": "#no"} ] }
```

nsconsoleloginprompt

Configuration for console prompt resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
promptstring	<String>	Read-write	Console login prompt string.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

nsdhcpip

Configuration for dhcp IP resource.

Operations

- RELEASE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

RELEASE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsdhcpip? **action=release**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsdhcpip":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nsdhcpparams

Configuration for DHCP parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dhcpclient	<String>	Read-write	Enables DHCP client to acquire IP address from the DHCP server in the next boot. When set to OFF, disables the DHCP client in the next boot. Default value: OFF Possible values = ON, OFF
saveroute	<String>	Read-write	DHCP acquired routes are saved on the Citrix ADC. Default value: OFF Possible values = ON, OFF
ipaddress	<String>	Read-only	DHCP acquired IP.
netmask	<String>	Read-only	DHCP acquired Netmask.
hostrtgw	<String>	Read-only	DHCP acquired Gateway.
running	<Boolean>	Read-only	DHCP mode.

nsdiameter

Configuration for Diameter Parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
identity	<String>	Read-write	DiameterIdentity to be used by NS. DiameterIdentity is used to identify a Diameter node uniquely. Before setting up diameter configuration, Citrix ADC (as a Diameter node) MUST be assigned a unique DiameterIdentity. example => set ns diameter -identity netscaler.com Now whenever Citrix ADC needs to use identity in diameter messages. It will use 'netscaler.com' as Origin-Host AVP as defined in RFC3588 .

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
realm	<String>	Read-write	Diameter Realm to be used by NS. example => set ns diameter -realm com Now whenever Citrix ADC system needs to use realm in diameter messages. It will use 'com' as Origin-Realm AVP as defined in RFC3588 . Minimum length = 1
serverclosepropagation	<String>	Read-write	when a Server connection goes down, whether to close the corresponding client connection if there were requests pending on the server. Default value: NO Possible values = YES, NO
ownernode	<Double>	Read-write	ID of the cluster node for which the diameter id is set,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			can be configured only through CLIP. Default value: -1 Minimum value = 0 Maximum value = 31
__count	<Double>	Read-only	count parameter

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsdiameter

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsdiameter? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsdiameter? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsdiameter resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsdiameter? **view=summary**

Use this query-parameter to get the summary output of nsdiameter resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsdiameter? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsdiameter resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsdiameter": [ {
```

```
        "ownernode":<Double_value>,

        "identity":<String_value>,

        "realm":<String_value>,

        "serverclosepropagation":<String_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsdiameter/ ownernode_value<Double>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsdiameter/ ownernode_value<Double> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsdiameter/ ownernode_value<Double> ?**view=summary**

Use this query-parameter to get the summary output of nsdiameter resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsdiameter": [ { "__count": "#no"} ] }
```

nsencryptionkey

Configuration for encryption key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Key name. This follows the same syntax rules as other expression entity names: It must begin with an alpha character (A-Z or a-z) or an underscore (_). The rest of the characters must be alpha, numeric (0-9) or underscores. It cannot be re or xp (reserved for regular and XPath expressions). It cannot be an expression reserved

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			word (e.g. SYS or HTTP). It cannot be used for an existing expression object (HTTP callout, patset, dataset, stringmap, or named expression). Minimum length = 1
method	<String>	Read-write	Cipher method to be used to encrypt and decrypt content. NONE - no encryption or decryption is performed The output of ENCRYPT() and DECRYPT() is the same as the input. RC4 - the RC4 stream cipher with a 128 bit (16 byte) key; RC4 is now considered insecure and should only be used if required by existing applciations. DES[-<mode>] - the Data Encryption Standard (DES)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			block cipher with a 64-bit (8 byte) key, with 56 data bits and 8 parity bits. DES is considered less secure than DES3 or AES so it should only be used if required by an existing applicastion. The optional mode is described below; DES without a mode is equivalent to DES-CBC. DES3[-<mode>] - the Triple Data Encryption Standard (DES) block cipher with a 192-bit (24 byte) key. The optional mode is described below; DES3 without a mode is equivalent to DES3-CBC. AES<keysize>[-<mode>] - the Advanced Encryption Standard block cipher, available with 128 bit (16

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			byte), 192 bit (24 byte), and 256 bit (32 byte) keys. The optional mode is described below; AES<keysize> without a mode is equivalent to AES<keysize>-CBC. For a block cipher, the <mode> specifies how multiple blocks of plaintext are encrypted and how the Initialization Vector (IV) is used. Choices are CBC (Cipher Block Chaining) - Each block of plaintext is XORed with the previous ciphertext block, or IV for the first block, before being encrypted. Padding is required if the plaintext is not a multiple of the cipher block size. CFB (Cipher Feedback) - The previous ciphertext

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			block, or the IV for the first block, is encrypted and the output is XORed with the current plaintext block to create the current ciphertext block. The 128-bit version of CFB is provided. Padding is not required. OFB (Output Feedback) - A keystream is generated by applying the cipher successfully to the IV and XORing the keystream blocks with the plaintext. Padding is not required. ECB (Electronic Codebook) - Each block of plaintext is independently encrypted. An IV is not used. Padding is required. This mode is considered less secure than the other modes because the same plaintext always

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			produces the same encrypted text and should only be used if required by an existing application. Possible values = NONE, RC4, DES3, AES128, AES192, AES256, DES, DES-CBC, DES-CFB, DES-OFB, DES-ECB, DES3-CBC, DES3-CFB, DES3-OFB, DES3-ECB, AES128-CBC, AES128-CFB, AES128-OFB, AES128-ECB, AES192-CBC, AES192-CFB, AES192-OFB, AES192-ECB, AES256-CBC, AES256-CFB, AES256-OFB, AES256-ECB
keyvalue	<String>	Read-write	The hex-encoded key value. The length is determined by the cipher method: RC4 - 16 bytes

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DES - 8 bytes (all modes) DES3 - 24 bytes (all modes) AES128 - 16 bytes (all modes) AES192 - 24 bytes (all modes) AES256 - 32 bytes (all modes) Note that the keyValue will be encrypted when it it is saved. There is a special key value AUTO which generates a new random key for the specified method. This kind of key is intended for use cases where the NetScaler both encrypts and decrypts the same data, such an HTTP header.
padding	<String>	Read-write	Enables or disables the padding of plaintext to meet the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			block size requirements of block ciphers: ON - For encryption, PKCS5/7 padding is used, which appends n bytes of value n on the end of the plaintext to bring it to the cipher block lnegth. If the plaintext length is alraady a multiple of the block length, an additional block with bytes of value block_length will be added. For decryption, ISO 10126 padding is accepted, which expects the last byte of the block to be the number of added pad bytes. Note that this accepts PKCS5/7 padding, as well as ANSI_X923 padding. Padding ON is the default for the ECB and CBD modes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OFF - No padding. An Undef error will occur with the ECB or CBC modes if the plaintext length is not a multitple of the cipher block size. This can be used with the CFB and OFB modes, and with the ECB and CBC modes if the plaintext will always be an integral number of blocks, or if custom padding is implemented using a policy extension function. Padding OFf is the default for CFB and OFB modes. Default value: DEFAULT Possible values = OFF, ON
iv	<String>	Read-write	The initalization voector (IV) for a block cipher, one block of data used to initialize the encryption. The best practice is to not specify an IV, in which case a new

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			random IV will be generated for each encryption. The format must be iv_data or keyid_iv_data to include the generated IV in the encrypted data. The IV should only be specified if it cannot be included in the encrypted data. The IV length is the cipher block size: RC4 - not used (error if IV is specified) DES - 8 bytes (all modes) DES3 - 8 bytes (all modes) AES128 - 16 bytes (all modes) AES192 - 16 bytes (all modes) AES256 - 16 bytes (all modes).
comment	<String>	Read-write	Comments associated with this encryption key.
__count	<Double>	Read-only	count parameter

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsencryptionkey? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsencryptionkey": [ { "__count": "#no"} ] }
```

nsencryptionparams

Configuration for default encryption parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
method	<String>	Read-write	Cipher method (and key length) to be used to encrypt and decrypt content. The default value is AES256. Possible values = NONE, RC4, DES3, AES128, AES192, AES256, DES, DES-CBC, DES-CFB, DES-OFB, DES-ECB, DES3-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CBC, DES3-CFB, DES3-OFB, DES3-ECB, AES128-CBC, AES128-CFB, AES128-OFB, AES128-ECB, AES192-CBC, AES192-CFB, AES192-OFB, AES192-ECB, AES256-CBC, AES256-CFB, AES256-OFB, AES256-ECB
keyvalue	<String>	Read-write	The base64-encoded key generation number, method, and key value. Note: * Do not include this argument if you are changing the encryption method. * To generate a new key value for the current encryption method, specify an empty string \(""\) as the value of this parameter. The parameter is passed implicitly, with its automatically

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			generated value, to the Citrix ADC packet engines even when it is not included in the command. Passing the parameter to the packet engines enables the appliance to save the key value to the configuration file and to propagate the key value to the secondary appliance in a high availability setup.

Operations

(click to see Properties)

- UPDATE
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsencryptionparams

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsencryptionparams":{

<b>      "method":<String_value>,

</b>      "keyvalue":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsencryptionparams

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsencryptionparams": [ {

      "method":<String_value>

}]}
```

nsevents

Configuration for events resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
eventno	<Double>	Read-write	Event number starting from which events must be shown.
time	<Double>	Read-only	Event no.
eventcode	<Double>	Read-only	event Code.
devid	<Double>	Read-only	Device Name.
devname	<String>	Read-only	Device Name.
text	<String>	Read-only	Event no.
data0	<Double>	Read-only	additional event information.
data1	<Double>	Read-only	additional event information.
data2	<Double>	Read-only	additional event information.
data3	<Double>	Read-only	additional event information.
__count	<Double>	Read-only	count parameter

Operations

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsevents

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **args=eventno: <Double_value>**

Use this query-parameter to get nsevents resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsevents resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **view=summary**

Use this query-parameter to get the summary output of nsevents resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsevents resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsevents": [ {

eventno:<Double_value>      "time":<Double_value>,
```

```
        "eventcode":<Double_value>,

        "devid":<Double_value>,

        "devname":<String_value>,

        "text":<String_value>,

        "data0":<Double_value>,

        "data1":<Double_value>,

        "data2":<Double_value>,

        "data3":<Double_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsevents? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsevents": [ { "__count": "#no"} ] }
```

nsextension

Configuration for Extension resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
src	<String>	Read-write	Local path to and name of, or URL (protocol, host, path, and file name) for, the file in which to store the imported extension. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
name	<String>	Read-write	Name to assign to the extension object on the Citrix ADC. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 31
comment	<String>	Read-write	Any comments to preserve information about the extension object. Maximum length = 128
overwrite	<Boolean>	Read-write	Overwrites the existing file.
trace	<String>	Read-write	Enables tracing to the NS log file of extension execution: off - turns off tracing (equivalent to unset ns extension <extension-name> -trace) calls - traces extension function calls with arguments and function returns with the first return value lines - traces the above plus line numbers for executed extension lines all - traces the above plus local variables changed

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			by executed extension lines Note that the DEBUG log level must be enabled to see extension tracing. This can be done by set audit syslogParams -loglevel ALL or -loglevel DEBUG. Default value: off Possible values = off, calls, lines, all
tracefunctions	<String>	Read-write	Comma-separated list of extension functions to trace. By default, all extension functions are traced. Maximum length = 256
tracevariables	<String>	Read-write	Comma-separated list of variables (in traced extension functions) to trace. By default, all variables are traced. Maximum length = 256
detail	<String>	Read-write	Show detail for extension function.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = brief, all
type	<String>	Read-only	. Possible values = WSDL, CustomSettings, XMLSchema, XMLErrorPage, htmlpage, CustomResp, Extension, JSONErrorPage, Signatures
functionhits	<Double>	Read-only	Number of time function evaluates successfully.
functionundefhits	<Double>	Read-only	Number of times error occured in evaluating extension function.
functionhaltcount	<Double>	Read-only	Number of time function evaluation is halted.
__count	<Double>	Read-only	count parameter

nsextension_binding

Binding object which returns the resources bound to nsextension.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the extension object. Minimum length = 1 Maximum length = 31
nsextension_extensionfunction_binding	<nsextension_extensionfunction_binding[]>	Read-only	extensionfunction that can be bound to nsextension.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsextension_binding": [ {

      "name":<String_value>,

      "nsextension_extensionfunction_binding":<nsextension_extensionfunction_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nsextension_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsextension_binding": [ {

      "name":<String_value>,

      "nsextension_extensionfunction_binding":<nsextension_extensionfunction_binding[]_value>

}]}
```

nsextension_extensionfunction_binding

Binding object showing the extensionfunction that can be bound to nsextension.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the extension object. Minimum length = 1 Maximum length = 31
extensionfunctionline number	<Double>	Read-only	Line number of the function in file.
extensionfunctionclasses	<String[]>	Read-only	List of classes (including inherited) that the function is present in.
extensionfunctionargtype	<String[]>	Read-only	List of extension function's arguments types.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
activeextensionfunction	<Integer>	Read-only	Extension function is in use or not.
extensionfunctionname	<String>	Read-only	Name of extension function given in the extension. Minimum length = 1 Maximum length = 31
extensionfunctionclasstype	<String>	Read-only	Extension function class type. Minimum length = 1 Maximum length = 31
extensionfuncdescription	<String>	Read-only	Any description to preserve information about the extension function. Maximum length = 1023
extensionfunctionallparams	<String[]>	Read-only	List of parameters (including promotions) that the function can accept.
extensionfunctionargcount	<Double>	Read-only	Number of parameters in the extension function.
extensionfunctionreturntype	<String>	Read-only	Extension function return type. Minimum length = 1 Maximum length = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
extensionfunctionclassescount	<Double>	Read-only	Number of classes the function is present in.
extensionfunctionallparamscount	<Double>	Read-only	Number of parameters (including promotions) that the function can accept.
__count	<Double>	Read-only	count parameter

```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension_extensionfunction_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nsextension_extensionfunction_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsextension_extensionfunction_binding": [ {

      "name":<String_value>,

      "extensionfunctionlinenumber":<Double_value>,

      "extensionfunctionclasses":<String[]_value>,

      "extensionfunctionargtype":<String[]_value>,

      "activeextensionfunction":<Integer_value>,

      "extensionfunctionname":<String_value>,
```

```
        "extensionfunctionclasstype":<String_value>,

        "extensionfuncdescription":<String_value>,

        "extensionfunctionallparams":<String[]_value>,

        "extensionfunctionargcount":<Double_value>,

        "extensionfunctionreturntype":<String_value>,

        "extensionfunctionclassescount":<Double_value>,

        "extensionfunctionallparamscount":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsextension_extensionfunction_binding/name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"nsextension_extensionfunction_binding": [ { "__count": "#no"} ] }
```

nsfeature

Configuration for feature resource.

Properties

Operations

(click to see Properties)

- ENABLE
- DISABLE
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsfeature? **action=enable**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsfeature":{
```

```
        "feature":<String[]_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DISABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsfeature? **action=disable**

HTTP Method: POST

Request Headers:

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nshardware

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nshardware": [ {
```

```
        "hwdescription":<String_value>,

        "sysid":<Double_value>,

        "manufactureday":<Integer_value>,

        "manufacturemonth":<Integer_value>,

        "manufactureyear":<Integer_value>,

        "cpufrequncy":<Integer_value>,

        "hostid":<Integer_value>,

        "host":<String_value>,

        "serialno":<String_value>,

        "encodedserialno":<String_value>,

        "netscaleruuid":<String_value>,

        "bmcrevision":<String_value>

 }]}
```

nshmackey

Configuration for HMAC key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Key name. This follows the same syntax rules as other expression entity names:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			It must begin with an alpha character (A-Z or a-z) or an underscore (_). The rest of the characters must be alpha, numeric (0-9) or underscores. It cannot be re or xp (reserved for regular and XPath expressions). It cannot be an expression reserved word (e.g. SYS or HTTP). It cannot be used for an existing expression object (HTTP callout, patset, dataset, stringmap, or named expression). Minimum length = 1
digest	<String>	Read-write	Digest (hash) function to be used in the HMAC computation. Possible values = MD2, MD4, MD5, SHA1, SHA224,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SHA256, SHA384, SHA512
keyvalue	<String>	Read-write	The hex-encoded key to be used in the HMAC computation. The key can be any length (up to a Citrix ADC-imposed maximum of 255 bytes). If the length is less than the digest block size, it will be zero padded up to the block size. If it is greater than the block size, it will be hashed using the digest function to the block size. The block size for each digest is: MD2 - 16 bytes MD4 - 16 bytes MD5 - 16 bytes SHA1 - 20 bytes SHA224 - 28 bytes SHA256 - 32 bytes SHA384 - 48 bytes SHA512 - 64 bytes Note that the key will be encrypted when it it is saved

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			There is a special key value AUTO which generates a new random key for the specified digest. This kind of key is intended for use cases where the NetScaler both generates and verifies an HMAC on the same data.
comment	<String>	Read-write	Comments associated with this encryption key.
__count	<Double>	Read-only	count parameter

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nshmackey

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nshmackey? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nshmackey? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nshmackey resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nshmackey? **view=summary**

Use this query-parameter to get the summary output of nshmackey resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nshmackey? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nshmackey resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nshmackey": [ {

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nshttpparam

HTTP Method: PUT

Request Headers:

nshttpprofile

Configuration for HTTP profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for an HTTP profile. Must begin with a letter, number, or the underscore \(_\) character. Other characters allowed, after the first character, are the hyphen \(-\), period \(.\), hash \(#\), space \(\), at \(@\), colon \(:\), and equal \(=\)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			characters. The name of a HTTP profile cannot be changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks \ (for example, "my http profile" or 'my http profile'\). Minimum length = 1 Maximum length = 127
dropinvalreqs	<String>	Read-write	Drop invalid HTTP requests or responses. Default value: DISABLED Possible values = ENABLED, DISABLED
markhttp09inval	<String>	Read-write	Mark HTTP/0.9 requests as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
markconnreqinval	<String>	Read-write	Mark CONNECT requests as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
marktracereqinval	<String>	Read-write	Mark TRACE requests as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
markrfc7230noncompliantinval	<String>	Read-write	Mark RFC7230 non-compliant transaction as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED
markhttpheaderextrawserror	<String>	Read-write	Mark Http header with extra white space as invalid. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cmponpush	<String>	Read-write	Start data compression on receiving a TCP packet with PUSH flag set. Default value: DISABLED Possible values = ENABLED, DISABLED
conmultiplex	<String>	Read-write	Reuse server connections for requests from more than one client connections. Default value: ENABLED Possible values = ENABLED, DISABLED
maxreusepool	<Double>	Read-write	Maximum limit on the number of connections, from the Citrix ADC to a particular server that are kept in the reuse pool. This setting is helpful for optimal memory utilization and for reducing the idle connections to the server just after the peak time. Zero implies no limit on reuse pool size. If non-zero value is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			given, it has to be greater than or equal to the number of running Packet Engines. Default value: 0 Minimum value = 0 Maximum value = 360000
dropextracrlf	<String>	Read-write	Drop any extra 'CR' and 'LF' characters present after the header. Default value: ENABLED Possible values = ENABLED, DISABLED
incomphdrdelay	<Double>	Read-write	Maximum time to wait, in milliseconds, between incomplete header packets. If the header packets take longer to arrive at Citrix ADC, the connection is silently dropped. Default value: 7000 Minimum value = 1 Maximum value = 360000
websocket	<String>	Read-write	HTTP connection to be upgraded to a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			web socket connection. Once upgraded, Citrix ADC does not process Layer 7 traffic on this connection. Default value: DISABLED Possible values = ENABLED, DISABLED
rtsptunnel	<String>	Read-write	Allow RTSP tunnel in HTTP. Once application/x-rtsp-tunnelled is seen in Accept or Content-Type header, Citrix ADC does not process Layer 7 traffic on this connection. Default value: DISABLED Possible values = ENABLED, DISABLED
reqtimeout	<Double>	Read-write	Time, in seconds, within which the HTTP request must complete. If the request does not complete within this time, the specified request timeout action is executed.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Zero disables the timeout. Default value: 0 Minimum value = 0 Maximum value = 86400
adpttimeout	<String>	Read-write	Adapts the configured request timeout based on flow conditions. The timeout is increased or decreased internally and applied on the flow. Default value: DISABLED Possible values = ENABLED, DISABLED
reqtimeoutaction	<String>	Read-write	Action to take when the HTTP request does not complete within the specified request timeout duration. You can configure the following actions: * RESET - Send RST (reset) to client when timeout occurs.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DROP - Drop silently when timeout occurs. * Custom responder action - Name of the responder action to trigger when timeout occurs, used to send custom message.
dropextradata	<String>	Read-write	Drop any extra data when server sends more data than the specified content-length. Default value: DISABLED Possible values = ENABLED, DISABLED
weblog	<String>	Read-write	Enable or disable web logging. Default value: ENABLED Possible values = ENABLED, DISABLED
clientiphdrexpr	<String>	Read-write	Name of the header that contains the real client IP address.
maxreq	<Double>	Read-write	Maximum number of requests allowed on a single connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Zero implies no limit on the number of requests. Default value: 0 Minimum value = 0 Maximum value = 65534
persistentetag	<String>	Read-write	Generate the persistent Citrix ADC specific ETag for the HTTP response with ETag header. Default value: DISABLED Possible values = ENABLED, DISABLED
spdy	<String>	Read-write	Enable SPDYv2 or SPDYv3 or both over SSL vserver. SSL will advertise SPDY support either during NPN Handshake or when client will advertises SPDY support during ALPN handshake. Both SPDY versions are enabled when this parameter is set to ENABLED. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = DISABLED, ENABLED, V2, V3
http2	<String>	Read-write	Choose whether to enable support for HTTP/2. Default value: DISABLED Possible values = ENABLED, DISABLED
http2direct	<String>	Read-write	Choose whether to enable support for Direct HTTP/2. Default value: DISABLED Possible values = ENABLED, DISABLED
http2strictcipher	<String>	Read-write	Choose whether to enable strict HTTP/2 cipher selection. Default value: ENABLED Possible values = ENABLED, DISABLED
altsvc	<String>	Read-write	Choose whether to enable support for Alternative Service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
reusepooltimeout	<Double>	Read-write	Idle timeout (in seconds) for server connections in re-use pool. Connections in the re-use pool are flushed, if they remain idle for the configured timeout. Default value: 0 Minimum value = 0 Maximum value = 31536000
maxheaderlen	<Double>	Read-write	Number of bytes to be queued to look for complete header before returning error. If complete header is not obtained after queuing these many bytes, request will be marked as invalid and no L7 processing will be done for that TCP connection. Default value: 24820

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 2048 Maximum value = 61440
minreusepool	<Double>	Read-write	Minimum limit on the number of connections, from the Citrix ADC to a particular server that are kept in the reuse pool. This setting is helpful for optimal memory utilization and for reducing the idle connections to the server just after the peak time. Zero implies no limit on reuse pool size. Default value: 0 Minimum value = 0 Maximum value = 360000
http2maxheaderlistsize	<Double>	Read-write	Maximum size of header list that the Citrix ADC is prepared to accept, in bytes. NOTE: The actual plain text header size that the Citrix ADC accepts is limited by maxHeaderLen. Please change maxHeaderLen parameter as well

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			when modifying http2MaxHeaderList Size. Default value: 24576 Minimum value = 8192 Maximum value = 65535
http2maxframesize	<Double>	Read-write	Maximum size of the frame payload that the Citrix ADC is willing to receive, in bytes. Default value: 16384 Minimum value = 16384 Maximum value = 32768
http2maxconcurrentstreams	<Double>	Read-write	Maximum number of concurrent streams that is allowed per connection. Default value: 100 Minimum value = 0 Maximum value = 1000
http2initialwindowsize	<Double>	Read-write	Initial window size for stream level flow control, in bytes.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 65535 Minimum value = 8192 Maximum value = 20971520
http2headertablesize	<Double>	Read-write	Maximum size of the header compression table used to decode header blocks, in bytes. Default value: 4096 Minimum value = 0 Maximum value = 16384
http2minseverconn	<Double>	Read-write	Minimum number of HTTP2 connections established to backend server, on receiving HTTP requests from client before multiplexing the streams into the available HTTP/2 connections. Default value: 20 Minimum value = 1 Maximum value = 360000
http2maxpingframes permin	<Double>	Read-write	Maximum number of ping frames allowed

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			in HTTP2 connection per minute. Default value: 60 Minimum value = 1 Maximum value = 360000
http2maxsettingsframespermin	<Double>	Read-write	Maximum number of settings frames allowed in HTTP2 connection per minute. Default value: 15 Minimum value = 1 Maximum value = 360000
http2maxresetframespermin	<Double>	Read-write	Maximum number of reset frames allowed in HTTP/2 connection per minute. Default value: 90 Minimum value = 1 Maximum value = 360000
http2maxemptyframespermin	<Double>	Read-write	Maximum number of empty frames allowed in HTTP2 connection per minute. Default value: 60 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 360000
apdexcltresptimethreshold	<Double>	Read-write	This option sets the satisfactory threshold (T) for client response time in milliseconds to be used for APDEX calculations. This means a transaction responding in less than this threshold is considered satisfactory. Transaction responding between T and 4*T is considered tolerable. Any transaction responding in more than 4*T time is considered frustrating. Citrix ADC maintains stats for such tolerable and frustrating transcations. And client response time related apdex counters are only updated on a vserver which receives clients traffic. Default value: 500 Minimum value = 1 Maximum value = 3600000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
refcnt	<Double>	Read-only	Number of entities using this profile.
builtin	<String[]>	Read-only	Flag to determine if http profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
apdexsvrresptimethreshold	<Double>	Read-only	This option sets the satisfactory threshold (T) for server response time in milliseconds to be used for APDEX calculations. This means a transaction responding in less than this threshold is considered satisfactory. Transaction responding between T and 4*T is considered tolerable. Any transaction responding in more than 4*T time is considered frustrating. Citrix ADC maintains stats for such tolerable and frustrating

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			transcations. Server Response time related apdex counters are only updated on backend services or a backend vserver which is not accepting client traffic. Default value: 400 Minimum value = 1 Maximum value = 3600000
__count	<Double>	Read-only	count parameter

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nshttpprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nshttpprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nshttpprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nshttpprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nshttpprofile? **view=summary**

Use this query-parameter to get the summary output of nshttpprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nshttpprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nshttpprofile resources in chunks.

nsicapprofile

Configuration for ICAP profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for an ICAP profile. Must begin with a letter, number, or the underscore \(_\) character. Other characters allowed, after the first character, are the hyphen \(-\), period \

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(.\), hash \(#\), space \(\), at \(@\), colon \(:\), and equal \(=\) characters. The name of a ICAP profile cannot be changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks \(for example, "my icap profile" or 'my icap profile'\). Minimum length = 1 Maximum length = 127
preview	<String>	Read-write	Enable or Disable preview header with ICAP request. This feature allows an ICAP server to see the beginning of a transaction, then decide if it wants to opt-out of the transaction early instead of receiving the remainder of the request message. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
previewlength	<Double>	Read-write	Value of Preview Header field. Citrix ADC uses the minimum of this set value and the preview size received on OPTIONS response. Default value: 4096 Minimum value = 0 Maximum value = 4294967294
uri	<String>	Read-write	URI representing icap service. It is a mandatory argument while creating an icapprofile. Minimum length = 1
hostheader	<String>	Read-write	ICAP Host Header. Minimum length = 1
useragent	<String>	Read-write	ICAP User Agent Header String. Minimum length = 1
mode	<String>	Read-write	ICAP Mode of operation. It is a mandatory argument while creating an icapprofile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = REQMOD, RESPMOD
queryparams	<String>	Read-write	Query parameters to be included with ICAP request URI. Entered values should be in arg=value format. For more than one parameters, add ; separated values. e.g.: arg1=val1;arg2=val2. Minimum length = 1
connectionkeepalive	<String>	Read-write	If enabled, Citrix ADC keeps the ICAP connection alive after a transaction to reuse it to send next ICAP request. Default value: ENABLED Possible values = ENABLED, DISABLED
allow204	<String>	Read-write	Enable or Disable sending Allow: 204 header in ICAP request. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
inserticapheaders	<String>	Read-write	Insert custom ICAP headers in the ICAP request to send to ICAP server. The headers can be static or can be dynamically constructed using PI Policy Expression. For example, to send static user agent and Client's IP address, the expression can be specified as "User-Agent: NS-ICAP-Client/ V1.0\r\nX-Client-IP: "+CLIENT.IP.SRC+"\r \n". The Citrix ADC does not check the validity of the specified header name-value. You must manually validate the specified header syntax. Minimum length = 1
inserthttprequest	<String>	Read-write	Exact HTTP request, in the form of an expression, which the Citrix ADC encapsulates and sends to the ICAP server. If you set this parameter, the ICAP request is sent using

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only this header. This can be used when the HTTP header is not available to send or ICAP server only needs part of the incoming HTTP request. The request expression is constrained by the feature for which it is used. The Citrix ADC does not check the validity of this request. You must manually validate the request. Minimum length = 1
reqtimeout	<Double>	Read-write	Time, in seconds, within which the remote server should respond to the ICAP-request. If the Netscaler does not receive full response with this time, the specified request timeout action is performed. Zero value disables this timeout functionality. Default value: 0 Minimum value = 0 Maximum value = 86400

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqtimeoutaction	<String>	Read-write	Name of the action to perform if the Vserver/Server representing the remote service does not respond with any response within the timeout value configured. The Supported actions are * BYPASS - This Ignores the remote server response and sends the request/response to Client/Server. * If the ICAP response with Encapsulated headers is not received within the request-timeout value configured, this Ignores the remote ICAP server response and sends the Full request/ response to Server/ Client. * RESET - Reset the client connection by closing it. The client program, such as a browser, will handle

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user. Default value: RESET Possible values = BYPASS, DROP, RESET
logaction	<String>	Read-write	Name of the audit message action which would be evaluated on receiving the ICAP response to emit the logs.
__count	<Double>	Read-only	count parameter

Operations

- UPDATE
- UNSET
- GET (ALL)
- GET

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsicapprofile

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsicapprofile":{

nsip

Configuration for ip resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IPv4 address to create on the Citrix ADC. Cannot be changed after the IP address is created. Minimum length = 1
netmask	<String>	Read-write	Subnet mask associated with the IP address.
type	<String>	Read-write	Type of the IP address to create on the Citrix ADC. Cannot be changed after the IP address

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is created. The following are the different types of Citrix ADC owned IP addresses: * A Subnet IP (SNIP) address is used by the Citrix ADC to communicate with the servers. The Citrix ADC also uses the subnet IP address when generating its own packets, such as packets related to dynamic routing protocols, or to send monitor probes to check the health of the servers. * A Virtual IP (VIP) address is the IP address associated with a virtual server. It is the IP address to which clients connect. An appliance managing a wide range of traffic may have many VIPs configured. Some of the attributes of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			VIP address are customized to meet the requirements of the virtual server. * A GSLB site IP (GSLBIP) address is associated with a GSLB site. It is not mandatory to specify a GSLBIP address when you initially configure the Citrix ADC. A GSLBIP address is used only when you create a GSLB site. * A Cluster IP (CLIP) address is the management address of the cluster. All cluster configurations must be performed by accessing the cluster through this IP address. Default value: SNIP Possible values = SNIP, VIP, NSIP, GSLBsiteIP, CLIP
arp	<String>	Read-write	Respond to ARP requests for this IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
icmp	<String>	Read-write	Respond to ICMP requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
vserver	<String>	Read-write	Use this option to set (enable or disable) the virtual server attribute for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
telnet	<String>	Read-write	Allow Telnet access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ftp	<String>	Read-write	Allow File Transfer Protocol (FTP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
gui	<String>	Read-write	Allow graphical user interface (GUI) access to this IP address. Default value: ENABLED Possible values = ENABLED, SECUREONLY, DISABLED
ssh	<String>	Read-write	Allow secure shell (SSH) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
snmp	<String>	Read-write	Allow Simple Network Management Protocol (SNMP) access to this IP address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
mgmtaccess	<String>	Read-write	Allow access to management applications on this IP address. Default value: DISABLED Possible values = ENABLED, DISABLED
restrictaccess	<String>	Read-write	Block access to nonmanagement applications on this IP. This option is applicable for MIPs, SNIPs, and NSIP, and is disabled by default. Nonmanagement applications can run on the underlying Citrix ADC Free BSD operating system. Default value: DISABLED Possible values = ENABLED, DISABLED
dynamicrouting	<String>	Read-write	Allow dynamic routing on this IP

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			address. Specific to Subnet IP (SNIP) address. Default value: DISABLED Possible values = ENABLED, DISABLED
decrementttl	<String>	Read-write	Decrement TTL by 1 when ENABLED.This setting is applicable only for UDP traffic. Default value: DISABLED Possible values = ENABLED, DISABLED
ospf	<String>	Read-write	Use this option to enable or disable OSPF on this IP address for the entity. Default value: DISABLED Possible values = ENABLED, DISABLED
bgp	<String>	Read-write	Use this option to enable or disable BGP on this IP address for the entity.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
rip	<String>	Read-write	Use this option to enable or disable RIP on this IP address for the entity. Default value: DISABLED Possible values = ENABLED, DISABLED
hostroute	<String>	Read-write	Option to push the VIP to ZebOS routing table for Kernel route redistribution through dynamic routing protocols. Possible values = ENABLED, DISABLED
advertiseondefaultpartition	<String>	Read-write	Advertise VIPs from Shared VLAN on Default Partition. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
networkroute	<String>	Read-write	Option to push the SNIP subnet to ZebOS routing table for Kernel route redistribution through dynamic routing protocol. Possible values = ENABLED, DISABLED
tag	<Double>	Read-write	Tag value for the network/host route associated with this IP. Default value: 0
hostrtgw	<String>	Read-write	IP address of the gateway of the route for this VIP address. Default value: -1
metric	<Integer>	Read-write	Integer value to add to or subtract from the cost of the route advertised for the VIP address. Minimum value = -16777215
vserverrhilevel	<String>	Read-write	Advertise the route for the Virtual IP (VIP) address on the basis of the state of the virtual servers associated with that VIP. * NONE - Advertise the route for the VIP address, regardless

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of the state of the virtual servers associated with the address. * ONE VSERVER - Advertise the route for the VIP address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - Advertise the route for the VIP address if all of the associated virtual servers are in UP state. * VSVR_CNTRLD - Advertise the route for the VIP address according to the RHIstate (RHI STATE) parameter setting on all the associated virtual servers of the VIP address along with their states. When Vserver RHI Level (RHI) parameter is set to VSVR_CNTRLD,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the following are different RHI behaviors for the VIP address on the basis of RHIstate (RHI STATE) settings on the virtual servers associated with the VIP address: * If you set RHI STATE to PASSIVE on all virtual servers, the Citrix ADC always advertises the route for the VIP address. * If you set RHI STATE to ACTIVE on all virtual servers, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers is in UP state. *If you set RHI STATE to ACTIVE on some and PASSIVE on others, the Citrix ADC advertises the route

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			for the VIP address if at least one of the associated virtual servers, whose RHI STATE set to ACTIVE, is in UP state. Default value: ONE_VSERVER Possible values = ONE_VSERVER, ALL_VSERVERS, NONE, VSVR_CNTRLD
ospflsatype	<String>	Read-write	Type of LSAs to be used by the OSPF protocol, running on the Citrix ADC, for advertising the route for this VIP address. Default value: TYPE5 Possible values = TYPE1, TYPE5
ospfarea	<Double>	Read-write	ID of the area in which the type1 link-state advertisements (LSAs) are to be advertised for this virtual IP (VIP) address by the OSPF protocol running on the Citrix ADC. When this parameter is not set,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the VIP is advertised on all areas. Default value: -1 Minimum value = 0 Maximum value = 4294967294LU
state	<String>	Read-write	Enable or disable the IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
vrid	<Double>	Read-write	A positive integer that uniquely identifies a VMAC address for binding to this VIP address. This binding is used to set up Citrix ADCs in an active-active configuration using VRRP. Minimum value = 1 Maximum value = 255
icmpresponse	<String>	Read-write	Respond to ICMP requests for a Virtual IP (VIP) address on the basis of the states of the virtual servers associated with that VIP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Available settings function as follows: * NONE - The Citrix ADC responds to any ICMP request for the VIP address, irrespective of the states of the virtual servers associated with the address. * ONE VSERVER - The Citrix ADC responds to any ICMP request for the VIP address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - The Citrix ADC responds to any ICMP request for the VIP address if all of the associated virtual servers are in UP state. * VSVR_CNTRLD - The behavior depends on the ICMP VSERVER RESPONSE setting on all the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			associated virtual servers. The following settings can be made for the ICMP VSERVER RESPONSE parameter on a virtual server: * If you set ICMP VSERVER RESPONSE to PASSIVE on all virtual servers, Citrix ADC always responds. * If you set ICMP VSERVER RESPONSE to ACTIVE on all virtual servers, Citrix ADC responds if even one virtual server is UP. * When you set ICMP VSERVER RESPONSE to ACTIVE on some and PASSIVE on others, Citrix ADC responds if even one virtual server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			set to ACTIVE is UP. Default value: 5 Possible values = NONE, ONE_VSERVER, ALL_VSERVERS, VSVR_CNTRLD
ownernode	<Double>	Read-write	The owner node in a Cluster for this IP address. Owner node can vary from 0 to 31. If ownernode is not specified then the IP is treated as Striped IP. Default value: 255
arpresponse	<String>	Read-write	Respond to ARP requests for a Virtual IP (VIP) address on the basis of the states of the virtual servers associated with that VIP. Available settings function as follows: * NONE - The Citrix ADC responds to any ARP request for the VIP address, irrespective of the states of the virtual servers associated with the address.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ONE VSERVER - The Citrix ADC responds to any ARP request for the VIP address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - The Citrix ADC responds to any ARP request for the VIP address if all of the associated virtual servers are in UP state. Default value: 5 Possible values = NONE, ONE_VSERVER, ALL_VSERVERS
ownerdownresponse	<String>	Read-write	in cluster system, if the owner node is down, whether should it respond to icmp/arp. Default value: YES Possible values = YES, NO
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. TD id 4095 is used reserved for LSN use . Minimum value = 0 Maximum value = 4095
arpowner	<Double>	Read-write	The arp owner in a Cluster for this IP address. It can vary from 0 to 31. Default value: 255
flags	<Double>	Read-only	The flags for this entry.
hostrtgwact	<String>	Read-only	Actual Gateway used for advertising host route.
ospfareaval	<Double>	Read-only	The area ID of the area in which OSPF Type1 LSAs are advertised.
viprtadv2bsd	<Boolean>	Read-only	Whether this route is advertised to FreeBSD.
vipvsercount	<Double>	Read-only	Number of vservers bound to this VIP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vipvserdowncount	<Double>	Read-only	Number of vservers bound to this VIP, which are down.
vipvsrvrrhiactivecount	<Double>	Read-only	Number of vservers that have RHI state ACTIVE.
vipvsrvrrhiactiveupcount	<Double>	Read-only	Number of vservers that have RHI state ACTIVE, which are UP.
freeports	<Double>	Read-only	Number of free Ports available on this IP.
iptype	<String[]>	Read-only	. Possible values = SNIP, VIP, NSIP, GSLBsiteIP, CLIP
operationalarpowner	<Double>	Read-only	Run time operational Arp Owner.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

get (all)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsip

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nsip? **args=ipaddress: <String_value> ,td: <Double_value> ,type: <String_value>**

Use this query-parameter to get nsip resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsip? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsip? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsip resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsip? **view=summary**

Use this query-parameter to get the summary output of nsip resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsip? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsip resources in chunks.

HTTP Method: GET

Request Headers:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipv6address	<String>	Read-write	IPv6 address to create on the Citrix ADC. Minimum length = 1
scope	<String>	Read-write	Scope of the IPv6 address to be created. Cannot be changed after the IP address is created. Default value: global Possible values = global, link-local
type	<String>	Read-write	Type of IP address to be created on the Citrix ADC. Cannot be changed after the IP address is created. Default value: SNIP Possible values = NSIP, VIP, SNIP, GSLBsiteIP, ADNSsvcIP, RADIUSListenersvcIP, CLIP
vlan	<Double>	Read-write	The VLAN number. Default value: 0 Minimum value = 0 Maximum value = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nd	<String>	Read-write	Respond to Neighbor Discovery (ND) requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
icmp	<String>	Read-write	Respond to ICMP requests for this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
vserver	<String>	Read-write	Enable or disable the state of all the virtual servers associated with this VIP6 address. Default value: ENABLED Possible values = ENABLED, DISABLED
telnet	<String>	Read-write	Allow Telnet access to this IP address. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
ftp	<String>	Read-write	Allow File Transfer Protocol (FTP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
gui	<String>	Read-write	Allow graphical user interface (GUI) access to this IP address. Default value: ENABLED Possible values = ENABLED, SECUREONLY, DISABLED
ssh	<String>	Read-write	Allow secure Shell (SSH) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
snmp	<String>	Read-write	Allow Simple Network Management

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Protocol (SNMP) access to this IP address. Default value: ENABLED Possible values = ENABLED, DISABLED
mgmtaccess	<String>	Read-write	Allow access to management applications on this IP address. Default value: DISABLED Possible values = ENABLED, DISABLED
restrictaccess	<String>	Read-write	Block access to nonmanagement applications on this IP address. This option is applicable forMIP6s, SNIP6s, and NSIP6s, and is disabled by default. Nonmanagement applications can run on the underlying Citrix ADC Free BSD operating system. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dynamicrouting	<String>	Read-write	Allow dynamic routing on this IP address. Specific to Subnet IPv6 (SNIP6) address. Default value: DISABLED Possible values = ENABLED, DISABLED
decrementhoplimit	<String>	Read-write	Decrement Hop Limit by 1 when ENABLED.This setting is applicable only for UDP traffic. Default value: DISABLED Possible values = ENABLED, DISABLED
hostroute	<String>	Read-write	Option to push the VIP6 to ZebOS routing table for Kernel route redistribution through dynamic routing protocols. Possible values = ENABLED, DISABLED
advertiseondefaultpartition	<String>	Read-write	Advertise VIPs from Shared VLAN on Default Partition.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
networkroute	<String>	Read-write	Option to push the SNIP6 subnet to ZebOS routing table for Kernel route redistribution through dynamic routing protocol. Possible values = ENABLED, DISABLED
tag	<Double>	Read-write	Tag value for the network/host route associated with this IP. Default value: 0
ip6hostrtgw	<String>	Read-write	IPv6 address of the gateway for the route. If Gateway is not set, VIP uses :: as the gateway. Default value: 0
metric	<Integer>	Read-write	Integer value to add to or subtract from the cost of the route advertised for the VIP6 address. Minimum value = -16777215

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vserverrhilevel	<String>	Read-write	Advertise or do not advertise the route for the Virtual IP (VIP6) address on the basis of the state of the virtual servers associated with that VIP6. * NONE - Advertise the route for the VIP6 address, irrespective of the state of the virtual servers associated with the address. * ONE VSERVER - Advertise the route for the VIP6 address if at least one of the associated virtual servers is in UP state. * ALL VSERVER - Advertise the route for the VIP6 address if all of the associated virtual servers are in UP state. * VSVR_CNTRLD. Advertise the route for the VIP address according to the RHIstate (RHI

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			STATE) parameter setting on all the associated virtual servers of the VIP address along with their states. When Vserver RHI Level (RHI) parameter is set to VSVR_CNTRLD, the following are different RHI behaviors for the VIP address on the basis of RHIstate (RHI STATE) settings on the virtual servers associated with the VIP address: * If you set RHI STATE to PASSIVE on all virtual servers, the Citrix ADC always advertises the route for the VIP address. * If you set RHI STATE to ACTIVE on all virtual servers, the Citrix ADC advertises the route for the VIP address if at least

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			one of the associated virtual servers is in UP state. *If you set RHI STATE to ACTIVE on some and PASSIVE on others, the Citrix ADC advertises the route for the VIP address if at least one of the associated virtual servers, whose RHI STATE set to ACTIVE, is in UP state. Default value: ONE_VSERVER Possible values = ONE_VSERVER, ALL_VSERVERS, NONE, VSVR_CNTRLD
ospf6lsatype	<String>	Read-write	Type of LSAs to be used by the IPv6 OSPF protocol, running on the Citrix ADC, for advertising the route for the VIP6 address. Default value: EXTERNAL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = INTRA_AREA, EXTERNAL
ospfarea	<Double>	Read-write	ID of the area in which the Intra-Area-Prefix LSAs are to be advertised for the VIP6 address by the IPv6 OSPF protocol running on the Citrix ADC. When ospfArea is not set, VIP6 is advertised on all areas. Default value: -1 Minimum value = 0 Maximum value = 4294967294LU
state	<String>	Read-write	Enable or disable the IP address. Default value: ENABLED Possible values = DISABLED, ENABLED
map	<String>	Read-write	Mapped IPV4 address for the IPV6 address.
vrid6	<Double>	Read-write	A positive integer that uniquely identifies a VMAC address for binding to this VIP address. This binding is used

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to set up Citrix ADCs in an active-active configuration using VRRP. Minimum value = 1 Maximum value = 255
ownernode	<Double>	Read-write	ID of the cluster node for which you are adding the IP address. Must be used if you want the IP address to be active only on the specific node. Can be configured only through the cluster IP address. Cannot be changed after the IP address is created. Default value: 255
ownerdownresponse	<String>	Read-write	in cluster system, if the owner node is down, whether should it respond to icmp/arp. Default value: YES Possible values = YES, NO
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
ndowner	<Double>	Read-write	NdOwner in Cluster for VIPS and Striped SNIPS. Default value: 255
iptype	<String[]>	Read-only	The type of the IPv6 address. Possible values = NSIP, VIP, SNIP, GSLBsiteIP, ADNSsvcIP, RADIUSListenersvcIP, CLIP
curstate	<String>	Read-only	Current state of this IP. Default value: ENABLED Possible values = DISABLED, ENABLED
viprtadv2bsd	<Boolean>	Read-only	Whether this route is advertised to FreeBSD.
vipvsercount	<Double>	Read-only	Number of vservers bound to this VIP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vipvserdowncount	<Double>	Read-only	Number of vservers bound to this VIP, which are down.
systemtype	<String>	Read-only	The type of the System. Possible Values: Standalone, HA, Cluster. Used for display purpose. Possible values = Stand-alone, HA, Cluster
operationalndowner	<Double>	Read-only	Operational ND6 Owner.
__count	<Double>	Read-only	count parameter

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsip6

nslicense

Configuration for license resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wl	<Boolean>	Read-write	Web Logging.
sp	<Boolean>	Read-write	Surge Protection.
lb	<Boolean>	Read-write	Load Balancing.
cs	<Boolean>	Read-write	Content Switching.
cr	<Boolean>	Read-write	Cache Redirect.
sc	<Boolean>	Read-write	Sure Connect.
cmp	<Boolean>	Read-write	Compression.
delta	<Boolean>	Read-write	Delta Compression.
pq	<Boolean>	Read-write	Priority Queuing.
ssl	<Boolean>	Read-write	Secure Sockets Layer.
gslb	<Boolean>	Read-write	Global Server Load Balancing.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gslbp	<Boolean>	Read-write	GSLB Proximity.
hdosp	<Boolean>	Read-write	DOS Protection.
routing	<Boolean>	Read-write	Routing.
cf	<Boolean>	Read-write	Content Filter.
contentaccelerator	<Boolean>	Read-write	transparent Integrated Caching.
ic	<Boolean>	Read-write	Integrated Caching.
sslvpn	<Boolean>	Read-write	SSL VPN.
f_sslvpn_users	<Double>	Read-write	Number of licensed users allowed by this license.
f_ica_users	<Double>	Read-write	Number of licensed users allowed by ICAONLY license. As long as the AG Feature is licensed, unlimited number of ICA connections are accepted. (In API, 0 value for this parameter means unlimited when AG license in ON).
aaa	<Boolean>	Read-write	AAA.
ospf	<Boolean>	Read-write	OSPF Routing.
rip	<Boolean>	Read-write	RIP Routing.
bgp	<Boolean>	Read-write	BGP Routing.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rewrite	<Boolean>	Read-write	Rewrite.
ipv6pt	<Boolean>	Read-write	IPv6 protocol translation.
appfw	<Boolean>	Read-write	Application Firewall.
responder	<Boolean>	Read-write	Responder.
agee	<Boolean>	Read-write	.
nsxn	<Boolean>	Read-write	.
htmlinjection	<Boolean>	Read-write	HTML Injection.
modelid	<Double>	Read-write	Model Number ID. Represents different numbers for two types of licenses.: * Bandwidth licenses - specifies the throughput bandwidth licensed for this appliance e.g. (For 20 Gbps) Model Number ID: 20000 * vCPU licenses - specifies number of vCPUs licensed for this appliance. e.g. (For 4 vCPU) Model Number ID: 4 vCPUs.
push	<Boolean>	Read-write	Citrix ADC Push.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wionns	<Boolean>	Read-write	WI on NS.
appflow	<Boolean>	Read-write	AppFlow.
cloudbridge	<Boolean>	Read-write	CloudBridge.
cloudbridgeappliance	<Boolean>	Read-write	.
cloudextenderappliance	<Boolean>	Read-write	.
isis	<Boolean>	Read-write	ISIS Routing.
cluster	<Boolean>	Read-write	Clustering.
ch	<Boolean>	Read-write	Call Home.
appqoe	<Boolean>	Read-write	AppQoS.
appflowica	<Boolean>	Read-write	Appflow for ICA.
isstandardlic	<Boolean>	Read-write	Standard License.
isenterpriselic	<Boolean>	Read-write	Enterprise License.
isplatinumlic	<Boolean>	Read-write	Platinum License.
issgwylic	<Boolean>	Read-write	Simple Gateway License.
isswglic	<Boolean>	Read-write	Secure Web Gateway License.
feo	<Boolean>	Read-write	Front End Optimization.
lsn	<Boolean>	Read-write	Large Scale NAT.
licensingmode	<String>	Read-write	Pooled Licensed. Default value: Local

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Local, Pooled, CICO, EXPRESS, CPU, CPU-Local
daystoexpiration	<Double>	Read-write	Days to expire. Minimum value = 0 Maximum value = 4294967294
rdpproxy	<Boolean>	Read-write	RDPPROXY.
rep	<Boolean>	Read-write	Reputation Services.
urlfiltering	<Boolean>	Read-write	URL Filtering.
videooptimization	<Boolean>	Read-write	Video Optimization.
forwardproxy	<Boolean>	Read-write	Forward Proxy.
sslinterception	<Boolean>	Read-write	SSL Interception.
remotecontentinspection	<Boolean>	Read-write	Remote Content Inspection.
adaptivetcp	<Boolean>	Read-write	Adaptive TCP.
cqa	<Boolean>	Read-write	Connection Quality Analytics.
bot	<Boolean>	Read-write	Bot Management.
apigateway	<Boolean>	Read-write	API Gateway.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

port	<Double>	Read-write	License server port.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
forceupdateip	<Boolean>	Read-write	If this flag is used while adding the licenseserver, existing config will be overwritten. Use this flag only if you are sure that the new licenseserver has the required capacity.
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
status	<Double>	Read-only	Status of license server.
grace	<Double>	Read-only	Grace status of server.
gptimeleft	<Double>	Read-only	Grace time left.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nslicenseserver":{
```

```
        "licenseserverip":<String_value>,

        "servername":<String_value>,

        "port":<Double_value>,

        "forceupdateip":<Boolean_value>

  }}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver/ licenseserverip_value<String>

Query-parameters:

args=servername: <String_value>
update
URL: http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
  {"nslicenseserver":{

        "licenseserverip":<String_value>,
```

```
        "servername":<String_value>,

        "port":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error
get (all)
URL: http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver? **args=licenseserverip: <String_value> ,servername: <String_value> ,nodeid: <Double_value>**

Use this query-parameter to get nslicenseserver resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nslicenseserver resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver? **view=summary**

Use this query-parameter to get the summary output of nslicenseserver resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nslicenseserver resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslicenseserver": [ {

licenseserverip:<String_value>,servername:<String_value>,nodeid:<Double_va
lue>      "port":<Double_value>,

      "status":<Double_value>,

      "grace":<Double_value>,

      "gptimeleft":<Double_value>
```

```
}]}
```

count

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserver? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslicenseserver": [ { "__count": "#no"} ] }
```

nslicenseserverpool

Configuration for licenseserver resource.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: `*

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslicenseserverpool

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nslimitidentifier

Configuration for limit Indetifier resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name for a rate limit identifier. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Reserved words must not be used.
threshold	<Double>	Read-write	Maximum number of requests that are allowed in the given timeslice when requests (mode is set as REQUEST_RATE) are tracked per timeslice. When connections (mode is set as CONNECTION) are tracked, it is the total number of connections that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			would be let through. Default value: 1 Minimum value = 1
timeslice	<Double>	Read-write	Time interval, in milliseconds, specified in multiples of 10, during which requests are tracked to check if they cross the threshold. This argument is needed only when the mode is set to REQUEST_RATE. Default value: 1000 Minimum value = 10
mode	<String>	Read-write	Defines the type of traffic to be tracked. * REQUEST_RATE - Tracks requests/ timeslice. * CONNECTION - Tracks active transactions. Examples 1. To permit 20 requests in 10 ms and 2 traps in 10 ms:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			add limitidentifier limit_req -mode request_rate -limitType smooth -timeslice 1000 -Threshold 2000 -trapsInTimeSlice 200 2. To permit 50 requests in 10 ms: set limitidentifier limit_req -mode request_rate -timeslice 1000 -Threshold 5000 -limitType smooth 3. To permit 1 request in 40 ms: set limitidentifier limit_req -mode request_rate -timeslice 2000 -Threshold 50 -limitType smooth 4. To permit 1 request in 200 ms and 1 trap in 130 ms: set limitidentifier limit_req -mode request_rate -timeslice 1000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-Threshold 5 -limitType smooth -trapsInTimeSlice 8 5. To permit 5000 requests in 1000 ms and 200 traps in 1000 ms: set limitidentifier limit_req -mode request_rate -timeslice 1000 -Threshold 5000 -limitType BURSTY. Default value: REQUEST_RATE Possible values = CONNECTION, REQUEST_RATE, NONE
limittype	<String>	Read-write	Smooth or bursty request type. * SMOOTH - When you want the permitted number of requests in a given interval of time to be spread evenly across the timeslice * BURSTY - When you want the permitted number of requests to exhaust

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the quota anytime within the timeslice. This argument is needed only when the mode is set to REQUEST_RATE. Default value: BURSTY Possible values = BURSTY, SMOOTH
selectorname	<String>	Read-write	Name of the rate limit selector. If this argument is NULL, rate limiting will be applied on all traffic received by the virtual server or the Citrix ADC (depending on whether the limit identifier is bound to a virtual server or globally) without any filtering. Minimum length = 1
maxbandwidth	<Double>	Read-write	Maximum bandwidth permitted, in kbps. Minimum value = 0 Maximum value = 4294967287
trapsintimeslice	<Double>	Read-write	Number of traps to be sent in the timeslice configured. A value of 0 indicates

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			that traps are disabled. Minimum value = 0 Maximum value = 65535
ngname	<String>	Read-only	Nodegroup name to which this identifier belongs to.
hits	<Double>	Read-only	The number of times this identifier was evaluated.
drop	<Double>	Read-only	The number of times action was taken.
rule	<String[]>	Read-only	Rule.
time	<Double>	Read-only	Time interval considered for rate limiting.
total	<Double>	Read-only	Maximum number of requests permitted in the computed timeslice.
trapscomputedintimeslice	<Double>	Read-only	The number of traps that would be sent in the timeslice configured. .
computedtraptimeslice	<Double>	Read-only	The time interval computed for sending traps.
referencecount	<Double>	Read-only	Total number of transactions pointing to this entry.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nslimitidentifier":{

<b>      "limitidentifier":<String_value>,

</b>      "threshold":<Double_value>,

      "timeslice":<Double_value>,

      "mode":<String_value>,

      "limittype":<String_value>,

      "selectorname":<String_value>,

      "maxbandwidth":<Double_value>,

      "trapsintimeslice":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier/ limitidentifier_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nslimitidentifier":{

<b>      "limitidentifier":<String_value>,

</b>      "threshold":<Double_value>,

      "timeslice":<Double_value>,

      "mode":<String_value>,

      "limittype":<String_value>,
```

```
      "selectorname":<String_value>,

      "maxbandwidth":<Double_value>,

      "trapsintimeslice":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nslimitidentifier":{

<b>      "limitidentifier":<String_value>,

</b>      "selectorname":true,

      "threshold":true,

      "timeslice":true,

      "mode":true,
```

```
        "limittype":true,

        "maxbandwidth":true,

        "trapsintimeslice":true

  }}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nslimitidentifier resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier? **view=summary**

Use this query-parameter to get the summary output of nslimitidentifier resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nslimitidentifier resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslimitidentifier": [ {

      "limitidentifier":<String_value>,

      "ngname":<String_value>,

      "threshold":<Double_value>,

      "timeslice":<Double_value>,

      "mode":<String_value>,

      "limittype":<String_value>,

      "selectorname":<String_value>,
```

```
        "hits":<Double_value>,

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslimitidentifier": [ { "__count": "#no"} ] }
```

nslimitidentifier_binding

Binding object which returns the resources bound to nslimitidentifier.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name of the rate limit identifier about which to display information. If a name is not provided, information about all rate limit identifiers is shown.
nslimitidentifier_nslimitsessions_binding	<nslimitidentifier_nslimitsessions_binding[]>	Read-only	nslimitsessions that can be bound to nslimitidentifier.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_binding/limitidentifier_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslimitidentifier_binding": [ {

      "limitidentifier":<String_value>,

      "nslimitidentifier_nslimitsessions_binding":<nslimitidentifier_nslimitsessions_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nslimitidentifier_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslimitidentifier_binding": [ {

      "limitidentifier":<String_value>,

      "nslimitidentifier_nslimitsessions_binding":<nslimitidentifier_nslimitsessions_binding[]_value>

}]}
```

nslimitidentifier_nslimitsessions_binding

Binding object showing the nslimitsessions that can be bound to nslimitidentifier.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name of the rate limit identifier about which to display information. If a name is not provided, information about all rate limit identifiers is shown.
__count	<Double>	Read-write	count parameter

Operations

nslimitsessions

Configuration for limit sessions resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitidentifier	<String>	Read-write	Name of the rate limit identifier for which to display the sessions. Minimum length = 1
detail	<Boolean>	Read-write	Show the individual hash values.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeout	<Double>	Read-only	The time remaining on the session before a flush can be attempted. If active transactions are present the session will not be flushed.
hits	<Double>	Read-only	The number of times this entry was hit.
drop	<Double>	Read-only	The number of times action was taken.
number	<Double[]>	Read-only	The hash of the matched selectlets.
name	<String>	Read-only	The string formed by gathering selectlet values.
unit	<Double>	Read-only	Total computed hash of the matched selectlets.
flags	<Double>	Read-only	Used internally to identify ip addresses.
referencecount	<Double>	Read-only	Total number of transactions pointing to this entry. Its the sum total of the connection and bandwidth references.
maxbandwidth	<Double>	Read-only	The current bandwidth.
selectoripv61	<String>	Read-only	First IPV6 address gathered.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
selectoripv62	<String>	Read-only	Second IPV6 address gathered.
flag	<Double>	Read-only	Used internally to identify ipv6 addresses.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- CLEAR

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitsessions? **action=clear**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nslimitsessions":{

<b>      "limitidentifier":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitsessions

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nslimitsessions? **args= limitidentifier:<String_value>, detail: <Boolean_value>**

Use this query-parameter to get nslimitsessions resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nslimitsessions? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nslimitsessions? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nslimitsessions resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nslimitsessions? **view=summary**

Use this query-parameter to get the summary output of nslimitsessions resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nslimitsessions? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nslimitsessions resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslimitsessions": [ {

<b>limitidentifier:<String_value>,</
b>detail:<Boolean_value>      "timeout":<Double_value>,

      "hits":<Double_value>,

      "drop":<Double_value>,

      "number":<Double[]_value>,

      "name":<String_value>,

      "unit":<Double_value>,

      "flags":<Double_value>,

      "referencecount":<Double_value>,

      "maxbandwidth":<Double_value>,

      "selectoripv61":<String_value>,

      "selectoripv62":<String_value>,

      "flag":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nslimitsessions? **args= limitidentifier:<String_value>, detail: <Boolean_value> ;count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nslimitsessions": [ { "__count": "#no"} ] }
```

nsmigration

Configuration for Migration operation resource.

Properties

(click to see Operations)

nsparam

Configuration for Citrix ADC parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
httpport	<Integer[]>	Read-write	HTTP ports on the web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1 Maximum value = 65535
maxconn	<Double>	Read-write	Maximum number of connections that will be made from the appliance to the web server(s) attached to it. The value entered here is applied globally to all attached servers. Default value: 0 Minimum value = 0 Maximum value = 4294967294
maxreq	<Double>	Read-write	Maximum number of requests that the system can pass on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a particular connection between the appliance and a server attached to it. Setting this value to 0 allows an unlimited number of requests to be passed. This value is overridden by the maximum number of requests configured on the individual service. Minimum value = 0 Maximum value = 65535
cip	<String>	Read-write	Enable or disable the insertion of the actual client IP address into the HTTP header request passed from the client to one, some, or all servers attached to the system. The passed address can then be accessed through a minor modification to the server. * If the CIP header is specified, it will be used as the client IP header. * If the CIP header is not specified, the value that has been

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			set will be used as the client IP header. Possible values = ENABLED, DISABLED
cipheader	<String>	Read-write	Text that will be used as the client IP address header. Minimum length = 1
cookieversion	<String>	Read-write	Version of the cookie inserted by the system. Possible values = 0, 1
securecookie	<String>	Read-write	Enable or disable secure flag for persistence cookie. Default value: ENABLED Possible values = ENABLED, DISABLED
pmtumin	<Double>	Read-write	Minimum path MTU value that Citrix ADC will process in the ICMP fragmentation needed message. If the ICMP message contains a value less than this value, then this value is used instead. Default value: 576

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 168 Maximum value = 1500
pmtutimeout	<Double>	Read-write	Interval, in minutes, for flushing the PMTU entries. Default value: 10 Minimum value = 1 Maximum value = 1440
ftpportrange	<String>	Read-write	Minimum and maximum port (port range) that FTP services are allowed to use. Minimum length = 1024 Maximum length = 64000
crportrange	<String>	Read-write	Port range for cache redirection services. Minimum length = 1 Maximum length = 65535
timezone	<String>	Read-write	Time zone for the Citrix ADC. Name of the time zone should be specified as argument.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: CoordinatedUniversalTime Minimum length = 1 Maximum length = 63
grantquotamaxclient	<Double>	Read-write	Percentage of shared quota to be granted at a time for maxClient. Default value: 10 Minimum value = 0 Maximum value = 100
exclusivequotamaxclient	<Double>	Read-write	Percentage of maxClient to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
grantquotaspillover	<Double>	Read-write	Percentage of shared quota to be granted at a time for spillover. Default value: 10 Minimum value = 0 Maximum value = 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
exclusivequotaspillover	<Double>	Read-write	Percentage of maximum limit to be given to PEs. Default value: 80 Minimum value = 0 Maximum value = 100
useproxyport	<String>	Read-write	Enable/Disable use_proxy_port setting. Default value: ENABLED Possible values = ENABLED, DISABLED
internaluserlogin	<String>	Read-write	Enables/disables the internal user from logging in to the appliance. Before disabling internal user login, you must have key-based authentication set up on the appliance. The file name for the key pair must be "ns_comm_key". Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aftpallowrandomsourceport	<String>	Read-write	Allow the FTP server to come from a random source port for active FTP data connections. Default value: DISABLED Possible values = ENABLED, DISABLED
icaports	<Integer[]>	Read-write	The ICA ports on the Web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1
tcpcip	<String>	Read-write	Enable or disable the insertion of the client TCP/IP header in TCP payload passed from the client to one, some, or all servers attached to the system. The passed address can then be accessed through a minor modification to the server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
servicepathingressvlan	<Double>	Read-write	VLAN on which the subscriber traffic arrives on the appliance. Minimum value = 1
secureicaports	<Integer[]>	Read-write	The Secure ICA ports on the Web server. This allows the system to perform connection off-load for any client request that has a destination port matching one of these configured ports. Minimum value = 1
mgmthttpport	<Integer>	Read-write	This allow the configuration of management HTTP port. Default value: 80 Minimum value = 1 Maximum value = 65534
mgmthttpsport	<Integer>	Read-write	This allows the configuration of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			management HTTPS port. Default value: 443 Minimum value = 1 Maximum value = 65534
proxyprotocol	<String>	Read-write	Disable/Enable v1 or v2 proxy protocol header for client info insertion. Default value: DISABLED Possible values = ENABLED, DISABLED
advancedanalyticsstats	<String>	Read-write	Disable/Enable advanace analytics stats. Default value: DISABLED Possible values = ENABLED, DISABLED

Operations

nspartition

Configuration for admin partition resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of the Partition. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
maxbandwidth	<Double>	Read-write	Maximum bandwidth, in Kbps, that the partition can consume. A zero value indicates the bandwidth is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			unrestricted on the partition and it can consume up to the system limits. Default value: 10240
minbandwidth	<Double>	Read-write	Minimum bandwidth, in Kbps, that the partition can consume. A zero value indicates the bandwidth is unrestricted on the partition and it can consume up to the system limits. Default value: 10240
maxconn	<Double>	Read-write	Maximum number of concurrent connections that can be open in the partition. A zero value indicates no limit on number of open connections. Default value: 1024
maxmemlimit	<Double>	Read-write	Maximum memory, in megabytes, allocated to the partition. A zero value indicates the memory is unlimited on the partition and it can consume up to the system limits.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 10 Minimum value = 0 Maximum value = 1048576
partitionmac	<String>	Read-write	Special MAC address for the partition which is used for communication over shared vlans in this partition. If not specified, the MAC address is auto-generated.
partitionid	<Double>	Read-only	Partition Id. Minimum value = 1
partitiontype	<String>	Read-only	Type of the Partition. Possible values = Default Partition, Current Partition
pmacinternal	<Boolean>	Read-only	Partition MAC is generated internally.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- SWITCH

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspartition":{

<b>      "partitionname":<String_value>,

</b>      "maxbandwidth":<Double_value>,

      "minbandwidth":<Double_value>,

      "maxconn":<Double_value>,

      "maxmemlimit":<Double_value>,

      "partitionmac":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition/ partitionname_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspartition":{

<b>      "partitionname":<String_value>,

</b>      "maxbandwidth":<Double_value>,

      "minbandwidth":<Double_value>,

      "maxconn":<Double_value>,

      "maxmemlimit":<Double_value>,

      "partitionmac":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspartition":{

<b>      "partitionname":<String_value>,

</b>      "maxbandwidth":true,

      "minbandwidth":true,

      "maxconn":true,

      "maxmemlimit":true,

      "partitionmac":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

SWITCH

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **action=Switch**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspartition":{

<b>      "partitionname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nspartition resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **view=summary**

Use this query-parameter to get the summary output of nspartition resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nspartition resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartition": [ {

      "partitionname":<String_value>,

      "partitionid":<Double_value>,

      "partitiontype":<String_value>,

      "maxbandwidth":<Double_value>,

      "minbandwidth":<Double_value>,
```

```
        "maxconn":<Double_value>,

        "maxmemlimit":<Double_value>,

        "partitionmac":<String_value>,

        "pmacinternal":<Boolean_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition/ partitionname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nspartition/ partitionname_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nspartition/ partitionname_value<String> ?**view=summary**

Use this query-parameter to get the summary output of nspartition resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nspartition": [ {

      "partitionname":<String_value>,

      "partitionid":<Double_value>,

      "partitiontype":<String_value>,

      "maxbandwidth":<Double_value>,

      "minbandwidth":<Double_value>,

      "maxconn":<Double_value>,

      "maxmemlimit":<Double_value>,

      "partitionmac":<String_value>,

      "pmacinternal":<Boolean_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartition": [ { "__count": "#no"} ] }
```

nspartitionmac

Configuration for partition MACs resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionmac	<String>	Read-write	A configured virtual MAC address that can be used by a partition for communication over shared VLANs.
partitionname	<String>	Read-write	Name of the partition to which the MAC has been assigned. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nspartitionmac resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac? **view=summary**

Use this query-parameter to get the summary output of nspartitionmac resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nspartitionmac resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartitionmac": [ {
      "partitionmac":<String_value>,
      "partitionname":<String_value>
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartitionmac? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartitionmac": [ { "__count": "#no"} ] }
```

nspartition_binding

Binding object which returns the resources bound to nspartition.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of partition for which to display parameters. Minimum length = 1
nspartition_bridgegroup_binding	<nspartition_bridgegroup_binding[]>	Read-only	bridgegroup that can be bound to nspartition.
nspartition_vlan_binding	<nspartition_vlan_binding[]>	Read-only	vlan that can be bound to nspartition.
nspartition_vxlan_binding	<nspartition_vxlan_binding[]>	Read-only	vxlan that can be bound to nspartition.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_binding/ partitionname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartition_binding": [ {

      "partitionname":<String_value>,

      "nspartition_vxlan_binding":<nspartition_vxlan_binding[]_value>,

      "nspartition_bridgegroup_binding":<nspartition_bridgegroup_binding[]
_value>,

      "nspartition_vlan_binding":<nspartition_vlan_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nspartition_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspartition_binding": [ {

      "partitionname":<String_value>,

      "nspartition_vxlan_binding":<nspartition_vxlan_binding[]_value>,

      "nspartition_bridgegroup_binding":<nspartition_bridgegroup_binding[]
_value>,

      "nspartition_vlan_binding":<nspartition_vlan_binding[]_value>

}]}
```

nspartition_bridgegroup_binding

Binding object showing the bridgegroup that can be bound to nspartition.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of the Partition. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. Minimum length = 1
bridgegroup	<Double>	Read-write	Identifier of the bridge group that is assigned to this partition. Minimum value = 1 Maximum value = 1000
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/nspartition_bridgegroup_binding

Request Payload:

```
{

"nspartition_vlan_binding":{

<b>      "partitionname":<String_value>,

</b>      "vlan":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vlan_binding/ partitionname_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vlan_binding/ partitionname_value<String> ? **args=vlan: <Double_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vlan_binding/ partitionname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vlan_binding/ partitionname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of nspartition_vlan_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vlan_binding/ partitionname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nspartition_vlan_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nspartition_vlan_binding": [ {

      "partitionname":<String_value>,

      "vlan":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vlan_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vlan_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nspartition_vlan_binding": [ {

      "partitionname":<String_value>,

      "vlan":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vlan_binding/ partitionname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"nspartition_vlan_binding": [ { "__count": "#no"} ] }
```

nspartition_vxlan_binding

Binding object showing the vxlan that can be bound to nspartition.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
partitionname	<String>	Read-write	Name of the Partition. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), and hyphen (-) characters. Minimum length = 1
vxlan	<Double>	Read-write	Identifier of the vxlan that is assigned to this partition. Minimum value = 1 Maximum value = 16777215
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/nspartition_vxlan_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"nspartition_vxlan_binding":{

<b>      "partitionname":<String_value>,

</b>      "vxlan":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding/ partitionname_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding/ partitionname_value<String> ? **args=vxlan: <Double_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding/ partitionname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding/ partitionname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of nspartition_vxlan_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding/ partitionname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nspartition_vxlan_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nspartition_vxlan_binding": [ {

      "partitionname":<String_value>,

      "vxlan":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nspartition_vxlan_binding": [ {

      "partitionname":<String_value>,

      "vxlan":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspartition_vxlan_binding/ partitionname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"nspartition_vxlan_binding": [ { "__count": "#no"} ] }
```

nspbr

Configuration for Policy Based Routing(PBR) entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the PBR. Must begin with an ASCII alphabetic or underscore \(_\) character, and must contain only ASCII alphanumeric, underscore, hash \(#\), period \(.\), space, colon \(:\), at \(@\), equals \(=\),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and hyphen \(-\) characters. Cannot be changed after the PBR is created. Minimum length = 1
action	<String>	Read-write	Action to perform on the outgoing IPv4 packets that match the PBR. Available settings function as follows: * ALLOW - The Citrix ADC sends the packet to the designated next-hop router. * DENY - The Citrix ADC applies the routing table for normal destination-based routing. Possible values = ALLOW, DENY
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4094
srcip	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipval	<String>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
srcport	<Boolean>	Read-write	Port number or range of port

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			numbers to match against the source port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Port number or range of port numbers to match against the source port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			TCP and UDP protocols. Maximum length = 65535
destip	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 10.102.29.30-10.102.29.189.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipval	<String>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			10.102.29.30-10.102.29.189.
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an outgoing IPv4 packet. In the command line interface, separate the range with a hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Port number or range of port numbers to match against the destination port number of an outgoing IPv4 packet. In the command line interface, separate the range with a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols. Maximum length = 65535
nexthop	<Boolean>	Read-write	IP address of the next hop router or the name of the link load balancing virtual server to which to send matching packets if action is set to ALLOW. If you specify a link load balancing (LLB) virtual server, which can provide a backup if a next hop link fails, first make sure that the next hops bound to the LLB virtual server are actually next hops that are directly connected to the Citrix ADC. Otherwise, the Citrix ADC throws an error when you attempt to create the PBR. The next hop can be null to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			represent null routes.
nexthopval	<String>	Read-write	The Next Hop IP address or gateway name.
iptunnel	<Boolean>	Read-write	The Tunnel name.
iptunnelname	<String>	Read-write	The iptunnel name where packets need to be forwarded upon.
vxlanvlanmap	<String>	Read-write	The vlan to vxlan mapping to be applied for incoming packets over this pbr tunnel.
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an outgoing IPv4 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
protocol	<String>	Read-write	Protocol, identified by protocol name, to match against the protocol of an outgoing IPv4 packet. Possible values = ICMP, IGMP, TCP, EGP, IGP, ARGUS, UDP, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, ICMPV6, IPv6-NoNx, IPv6-Opts, Any-Host-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Internal-Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			FC, RSVP-E2E-IGNORE, Mobility-Header, UDPLite
protocolnumber	<Double>	Read-write	Protocol, identified by protocol number, to match against the protocol of an outgoing IPv4 packet. Minimum value = 1 Maximum value = 255
vlan	<Double>	Read-write	ID of the VLAN. The Citrix ADC compares the PBR only to the outgoing packets on the specified VLAN. If you do not specify any interface ID, the appliance compares the PBR to the outgoing packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN. The Citrix ADC compares the PBR only to the outgoing packets on the specified VXLAN. If you do not specify any interface ID, the appliance compares the PBR to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			outgoing packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC compares the PBR only to the outgoing packets on the specified interface. If you do not specify any value, the appliance compares the PBR to the outgoing packets on all interfaces.
priority	<Double>	Read-write	Priority of the PBR, which determines the order in which it is evaluated relative to the other PBRs. If you do not specify priorities while creating PBRs, the PBRs are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 81920
msr	<String>	Read-write	Monitor the route specified byte Next Hop parameter. This parameter is not applicable if you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specify a link load balancing (LLB) virtual server name with the Next Hop parameter. Default value: DISABLED Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	The name of the monitor.(Can be only of type ping or ARP). Minimum length = 1
state	<String>	Read-write	Enable or disable the PBR. After you apply the PBRs, the Citrix ADC compares outgoing packets to the enabled PBRs. Default value: ENABLED Possible values = ENABLED, DISABLED
ownergroup	<String>	Read-write	The owner node group in a Cluster for this pbr rule. If ownernode is not specified then the pbr rule is treated as Striped pbr rule.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DEFAULT_NG Minimum length = 1
detail	<Boolean>	Read-write	To get a detailed view.
hits	<Double>	Read-only	The hits of this PBR.
kernelstate	<String>	Read-only	The commit status of the PBR. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY, SFAPPLIED, SFNOTAPPLIED, SFAPPLIED61, SFNOTAPPLIED61
curstate	<Double>	Read-only	If this route is UP/DOWN.
totalprobes	<Double>	Read-only	The total number of probes sent.
totalfailedprobes	<Double>	Read-only	The total number of failed probes.
failedprobes	<Double>	Read-only	Number of the current failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
data	<Boolean>	Read-only	Internal data of this route.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- ENABLE
- DISABLE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbr

Content-Type:application/json

Request Payload:

```
{"nspbr":{

<b>      "name":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbr

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nspbr? **args=name: <String_value> ,detail: <Boolean_value>**

Use this query-parameter to get nspbr resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nspbr? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nspbr? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nspbr resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nspbr? **view=summary**

Use this query-parameter to get the summary output of nspbr resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nspbr? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nspbr resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbr/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nspbr/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nspbr/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nspbr resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

```

nspbr6

Configuration for PBR6 entry resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the PBR6. Must begin with an ASCII alphabetic or underscore \(_\) character, and must contain only ASCII alphanumeric, underscore, hash \(#\), period \(.\), space, colon \(:\), at \(@\), equals \(=\), and hyphen \(-\) characters. Cannot be changed after the PBR6 is created. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4094
action	<String>	Read-write	Action to perform on the outgoing IPv6 packets that match the PBR6. Available settings function as follows: * ALLOW - The Citrix ADC sends the packet to the designated next-hop router. * DENY - The Citrix ADC applies the routing table for normal destination-based routing. Possible values = ALLOW, DENY
srcipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcipv6val	<String>	Read-write	IP address or range of IP addresses to match against the source IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.
srcport	<Boolean>	Read-write	Port number or range of port numbers to match against the source port number of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen. For example: 40-90.
srcportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
srcportval	<String>	Read-write	Source port (range). Maximum length = 65535

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
destipv6	<Boolean>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.
destipop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destipv6val	<String>	Read-write	IP address or range of IP addresses to match against the destination IP address of an outgoing IPv6 packet. In the command line interface, separate the range with a hyphen.
destport	<Boolean>	Read-write	Port number or range of port numbers to match against the destination port number of an outgoing IPv6 packet. In the command line interface, separate the range with a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen. For example: 40-90. Note: The destination port can be specified only for TCP and UDP protocols.
destportop	<String>	Read-write	Either the equals (=) or does not equal (!=) logical operator. Possible values = =, !=, EQ, NEQ
destportval	<String>	Read-write	Destination port (range). Maximum length = 65535
srcmac	<String>	Read-write	MAC address to match against the source MAC address of an outgoing IPv6 packet.
srcmacmask	<String>	Read-write	Used to define range of Source MAC address. It takes string of 0 and 1, 0s are for exact match and 1s for wildcard. For matching first 3 bytes of MAC address, srcMacMask value "000000111111". . Default value: "000000000000"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
protocol	<String>	Read-write	Protocol, identified by protocol name, to match against the protocol of an outgoing IPv6 packet. Possible values = ICMPV6, TCP, UDP, ICMP, IGMP, EGP, IGP, ARGUS, RDP, RSVP, EIGRP, L2TP, ISIS, GGP, IPoverIP, ST, CBT, BBN-RCC-M, NVP-II, PUP, EMCON, XNET, CHAOS, MUX, DCN-MEAS, HMP, PRM, XNS-IDP, TRUNK-1, TRUNK-2, LEAF-1, LEAF-2, IRTP, ISO-TP4, NETBLT, MFE-NSP, MERIT-INP, SEP, 3PC, IDPR, XTP, DDP, IDPR-CMTP, TP++, IL, IPv6, SDRP, IPv6-Route, IPv6-Frag, IDRP, GRE, MHRP, BNA, ESP, AH, I-NLSP, SWIPE, NARP, MOBILE, TLSP, SKIP, IPv6-NoNx, IPv6-Opts, Any-Host-Internal-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Protocol, CFTP, Any-Local-Network, SAT-EXPAK, KRYPTOLAN, RVD, IPPC, Any-Distributed-File-System, TFTP, VISA, IPCV, CPNX, CPHB, WSN, PVP, BR-SAT-MO, SUN-ND, WB-MON, WB-EXPAK, ISO-IP, VMTP, SECURE-VM, VINES, TTP, NSFNET-IG, DGP, TCF, OSPFIGP, Sprite-RP, LARP, MTP, AX.25, IPIP, MICP, SCC-SP, ETHERIP, Any-Private-Encryption-Scheme, GMTP, IFMP, PNNI, PIM, ARIS, SCPS, QNX, A/N, IPComp, SNP, Compaq-Pe, IPX-in-IP, VRRP, PGM, Any-0-Hop-Protocol, ENCAP, DDX, IATP, STP, SRP, UTI, SMP, SM, PTP, FIRE, CRTP, CRUDP, SSCOPMCE, IPLT, SPS, PIPE, SCTP, FC, RSVP-E2E-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IGNORE, Mobility-Header, UDPLite
protocolnumber	<Double>	Read-write	Protocol, identified by protocol number, to match against the protocol of an outgoing IPv6 packet. Minimum value = 1 Maximum value = 255
vlan	<Double>	Read-write	ID of the VLAN. The Citrix ADC compares the PBR6 only to the outgoing packets on the specified VLAN. If you do not specify an interface ID, the appliance compares the PBR6 to the outgoing packets on all VLANs. Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN. The Citrix ADC compares the PBR6 only to the outgoing packets on the specified VXLAN. If you do not specify an interface ID, the appliance compares the PBR6 to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			outgoing packets on all VXLANs. Minimum value = 1 Maximum value = 16777215
Interface	<String>	Read-write	ID of an interface. The Citrix ADC compares the PBR6 only to the outgoing packets on the specified interface. If you do not specify a value, the appliance compares the PBR6 to the outgoing packets on all interfaces.
priority	<Double>	Read-write	Priority of the PBR6, which determines the order in which it is evaluated relative to the other PBR6s. If you do not specify priorities while creating PBR6s, the PBR6s are evaluated in the order in which they are created. Minimum value = 1 Maximum value = 81920
state	<String>	Read-write	Enable or disable the PBR6. After you apply the PBR6s, the Citrix ADC compares

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			outgoing packets to the enabled PBR6s. Default value: ENABLED Possible values = ENABLED, DISABLED
msr	<String>	Read-write	Monitor the route specified by the Next Hop parameter. Default value: DISABLED Possible values = ENABLED, DISABLED
monitor	<String>	Read-write	The name of the monitor.(Can be only of type ping or ARP). Minimum length = 1
nexthop	<Boolean>	Read-write	IP address of the next hop router to which to send matching packets if action is set to ALLOW. This next hop should be directly reachable from the appliance.
nexthopval	<String>	Read-write	The Next Hop IPv6 address.
iptunnel	<String>	Read-write	The iptunnel name where packets need

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to be forwarded upon.
vxlanvlanmap	<String>	Read-write	The vlan to vxlan mapping to be applied for incoming packets over this pbr tunnel.
nexthopvlan	<Double>	Read-write	VLAN number to be used for link local nexthop . Minimum value = 1 Maximum value = 4094
ownergroup	<String>	Read-write	The owner node group in a Cluster for this pbr rule. If owner node group is not specified then the pbr rule is treated as Striped pbr rule. Default value: DEFAULT_NG Minimum length = 1
detail	<Boolean>	Read-write	To get a detailed view.
kernelstate	<String>	Read-only	Commit status of the PBR6. Default value: NOTAPPLIED Possible values = APPLIED, NOTAPPLIED, RE-APPLY,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SFAPPLIED, SFNOTAPPLIED
hits	<Double>	Read-only	Number of hits of this PBR6.
curstate	<Double>	Read-only	If this route is UP/DOWN.
totalprobes	<Double>	Read-only	The total number of probes sent.
totalfailedprobes	<Double>	Read-only	The total number of failed probes.
failedprobes	<Double>	Read-only	Number of the current failed monitoring probes.
monstatcode	<Integer>	Read-only	The code indicating the monitor response.
monstatparam1	<Integer>	Read-only	First parameter for use with message code.
monstatparam2	<Integer>	Read-only	Second parameter for use with message code.
monstatparam3	<Integer>	Read-only	Third parameter for use with message code.
data	<Boolean>	Read-only	Internal data of this route.
__count	<Double>	Read-only	count parameter

Operations

- UNSET
- ENABLE
- DISABLE
- GET (ALL)
- GET
- COUNT
- CLEAR
- APPLY

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbr6

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nspbr6? **args=name: <String_value> ,detail: <Boolean_value>**

Use this query-parameter to get nspbr6 resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nspbr6? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nspbr6? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nspbr6 resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nspbr6? **view=summary**

Use this query-parameter to get the summary output of nspbr6 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nspbr6? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nspbr6 resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbr6/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nspbr6/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nspbr6/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nspbr6 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nspbr6": [ {

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbr6? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nspbr6": [ { "__count": "#no"} ] }
```

nspbrs

Configuration for Policy based routing resource.

Operations

- RENUMBER
- CLEAR
- APPLY

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

RENUMBER

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbrs? **action=renumber**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspbrs":{
```

```
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbrs? **action=clear**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspbrs":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

APPLY

URL: http:// <netscaler-ip-address> /nitro/v1/config/nspbrs? **action=apply**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nspbrs":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nsratecontrol

Configuration for rate control resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tcpthreshold	<Double>	Read-write	Number of SYNs permitted per 10 milliseconds.
udpthreshold	<Double>	Read-write	Number of UDP packets permitted per 10 milliseconds.
icmpthreshold	<Double>	Read-write	Number of ICMP packets permitted per 10 milliseconds. Default value: 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tcprstthreshold	<Double>	Read-write	The number of TCP RST packets permitted per 10 milli second. zero means rate control is disabled and 0xffffffff means every thing is rate controlled. Default value: 100

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsratecontrol

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsratecontrol":{

      "tcpthreshold":<Double_value>,

      "udpthreshold":<Double_value>,

      "icmpthreshold":<Double_value>,

      "tcprstthreshold":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsratecontrol? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsratecontrol":{
      "tcpthreshold":true,
      "udpthreshold":true,
      "icmpthreshold":true,
      "tcprstthreshold":true
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsratecontrol

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsratecontrol": [ {

      "tcpthreshold":<Double_value>,

      "udpthreshold":<Double_value>,

      "icmpthreshold":<Double_value>,

      "tcprstthreshold":<Double_value>

}]}
```

nsrollbackcmd

Configuration for Generate rollback commands resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
filename	<String>	Read-write	File that contains the commands for which the rollback commands must be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			generated. Specify the full path of the file name.
outtype	<String>	Read-write	Format in which the rollback commands must be generated. Possible values = cli, xml

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note: *`

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsrollbackcmd

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nsrollbackcmd? **args=filename: <String_value> ,outtype: <String_value>**

Use this query-parameter to get nsrollbackcmd resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsrollbackcmd": [ {

filename:<String_value>,outtype:<String_value>

}]}
```

nsrpcnode

Configuration for rpc node resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the node. This has to be in the same subnet as the NSIP address. Minimum length = 1
password	<String>	Read-write	Password to be used in authentication with the peer system node. Minimum length = 1
srcip	<String>	Read-write	Source IP address to be used to communicate with the peer system node. The default value is 0, which means that the appliance uses the NSIP address as the source IP address.
secure	<String>	Read-write	State of the channel when talking to the node. Possible values = YES, NO
__count	<Double>	Read-only	count parameter

Operations

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsrpcnode":{

<b>      "ipaddress":<String_value>,

</b>      "password":<String_value>,

      "srcip":<String_value>,

      "secure":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsrpcnode":{

<b>      "ipaddress":<String_value>,

</b>      "password":true,

      "srcip":true,

      "secure":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsrpcnode resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode? **view=summary**

Use this query-parameter to get the summary output of nsrpcnode resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsrpcnode resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsrpcnode": [ {

      "ipaddress":<String_value>,

      "password":<String_value>,

      "srcip":<String_value>,

      "secure":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode/ ipaddress_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode/ ipaddress_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode/ ipaddress_value<String> ?**view=summary**

Use this query-parameter to get the summary output of nsrpcnode resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsrpcnode": [ {

      "ipaddress":<String_value>,

      "password":<String_value>,

      "srcip":<String_value>,

      "secure":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsrpcnode? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsrpcnode": [ { "__count": "#no"} ] }
```

nsrunningconfig

Configuration for running configuration resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
withdefaults	<Boolean>	Read-write	Include default values of parameters that have not been explicitly configured. If this argument is disabled, such parameters are not included.
response	<String>	Read-only	running config data as text blob.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsrunningconfig

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nsrunningconfig? **args=withdefaults: <Boolean_value>**

Use this query-parameter to get nsrunningconfig resources based on additional properties.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsrunningconfig": [ {

withdefaults:<Boolean_value>      "response":<String_value>

}]}
```

nssavedconfig

Configuration for last saved configuration resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
textblob	<String>	Read-write	Text of the last saved configuration.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssavedconfig

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssavedconfig": [ {

      "textblob":<String_value>

}]}
```

nsservicefunction

Configuration for service Function resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicefunctionname	<String>	Read-write	Name of the service function to be created. Leading character must be a number or letter. Other characters allowed, after the first character, are @ _ - . (period) : (colon) # and space ( ). Minimum length = 1
ingressvlan	<Double>	Read-write	VLAN ID on which the traffic from service function reaches Citrix ADC. Minimum value = 1 Maximum value = 4094
__count	<Double>	Read-only	count parameter

Operations

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicefunction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsservicefunction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsservicefunction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsservicefunction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsservicefunction? **view=summary**

Use this query-parameter to get the summary output of nsservicefunction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsservicefunction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsservicefunction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicefunction": [ {

      "servicefunctionname":<String_value>,

      "ingressvlan":<Double_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicefunction/ servicefunctionname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsservicefunction/ servicefunctionname_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsservicefunction/ servicefunctionname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nsservicefunction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsservicefunction": [ {

      "servicefunctionname":<String_value>,

      "ingressvlan":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicefunction? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicefunction": [ { "__count": "#no"} ] }
```

nsservicepath

Configuration for service Chain resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicepathname	<String>	Read-write	Name for the Service path. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsservicepath":{

<b>      "servicepathname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath/ servicepathname_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsservicepath resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath? **view=summary**

Use this query-parameter to get the summary output of nsservicepath resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsservicepath resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicepath": [ {

      "servicepathname":<String_value>,

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath/ servicepathname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath/ servicepathname_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath/ servicepathname_value<String> ?**view=summary**

Use this query-parameter to get the summary output of nsservicepath resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsservicepath": [ {

      "servicepathname":<String_value>,

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicepath": [ { "__count": "#no"} ] }
```

nsservicepath_binding

Binding object which returns the resources bound to nsservicepath.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicepathname	<String>	Read-write	Name for the Service path. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
nsservicepath_nsservicefunction_binding	<nsservicepath_nsservicefunction_binding []>	Read-only	nsservicefunction that can be bound to nsservicepath.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_binding/servicepathname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicepath_binding": [ {

      "servicepathname":<String_value>,

      "nsservicepath_nsservicefunction_binding":<nsservicepath_nsservicefu
nction_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsservicepath_binding": [ {

      "servicepathname":<String_value>,

      "nsservicepath_nsservicefunction_binding":<nsservicepath_nsservicefu
nction_binding[]_value>

}]}
```

nsservicepath_nsservicefunction_binding

Binding object showing the nsservicefunction that can be bound to nsservicepath.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicepathname	<String>	Read-write	Name for the Service path. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1
index	<Double>	Read-write	The serviceindex of each servicefunction in path. Minimum value = 1
servicefunction	<String>	Read-write	List of service functions constituting the chain. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

URL: http:// <netscaler-ip-address /nitro/v1/config/nsservicepath_nsservicefunction_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"nsservicepath_nsservicefunction_binding":{

<b>      "servicepathname":<String_value>,

</b><b>      "servicefunction":<String_value>,

</b><b>      "index":<Double_value></b>
```

```
}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding/servicepathname_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding/servicepathname_value<String> ? **args= servicefunction:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding/servicepathname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding/ servicepathname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of nsservicepath_nsservicefunction_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding/ servicepathname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsservicepath_nsservicefunction_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nsservicepath_nsservicefunction_binding": [ {

      "servicepathname":<String_value>,

      "index":<Double_value>,

      "servicefunction":<String_value>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nsservicepath_nsservicefunction_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"nsservicepath_nsservicefunction_binding": [ { "__count": "#no"} ] }
```

nssimpleacl

Configuration for simple ACL resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclname	<String>	Read-write	Name for the simple ACL rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the simple ACL rule is created. Minimum length = 1
aclaction	<String>	Read-write	Drop incoming IPv4 packets that match the simple ACL rule. Possible values = DENY
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
srcip	<String>	Read-write	IP address to match against the source IP address of an incoming IPv4 packet.
destport	<Integer>	Read-write	Port number to match against the destination port number of an incoming IPv4 packet. DestPort is mandatory while setting Protocol. Omitting the port number and protocol creates an all-ports and all protocols simple ACL rule, which matches any port and any protocol. In that case, you cannot create another simple ACL rule specifying a specific port and the same source IPv4 address. Minimum value = 1 Maximum value = 65535
protocol	<String>	Read-write	Protocol to match against the protocol

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of an incoming IPv4 packet. You must set this parameter if you have set the Destination Port parameter. Possible values = TCP, UDP
ttl	<Double>	Read-write	Number of seconds, in multiples of four, after which the simple ACL rule expires. If you do not want the simple ACL rule to expire, do not specify a TTL value. Minimum value = 4 Maximum value = 2147483647
estsessions	<Boolean>	Read-write	.
hits	<Double>	Read-only	Number of hits for this ACL rule.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- CLEAR
- DELETE
- FLUSH
- GET (ALL)
- GET

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nssimpleacl":{

<b>      "aclname":<String_value>,

</b><b>      "aclaction":<String_value>,

</b>      "td":<Double_value>,

<b>      "srcip":<String_value>,

</b>      "destport":<Integer_value>,

      "protocol":<String_value>,

      "ttl":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl? **action=clear**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nssimpleacl":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl/ aclname_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl? **action=flush**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nssimpleacl":{

<b>      "estsessions":<Boolean_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nssimpleacl resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl? **view=summary**

Use this query-parameter to get the summary output of nssimpleacl resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nssimpleacl resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssimpleacl": [ {

      "aclname":<String_value>,

      "aclaction":<String_value>,

      "hits":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssimpleacl": [ { "__count": "#no"} ] }
```

nssimpleacl6

Configuration for simple ACL6 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
aclname	<String>	Read-write	Name for the simple ACL6 rule. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the simple ACL6 rule is created. Minimum length = 1
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0. Minimum value = 0 Maximum value = 4094
aclaction	<String>	Read-write	Drop incoming IPv6 packets that match the simple ACL6 rule. Possible values = DENY
srcipv6	<String>	Read-write	IP address to match against the source IP address of an incoming IPv6 packet.
destport	<Integer>	Read-write	Port number to match against the destination port number of an incoming IPv6 packet. DestPort is mandatory while setting Protocol. Omitting the port number and protocol creates an all-ports and all protocol simple ACL6 rule, which

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			matches any port and any protocol. In that case, you cannot create another simple ACL6 rule specifying a specific port and the same source IPv6 address. Minimum value = 1 Maximum value = 65535
protocol	<String>	Read-write	Protocol to match against the protocol of an incoming IPv6 packet. You must set this parameter if you set the Destination Port parameter. Possible values = TCP, UDP
ttl	<Double>	Read-write	Number of seconds, in multiples of four, after which the simple ACL6 rule expires. If you do not want the simple ACL6 rule to expire, do not specify a TTL value. Minimum value = 4 Maximum value = 2147483647

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
estsessions	<Boolean>	Read-write	.
hits	<Double>	Read-only	Number of hits for this SACL6 rule.
__count	<Double>	Read-only	count parameter

Operations

- ADD
- CLEAR
- FLUSH
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nssimpleacl6":{

<b>      "aclname":<String_value>,

</b>      "td":<Double_value>,

<b>      "aclaction":<String_value>,

</b><b>      "srcipv6":<String_value>,

</b>      "destport":<Integer_value>,

      "protocol":<String_value>,

      "ttl":<Double_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6? **action=clear**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nssimpleacl6":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6? **action=flush**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nssimpleacl6":{

<b>      "estsessions":<Boolean_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6/ aclname_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nssimpleacl6 resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6? **view=summary**

Use this query-parameter to get the summary output of nssimpleacl6 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nssimpleacl6 resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssimpleacl6": [ {
      "aclname":<String_value>,
      "aclaction":<String_value>,
      "td":<Double_value>,
      "srcipv6":<String_value>,
      "destport":<Integer_value>,
      "protocol":<String_value>,
      "ttl":<Double_value>,
      "hits":<Double_value>
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6/ aclname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6/ aclname_value<String> ?
attrs=property-name1,property-name2

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6/ aclname_value<String> ?
view=summary

Use this query-parameter to get the summary output of nssimpleacl6 resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssimpleacl6? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssimpleacl6": [ { "__count": "#no"} ] }
```

nssourceroutecachetable

Configuration for Source IP Mac Cache Table. resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sourceip	<String>	Read-write	Source ip of the connection.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sourcemac	<String>	Read-write	source MAC address of an incoming IPv6 packet.
vlan	<Double>	Read-write	ID of the VLAN.
Interface	<String>	Read-write	ID of an interface.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- FLUSH

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

FLUSH

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **action=flush**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nssourceroutecachetable":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nssourceroutecachetable resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **view=summary**

Use this query-parameter to get the summary output of nssourceroutecachetable resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nssourceroutecachetable? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nssourceroutecachetable resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssourceroutecachetable": [ {
      "sourceip":<String_value>,
      "sourcemac":<String_value>,
      "vlan":<Double_value>,
      "Interface":<String_value>
}]}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nssourceroutecachetable": [ { "__count": "#no"} ] }
```

nsspparams

Configuration for Surge Protection parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
basethreshold	<Integer>	Read-write	Maximum number of server connections that can be opened before surge protection is activated. Default value: 200 Minimum value = 0 Maximum value = 32767
throttle	<String>	Read-write	Rate at which the system opens connections to the server. Default value: Normal Possible values = Aggressive, Normal, Relaxed
table0	<Integer[]>	Read-only	Table.
builtin	<String[]>	Read-only	Flag to determine if sp param is built-in or not. Possible values = MODIFIABLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

      "feature":<String_value>
}]}
```

nsstats

Configuration for stats resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cleanuplevel	<String>	Read-write	The level of stats to be cleared. 'global' option will clear global counters only, 'all' option will clear all device counters also along with global counters. For both the cases only 'ever incrementing counters' i.e. total counters will be cleared. Possible values = global, all

Operations

(click to see Properties)

- CLEAR

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsstats? **action=clear**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsstats":{

<b>      "cleanuplevel":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

nssurgeq

Configuration for surge queue resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of a virtual server, service or service group for which the SurgeQ must be flushed.
servername	<String>	Read-write	Name of a service group member. This argument is needed when you want to flush the SurgeQ of a service group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
port	<Integer>	Read-write	port on which server is bound to the entity(Servicegroup). Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

Operations

(click to see Properties)

- FLUSH

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

}]}
```

nstcpparam

Configuration for tcp parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ws	<String>	Read-write	Enable or disable window scaling. Default value: ENABLED Possible values = ENABLED, DISABLED
wsval	<Double>	Read-write	Factor used to calculate the new window size. This argument is needed only when the window scaling is enabled. Default value: 8 Minimum value = 0 Maximum value = 14
sack	<String>	Read-write	Enable or disable Selective ACKnowledgement (SACK). Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
learnvsvrmss	<String>	Read-write	Enable or disable maximum segment size (MSS) learning for virtual servers. Default value: DISABLED Possible values = ENABLED, DISABLED
maxburst	<Double>	Read-write	Maximum number of TCP segments allowed in a burst. Default value: 6 Minimum value = 1 Maximum value = 255
initialcwnd	<Double>	Read-write	Initial maximum upper limit on the number of TCP packets that can be outstanding on the TCP link to the server. Default value: 10 Minimum value = 1 Maximum value = 44

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
recvbuffsize	<Double>	Read-write	TCP Receive buffer size. Default value: 8190 Minimum value = 8190 Maximum value = 20971520
delayedack	<Double>	Read-write	Timeout for TCP delayed ACK, in milliseconds. Default value: 100 Minimum value = 10 Maximum value = 300
downstaterst	<String>	Read-write	Flag to switch on RST on down services. Default value: DISABLED Possible values = ENABLED, DISABLED
nagle	<String>	Read-write	Enable or disable the Nagle algorithm on TCP connections. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
limitedpersist	<String>	Read-write	Limit the number of persist (zero window) probes. Default value: ENABLED Possible values = ENABLED, DISABLED
oooqsize	<Double>	Read-write	Maximum size of out-of-order packets queue. A value of 0 means no limit. Default value: 300 Minimum value = 0 Maximum value = 65535
ackonpush	<String>	Read-write	Send immediate positive acknowledgement (ACK) on receipt of TCP packets with PUSH flag. Default value: ENABLED Possible values = ENABLED, DISABLED
maxpktpermss	<Double>	Read-write	Maximum number of TCP packets allowed per maximum segment size (MSS). Minimum value = 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 1460
pktperretx	<Integer>	Read-write	Maximum limit on the number of packets that should be retransmitted on receiving a partial ACK. Default value: 1 Minimum value = 1 Maximum value = 100
minrto	<Integer>	Read-write	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole number if divided by 10). Default value: 1000 Minimum value = 10 Maximum value = 64000
slowstartincr	<Integer>	Read-write	Multiplier that determines the rate at which slow start increases the size of the TCP transmission window after each acknowledgement of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			successful transmission. Default value: 2 Minimum value = 1 Maximum value = 100
maxdynserverprobes	<Double>	Read-write	Maximum number of probes that Citrix ADC can send out in 10 milliseconds, to dynamically learn a service. Citrix ADC probes for the existence of the origin in case of wildcard virtual server or services. Default value: 7 Minimum value = 1 Maximum value = 65535
synholdfastgiveup	<Double>	Read-write	Maximum threshold. After crossing this threshold number of outstanding probes for origin, the Citrix ADC reduces the number of connection retries for probe connections. Default value: 1024 Minimum value = 256

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 65535
maxsynholdperprobe	<Double>	Read-write	Limit the number of client connections (SYN) waiting for status of single probe. Any new SYN packets will be dropped. Default value: 128 Minimum value = 1 Maximum value = 255
maxsynhold	<Double>	Read-write	Limit the number of client connections (SYN) waiting for status of probe system wide. Any new SYN packets will be dropped. Default value: 16384 Minimum value = 256 Maximum value = 65535
msslearninterval	<Double>	Read-write	Duration, in seconds, to sample the Maximum Segment Size (MSS) of the services. The Citrix ADC determines the best MSS to set for the virtual server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			based on this sampling. The argument to enable maximum segment size (MSS) for virtual servers must be enabled. Default value: 180 Minimum value = 1 Maximum value = 1048576
msslearndelay	<Double>	Read-write	Frequency, in seconds, at which the virtual servers learn the Maximum segment size (MSS) from the services. The argument to enable maximum segment size (MSS) for virtual servers must be enabled. Default value: 3600 Minimum value = 1 Maximum value = 1048576
maxtimewaitconn	<Double>	Read-write	Maximum number of connections to hold in the TCP TIME_WAIT state on a packet engine. New connections entering TIME_WAIT state are proactively cleaned up.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 7000 Minimum value = 1
kaprobeupdatelastactivity	<String>	Read-write	Update last activity for KA probes. Default value: ENABLED Possible values = ENABLED, DISABLED
maxsynackretx	<Double>	Read-write	When 'syncookie' is disabled in the TCP profile that is bound to the virtual server or service, and the number of TCP SYN+ACK retransmission by Citrix ADC for that virtual server or service crosses this threshold, the Citrix ADC responds by using the TCP SYN-Cookie mechanism. Default value: 100 Minimum value = 100 Maximum value = 1048576
synattackdetection	<String>	Read-write	Detect TCP SYN packet flood and send an SNMP trap.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: ENABLED Possible values = ENABLED, DISABLED
connflushifnomem	<String>	Read-write	Flush an existing connection if no memory can be obtained for new connection. HALF_CLOSED_AND_IDLE: Flush a connection that is closed by us but not by peer, or failing that, a connection that is past configured idle time. New connection fails if no such connection can be found. FIFO: If no half-closed or idle connection can be found, flush the oldest non-management connection, even if it is active. New connection fails if the oldest few connections are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			management connections. Note: If you enable this setting, you should also consider lowering the zombie timeout and half-close timeout, while setting the Citrix ADC timeout. See Also: connFlushThres argument below. Default value: NSA_CONNFLUSH_NONE Possible values = NONE , HALFCLOSED_AND_IDLE, FIFO
connflushthres	<Double>	Read-write	Flush an existing connection (as configured through -connFlushIfNoMem FIFO) if the system has more than specified number of connections, and a new connection is to be established. Note: This value may be rounded down to be a whole multiple of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the number of packet engines running. Minimum value = 1
mptcpconcloseonpassivesf	<String>	Read-write	Accept DATA_FIN/FAST_CLOSE on passive subflow. Default value: ENABLED Possible values = ENABLED, DISABLED
mptcpchecksum	<String>	Read-write	Use MPTCP DSS checksum. Default value: ENABLED Possible values = ENABLED, DISABLED
mptcpsftimeout	<Double>	Read-write	The timeout value in seconds for idle mptcp subflows. If this timeout is not set, idle subflows are cleared after cltTimeout of vserver. Default value: 0 Minimum value = 0 Maximum value = 31536000
mptcpsfreplacetimeout	<Double>	Read-write	The minimum idle time value in seconds for idle

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			mptcp subflows after which the sublow is replaced by new incoming subflow if maximum subflow limit is reached. The priority for replacement is given to those subflow without any transaction. Default value: 10 Minimum value = 0 Maximum value = 31536000
mptcpmaxsf	<Double>	Read-write	Maximum number of subflow connections supported in established state per mptcp connection. Default value: 4 Minimum value = 2 Maximum value = 6
mptcpmaxpendingsf	<Double>	Read-write	Maximum number of subflow connections supported in pending join state per mptcp connection. Default value: 4 Minimum value = 0 Maximum value = 4

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mptcppendingjointhreshold	<Double>	Read-write	Maximum system level pending join connections allowed. Default value: 0 Minimum value = 0 Maximum value = 4294967294
mptcprtostoswitchsf	<Double>	Read-write	Number of RTO's at subflow level, after which MPCTP should start using other subflow. Default value: 2 Minimum value = 1 Maximum value = 6
mptcpusebackupondss	<String>	Read-write	When enabled, if NS receives a DSS on a backup subflow, NS will start using that subflow to send data. And if disabled, NS will continue to transmit on current chosen subflow. In case there is some error on a subflow (like RTO's/RST etc.) then NS can choose a backup subflow irrespective of this tunable. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tcpmaxretries	<Double>	Read-write	Number of RTO's after which a connection should be freed. Default value: 7 Minimum value = 1 Maximum value = 7
mptcpimmediatesfcloseonfin	<String>	Read-write	Allow subflows to close immediately on FIN before the DATA_FIN exchange is completed at mptcp level. Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpclosemptcpsessiononlastsfclose	<String>	Read-write	Allow to send DATA FIN or FAST CLOSE on mptcp connection while sending FIN or RST on the last subflow. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tcpfastopencookietimeout	<Double>	Read-write	Timeout in seconds after which a new TFO Key is computed for generating TFO Cookie. If zero, the same key is used always. If timeout is less than 120seconds, NS defaults to 120seconds timeout. Default value: 0 Minimum value = 0 Maximum value = 31536000
autosyncookietimeout	<Double>	Read-write	Timeout for the server to function in syncookie mode after the synattack. This is valid if TCP syncookie is disabled on the profile and server acts in non syncookie mode by default. Default value: 30 Minimum value = 7 Maximum value = 65535
tcpfintimeout	<Double>	Read-write	The amount of time in seconds, after which a TCP connnection in the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			TCP TIME-WAIT state is flushed. Default value: 40 Minimum value = 10 Maximum value = 240
builtin	<String[]>	Read-only	Flag to determine if the tcp param is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

nstcpprofile

Configuration for TCP profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for a TCP profile. Must begin with a letter, number, or the underscore \(_\) character. Other characters allowed, after the first character, are the hyphen \(-\), period \(.\), hash \(#\), space \(\), at \(@\), colon \(:\), and equal \(=\)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			characters. The name of a TCP profile cannot be changed after it is created. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks \ (for example, "my tcp profile" or 'my tcp profile'\). Minimum length = 1 Maximum length = 127
ws	<String>	Read-write	Enable or disable window scaling. Default value: DISABLED Possible values = ENABLED, DISABLED
sack	<String>	Read-write	Enable or disable Selective ACKnowledgement (SACK). Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
wsval	<Double>	Read-write	Factor used to calculate the new window size. This argument is needed only when window scaling is enabled. Default value: 4 Minimum value = 0 Maximum value = 14
nagle	<String>	Read-write	Enable or disable the Nagle algorithm on TCP connections. Default value: DISABLED Possible values = ENABLED, DISABLED
ackonpush	<String>	Read-write	Send immediate positive acknowledgement (ACK) on receipt of TCP packets with PUSH flag. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mss	<Double>	Read-write	Maximum number of octets to allow in a TCP data segment. Minimum value = 0 Maximum value = 9176
maxburst	<Double>	Read-write	Maximum number of TCP segments allowed in a burst. Default value: 6 Minimum value = 1 Maximum value = 255
initialcwnd	<Double>	Read-write	Initial maximum upper limit on the number of TCP packets that can be outstanding on the TCP link to the server. Default value: 4 Minimum value = 1 Maximum value = 44
delayedack	<Double>	Read-write	Timeout for TCP delayed ACK, in milliseconds. Default value: 100 Minimum value = 10 Maximum value = 300

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
oooqsize	<Double>	Read-write	Maximum size of out-of-order packets queue. A value of 0 means no limit. Default value: 64 Minimum value = 0 Maximum value = 65535
maxpktpermss	<Double>	Read-write	Maximum number of TCP packets allowed per maximum segment size (MSS). Minimum value = 0 Maximum value = 1460
pktperretx	<Double>	Read-write	Maximum limit on the number of packets that should be retransmitted on receiving a partial ACK. Default value: 1 Minimum value = 1 Maximum value = 512
minrto	<Double>	Read-write	Minimum retransmission timeout, in milliseconds, specified in 10-millisecond increments (value must yield a whole

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number if divided by 10). Default value: 1000 Minimum value = 10 Maximum value = 64000
slowstartincr	<Double>	Read-write	Multiplier that determines the rate at which slow start increases the size of the TCP transmission window after each acknowledgement of successful transmission. Default value: 2 Minimum value = 1 Maximum value = 100
buffersize	<Double>	Read-write	TCP buffering size, in bytes. Default value: 8190 Minimum value = 8190 Maximum value = 20971520
syncookie	<String>	Read-write	Enable or disable the SYNCOOKIE mechanism for TCP handshake with clients. Disabling SYNCOOKIE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			prevents SYN attack protection on the Citrix ADC. Default value: ENABLED Possible values = ENABLED, DISABLED
kaprobeupdatelastactivity	<String>	Read-write	Update last activity for the connection after receiving keep-alive (KA) probes. Default value: ENABLED Possible values = ENABLED, DISABLED
flavor	<String>	Read-write	Set TCP congestion control algorithm. Default value: Default Possible values = Default, Westwood, BIC, CUBIC, Nile
dynamicreceivebuffering	<String>	Read-write	Enable or disable dynamic receive buffering. When enabled, allows the receive buffer to be adjusted dynamically based on memory and network conditions.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: The buffer size argument must be set for dynamic adjustments to take place. Default value: DISABLED Possible values = ENABLED, DISABLED
ka	<String>	Read-write	Send periodic TCP keep-alive (KA) probes to check if peer is still up. Default value: DISABLED Possible values = ENABLED, DISABLED
kaconnidletime	<Double>	Read-write	Duration, in seconds, for the connection to be idle, before sending a keep-alive (KA) probe. Minimum value = 1 Maximum value = 4095
kamaxprobes	<Double>	Read-write	Number of keep-alive (KA) probes to be sent when not acknowledged, before assuming the peer to be down.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 254
kaprobeinterval	<Double>	Read-write	Time interval, in seconds, before the next keep-alive (KA) probe, if the peer does not respond. Minimum value = 1 Maximum value = 4095
sendbuffsize	<Double>	Read-write	TCP Send Buffer Size. Default value: 8190 Minimum value = 8190 Maximum value = 20971520
mptcp	<String>	Read-write	Enable or disable Multipath TCP. Default value: DISABLED Possible values = ENABLED, DISABLED
establishclientconn	<String>	Read-write	Establishing Client Client connection on First data/ Final-ACK / Automatic.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: AUTOMATIC Possible values = AUTOMATIC, CONN_ESTABLISHED, ON_FIRST_DATA
tcpsegoffload	<String>	Read-write	Offload TCP segmentation to the NIC. If set to AUTOMATIC, TCP segmentation will be offloaded to the NIC, if the NIC supports it. Default value: AUTOMATIC Possible values = AUTOMATIC, DISABLED
rstwindowattenuate	<String>	Read-write	Enable or disable RST window attenuation to protect against spoofing. When enabled, will reply with corrective ACK when a sequence number is invalid. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rstmaxack	<String>	Read-write	Enable or disable acceptance of RST that is out of window yet echoes highest ACK sequence number. Useful only in proxy mode. Default value: DISABLED Possible values = ENABLED, DISABLED
spoofsyndrop	<String>	Read-write	Enable or disable drop of invalid SYN packets to protect against spoofing. When disabled, established connections will be reset when a SYN packet is received. Default value: ENABLED Possible values = ENABLED, DISABLED
ecn	<String>	Read-write	Enable or disable TCP Explicit Congestion Notification. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
mptcpdropdataonpreestsf	<String>	Read-write	Enable or disable silently dropping the data on Pre-Established subflow. When enabled, DSS data packets are dropped silently instead of dropping the connection when data is received on pre established subflow. Default value: DISABLED Possible values = ENABLED, DISABLED
mptcpfastopen	<String>	Read-write	Enable or disable Multipath TCP fastopen. When enabled, DSS data packets are accepted before receiving the third ack of SYN handshake. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mptcpsessiontimeout	<Double>	Read-write	MPTCP session timeout in seconds. If this value is not set, idle MPTCP sessions are flushed after vserver's client idle timeout. Default value: 0 Minimum value = 0 Maximum value = 86400
timestamp	<String>	Read-write	Enable or Disable TCP Timestamp option (RFC 1323). Default value: DISABLED Possible values = ENABLED, DISABLED
dsack	<String>	Read-write	Enable or disable DSACK. Default value: ENABLED Possible values = ENABLED, DISABLED
ackaggregation	<String>	Read-write	Enable or disable ACK Aggregation. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
frto	<String>	Read-write	Enable or disable FRTO (Forward RTO-Recovery). Default value: DISABLED Possible values = ENABLED, DISABLED
maxcwnd	<Double>	Read-write	TCP Maximum Congestion Window. Default value: 524288 Minimum value = 8190 Maximum value = 20971520
fack	<String>	Read-write	Enable or disable FACK (Forward ACK). Default value: DISABLED Possible values = ENABLED, DISABLED
tcpmode	<String>	Read-write	TCP Optimization modes TRANSPARENT / ENDPOINT.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: TRANSPARENT Possible values = TRANSPARENT, ENDPOINT
tcpfastopen	<String>	Read-write	Enable or disable TCP Fastopen. When enabled, NS can receive or send Data in SYN or SYN-ACK packets. Default value: DISABLED Possible values = ENABLED, DISABLED
hystart	<String>	Read-write	Enable or disable CUBIC Hystart. Default value: DISABLED Possible values = ENABLED, DISABLED
dupackthresh	<Double>	Read-write	TCP dupack threshold. Default value: 3 Minimum value = 1 Maximum value = 15
burstratecontrol	<String>	Read-write	TCP Burst Rate Control DISABLED/

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			FIXED/DYNAMIC. FIXED requires a TCP rate to be set. Default value: DISABLED Possible values = DISABLED, FIXED, DYNAMIC
tcprate	<Double>	Read-write	TCP connection payload send rate in Kb/s. Default value: 0 Minimum value = 0 Maximum value = 10000000
rateqmax	<Double>	Read-write	Maximum connection queue size in bytes, when BurstRateControl is used. Default value: 0 Minimum value = 0 Maximum value = 1000000000
drophalfclosedconnontimeout	<String>	Read-write	Silently drop tcp half closed connections on idle timeout. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
dropestconnontimeout	<String>	Read-write	Silently drop tcp established connections on idle timeout. Default value: DISABLED Possible values = ENABLED, DISABLED
applyadaptivetcp	<String>	Read-write	Apply Adaptive TCP optimizations. Default value: DISABLED Possible values = ENABLED, DISABLED
tcpfastopencookiesize	<Double>	Read-write	TCP FastOpen Cookie size. This accepts only even numbers. Odd number is trimmed down to nearest even number. Default value: 8 Minimum value = 4 Maximum value = 16
taillossprobe	<String>	Read-write	TCP tail loss probe optimizations.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
clientiptcpoption	<String>	Read-write	Client IP in TCP options. Default value: DISABLED Possible values = ENABLED, DISABLED
clientiptcpoptionnumber	<Double>	Read-write	ClientIP TCP Option number. Minimum value = 1 Maximum value = 254
refcnt	<Double>	Read-only	Number of entities using this profile.
builtin	<String[]>	Read-only	Flag to determine if tcp profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstcpprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nstcpprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nstcpprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nstcpprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nstcpprofile? **view=summary**

Use this query-parameter to get the summary output of nstcpprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nstcpprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nstcpprofile resources in chunks.

HTTP Method: GET

```

nstimeout

Configuration for timeout resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
zombie	<Double>	Read-write	Interval, in seconds, at which the Citrix ADC zombie cleanup process must run. This process cleans up inactive TCP connections. Default value: 120 Minimum value = 1 Maximum value = 600
client	<Double>	Read-write	Client idle timeout (in seconds). If zero, the service-type default value is taken when service is created. Default value: 0 Minimum value = 0 Maximum value = 18000
server	<Double>	Read-write	Server idle timeout (in seconds). If zero,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the service-type default value is taken when service is created. Default value: 0 Minimum value = 0 Maximum value = 18000
httpclient	<Double>	Read-write	Global idle timeout, in seconds, for client connections of HTTP service type. This value is over ridden by the client timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 18000
httpserver	<Double>	Read-write	Global idle timeout, in seconds, for server connections of HTTP service type. This value is over ridden by the server timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 18000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tcpclient	<Double>	Read-write	Global idle timeout, in seconds, for non-HTTP client connections of TCP service type. This value is over ridden by the client timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 18000
tcpserver	<Double>	Read-write	Global idle timeout, in seconds, for non-HTTP server connections of TCP service type. This value is over ridden by the server timeout that is configured on entities. Default value: 0 Minimum value = 0 Maximum value = 18000
anyclient	<Double>	Read-write	Global idle timeout, in seconds, for non-TCP client connections. This value is over ridden by the client timeout that is configured on individual entities.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 31536000
anyserver	<Double>	Read-write	Global idle timeout, in seconds, for non TCP server connections. This value is over ridden by the server timeout that is configured on individual entities. Default value: 0 Minimum value = 0 Maximum value = 31536000
anytcpclient	<Double>	Read-write	Global idle timeout, in seconds, for TCP client connections. This value takes precedence over entity level timeout settings (vserver/ service). This is applicable only to transport protocol TCP. Default value: 0 Minimum value = 0 Maximum value = 31536000

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
anytcpserver	<Double>	Read-write	Global idle timeout, in seconds, for TCP server connections. This value takes precedence over entity level timeout settings (vserver/ service). This is applicable only to transport protocol TCP. Default value: 0 Minimum value = 0 Maximum value = 31536000
halfclose	<Double>	Read-write	Idle timeout, in seconds, for connections that are in TCP half-closed state. Default value: 10 Minimum value = 1 Maximum value = 600
nontcpzombie	<Double>	Read-write	Interval at which the zombie clean-up process for non-TCP connections should run. Inactive IP NAT connections will be cleaned up. Default value: 60 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 600
reducedfintimeout	<Double>	Read-write	Alternative idle timeout, in seconds, for closed TCP NATPCB connections. Default value: 30 Minimum value = 1 Maximum value = 300
reducedrsttimeout	<Double>	Read-write	Timer interval, in seconds, for abruptly terminated TCP NATPCB connections. Default value: 0 Minimum value = 0 Maximum value = 300
newconnidletimeout	<Double>	Read-write	Timer interval, in seconds, for new TCP NATPCB connections on which no data was received. Default value: 4 Minimum value = 1 Maximum value = 120

Operations

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimeout

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstimeout":{
      "zombie":<Double_value>,
      "client":<Double_value>,
      "server":<Double_value>,
      "httpclient":<Double_value>,
      "httpserver":<Double_value>,
      "tcpclient":<Double_value>,
      "tcpserver":<Double_value>,
      "anyclient":<Double_value>,
      "anyserver":<Double_value>,
      "anytcpclient":<Double_value>,
      "anytcpserver":<Double_value>,
      "halfclose":<Double_value>,
      "nontcpzombie":<Double_value>,
      "reducedfintimeout":<Double_value>,
      "reducedrsttimeout":<Double_value>,
      "newconnidletimeout":<Double_value>
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimeout? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstimeout":{

      "zombie":true,

      "client":true,

      "reducedfintimeout":<Double_value>,

      "reducedrsttimeout":<Double_value>,

      "newconnidletimeout":<Double_value>

}]}
```

nstimer

Configuration for Timer resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Timer name. Minimum length = 1
interval	<Integer>	Read-write	The frequency at which the policies bound to this timer are invoked. The minimum value is 20 msec. The maximum value is 20940 in seconds and 349 in minutes. Default value: 5 Minimum value = 1 Maximum value = 20940000
unit	<String>	Read-write	Timer interval unit. Default value: SEC Possible values = SEC, MIN
comment	<String>	Read-write	Comments associated with this timer.
newname	<String>	Read-write	The new name of the timer. Minimum length = 1
__count	<Double>	Read-only	count parameter

```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nstimer resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **view=summary**

Use this query-parameter to get the summary output of nstimer resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nstimer resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstimer": [ {

      "name":<String_value>,

      "interval":<Integer_value>,

      "unit":<String_value>,

      "comment":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nstimer/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nstimer/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nstimer resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nstimer": [ {

      "name":<String_value>,

      "interval":<Integer_value>,

      "unit":<String_value>,

      "comment":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimer? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstimer": [ { "__count": "#no"} ] }
```

nstimer_autoscalepolicy_binding

Binding object showing the autoscalepolicy that can be bound to nstimer.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the timer policy.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
policyname	<String>	Read-write	The timer policy associated with the timer.
name	<String>	Read-write	Timer name. Minimum length = 1
threshold	<Double>	Read-write	Denotes the threshold. If the rule of the policy in the binding relation evaluates 'threshold size' number of times in 'sample size' to true, then the corresponding action is taken. Its value needs to be less than or equal to the sample size value.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 3 Minimum value = 1 Maximum value = 32
samplesize	<Double>	Read-write	Denotes the sample size. Sample size value of 'x' means that previous '(x - 1)' policy's rule evaluation results and the current evaluation result are present with the binding. For example, sample size of 10 means that there is a state of previous 9 policy evaluation results and also the current policy evaluation result. Default value: 3 Minimum value = 1 Maximum value = 32
vserver	<String>	Read-write	Name of the vserver which provides the context for the rule in timer policy. When not specified it is treated as a Global Default context.
__count	<Double>	Read-write	count parameter

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimezone

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nstimezone? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nstimezone? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nstimezone resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nstimezone? **view=summary**

Use this query-parameter to get the summary output of nstimezone resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nstimezone? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nstimezone resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstimezone": [ {

      "value":<String_value>,

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimezone/ value_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nstimezone/ value_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nstimezone/ value_value<String> ? **view=summary**

Use this query-parameter to get the summary output of nstimezone resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nstimezone": [ {

      "value":<String_value>,

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstimezone? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstimezone": [ { "__count": "#no"} ] }
```

nstrafficdomain

Configuration for Traffic Domain resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Double>	Read-write	Integer value that uniquely identifies a traffic domain. Minimum value = 1 Maximum value = 4094
aliasname	<String>	Read-write	Name of traffic domain being added. Minimum length = 1 Maximum length = 31
vmac	<String>	Read-write	Associate the traffic domain with a VMAC address instead of with VLANs. The Citrix ADC then

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			sends the VMAC address of the traffic domain in all responses to ARP queries for network entities in that domain. As a result, the ADC can segregate subsequent incoming traffic for this traffic domain on the basis of the destination MAC address, because the destination MAC address is the VMAC address of the traffic domain. After creating entities on a traffic domain, you can easily manage and monitor them by performing traffic domain level operations. Default value: DISABLED Possible values = ENABLED, DISABLED
state	<String>	Read-only	The state of TrafficDmain. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- CLEAR
- ENABLE
- DISABLE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstrafficdomain":{

<b>      "td":<Double_value>,

</b>      "aliasname":<String_value>,

      "vmac":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain/ td_value<Double>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

CLEAR

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **action=clear**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstrafficdomain":{

<b>      "td":<Double_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **action=enable**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstrafficdomain":{

<b>      "td":<Double_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DISABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **action=disable**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nstrafficdomain":{

<b>      "td":<Double_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nstrafficdomain resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **view=summary**

Use this query-parameter to get the summary output of nstrafficdomain resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nstrafficdomain resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain": [ {

      "td":<Double_value>,

      "aliasname":<String_value>,

      "vmac":<String_value>,

      "state":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain/ td_value<Double>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain/ td_value<Double> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain/ td_value<Double> ? **view=summary**

Use this query-parameter to get the summary output of nstrafficdomain resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nstrafficdomain": [ {

      "td":<Double_value>,
```

```
        "aliasname":<String_value>,

        "vmac":<String_value>,

        "state":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain": [ { "__count": "#no"} ] }
```

nstrafficdomain_binding

Binding object which returns the resources bound to nstrafficdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Double>	Read-write	Integer value that uniquely identifies a traffic domain. Minimum value = 1 Maximum value = 4094
nstrafficdomain_bridgegroup_binding	<nstrafficdomain_bridgegroup_binding[]>	Read-only	bridgegroup that can be bound to nstrafficdomain.
nstrafficdomain_vlan_binding	<nstrafficdomain_vlan_binding[]>	Read-only	vlan that can be bound to nstrafficdomain.
nstrafficdomain_vxlan_binding	<nstrafficdomain_vxlan_binding[]>	Read-only	vxlan that can be bound to nstrafficdomain.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_binding/ td_value<Double>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain_binding": [ {

      "td":<Double_value>,

      "nstrafficdomain_vlan_binding":<nstrafficdomain_vlan_binding[]_value
>,

      "nstrafficdomain_vxlan_binding":<nstrafficdomain_vxlan_binding[]_val
ue>,

      "nstrafficdomain_bridgegroup_binding":<nstrafficdomain_bridgegroup_b
inding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nstrafficdomain_binding": [ {

      "td":<Double_value>,

      "nstrafficdomain_vlan_binding":<nstrafficdomain_vlan_binding[]_value
>,

      "nstrafficdomain_vxlan_binding":<nstrafficdomain_vxlan_binding[]_val
ue>,

      "nstrafficdomain_bridgegroup_binding":<nstrafficdomain_bridgegroup_b
inding[]_value>

}]}
```

nstrafficdomain_bridgegroup_binding

Binding object showing the bridgegroup that can be bound to nstrafficdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
bridgegroup	<Double>	Read-write	ID of the configured bridge to bind to this traffic domain. More than one bridge group can be bound to a traffic domain, but the same bridge

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			group cannot be a part of multiple traffic domains. Minimum value = 1 Maximum value = 1000
td	<Double>	Read-write	Integer value that uniquely identifies a traffic domain. Minimum value = 1 Maximum value = 4094
__count	<Double>	Read-write	count parameter

Operations

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"nstrafficdomain_vlan_binding": [ { "__count": "#no"} ] }
```

nstrafficdomain_vxlan_binding

Binding object showing the vxlan that can be bound to nstrafficdomain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
td	<Double>	Read-write	Integer value that uniquely identifies a traffic domain.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 4094
vxlan	<Double>	Read-write	ID of the VXLAN to bind to this traffic domain. More than one VXLAN can be bound to a traffic domain, but the same VXLAN cannot be a part of multiple traffic domains. Minimum value = 1 Maximum value = 16777215
__count	<Double>	Read-write	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/nstrafficdomain_vxlan_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"nstrafficdomain_vxlan_binding":{

<b>      "td":<Double_value>,

</b>      "vxlan":<Double_value>
```

```
}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_vxlan_binding/ td_value<Double>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_vxlan_binding/ td_value<Double> ? **args=vxlan: <Double_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_vxlan_binding/ td_value<Double>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_vxlan_binding/ td_value<Double> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of nstrafficdomain_vxlan_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_vxlan_binding/ td_value<Double> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nstrafficdomain_vxlan_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nstrafficdomain_vxlan_binding": [ {

      "td":<Double_value>,

      "vxlan":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_vxlan_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_vxlan_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "nstrafficdomain_vxlan_binding": [ {

      "td":<Double_value>,

      "vxlan":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nstrafficdomain_vxlan_binding/td_value<Double> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"nstrafficdomain_vxlan_binding": [ { "__count": "#no"} ] }
```

nsvariable

Configuration for variable resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Variable name. This follows the same syntax rules as other

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression entity names: It must begin with an alpha character (A-Z or a-z) or an underscore (_). The rest of the characters must be alpha, numeric (0-9) or underscores. It cannot be re or xp (reserved for regular and XPath expressions). It cannot be an expression reserved word (e.g. SYS or HTTP). It cannot be used for an existing expression object (HTTP callout, patset, dataset, stringmap, or named expression). Minimum length = 1
type	<String>	Read-write	Specification of the variable type; one of the following: ulong - singleton variable with an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			unsigned 64-bit value. text(value-max-size) - singleton variable with a text string value. map(text(key-max-size),ulong,max-entries) - map of text string keys to unsigned 64-bit values. map(text(key-max-size),text(value-max-size),max-entries) - map of text string keys to text string values. where value-max-size is a positive integer that is the maximum number of bytes in a text string value. key-max-size is a positive integer that is the maximum number of bytes in a text string key. max-entries is a positive integer that is the maximum

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			number of entries in a map variable. For a global singleton text variable, value-max-size <= 64000. For a global map with ulong values, key-max-size <= 64000. For a global map with text values, key-max-size + value-max-size <= 64000. max-entries is a positive integer that is the maximum number of entries in a map variable. This has a theoretical maximum of 2\^64-1, but in actual use will be much smaller, considering the memory available for use by the map. Example: map(text(10),text(20),100) specifies a map of text string

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			keys (max size 10 bytes) to text string values (max size 20 bytes), with 100 max entries. Minimum length = 1
scope	<String>	Read-write	Scope of the variable: global - (default) one set of values visible across all Packet Engines on a standalone Citrix ADC, an HA pair, or all nodes of a cluster transaction - one value for each request-response transaction (singleton variables only; no expiration). Default value: global Possible values = global, transaction
iffull	<String>	Read-write	Action to perform if an assignment to a map exceeds its configured max-entries:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			lru - (default) reuse the least recently used entry in the map. undef - force the assignment to return an undefined (Undef) result to the policy executing the assignment. Default value: lru Possible values = undef, lru
ifvaluetoobig	<String>	Read-write	Action to perform if an value is assigned to a text variable that exceeds its configured max-size, or if a key is used that exceeds its configured max-size: truncate - (default) truncate the text string to the first max-size bytes and proceed. undef - force the assignment or expression evaluation to return an undefined (Undef) result to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy executing the assignment or expression. Default value: truncate Possible values = undef, truncate
ifnovalue	<String>	Read-write	Action to perform if on a variable reference in an expression if the variable is single-valued and uninitialized or if the variable is a map and there is no value for the specified key: init - (default) initialize the single-value variable, or create a map entry for the key and the initial value, using the -init value or its default. undef - force the expression evaluation to return an undefined (Undef) result to the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy executing the expression. Default value: init Possible values = undef, init
init	<String>	Read-write	Initialization value for this variable, to which a singleton variable or map entry will be set if it is referenced before an assignment action has assigned it a value. If the singleton variable or map entry already has been assigned a value, setting this parameter will have no effect on that variable value. Default: 0 for ulong, NULL for text.
expires	<Double>	Read-write	Value expiration in seconds. If the value is not referenced within the expiration period it will be deleted. 0 (the default) means no expiration. Minimum value = 0 Maximum value = 31622400

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Comments associated with this variable.
referencecount	<Double>	Read-only	The number of references to the variable in expressions and assignments.
__count	<Double>	Read-only	count parameter

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsvpxparam? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsvpxparam": [ { "__count": "#no"} ] }
```

nsweblogparam

Configuration for Web log parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
buffersizemb	<Double>	Read-write	Buffer size, in MB, allocated for log transaction data on the system. The maximum value is limited to the memory available on the system. Default value: 16 Minimum value = 1 Maximum value = 4294967294LU
customreqhdrs	<String[]>	Read-write	Name(s) of HTTP request headers whose values should be exported by the Web Logging feature. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
customrsphdrs	<String[]>	Read-write	Name(s) of HTTP response headers whose values should be exported by the Web Logging feature. Minimum length = 1
builtin	<String[]>	Read-only	Flag to determine if log bufs is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsweblogparam

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsweblogparam":{

      "buffersizemb":<Double_value>,

      "customreqhdrs":<String[]_value>,

      "customrsphdrs":<String[]_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsweblogparam? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"nsweblogparam":{

      "buffersizemb":true,

      "customreqhdrs":true,

      "customrsphdrs":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsweblogparam

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsweblogparam": [ {

      "buffersizemb":<Double_value>,

      "customreqhdrs":<String[]_value>,

      "customrsphdrs":<String[]_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>

}]}
```

nsxmlnamespace

Configuration for XML namespace resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
prefix	<String>	Read-write	XML prefix. Minimum length = 1
Namespace	<String>	Read-write	Expanded namespace for which the XML prefix is provided. Minimum length = 1
description	<String>	Read-write	Description for the prefix. Minimum length = 1
__count	<Double>	Read-only	count parameter

      "description":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsxmlnamespace

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsxmlnamespace? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/nsxmlnamespace? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of nsxmlnamespace resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsxmlnamespace? **view=summary**

Use this query-parameter to get the summary output of nsxmlnamespace resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/nsxmlnamespace? **pagesize=#no;pageno=#no**

Use this query-parameter to get the nsxmlnamespace resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "nsxmlnamespace": [ {

      "prefix":<String_value>,

      "Namespace":<String_value>,

      "description":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/nsxmlnamespace/ prefix_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/nsxmlnamespace/ prefix_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/nsxmlnamespace/ prefix_value<String> ?**view=summary**

Use this query-parameter to get the summary output of nsxmlnamespace resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Response Payload:

```
{ "nsxmlnamespace": [ { "__count": "#no"} ] }
```

reboot

Configuration for 0 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
warm	<Boolean>	Read-write	Restarts the Citrix ADC software without rebooting the underlying operating system. The session terminates and you must log on to the appliance after it has restarted.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: This argument is required only for nCore appliances. Classic appliances ignore this argument.

Operations

(click to see Properties)

- REBOOT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

REBOOT

URL: http:// <netscaler-ip-address> /nitro/v1/config/reboot

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"reboot":{

      "warm":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

shutdown

Configuration for 0 resource.

{"shutdown":{

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ntp

NTP

NTP configuration.

NAME	DESCRIPTION
ntpparam	Configuration for NTP parameter
ntpserver	Configuration for NTP server
ntpstatus	Configuration for ntp status
ntpsync	Configuration for NTP sync

ntpparam

Configuration for NTP parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
authentication	<String>	Read-write	Apply NTP authentication, which enables the NTP client (Citrix ADC) to verify that the server is in fact known and trusted. Default value: YES Possible values = YES, NO
trustedkey	<Double[]>	Read-write	Key identifiers that are trusted for server authentication with symmetric key cryptography in the keys file. Minimum value = 1 Maximum value = 65534
autokeylogsec	<Double>	Read-write	Autokey protocol requires the keys to be refreshed periodically. This parameter specifies the interval between regenerations of new session keys. In seconds, expressed as a power of 2. Default value: 12 Minimum value = 0 Maximum value = 32

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
revokelogsec	<Double>	Read-write	Interval between re-randomizations of the autokey seeds to prevent brute-force attacks on the autokey algorithms. Default value: 16 Minimum value = 0 Maximum value = 32

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
response	<String>	Read-write	.

Operations

(click to see Properties)

- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ntpstatus

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ntpstatus": [ {

      "response":<String_value>

}]}
```

ntpsync

Configuration for NTP sync resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
state	<String>	Read-write	Show NTP status. Possible values = ENABLED, DISABLED

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ntpsync": [ {

      "state":<String_value>

}]}
```

pcp

Pcp

Port Control Protocol Configuration.

NAME	DESCRIPTION
pcpmap	Configuration for server
pcpprofile	Configuration for PCP Profile
pcpserver	Configuration for server

pcpmap

Configuration for server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
nattype	<String>	Read-write	Type of sessions to be displayed. Default value: NAT44

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = NAT44, DS-Lite, NAT64
pcpsrcip	<String>	Read-only	Internal IP address.
subscrip	<String>	Read-only	IPV4 src address of Client in DS-Lite.
pcpsrcport	<Integer>	Read-only	Internal Port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
pcpdstip	<String>	Read-only	Remote PEER IP address.
pcpdstport	<Integer>	Read-only	Remote PEER Port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
pcpnatip	<String>	Read-only	External IP address.
pcpnatport	<Integer>	Read-only	External Port Number. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pcpprotocol	<String>	Read-only	Protocol of the PCP mapping. Possible values = HopOpt, icmp, igmp, ggp, ipv4, st, tcp, udp
pcpaddr	<Double>	Read-only	Address of PCP Map entity.
pcpnounce	<Double>	Read-only	PCP Mapping Nounce.
pcprefcnt	<Double>	Read-only	Refcount, which indicates how many session is active.
pcplifetime	<Double>	Read-only	Integer value that shows the requested lifetime.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/pcpmap

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **args=nattype: <String_value>**

Use this query-parameter to get pcpmap resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of pcpmap resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **view=summary**

Use this query-parameter to get the summary output of pcpmap resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **pagesize=#no;pageno=#no**

Use this query-parameter to get the pcpmap resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "pcpmap": [ {

nattype:<String_value>      "pcpsrcip":<String_value>,

      "subscrip":<String_value>,

      "pcpsrcport":<Integer_value>,

      "pcpdstip":<String_value>,
```

```
        "pcpdstport":<Integer_value>,

        "pcpnatip":<String_value>,

        "pcpnatport":<Integer_value>,

        "pcpprotocol":<String_value>,

        "pcpaddr":<Double_value>,

        "pcpnounce":<Double_value>,

        "pcprefcnt":<Double_value>,

        "pcplifetime":<Double_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/pcpmap? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "pcpmap": [ { "__count": "#no"} ] }
```

pcpprofile

Configuration for PCP Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the PCP Profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my pcpProfile" or my pcpProfile).
mapping	<String>	Read-write	This argument is for enabling/disabling the MAP opcode of current PCP Profile. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
peer	<String>	Read-write	This argument is for enabling/disabling the PEER opcode of current PCP Profile. Default value: ENABLED Possible values = ENABLED, DISABLED
minmaplife	<Double>	Read-write	Integer value that identify the minimum mapping lifetime (in seconds) for a pcp profile. default(120s). Minimum value = 1 Maximum value = 2147483647
maxmaplife	<Double>	Read-write	Integer value that identify the maximum mapping lifetime (in seconds) for a pcp profile. default(86400s = 24Hours). Minimum value = 1 Maximum value = 2147483647
announcemulticount	<Double>	Read-write	Integer value that identify the number

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			announce message to be send. Default value: 10 Minimum value = 0 Maximum value = 65535
thirdparty	<String>	Read-write	This argument is for enabling/disabling the THIRD PARTY opcode of current PCP Profile. Default value: DISABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "pcpserver": [ { "__count": "#no"} ] }
```

policy

Policy

Policy configuration.

NAME	DESCRIPTION
policydataset	Configuration for TYPE set
policydataset_binding	Binding object showing the resources that can be bound to policydataset
policydataset_value_binding	Binding object showing the value that can be bound to policydataset
policyevaluation	Configuration for expr evaluation
policyexpression	Configuration for expression
policyhttpcallout	Configuration for HTTP callout
policymap	Configuration for map policy
policyparam	Configuration for policy parameter
policypatset	Configuration for PAT set
policypatset_binding	Binding object showing the resources that can be bound to policypatset
policypatset_pattern_binding	Binding object showing the pattern that can be bound to policypatset
policystringmap	Configuration for string map
policystringmap_binding	Binding object showing the resources that can be bound to policystringmap

NAME	DESCRIPTION
policystringmap_pattern_binding	Binding object showing the pattern that can be bound to policystringmap
policyurlset	Configuration for URL set

policydataset

Configuration for TYPE set resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the dataset. Must not exceed 127 characters. Minimum length = 1
type	<String>	Read-write	Type of value to bind to the dataset. Possible values = ipv4, number, ipv6, ulong, double, mac
indextype	<String>	Read-write	Index type. Possible values = Auto-generated, User-defined
comment	<String>	Read-write	Any comments to preserve information about this dataset or a data bound to this dataset.
description	<String>	Read-only	Description of the set.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policydataset":{

<b>      "name":<String_value>,

</b><b>      "type":<String_value>,

</b>      "indextype":<String_value>,

      "comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policydataset resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **view=summary**

Use this query-parameter to get the summary output of policydataset resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policydataset resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policydataset": [ {

      "name":<String_value>,

      "description":<String_value>,

      "type":<String_value>,

      "indextype":<String_value>,

      "comment":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/policydataset/ name_value<String> ?
attrs=property-name1,property-name2

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/policydataset/ name_value<String> ?
view=summary

Use this query-parameter to get the summary output of policydataset resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policydataset": [ {

      "name":<String_value>,

      "description":<String_value>,

      "type":<String_value>,
```

```
        "indextype":<String_value>,

        "comment":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policydataset": [ { "__count": "#no"} ] }
```

policydataset_binding

Binding object which returns the resources bound to policydataset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the dataset. Must not exceed 127 characters. Minimum length = 1
policydataset_value_binding	<policydataset_value_binding[]>	Read-only	value that can be bound to policydataset.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policydataset_binding": [ {

      "name":<String_value>,

      "policydataset_value_binding":<policydataset_value_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policydataset_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/policydataset_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policydataset_binding": [ {

      "name":<String_value>,

      "policydataset_value_binding":<policydataset_value_binding[]_value>

}]}
```

policydataset_value_binding

Binding object showing the value that can be bound to policydataset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
value	<String>	Read-write	Value of the specified type that is associated with the dataset.
name	<String>	Read-write	Name of the dataset to which to bind the value. Minimum length = 1
index	<Double>	Read-write	The index of the value (ipv4, ipv6, number) associated with the set.
comment	<String>	Read-write	Any comments to preserve information about this dataset or a data bound to this dataset.
endrange	<String>	Read-write	The dataset entry is a range from <value> through <end_range>, inclusive.
__count	<Double>	Read-write	count parameter

```

policyevaluation

Configuration for expr evaluation resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
expression	<String>	Read-write	Expression string. For example: http.req.body(100).contains("this").
action	<String>	Read-write	Rewrite action name. Supported rewrite action types are: -delete -delete_all -delete_http_header -insert_after -insert_after_all -insert_before -insert_before_all -insert_http_header

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-replace -replace_all . Minimum length = 1
type	<String>	Read-write	Indicates request or response input packet. Possible values = HTTP_REQ, HTTP_RES, TEXT
input	<String>	Read-write	Text representation of input packet.
pitmodifiedinputdata	<String>	Read-only	Text representation of packet after evaluating expression or rewrite action.
pitboolresult	<Boolean>	Read-only	Result of the expression in bool format.
pitnumresult	<Double>	Read-only	Result of the expression in num format.
pitdoubleresult	<Double>	Read-only	Result of the expression in double format.
pitulongresult	<Double>	Read-only	Result of the expression in unsigned long format.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pitrefresult	<String>	Read-only	Result of the expression in string format.
pitoffsetresult	<Double>	Read-only	Offset of the resultant sting.
pitoffsetresultlen	<Double>	Read-only	Offset length of the resultant sting.
istruncatedrefresult	<Boolean>	Read-only	Identify whether ref result is truncated result.
pitboolevaltime	<Double>	Read-only	Average evaluation time of bool type expression in nanoseconds.
pitnumevaltime	<Double>	Read-only	Average evaluation time of num type expression in nanoseconds.
pitdoubleevaltime	<Double>	Read-only	Average evaluation time of double type expression in nanoseconds.
pitulongevaltime	<Double>	Read-only	Average evaluation time of unsigned long type expression in nanoseconds.
pitrefevaltime	<Double>	Read-only	Average evaluation time of string type expression in nanoseconds.
pitoffsetevaltime	<Double>	Read-only	Average evaluation time in finding offset of the resultant string

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			in the input. Time is in nanoseconds.
pitactionevaltime	<Double>	Read-only	Average evaluation time of rewrite action in nanoseconds.
pitoperationperformerarray	<String[]>	Read-only	Details of the operation Citrix ADC performed at various offsets during applying of rewrite action on input data. Operation can be insertion, modfication or deletion. Possible values = INSERT, MODIFY, DELETE
pitoldoffsetarray	<Double[]>	Read-only	Details of the offsets in the input data at which Citrix ADC either inserted or modified or deleted data during applying of rewrite action.
pitnewoffsetarray	<Double[]>	Read-only	Details of the offsets in the output data at which Citrix ADC either inserted or modified or deleted data during applying of rewrite action.
pitoffsetlengtharray	<Double[]>	Read-only	Details of the lengths of the data which Citrix ADC modified or deleted during

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			applying of rewrite action.
pitoffsetnewlengtharray	<Double[]>	Read-only	Details of the lengths of the data which Citrix ADC either inserted or modified during applying of rewrite action.
pitboolerrorresult	<String>	Read-only	Result of the bool type expression if any error occurs during evaluation. Result will be in string format.
pitnumerrorresult	<String>	Read-only	Result of the num type expression if any error occurs during evaluation. Result will be in string format.
pitdoubleerrorresult	<String>	Read-only	Result of the double type expression if any error occurs during evaluation. Result will be in string format.
pitulongerrorresult	<String>	Read-only	Result of the unsigned long type expression if any error occurs during evaluation. Result will be in string format.
pitreferrorresult	<String>	Read-only	Result of the ref type expression if any error occurs during

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			evaluation. Result will be in string format.
pitoffseterrorresult	<String>	Read-only	Result of the expression if any error occurs in calculating offset. Result will be in string format.
pitactionerrorresult	<String>	Read-only	Result of the action if any error occurs in evaluation. Result will be in string format.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyevaluation

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/policyevaluation? **args=expression: <String_value> ,action: <String_value> , type:<String_value>, input:<String_value>,**

Use this query-parameter to get policyevaluation resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/policyevaluation? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/policyevaluation? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policyevaluation resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/policyevaluation? **view=summary**

Use this query-parameter to get the summary output of policyevaluation resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/policyevaluation? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policyevaluation resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

{ "policyevaluation": [ { "__count": "#no"} ] }
```

policyexpression

Configuration for expression resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name for the expression. Not case sensitive. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Must not begin with 're' or 'xp' or be a word reserved for use as an expression qualifier prefix (such as HTTP) or enumeration value (such as ASCII). Must not be the name of an existing named expression, pattern set, dataset, stringmap, or HTTP callout. Minimum length = 1
value	<String>	Read-write	Expression string. For example: http.req.body(100).contains("this").
description	<String>	Read-write	Description for the expression.
comment	<String>	Read-write	Any comments associated with the expression. Displayed upon viewing the policy expression.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientsecuritymessage	<String>	Read-write	Message to display if the expression fails. Allowed for classic end-point check expressions only. Minimum length = 1
type	<String>	Read-write	Type of expression. Can be a classic or default syntax (advanced) expression. Possible values = CLASSIC, ADVANCED
hits	<Double>	Read-only	The total number of hits.
pihits	<Double>	Read-only	The total number of hits.
type1	<String>	Read-only	The type of expression. This is for output only. Possible values = CLASSIC, ADVANCED
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default policy expression.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyexpression

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policyexpression":{

<b>      "name":<String_value>,

</b><b>      "value":<String_value>,

</b>      "description":<String_value>,

      "comment":<String_value>,

      "clientsecuritymessage":<String_value>
```

```
}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyexpression/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyexpression

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policyexpression":{

<b>      "name":<String_value>,
```

```
</b>      "value":<String_value>,

      "description":<String_value>,

      "comment":<String_value>,

      "clientsecuritymessage":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyexpression? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policyexpression":{

<b>      "name":<String_value>,

</b>      "description":true,

      "comment":true,

      "clientsecuritymessage":true
```

```
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyexpression

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/policyexpression? **args=name: <String_value> ,type: <String_value>**

Use this query-parameter to get policyexpression resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/policyexpression? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/policyexpression? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policyexpression resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/policyexpression? **view=summary**

Use this query-parameter to get the summary output of policyexpression resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/policyexpression? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policyexpression resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policyexpression": [ {

name:<String_value>,type:<String_value>      "value":<String_value>,

      "hits":<Double_value>,

      "pihits":<Double_value>,

      "type1":<String_value>,

      "clientsecuritymessage":<String_value>,

      "description":<String_value>,
```

```
        "comment":<String_value>,

        "isdefault":<Boolean_value>,

        "builtin":<String[]_value>,

        "feature":<String_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyexpression/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/policyexpression/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/policyexpression/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of policyexpression resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policyexpression": [ {

name:<String_value>,type:<String_value>      "value":<String_value>,

      "hits":<Double_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyexpression? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policyexpression": [ { "__count": "#no"} ] }
```

policyhttpcallout

Configuration for HTTP callout resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the HTTP callout. Not case sensitive. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Must not begin with 're' or 'xp' or be a word

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			reserved for use as an expression qualifier prefix (such as HTTP) or enumeration value (such as ASCII). Must not be the name of an existing named expression, pattern set, dataset, stringmap, or HTTP callout. Minimum length = 1
ipaddress	<String>	Read-write	IP Address of the server (callout agent) to which the callout is sent. Can be an IPv4 or IPv6 address. Mutually exclusive with the Virtual Server parameter. Therefore, you cannot set the <IP Address, Port> and the Virtual Server in the same HTTP callout.
port	<Integer>	Read-write	Server port to which the HTTP callout agent is mapped. Mutually exclusive with the Virtual Server parameter. Therefore, you cannot set the <IP Address, Port> and the Virtual Server in

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the same HTTP callout. Minimum value = 1
vserver	<String>	Read-write	Name of the load balancing, content switching, or cache redirection virtual server (the callout agent) to which the HTTP callout is sent. The service type of the virtual server must be HTTP. Mutually exclusive with the IP address and port parameters. Therefore, you cannot set the <IP Address, Port> and the Virtual Server in the same HTTP callout. Minimum length = 1
returntype	<String>	Read-write	Type of data that the target callout agent returns in response to the callout. Available settings function as follows: * TEXT - Treat the returned value as a text string. * NUM - Treat the returned value as a number.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* BOOL - Treat the returned value as a Boolean value. Note: You cannot change the return type after it is set. Possible values = BOOL, NUM, TEXT
httpmethod	<String>	Read-write	Method used in the HTTP request that this callout sends. Mutually exclusive with the full HTTP request expression. Possible values = GET, POST
hostexpr	<String>	Read-write	String expression to configure the Host header. Can contain a literal value (for example, 10.101.10.11) or a derived value (for example, http.req.header("Host")). The literal value can be an IP address or a fully qualified domain name. Mutually exclusive with the full HTTP request expression. Minimum length = 1
urlstemexpr	<String>	Read-write	String expression for generating the URL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			stem. Can contain a literal string (for example, "/mysite/index.html") or an expression that derives the value (for example, http.req.url). Mutually exclusive with the full HTTP request expression. Minimum length = 1
headers	<String[]>	Read-write	One or more headers to insert into the HTTP request. Each header is specified as "name(expr)", where expr is an expression that is evaluated at runtime to provide the value for the named header. You can configure a maximum of eight headers for an HTTP callout. Mutually exclusive with the full HTTP request expression.
parameters	<String[]>	Read-write	One or more query parameters to insert into the HTTP request URL (for a GET request) or into the request body (for a POST request). Each parameter is specified as

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"name(expr)", where expr is an expression that is evaluated at run time to provide the value for the named parameter (name=value). The parameter values are URL encoded. Mutually exclusive with the full HTTP request expression.
bodyexpr	<String>	Read-write	An advanced string expression for generating the body of the request. The expression can contain a literal string or an expression that derives the value (for example, client.ip.src). Mutually exclusive with -fullReqExpr. Minimum length = 1
fullreqexpr	<String>	Read-write	Exact HTTP request, in the form of an expression, which the Citrix ADC sends to the callout agent. If you set this parameter, you must not include HTTP method, host expression, URL stem expression, headers, or parameters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			The request expression is constrained by the feature for which the callout is used. For example, an HTTP.RES expression cannot be used in a request-time policy bank or in a TCP content switching policy bank. The Citrix ADC does not check the validity of this request. You must manually validate the request. Minimum length = 1
scheme	<String>	Read-write	Type of scheme for the callout server. Possible values = http, https
resultexpr	<String>	Read-write	Expression that extracts the callout results from the response sent by the HTTP callout agent. Must be a response based expression, that is, it must begin with HTTP.RES. The operations in this expression must

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			match the return type. For example, if you configure a return type of TEXT, the result expression must be a text based expression. If the return type is NUM, the result expression (resultExpr) must return a numeric value, as in the following example: http.res.body(10000) .length. Minimum length = 1
cacheforsecs	<Double>	Read-write	Duration, in seconds, for which the callout response is cached. The cached responses are stored in an integrated caching content group named "calloutContentGroup". If no duration is configured, the callout responses will not be cached unless normal caching configuration is used to cache them. This parameter takes precedence over any normal caching configuration that would otherwise apply to these responses.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note that the calloutContentGroup definition may not be modified or removed nor may it be used with other cache policies. Minimum value = 1 Maximum value = 31536000
comment	<String>	Read-write	Any comments to preserve information about this HTTP callout.
hits	<Double>	Read-only	Total hits.
undefhits	<Double>	Read-only	Total undefs.
svrstate	<String>	Read-only	The state of the service. Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
effectivestate	<String>	Read-only	The effective state of the service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = UP, DOWN, UNKNOWN, BUSY, OUT OF SERVICE, GOING OUT OF SERVICE, DOWN WHEN GOING OUT OF SERVICE, NS_EMPTY_STR, Unknown, DISABLED
undefreason	<String>	Read-only	Reason for last undef. Possible values = Failed to add service, Vserver not found, Not a HTTP or SSL vserver, Generated callout request is invalid, Content-Length header not found in callout request, Not enough space to put Content-Length value, Config incomplete, Server is DOWN, Creating callout connection failed, No memory to generate callout request packets, No memory to create callout task, No memory to create

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			callout async, Callout request expression undef, No callout response expression, Skipped callout response eval, Callout response pixl init undef, Callout response expression undef
recursivecallout	<Double>	Read-only	Number of recursive callouts.
__count	<Double>	Read-only	count parameter

Operations

```

policymap

Configuration for map policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
mappolicyname	<String>	Read-write	Name for the map policy. Must begin with a letter, number, or the underscore (_) character and must consist only of letters, numbers, and the hash (#), period (.), colon (:), space ( ), at (@), equals (=), hyphen (-), and underscore (_) characters. CLI Users: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my map" or 'my map'). Minimum length = 1
sd	<String>	Read-write	Publicly known source domain name. This is the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			domain name with which a client request arrives at a reverse proxy virtual server for cache redirection. If you specify a source domain, you must specify a target domain. Minimum length = 1
su	<String>	Read-write	Source URL. Specify all or part of the source URL, in the following format: /[[prefix] [*]] [.suffix]. Minimum length = 1
td	<String>	Read-write	Target domain name sent to the server. The source domain name is replaced with this domain name. Minimum length = 1
tu	<String>	Read-write	Target URL. Specify the target URL in the following format: /[[prefix] [*]][.suffix]. Minimum length = 1
targetname	<String>	Read-only	The expression string.
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/policymap

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policymap":{

<b>      "mappolicyname":<String_value>,

</b><b>      "sd":<String_value>,

</b>      "su":<String_value>,

      "td":<String_value>,

      "tu":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policymap/ mappolicyname_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policymap

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/policymap? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/policymap? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policymap resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/policymap? **view=summary**

Use this query-parameter to get the summary output of policymap resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/policymap? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policymap resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policymap": [ {

      "mappolicyname":<String_value>,

      "sd":<String_value>,

      "su":<String_value>,

      "td":<String_value>,

      "tu":<String_value>,

      "targetname":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policymap/ mappolicyname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/policymap/ mappolicyname_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/policymap/ mappolicyname_value<String> ?**view=summary**

Use this query-parameter to get the summary output of policymap resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policymap": [ {

      "mappolicyname":<String_value>,

      "sd":<String_value>,

      "su":<String_value>,

      "td":<String_value>,

      "tu":<String_value>,

      "targetname":<String_value>
```

```
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policymap? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policymap": [ { "__count": "#no"} ] }
```

policyparam

Configuration for policy parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeout	<Double>	Read-write	Maximum time in milliseconds to allow for processing expressions without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed. Default value: 3900 Minimum value = 1 Maximum value = 5000

Operations

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policyparam": [ {

      "timeout":<Double_value>

}]}
```

policypatset

Configuration for PAT set resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name of the pattern set. Not case sensitive. Must begin with an ASCII letter or underscore (_) character and must contain only alphanumeric and underscore characters. Must not be the name of an existing named expression, pattern set, dataset, string

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			map, or HTTP callout. Minimum length = 1
indextype	<String>	Read-write	Index type. Possible values = Auto-generated, User-defined
comment	<String>	Read-write	Any comments to preserve information about this patset or a pattern bound to this patset.
description	<String>	Read-only	Description of the patset.
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policypatset": [ { "__count": "#no"} ] }
```

policypatset_binding

Binding object which returns the resources bound to policypatset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the pattern set for which to display the detailed information. If a name is not provided, a list of all pattern sets configured on the appliance is shown. Minimum length = 1
policypatset_pattern_binding	<policypatset_pattern_binding[]>	Read-only	pattern that can be bound to policypatset.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policypatset_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policypatset_binding": [ {

      "name":<String_value>,

      "policypatset_pattern_binding":<policypatset_pattern_binding[]_value
>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policypatset_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/policypatset_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policypatset_binding": [ {

      "name":<String_value>,

      "policypatset_pattern_binding":<policypatset_pattern_binding[]_value
>

}]}
```

policypatset_pattern_binding

Binding object showing the pattern that can be bound to policypatset.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
String	<String>	Read-write	String of characters that constitutes a pattern. For more information about the characters that can be used, refer to the character set parameter. Note: Minimum length for pattern sets used in rewrite actions of type REPLACE_ALL, DELETE_ALL, INSERT_AFTER_ALL, and INSERT_BEFORE_ALL, is three characters.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-write	The feature to be checked while applying this config.
builtin	<String[]>	Read-write	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
name	<String>	Read-write	Name of the pattern set to which to bind the string. Minimum length = 1
charset	<String>	Read-write	Character set associated with the characters in the string. Note: UTF-8 characters can be entered directly (if the UI supports it) or can be encoded as a sequence of hexadecimal bytes '\xNN'. For example, the UTF-8 character 'ü' can be encoded as '\xC3\xBC'. Possible values = ASCII, UTF_8
index	<Double>	Read-write	The index of the string associated with the patset.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Any comments to preserve information about this patset or a pattern bound to this patset.
__count	<Double>	Read-write	count parameter

policystringmap

Configuration for string map resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name for the string map. Not case sensitive. Must begin with an ASCII letter or underscore (_) character, and must consist only of ASCII alphanumeric or underscore characters. Must not begin with 're' or 'xp' or be a word reserved for use as an expression qualifier prefix (such as HTTP) or enumeration value (such as ASCII). Must not be the name of an existing named expression, pattern set, dataset, string map, or HTTP callout. Minimum length = 1
comment	<String>	Read-write	Comments associated with the string map or key-value pair bound to this string map.
__count	<Double>	Read-only	count parameter

Operations

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policystringmap":{

<b>      "name":<String_value>,

</b>      "comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policystringmap":{

<b>      "name":<String_value>,

</b>      "comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"policystringmap":{

<b>      "name":<String_value>,

</b>      "comment":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of policystringmap resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **view=summary**

Use this query-parameter to get the summary output of policystringmap resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policystringmap resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policystringmap": [ {

      "name":<String_value>,

      "comment":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap/ name_value<String> ?
attrs=property-name1,property-name2

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap/ name_value<String> ?
view=summary

Use this query-parameter to get the summary output of policystringmap resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policystringmap": [ {

      "name":<String_value>,

      "comment":<String_value>
```

```
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policystringmap": [ { "__count": "#no"} ] }
```

policystringmap_binding

Binding object which returns the resources bound to policystringmap.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the string map to display. If a name is not provided, a list of all the configured string maps is shown. Minimum length = 1
policystringmap_pattern_binding	<policystringmap_pattern_binding[]>	Read-only	pattern that can be bound to policystringmap.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policystringmap_binding": [ {

      "name":<String_value>,

      "policystringmap_pattern_binding":<policystringmap_pattern_binding[]
_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "policystringmap_binding": [ {

      "name":<String_value>,

      "policystringmap_pattern_binding":<policystringmap_pattern_binding[]
_value>

}]}
```

policystringmap_pattern_binding

Binding object showing the pattern that can be bound to policystringmap.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
value	<String>	Read-write	Character string constituting the value associated with the key. This value is returned when processed data matches the associated key. Refer to the key parameter for details of the value character set. Minimum length = 1
name	<String>	Read-write	Name of the string map to which to bind the key-value pair. Minimum length = 1
key	<String>	Read-write	Character string constituting the key to be bound to the string map. The key is matched against the data processed by the operation that uses the string map. The default character set is ASCII. UTF-8 characters can be included if the character set is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			UTF-8. UTF-8 characters can be entered directly (if the UI supports it) or can be encoded as a sequence of hexadecimal bytes '\xNN'. For example, the UTF-8 character 'ü' can be encoded as '\xC3\xBC'. Minimum length = 1
comment	<String>	Read-write	Comments associated with the string map or key-value pair bound to this string map.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/policystringmap_pattern_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"policystringmap_pattern_binding":{

<b>      "name":<String_value>,

</b><b>      "key":<String_value>,
```

```
</b><b>      "value":<String_value>,

</b>      "comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_pattern_binding/ name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_pattern_binding/ name_value<String> ? **args= key:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_pattern_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_pattern_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of policystringmap_pattern_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_pattern_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the policystringmap_pattern_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policystringmap_pattern_binding": [ {

      "value":<String_value>,

      "name":<String_value>,
```

```
      "key":<String_value>,

      "comment":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_pattern_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_pattern_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "policystringmap_pattern_binding": [ {
```

```
        "value":<String_value>,

        "name":<String_value>,

        "key":<String_value>,

        "comment":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/policystringmap_pattern_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"policystringmap_pattern_binding": [ { "__count": "#no"} ] }
```

policyurlset

Configuration for URL set resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Unique name of the url set. Not case sensitive. Must begin with an ASCII letter or underscore (_) character and must contain only alphanumeric and underscore characters. Must not be the name of an existing named expression, pattern set, dataset, string map, or HTTP callout. Minimum length = 1 Maximum length = 127
comment	<String>	Read-write	Any comments to preserve information about this url set.
imported	<Boolean>	Read-write	when set, display shows all imported urlsets. Default value: 0
overwrite	<Boolean>	Read-write	Overwrites the existing file. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
delimiter	<String>	Read-write	CSV file record delimiter. Default value: 44
rowseparator	<String>	Read-write	CSV file row separator. Default value: 10
url	<String>	Read-write	URL (protocol, host, path and file name) from where the CSV (comma separated file) file will be imported or exported. Each record/line will one entry within the urlset. The first field contains the URL pattern, subsequent fields contains the metadata, if available. HTTP, HTTPS and FTP protocols are supported. NOTE: The operation fails if the destination HTTPS server requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
interval	<Double>	Read-write	The interval, in seconds, rounded down to the nearest

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			15 minutes, at which the update of urlset occurs. Default value: 0 Minimum value = 0 Maximum value = 2592000
privateset	<Boolean>	Read-write	Prevent this urlset from being exported. Default value: 0
subdomainexactmatch	<Boolean>	Read-write	Force exact subdomain matching, ex. given an entry 'google.com' in the urlset, a request to 'news.google.com' won't match, if subdomainExactMatch is set. Default value: 0
matchedid	<Double>	Read-write	An ID that would be sent to AppFlow to indicate which URLSet was the last one that matched the requested URL. Default value: 1 Minimum value = 2 Maximum value = 31
canaryurl	<String>	Read-write	Add this URL to this urlset. Used for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			testing when contents of urlset is kept confidential. Minimum length = 1 Maximum length = 2047
patterncount	<Double>	Read-only	Number of patterns in this urlset. Default value: 0
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT
- IMPORT
- CHANGE
- EXPORT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/policyurlset

pq

Priority Queuing

Priority Queuing configuration. Priority Queuing ensures that key customer web sites get the timely responses they need. System provides priority-based queuing, which provides different levels of service to customers.

NAME	DESCRIPTION
pqbinding	Configuration for PQ bindings
pqpolicy	Configuration for PQ policy

pqbinding

Configuration for PQ bindings resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	Name of the load balancing virtual server for which to display the priority queuing policy. Minimum length = 1
policyname	<String>	Read-only	The name of the priority queuing policy.
rule	<String>	Read-only	The condition for applying the policy.
priority	<Double>	Read-only	The priority of queuing the request.
weight	<Double>	Read-only	Weight.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
qdepth	<Double>	Read-only	Queue Depth.
polqdepth	<Double>	Read-only	Policy Queue Depth.
hits	<Double>	Read-only	Total number of hits.
__count	<Double>	Read-only	count parameter

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/pqbinding

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/pqbinding? **args= vservername:<String_value>,**

Use this query-parameter to get pqbinding resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/pqbinding? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/pqbinding? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of pqbinding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/pqbinding? **view=summary**

Use this query-parameter to get the summary output of pqbinding resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/pqbinding? **pagesize=#no;pageno=#no**

Use this query-parameter to get the pqbinding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "pqbinding": [ {

<b>vservername:<String_value>,</b>      "policyname":<String_value>,

      "rule":<String_value>,

      "priority":<Double_value>,

      "weight":<Double_value>,

      "qdepth":<Double_value>,

      "polqdepth":<Double_value>,

      "hits":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/pqbinding? **args= vservername:<String_value>, ;count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "pqbinding": [ { "__count": "#no"} ] }
```

pqpolicy

Configuration for PQ policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name for the priority queuing policy. Must begin with a letter, number, or the underscore symbol (_). Other characters allowed, after the first character, are the hyphen (-), period (.) hash (#), space ( ), at (@),

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			equals (=), and colon (:) characters. Minimum length = 1
rule	<String>	Read-write	Expression or name of a named expression, against which the request is evaluated. The priority queuing policy is applied if the rule evaluates to true. Note: * On the command line interface, if the expression includes blank spaces, the entire expression must be enclosed in double quotation marks. * If the expression itself includes double quotation marks, you must escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you will not have to escape

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the double quotation marks. * Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"'.
priority	<Double>	Read-write	Priority for queuing the request. If server resources are not available for a request that matches the configured rule, this option specifies a priority for queuing the request until the server resources are available again. Enter the value of positive_integer as 1, 2 or 3. The highest priority level is 1 and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the lowest priority value is 3. Minimum value = 1 Maximum value = 3
weight	<Double>	Read-write	Weight of the priority. Each priority is assigned a weight according to which it is served when server resources are available. The weight for a higher priority request must be set higher than that of a lower priority request. To prevent delays for low-priority requests across multiple priority levels, you can configure weighted queuing for serving requests. The default weights for the priorities are: * Gold - Priority 1 - Weight 3 * Silver - Priority 2 - Weight 2 * Bronze - Priority 3 - Weight 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Specify the weights as 0 through 101. A weight of 0 indicates that the particular priority level should be served only when there are no requests in any of the priority queues. A weight of 101 specifies a weight of infinity. This means that this priority level is served irrespective of the number of clients waiting in other priority queues. Minimum value = 0 Maximum value = 101
qdepth	<Double>	Read-write	Queue depth threshold value. When the queue size (number of requests in the queue) on the virtual server to which this policy is bound, increases to the specified qDepth value, subsequent requests are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			dropped to the lowest priority level. Default value: 0 Minimum value = 0 Maximum value = 4294967294
polqdepth	<Double>	Read-write	Policy queue depth threshold value. When the policy queue size (number of requests in all the queues belonging to this policy) increases to the specified polqDepth value, subsequent requests are dropped to the lowest priority level. Default value: 0 Minimum value = 0 Maximum value = 4294967294
hits	<Double>	Read-only	Total number of hits.
__count	<Double>	Read-only	count parameter

protocol

Protocol

Protocol Configuration.

NAME	DESCRIPTION
protocolhttpband	Configuration for HTTP request/response band

protocolhttpband

Configuration for HTTP request/response band resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqbandsize	<Integer>	Read-write	Band size, in bytes, for HTTP request

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			band statistics. For example, if you specify a band size of 100 bytes, statistics will be maintained and displayed for the following size ranges: 0 - 99 bytes 100 - 199 bytes 200 - 299 bytes and so on. Default value: 100 Minimum value = 50
respbandsize	<Integer>	Read-write	Band size, in bytes, for HTTP response band statistics. For example, if you specify a band size of 100 bytes, statistics will be maintained and displayed for the following size ranges: 0 - 99 bytes 100 - 199 bytes 200 - 299 bytes and so on. Default value: 1024 Minimum value = 50

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of statistics to display. Possible values = REQUEST, RESPONSE
nodeid	<Double>	Read-write	Unique number that identifies the cluster node. Minimum value = 0 Maximum value = 31
bandrange	<Integer>	Read-only	The range of the HTTP request/ response size, in bytes.
numberofbands	<Integer>	Read-only	The total number of http bands.
totalbandsize	<Double[]>	Read-only	The total size of all HTTP requests/ responses in this size range.
avgbandsize	<Double[]>	Read-only	The average size of all HTTP requests/ responses in this size range.
avgbandsizenew	<Double[]>	Read-only	The average size of all HTTP requests/ responses in this size range.
banddata	<Double[]>	Read-only	The total size of all HTTP requests/ responses in this size range,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expressed as a percentage of the total size of all HTTP requests/responses.
banddatanew	<Double[]>	Read-only	The total size of all HTTP requests/responses in this size range, expressed as a percentage of the total size of all HTTP requests/responses.
accesscount	<Double[]>	Read-only	The number of HTTP requests/responses in this size range.
accessratio	<Double[]>	Read-only	The number of HTTP requests/responses in this size range, expressed as a percentage of the total number of HTTP requests/responses.
accessrationew	<Double[]>	Read-only	The number of HTTP requests/responses in this size range, expressed as a percentage of the total number of HTTP requests/responses.
totals	<Integer[]>	Read-only	The total of totalBandSize, avgBandSize, BandData, accessCount,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			accessRatio respectively.

rdp

Rdp

RDP configuration.

NAME	DESCRIPTION
rdpclientprofile	Configuration for RDP clientprofile
rdpconnections	Configuration for active rdp connections
rdpserverprofile	Configuration for RDP serverprofile

rdpclientprofile

Configuration for RDP clientprofile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the rdp profile. Minimum length = 1
rdpurloverride	<String>	Read-write	This setting determines whether the RDP parameters supplied in the vpn url override those specified in the RDP profile. Default value: ENABLE Possible values = ENABLE, DISABLE
redirectclipboard	<String>	Read-write	This setting corresponds to the Clipboard check box on the Local Resources tab under Options in RDC. Default value: ENABLE Possible values = ENABLE, DISABLE
redirectdrives	<String>	Read-write	This setting corresponds to the selections for Drives under More on the Local Resources tab

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
redirectprinters	<String>	Read-write	This setting corresponds to the selection in the Printers check box on the Local Resources tab under Options in RDC. Default value: ENABLE Possible values = ENABLE, DISABLE
redirectcomports	<String>	Read-write	This setting corresponds to the selections for comports under More on the Local Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
redirectpnpdevices	<String>	Read-write	This setting corresponds to the selections for pnpdevices under More on the Local

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
keyboardhook	<String>	Read-write	This setting corresponds to the selection in the Keyboard drop-down list on the Local Resources tab under Options in RDC. Default value: InFullScreenMode Possible values = OnLocal, OnRemote, InFullScreenMode
audiocapturemode	<String>	Read-write	This setting corresponds to the selections in the Remote audio area on the Local Resources tab under Options in RDC. Default value: DISABLE Possible values = ENABLE, DISABLE
videoplaybackmode	<String>	Read-write	This setting determines if Remote Desktop Connection (RDC)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			will use RDP efficient multimedia streaming for video playback. Default value: ENABLE Possible values = ENABLE, DISABLE
multimonitorsupport	<String>	Read-write	Enable/Disable Multiple Monitor Support for Remote Desktop Connection (RDC). Default value: ENABLE Possible values = ENABLE, DISABLE
rdpcookievalidity	<Double>	Read-write	RDP cookie validity period. RDP cookie validity time is applicable for new connection and also for any re-connection that might happen, mostly due to network disruption or during fail-over. Default value: 60 Minimum value = 1 Maximum value = 86400
addusernameinrdpfile	<String>	Read-write	Add username in rdp file.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
rdpfilename	<String>	Read-write	RDP file name to be sent to End User. Minimum length = 1
rdphost	<String>	Read-write	Fully-qualified domain name (FQDN) of the RDP Listener. Maximum length = 252
rdplistener	<String>	Read-write	IP address (or) Fully-qualified domain name(FQDN) of the RDP Listener with the port in the format IP:Port (or) FQDN:Port. Maximum length = 255
rdpcustomparams	<String>	Read-write	Option for RDP custom parameters settings (if any). Custom params needs to be separated by ';'. Default value: 0 Minimum length = 1
psk	<String>	Read-write	Pre shared key value. Default value: 0

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
randomizerdpfilename	<String>	Read-write	Will generate unique filename everytime rdp file is downloaded by appending output of time() function in the format <rdpfileName>_<time>.rdp. This tries to avoid the pop-up for replacement of existing rdp file during each rdp connection launch, hence providing better end-user experience. Default value: NO Possible values = YES, NO
rdplinkattribute	<String>	Read-write	Citrix Gateway allows the configuration of rdpLinkAttribute parameter which can be used to fetch a list of RDP servers(IP/FQDN) that a user can access, from an Authentication server attribute(Example: LDAP, SAML). Based on the list received, the RDP links will be generated and displayed to the user.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: The Attribute mentioned in the rdpLinkAttribute should be fetched through corresponding authentication method.
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of rdpclientprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile? **view=summary**

Use this query-parameter to get the summary output of rdpclientprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/rdpclientprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the rdpclientprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rdpclientprofile": [ { "__count": "#no"} ] }
```

rdpconnections

Configuration for active rdp connections resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
username	<String>	Read-write	User name for which to display connections. Minimum length = 1
all	<Boolean>	Read-write	Terminate all active rdpconnections.
endpointip	<String>	Read-only	The client IP address.
endpointport	<Integer>	Read-only	The client port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
targetip	<String>	Read-only	The Server IP address.
targetport	<Integer>	Read-only	The server port. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
peid	<Double>	Read-only	Core id of the session owner.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT
- KILL

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

KILL

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **action=kill**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rdpconnections":{
      "username":<String_value>,
      "all":<Boolean_value>
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **args=username: <String_value>**

Use this query-parameter to get rdpconnections resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of rdpconnections resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **view=summary**

Use this query-parameter to get the summary output of rdpconnections resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **pagesize=#no;pageno=#no**

Use this query-parameter to get the rdpconnections resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rdpconnections": [ {

username:<String_value>      "endpointip":<String_value>,
```

```
        "endpointport":<Integer_value>,

        "targetip":<String_value>,

        "targetport":<Integer_value>,

        "peid":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/rdpconnections? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rdpconnections": [ { "__count": "#no"} ] }
```

rdpserverprofile

Configuration for RDP serverprofile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the rdp server profile. Minimum length = 1 Maximum length = 32
rdpip	<String>	Read-write	IPv4 or IPv6 address of RDP listener. This terminates client RDP connections. Minimum length = 1
rdpport	<Double>	Read-write	TCP port on which the RDP connection is established. Default value: 3389 Minimum value = 1 Maximum value = 65535
psk	<String>	Read-write	Pre shared key value.
rdpredirection	<String>	Read-write	Enable/Disable RDP redirection support. This needs to be enabled in presence of connection broker or session directory with IP cookie(msts cookie) based redirection support.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLE Possible values = ENABLE, DISABLE
builtin	<String[]>	Read-only	Indicates that a variable is a built-in (SYSTEM INTERNAL) type. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

responderparam	Configuration for responser parameter
responderpolicy	Configuration for responder policy
responderpolicy_binding	Binding object showing the resources that can be bound to responderpolicy
responderpolicy_crvserver_binding	Binding object showing the crvserver that can be bound to responderpolicy
responderpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to responderpolicy
responderpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to responderpolicy

NAME	DESCRIPTION
responderpolicy_responderglobal_binding	Binding object showing the responderglobal that can be bound to responderpolicy
responderpolicy_responderpolicylabel_binding	Binding object showing the responderpolicylabel that can be bound to responderpolicy
responderpolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to responderpolicy
responderpolicylabel	Configuration for responder policy label
responderpolicylabel_binding	Binding object showing the resources that can be bound to responderpolicylabel
responderpolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to responderpolicylabel
responderpolicylabel_responderpolicy_binding	Binding object showing the responderpolicy that can be bound to responderpolicylabel

responderaction

Configuration for responder action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the responder action. Must begin with a letter, number, or the underscore character

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the responder policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder action" or 'my responder action').
type	<String>	Read-write	Type of responder action. Available settings function as follows: * respondwith <target> - Respond to the request with the expression specified as the target.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* respondwithhtmlpage - Respond to the request with the uploaded HTML page object specified as the target. * redirect - Redirect the request to the URL specified as the target. * sqlresponse_ok - Send an SQL OK response. * sqlresponse_error - Send an SQL ERROR response. Possible values = noop, respondwith, redirect, respondwithhtmlpage, sqlresponse_ok, sqlresponse_error
target	<String>	Read-write	Expression specifying what to respond with. Typically a URL for redirect policies or a default-syntax expression. In addition to Citrix ADC default-syntax expressions that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			refer to information in the request, a stringbuilder expression can contain text and HTML, and simple escape codes that define new lines and paragraphs. Enclose each stringbuilder expression element (either a Citrix ADC default-syntax expression or a string) in double quotation marks. Use the plus (+) character to join the elements. Examples: 1) Respondwith expression that sends an HTTP 1.1 200 OK response: "HTTP/1.1 200 OK\r\n\r\n" 2) Redirect expression that redirects user to the specified web host and appends the request URL to the redirect.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"http://backupsite2.com" + HTTP.REQ.URL 3) Respondwith expression that sends an HTTP 1.1 404 Not Found response with the request URL included in the response: "HTTP/1.1 404 Not Found\r\n\r\n"+ "HTTP.REQ.URL.HTTP_URL_SAFE" + "does not exist on the web server." The following requirement applies only to the Citrix ADC CLI: Enclose the entire expression in single quotation marks. (Citrix ADC expression elements should be included inside the single quotation marks for the entire expression, but do not need to be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclosed in double quotation marks.).
htmlpage	<String>	Read-write	For respondwithhtmlpage policies, name of the HTML page object to use as the response. You must first import the page object. Minimum length = 1
bypasssafetycheck	<String>	Read-write	Bypass the safety check, allowing potentially unsafe expressions. An unsafe expression in a response is one that contains references to request elements that might not be present in all requests. If a response refers to a missing request element, an empty string is used instead. Default value: NO Possible values = YES, NO
comment	<String>	Read-write	Comment. Any type of information about this responder action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
responsestatuscode	<Double>	Read-write	HTTP response status code, for example 200, 302, 404, etc. The default value for the redirect action type is 302 and for respondwithhtmlpage is 200. Minimum value = 100 Maximum value = 599
reasonphrase	<String>	Read-write	Expression specifying the reason phrase of the HTTP response. The reason phrase may be a string literal with quotes or a PI expression. For example: "Invalid URL: " + HTTP.REQ.URL. Minimum length = 1
headers	<String[]>	Read-write	One or more headers to insert into the HTTP response. Each header is specified as "name(expr)", where expr is an expression that is evaluated at runtime to provide the value for the named header. You can configure a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			maximum of eight headers for a responder action.
newname	<String>	Read-write	New name for the responder action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder action" or my responder action'). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
hits	<Double>	Read-only	The number of times the action has been taken.
referencecount	<Double>	Read-only	The number of references to the action.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
builtin	<String[]>	Read-only	Flag to determine whether responder action is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

- GET

- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderaction

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderaction":{

<b>      "name":<String_value>,

</b><b>      "type":<String_value>,

</b>      "target":<String_value>,

      "htmlpage":<String_value>,

      "bypasssafetycheck":<String_value>,

      "comment":<String_value>,

      "responsestatuscode":<Double_value>,

      "reasonphrase":<String_value>,

      "headers":<String[]_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderaction/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderaction

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderaction":{

<b>      "name":<String_value>,

</b>      "target":<String_value>,

      "bypasssafetycheck":<String_value>,

      "htmlpage":<String_value>,

      "responsestatuscode":<Double_value>,

      "reasonphrase":<String_value>,

      "comment":<String_value>,

      "headers":<String[]_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderaction? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderaction":{

<b>      "name":<String_value>,

</b>      "responsestatuscode":true,

      "reasonphrase":true,

      "comment":true,

      "headers":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderaction? **action=rename**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"responderaction":{

<b>      "name":<String_value>,

</b><b>      "newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/responderaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/responderaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of responderaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/responderaction? **view=summary**

Use this query-parameter to get the summary output of responderaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/responderaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the responderaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderaction": [ {

      "name":<String_value>,
```

```
        "type":<String_value>,

        "target":<String_value>,

        "htmlpage":<String_value>,

        "bypasssafetycheck":<String_value>,

        "hits":<Double_value>,

        "referencecount":<Double_value>,

        "undefhits":<Double_value>,

        "comment":<String_value>,

        "builtin":<String[]_value>,

        "feature":<String_value>,

        "responsestatuscode":<Double_value>,

        "reasonphrase":<String_value>,

        "headers":<String[]_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderaction/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/responderaction/ name_value<String> ?
attrs=property-name1,property-name2

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/responderaction/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of responderaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "responderaction": [ {

      "name":<String_value>,

      "type":<String_value>,

      "target":<String_value>,

        "headers":<String[]_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderaction? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderaction": [ { "__count": "#no"} ] }
```

responderglobal_binding

Binding object which returns the resources bound to responderglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
responderglobal_responderpolicy_binding	<responderglobal_responderpolicy_binding[]>	Read-write	responderpolicy that can be bound to responderglobal.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderglobal_binding": [ {

      "responderglobal_responderpolicy_binding":<responderglobal_responder
policy_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/responderglobal_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderglobal_binding": [ {

      "responderglobal_responderpolicy_binding":<responderglobal_responder
policy_binding[]_value>

}]}
```

responderglobal_responderpolicy_binding

Binding object showing the responderpolicy that can be bound to responderglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the responder policy.
labelname	<String>	Read-write	Name of the policy label to invoke. If the current policy evaluates to TRUE, the invoke parameter is set, and Label Type is policylabel.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
type	<String>	Read-write	Specifies the bind point whose policies you want to display. Available settings function as follows: - REQ_OVERRIDE - Request override. Binds the policy to the priority request queue. - REQ_DEFAULT - Binds the policy to the default request queue. - OTHERTCP_REQ_OVERRIDE - Binds the policy to the non-HTTP TCP priority request queue. - OTHERTCP_REQ_DEFAULT - Binds the policy to the non-HTTP TCP default request queue.. - SIPUDP_REQ_OVERRIDE - Binds the policy to the SIP UDP priority response queue.. -

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SIPUDP_REQ_DEFAULT - Binds the policy to the SIP UDP default response queue. - RADIUS_REQ_OVERRIDE - Binds the policy to the RADIUS priority response queue.. - RADIUS_REQ_DEFAULT - Binds the policy to the RADIUS default response queue. - MSSQL_REQ_OVERRIDE - Binds the policy to the Microsoft SQL priority response queue.. - MSSQL_REQ_DEFAULT - Binds the policy to the Microsoft SQL default response queue. - MYSQL_REQ_OVERRIDE - Binds the policy to the MySQL priority response queue. - MYSQL_REQ_DEFAULT - Binds the policy to the MySQL default response queue. Possible values = REQ_OVERRIDE, REQ_DEFAULT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			OVERRIDE, DEFAULT, OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, SIPUDP_REQ_OVERRIDE, SIPUDP_REQ_DEFAULT, SIPTCP_REQ_OVERRIDE, SIPTCP_REQ_DEFAULT, MSSQL_REQ_OVERRIDE, MSSQL_REQ_DEFAULT, MYSQL_REQ_OVERRIDE, MYSQL_REQ_DEFAULT, NAT_REQ_OVERRIDE, NAT_REQ_DEFAULT, DIAMETER_REQ_OVERRIDE, DIAMETER_REQ_DEFAULT, RADIUS_REQ_OVERRIDE, RADIUS_REQ_DEFAULT, DNS_REQ_OVERRIDE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DNS_REQ_DEFAULT
labeltype	<String>	Read-write	Type of invocation, Available settings function as follows: - vserver - Forward the request to the specified virtual server. - policylabel - Invoke the specified policy label. Possible values = vserver, policylabel
numpol	<Double>	Read-only	number of polices bound to label.
flowtype	<Double>	Read-only	flowtype of the bound responder policy.
__count	<Double>	Read-only	count parameter

Operations

      "name":<String_value>,
```

```
      "response":<String_value>

}]}
```

responderparam

Configuration for responser parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefaction	<String>	Read-write	Action to perform when policy evaluation creates an UNDEF condition. Available settings function as follows: * NOOP - Send the request to the protected server. * RESET - Reset the request and notify the user's browser, so that the user can resend the request. * DROP - Drop the request without sending a response to the user. Default value: "NOOP"

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
timeout	<Double>	Read-write	Maximum time in milliseconds to allow for processing all the policies and their selected actions without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed. Default value: 3900 Minimum value = 1 Maximum value = 5000

responderpolicy

Configuration for responder policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the responder policy. Must begin with a letter, number, or the underscore character (_), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			must contain only letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the responder policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder policy" or 'my responder policy').
rule	<String>	Read-write	Expression that the policy uses to determine whether to respond to the specified request.
action	<String>	Read-write	Name of the responder action to perform if the request matches this responder policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			There are also some built-in actions which can be used. These are: * NOOP - Send the request to the protected server instead of responding to it. * RESET - Reset the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal error condition. Only the above built-in actions can be used.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
comment	<String>	Read-write	Any type of information about this responder policy.
logaction	<String>	Read-write	Name of the messagelog action to use for requests that match this policy.
appflowaction	<String>	Read-write	AppFlow action to invoke for requests that match this policy.
newname	<String>	Read-write	New name for the responder policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy" or 'my responder policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of policy UNDEF hits.
builtin	<String[]>	Read-only	Flag to determine if responder policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/responderpolicylabel/ labelname_value<String> ?**view=summary**

Use this query-parameter to get the summary output of responderpolicylabel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "responderpolicylabel": [ {

      "labelname":<String_value>,

      "policylabeltype":<String_value>,

      "numpol":<Double_value>,

      "hits":<Double_value>,

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "invoke_labelname":<String_value>,

      "comment":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicylabel? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicylabel": [ { "__count": "#no"} ] }
```

responderpolicylabel_binding

Binding object which returns the resources bound to responderpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the responder policy label.
responderpolicylabel_policybinding_binding	<responderpolicylabel_policybinding_binding[]>	Read-only	policybinding that can be bound to responderpolicylabel.
responderpolicylabel_responderpolicy_binding	<responderpolicylabel_responderpolicy_binding[]>	Read-only	responderpolicy that can be bound to responderpolicylabel.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicylabel_binding/labelname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicylabel_binding": [ {

      "labelname":<String_value>,

      "responderpolicylabel_responderpolicy_binding":<responderpolicylabel
_responderpolicy_binding[]_value>,

      "responderpolicylabel_policybinding_binding":<responderpolicylabel_p
olicybinding_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicylabel_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/responderpolicylabel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "responderpolicylabel_binding": [ {

      "labelname":<String_value>,

      "responderpolicylabel_responderpolicy_binding":<responderpolicylabel
_responderpolicy_binding[]_value>,

      "responderpolicylabel_policybinding_binding":<responderpolicylabel_p
olicybinding_binding[]_value>

}]}
```

responderpolicylabel_policybinding_binding

Binding object showing the policybinding that can be bound to responderpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
policyname	<String>	Read-write	Name of the responder policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the responder policy label to which to bind the policy.
invoke_labelname	<String>	Read-write	* If labelType is policylabel, name of the policy label to invoke. - If labelType is reqvserver or resvserver, name of the virtual server.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	If the current policy evaluates to TRUE, terminate evaluation of policies bound to the current policy label and evaluate the specified policy label.
labeltype	<String>	Read-write	Type of policy label to invoke. Available settings function as follows: - vserver - Invoke an unnamed policy label associated with a virtual server. - policylabel - Invoke a user-defined policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = vserver, policylabel
__count	<Double>	Read-write	count parameter

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_crvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"responderpolicy_crvserver_binding": [ { "__count": "#no"} ] }
```

responderpolicy_csvserver_binding

Binding object showing the csvserver that can be bound to responderpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the responder policy for which to display settings.
priority	<Double>	Read-only	Specifies the priority of the policy.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_csvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_csvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of responderpolicy_csvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/responderpolicy_csvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the responderpolicy_csvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "responderpolicy_csvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

rewrite

Rewrite

Rewrite configuration.

NAME	DESCRIPTION
rewriteaction	Configuration for rewrite action
rewriteglobal_binding	Binding object showing the resources that can be bound to rewriteglobal
rewriteglobal_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to rewriteglobal
rewriteparam	Configuration for rewrite parameter

NAME	DESCRIPTION
rewritepolicy	Configuration for rewrite policy
rewritepolicy_binding	Binding object showing the resources that can be bound to rewritepolicy
rewritepolicy_csvserver_binding	Binding object showing the csvserver that can be bound to rewritepolicy
rewritepolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to rewritepolicy
rewritepolicy_rewriteglobal_binding	Binding object showing the rewriteglobal that can be bound to rewritepolicy
rewritepolicy_rewritepolicylabel_binding	Binding object showing the rewritepolicylabel that can be bound to rewritepolicy
rewritepolicy_vpnvserver_binding	Binding object showing the vpnvserver that can be bound to rewritepolicy
rewritepolicylabel	Configuration for rewrite policy label
rewritepolicylabel_binding	Binding object showing the resources that can be bound to rewritepolicylabel
rewritepolicylabel_policybinding_binding	Binding object showing the policybinding that can be bound to rewritepolicylabel
rewritepolicylabel_rewritepolicy_binding	Binding object showing the rewritepolicy that can be bound to rewritepolicylabel

rewriteaction

Configuration for rewrite action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the user-defined rewrite action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite action" or 'my rewrite action').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Type of user-defined rewrite action. The information that you provide for, and the effect of, each type are as follows:: * REPLACE <target> <string_builder_expr>. Replaces the string with the string-builder expression. * REPLACE_ALL <target> <string_builder_expr1> -(pattern|search) <string_builder_expr2>. In the request or response specified by <target>, replaces all occurrences of the string defined by <string_builder_expr1> with the string defined by <string_builder_expr2>. You can use a PCRE-format pattern or the search facility to find the strings to be replaced.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* REPLACE_HTTP_RES <string_builder_expr>. Replaces the complete HTTP response with the string defined by the string-builder expression. * REPLACE_SIP_RES <target> - Replaces the complete SIP response with the string specified by <target>. * INSERT_HTTP_HEADER <header_string_builder_expr> <contents_string_builder_expr>. Inserts the HTTP header specified by <header_string_builder_expr> and header contents specified by <contents_string_builder_expr>.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* DELETE_HTTP_HEADER <target>. Deletes the HTTP header specified by <target>. * CORRUPT_HTTP_HEADER <target>. Replaces the header name of all occurrences of the HTTP header specified by <target> with a corrupted name, so that it will not be recognized by the receiver Example: MY_HEADER is changed to MHEY_ADER. * INSERT_BEFORE <string_builder_expr1> <string_builder_expr1>. Finds the string specified in <string_builder_expr1> and inserts the string in <string_builder_expr2> before it.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* INSERT_BEFORE_ALL <target> <string_builder_expr1> -(pattern|search) <string_builder_expr2>. In the request or response specified by <target>, locates all occurrences of the string specified in <string_builder_expr1> and inserts the string specified in <string_builder_expr2> before each. You can use a PCRE-format pattern or the search facility to find the strings. * INSERT_AFTER <string_builder_expr1> <string_builder_expr2>. Finds the string specified in <string_builder_expr1>, and inserts the string specified in <string_builder_expr2> after it.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* INSERT_AFTER_ALL <target> <string_builder_expr1> -(pattern|search) <string_builder_expr>. In the request or response specified by <target>, locates all occurrences of the string specified by <string_builder_expr1> and inserts the string specified by <string_builder_expr2> after each. You can use a PCRE-format pattern or the search facility to find the strings. * DELETE <target>. Finds and deletes the specified target. * DELETE_ALL <target> -(pattern|search) <string_builder_expr>. In the request or response specified by <target>, locates and deletes all occurrences of the string specified by

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			<string_builder_expr>. You can use a PCRE-format pattern or the search facility to find the strings. * REPLACE_DIAMETER_HEADER_FIELD <target> <field value>. In the request or response modify the header field specified by <target>. Use Diameter.req.flags.SET(<flag>) or Diameter.req.flags.UNSET<flag> as 'stringbuilderexpression' to set or unset flags. * REPLACE_DNS_HEADER_FIELD <target>. In the request or response modify the header field specified by <target>. * REPLACE_DNS_ANSWER_SECTION <target>. Replace

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the DNS answer section in the response. This is currently applicable for A and AAAA records only. Use DNS.NEW_RRSET_A ; DNS.NEW_RRSET_AAAA expressions to configure the new answer section . Possible values = noop, delete, insert_http_header, delete_http_header, corrupt_http_header , insert_before, insert_after, replace, replace_http_res, delete_all, replace_all, insert_before_all, insert_after_all, clientless_vpn_encode, clientless_vpn_encode_all, clientless_vpn_decode, clientless_vpn_decode_all, insert_sip_header, delete_sip_header,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			corrupt_sip_header, replace_sip_res, replace_diameter_header_field, replace_dns_header_field, replace_dns_answer_section
target	<String>	Read-write	Expression that specifies which part of the request or response to rewrite. Minimum length = 1
stringbuilderexpr	<String>	Read-write	Expression that specifies the content to insert into the request or response at the specified location, or that replaces the specified string.
pattern	<String>	Read-write	DEPRECATED in favor of -search: Pattern that is used to match multiple strings in the request or response. The pattern may be a string literal (without quotes) or a PCRE-format regular expression with a delimiter that consists of any printable ASCII non-alphanumeric character except for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the underscore (_) and space ( ) that is not otherwise used in the expression. Example: re~https?://| HTTPS?://~ The preceding regular expression can use the tilde (~) as the delimiter because that character does not appear in the regular expression itself. Used in the INSERT_BEFORE_ALL, INSERT_AFTER_ALL, REPLACE_ALL, and DELETE_ALL action types.
search	<String>	Read-write	Search facility that is used to match multiple strings in the request or response. Used in the INSERT_BEFORE_ALL, INSERT_AFTER_ALL, REPLACE_ALL, and DELETE_ALL action types. The following search types are supported: * Text ("text(string)") - A literal string. Example: -search text("hello")

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* Regular expression ("regex(re<delimiter>regular exp<delimiter>)") - Pattern that is used to match multiple strings in the request or response. The pattern may be a PCRE-format regular expression with a delimiter that consists of any printable ASCII non-alphanumeric character except for the underscore (_) and space ( ) that is not otherwise used in the expression. Example: -search regex(re~\^hello*~) The preceding regular expression can use the tilde (~) as the delimiter because that character does not appear in the regular expression itself.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* XPath ("xpath(xp<delimiter>xpath expression<delimiter>)") - An XPath expression to search XML. The delimiter has the same rules as for regex. Example: -search xpath(xp%/a/b%) * JSON ("xpath_json(xp<delimiter>xpath expression<delimiter>)") - An XPath expression to search JSON. The delimiter has the same rules as for regex. Example: -search xpath_json(xp%/a/b%) NOTE: JSON searches use the same syntax as XPath searches, but operate on JSON files instead of standard XML files.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* HTML ("xpath_html(xp<delimiter>xpath expression<delimiter>)") - An XPath expression to search HTML. The delimiter has the same rules as for regex. Example: -search xpath_html(xp%/html/body%) NOTE: HTML searches use the same syntax as XPath searches, but operate on HTML files instead of standard XML files; HTML 5 rules for the file syntax are used; HTML 4 and later are supported. * Patset ("patset(patset)") - A predefined pattern set. Example: -search patset("patset1"). * Datset ("dataset(dataset)") - A predefined dataset. Example:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			-search dataset("dataset1"). * AVP ("avp(avp number)") - AVP number that is used to match multiple AVPs in a Diameter/ Radius Message. Example: -search avp(999) Note: for all these the TARGET prefix can be used in the replacement expression to specify the text that was selected by the -search parameter, optionally adjusted by the -refineSearch parameter. Example: TARGET.BEFORE_STR(",").
bypasssafetycheck	<String>	Read-write	Bypass the safety check and allow unsafe expressions. An unsafe expression is one that contains references to message elements that might not be present in all messages. If an

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			expression refers to a missing request element, an empty string is used instead. Default value: NO Possible values = YES, NO
refinesearch	<String>	Read-write	Specify additional criteria to refine the results of the search. Always starts with the "extend(m,n)" operation, where 'm' specifies number of bytes to the left of selected data and 'n' specifies number of bytes to the right of selected data to extend the selected area. You can use refineSearch only on body expressions, and for the INSERT_BEFORE_ALL, INSERT_AFTER_ALL, REPLACE_ALL, and DELETE_ALL action types.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Example: -refineSearch 'EXTEND(10, 20).REGEX_SELECT(re~0x[0-9a-zA-Z]+~).
comment	<String>	Read-write	Comment. Can be used to preserve information about this rewrite action.
newname	<String>	Read-write	New name for the rewrite action. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my rewrite action" or 'my rewrite action'). Minimum length = 1
hits	<Double>	Read-only	The number of times the action has been taken.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Double>	Read-only	The number of references to the action.
description	<String>	Read-only	Description of the action.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default rewriteaction.
builtin	<String[]>	Read-only	Flag to determine whether rewrite action is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT
- RENAME

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewriteaction":{

<b>      "name":<String_value>,

</b><b>      "type":<String_value>,

</b><b>      "target":<String_value>,

</b>      "stringbuilderexpr":<String_value>,

      "pattern":<String_value>,

      "search":<String_value>,

      "bypasssafetycheck":<String_value>,

      "refinesearch":<String_value>,

      "comment":<String_value>
```

```
}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewriteaction":{

<b>      "name":<String_value>,
```

```
</b>      "target":<String_value>,

      "stringbuilderexpr":<String_value>,

      "bypasssafetycheck":<String_value>,

      "pattern":<String_value>,

      "search":<String_value>,

      "bypasssafetycheck":<String_value>,

      "refinesearch":<String_value>,

      "comment":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewriteaction":{
```

```
<b>      "name":<String_value>,

</b>      "stringbuilderexpr":true,

      "refinesearch":true,

      "comment":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction? **action=rename**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewriteaction":{

<b>      "name":<String_value>,

</b><b>      "newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of rewriteaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction? **view=summary**

Use this query-parameter to get the summary output of rewriteaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the rewriteaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewriteaction": [ {

      "name":<String_value>,

      "type":<String_value>,

      "target":<String_value>,

      "stringbuilderexpr":<String_value>,

      "pattern":<String_value>,

      "search":<String_value>,

      "bypasssafetycheck":<String_value>,

      "refinesearch":<String_value>,

      "hits":<Double_value>,

      "undefhits":<Double_value>,

      "referencecount":<Double_value>,

      "description":<String_value>,
```

```
        "isdefault":<Boolean_value>,

        "comment":<String_value>,

        "builtin":<String[]_value>,

        "feature":<String_value>

  }]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of rewriteaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewriteaction": [ {

      "name":<String_value>,

      "type":<String_value>,

      "target":<String_value>,

```
        "feature":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteaction? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewriteaction": [ { "__count": "#no"} ] }
```

rewriteglobal_binding

Binding object which returns the resources bound to rewriteglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rewriteglobal_rewrite policy_binding	<rewriteglobal_rewrit epolicy_binding[]>	Read-write	rewritepolicy that can be bound to rewriteglobal.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewriteglobal_binding": [ {

      "rewriteglobal_rewritepolicy_binding":<rewriteglobal_rewritepolicy_b
inding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewriteglobal_binding": [ {

      "rewriteglobal_rewritepolicy_binding":<rewriteglobal_rewritepolicy_b
inding[]_value>

}]}
```

rewriteglobal_rewritepolicy_binding

Binding object showing the rewritepolicy that can be bound to rewriteglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
globalbindtype	<String>	Read-write	. Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	Name of the rewrite policy.
labelname	<String>	Read-write	* If labelType is policylabel, name of the policy label to invoke. - If labelType is reqvserver or resvserver, name of the virtual server to which to forward the request of response.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Terminate evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	The bindpoint to which to policy is bound. Possible values = REQ_OVERRIDE, REQ_DEFAULT, RES_OVERRIDE, RES_DEFAULT, OTHERTCP_REQ_OVERRIDE, OTHERTCP_REQ_DEFAULT, OTHERTCP_RES_OVERRIDE, OTHERTCP_RES_DEFAULT, SIPUDP_REQ_OVERRIDE, SIPUDP_REQ_DEFAULT, SIPUDP_RES_OVERRIDE, SIPUDP_RES_DEFAULT, SIPTCP_REQ_OVERRIDE, SIPTCP_REQ_DEFAULT, SIPTCP_RES_OVERRIDE, SIPTCP_RES_DEFAULT, DIAMETER_REQ_OVERRIDE, DIAMETER_REQ_DEFAULT,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DIAMETER_RES_OVERRIDE, DIAMETER_RES_DEFAULT, RADIUS_REQ_OVERRIDE, RADIUS_REQ_DEFAULT, RADIUS_RES_OVERRIDE, RADIUS_RES_DEFAULT, DNS_REQ_OVERRIDE, DNS_REQ_DEFAULT, DNS_RES_OVERRIDE, DNS_RES_DEFAULT
labeltype	<String>	Read-write	Type of invocation. Available settings function as follows: - reqvserver - Forward the request to the specified request virtual server. - resvserver - Forward the response to the specified response virtual server. - policylabel - Invoke the specified policy label. Possible values = reqvserver,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resvserver, policylabel
flowtype	<Double>	Read-only	flowtype of the bound rewrite policy.
numpol	<Double>	Read-only	The number of policies bound to the bindpoint.
__count	<Double>	Read-only	count parameter

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_rewritepolicy_binding

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_rewritepolicy_binding? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of rewriteglobal_rewritepolicy_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_rewritepolicy_binding?
pagesize=#no;pageno=#no

Use this query-parameter to get the rewriteglobal_rewritepolicy_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewriteglobal_rewritepolicy_binding": [ {

      "priority":<Double_value>,

      "globalbindtype":<String_value>,

      "policyname":<String_value>,

      "labelname":<String_value>,

      "gotopriorityexpression":<String_value>,
```

```
        "invoke":<Boolean_value>,

        "type":<String_value>,

        "labeltype":<String_value>,

        "flowtype":<Double_value>,

        "numpol":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_rewritepolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_rewritepolicy_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewriteglobal_rewritepolicy_binding": [ {

      "priority":<Double_value>,

      "globalbindtype":<String_value>,

      "policyname":<String_value>,

      "labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "invoke":<Boolean_value>,

      "type":<String_value>,

      "labeltype":<String_value>,

      "flowtype":<Double_value>,

      "numpol":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteglobal_rewritepolicy_binding?**count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewriteglobal_rewritepolicy_binding": [ { "__count": "#no"} ] }
```

rewriteparam

Configuration for rewrite parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an error condition in evaluating the expression. Available settings function as follows: * NOREWRITE - Do not modify the message.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* RESET - Reset the connection and notify the user's browser, so that the user can resend the request. * DROP - Drop the message without sending a response to the user. Default value: "NOREWRITE"
timeout	<Double>	Read-write	Maximum time in milliseconds to allow for processing all the policies and their selected actions without interruption. If the timeout is reached then the evaluation causes an UNDEF to be raised and no further processing is performed. Note that some rewrites may have already been performed. Default value: 3900 Minimum value = 1 Maximum value = 5000

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteparam

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewriteparam":{
      "undefaction":<String_value>,
      "timeout":<Double_value>
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteparam? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"rewriteparam":{
      "undefaction":true,
      "timeout":true
```

```
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewriteparam

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewriteparam": [ {

      "undefaction":<String_value>,

      "timeout":<Double_value>

}]}
```

rewritepolicy

Configuration for rewrite policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the rewrite policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Can be changed after the rewrite policy is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite policy" or 'my rewrite policy').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
rule	<String>	Read-write	Expression against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the \ character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks.
action	<String>	Read-write	Name of the rewrite action to perform if the request or response matches this rewrite policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			There are also some built-in actions which can be used. These are: * NOREWRITE - Send the request from the client to the server or response from the server to the client without making any changes in the message. * RESET - Resets the client connection by closing it. The client program, such as a browser, will handle this and may inform the user. The client may then resend the request if desired. * DROP - Drop the request without sending a response to the user.
undefaction	<String>	Read-write	Action to perform if the result of policy evaluation is undefined (UNDEF). An UNDEF event indicates an internal

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			error condition. Only the above built-in actions can be used.
comment	<String>	Read-write	Any comments to preserve information about this rewrite policy.
logaction	<String>	Read-write	Name of messagelog action to use when a request matches this policy.
newname	<String>	Read-write	New name for the rewrite policy. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			marks (for example, "my rewrite policy" or 'my rewrite policy'). Minimum length = 1
hits	<Double>	Read-only	Number of hits.
undefhits	<Double>	Read-only	Number of Undef hits.
description	<String>	Read-only	Description of the policy.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default rewritepolicy.
builtin	<String[]>	Read-only	Flag to determine if rewrite policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

```

rewritepolicylabel

Configuration for rewrite policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the rewrite policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. Cannot be changed after the rewrite policy label is added. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my rewrite policy label" or 'my rewrite policy label').
transform	<String>	Read-write	Types of transformations allowed by the policies bound to the label. For Rewrite, the following types are supported:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* http_req - HTTP requests * http_res - HTTP responses * othertcp_req - Non-HTTP TCP requests * othertcp_res - Non-HTTP TCP responses * url - URLs * text - Text strings * clientless_vpn_req - Citrix ADC clientless VPN requests * clientless_vpn_res - Citrix ADC clientless VPN responses * sipudp_req - SIP requests * sipudp_res - SIP responses * diameter_req - DIAMETER requests

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* diameter_res - DIAMETER responses * radius_req - RADIUS requests * radius_res - RADIUS responses * dns_req - DNS requests * dns_res - DNS responses. Possible values = http_req, http_res, othertcp_req, othertcp_res, url, text, clientless_vpn_req, clientless_vpn_res, sipudp_req, sipudp_res, siptcp_req, siptcp_res, diameter_req, diameter_res, radius_req, radius_res, dns_req, dns_res
comment	<String>	Read-write	Any comments to preserve information about this rewrite policy label.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
newname	<String>	Read-write	New name for the rewrite policy label. Must begin with a letter, number, or the underscore character (_), and must contain only letters, numbers, and the hyphen (-), period (.) hash (#), space ( ), at (@), equals (=), colon (:), and underscore characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my policy label" or 'my policy label'). Minimum length = 1
numpol	<Double>	Read-only	Number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of invocation. Available settings function as follows: * reqvserver - Forward the request to the specified request virtual server. * resvserver - Forward the response to the specified response virtual server. * policylabel - Invoke the specified policy label. Possible values = reqvserver, resvserver, policylabel
invoke_labelname	<String>	Read-only	* If labelType is policylabel, name of the policy label to invoke.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* If labelType is reqvserver or resvserver, name of the virtual server to which to forward the request or response.
flowtype	<Double>	Read-only	Flowtype of the bound rewrite policy.
description	<String>	Read-only	Description of the policylabel.
isdefault	<Boolean>	Read-only	A value of true is returned if it is a default rewritepolicylabel.
builtin	<String[]>	Read-only	Flag to determine if rewrite policy label is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel/ labelname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel/ labelname_value<String> ?
attrs=property-name1,property-name2

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel/ labelname_value<String> ?**view=summary**

Use this query-parameter to get the summary output of rewritepolicylabel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewritepolicylabel": [ {

      "labelname":<String_value>,

      "transform":<String_value>,

      "numpol":<Double_value>,

      "hits":<Double_value>,

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,
```

```
        "labeltype":<String_value>,

        "invoke_labelname":<String_value>,

        "flowtype":<Double_value>,

        "description":<String_value>,

        "isdefault":<Boolean_value>,

        "comment":<String_value>,

        "builtin":<String[]_value>,

        "feature":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewritepolicylabel": [ { "__count": "#no"} ] }
```

rewritepolicylabel_binding

Binding object which returns the resources bound to rewritepolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the rewrite policy label.
rewritepolicylabel_policybinding_binding	<rewritepolicylabel_policybinding_binding[]>	Read-only	policybinding that can be bound to rewritepolicylabel.
rewritepolicylabel_rewritepolicy_binding	<rewritepolicylabel_rewritepolicy_binding[]>	Read-only	rewritepolicy that can be bound to rewritepolicylabel.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel_binding/labelname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewritepolicylabel_binding": [ {

      "labelname":<String_value>,

      "rewritepolicylabel_policybinding_binding":<rewritepolicylabel_policybinding_binding[]_value>,

      "rewritepolicylabel_rewritepolicy_binding":<rewritepolicylabel_rewritepolicy_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicylabel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "rewritepolicylabel_binding": [ {

      "labelname":<String_value>,

      "rewritepolicylabel_policybinding_binding":<rewritepolicylabel_policybinding_binding[]_value>,

      "rewritepolicylabel_rewritepolicy_binding":<rewritepolicylabel_rewritepolicy_binding[]_value>

}]}
```

rewritepolicylabel_policybinding_binding

Binding object showing the policybinding that can be bound to rewritepolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
policyname	<String>	Read-write	Name of the rewrite policy to bind to the policy label.
labelname	<String>	Read-write	Name of the rewrite policy label to which to bind the policy.
invoke_labelname	<String>	Read-write	* If labelType is policylabel, name of the policy label to invoke. - If labelType

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			is reqvserver or resvserver, name of the virtual server to which to forward the request or response.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Suspend evaluation of policies bound to the current policy label, and then forward the request to the specified virtual server or evaluate the specified policy label.
labeltype	<String>	Read-write	Type of invocation. Available settings function as follows: - reqvserver - Forward the request to the specified request virtual server. - resvserver - Forward the response to the specified response virtual server. - policylabel - Invoke the specified policy label. Possible values = reqvserver,

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_csvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewritepolicy_csvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Integer_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_csvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"rewritepolicy_csvserver_binding": [ { "__count": "#no"} ] }
```

rewritepolicy_lbvserver_binding

Binding object showing the lbvserver that can be bound to rewritepolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	Location where policy is bound.
name	<String>	Read-write	Name of the rewrite policy.
priority	<Double>	Read-only	Specifies the priority of the policy.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			resvserver, policylabel
activepolicy	<Integer>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_lbvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_lbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of rewritepolicy_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_lbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the rewritepolicy_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "rewritepolicy_lbvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Integer_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/rewritepolicy_lbvserver_binding

HTTP Method: GET

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/routerdynamicrouting? **args=commandstring: <String_value> ,nodeid: <Double_value>**

Use this query-parameter to get routerdynamicrouting resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/routerdynamicrouting? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/routerdynamicrouting? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of routerdynamicrouting resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/routerdynamicrouting? **view=summary**

Use this query-parameter to get the summary output of routerdynamicrouting resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/routerdynamicrouting? **pagesize=#no;pageno=#no**

Use this query-parameter to get the routerdynamicrouting resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "routerdynamicrouting": [ {

commandstring:<String_value>,nodeid:<Double_value>      "output":<String_value>

}]}
```

count
URL: http:// <netscaler-ip-address> /nitro/v1/config/routerdynamicrouting? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "routerdynamicrouting": [ { "__count": "#no"} ] }
```

SC

Sure Connect

SureConnect configuration. SureConnect allows the system to deliver alternate content to clients when the system is under heavy load for the original URL. The original content will be served to the client, automatically, after an estimated delay period.

NAME	DESCRIPTION
scparameter	Configuration for SC parameter
scpolicy	Configuration for SureConnect policy

scparameter

Configuration for SC parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sessionlife	<Double>	Read-write	Time, in seconds, between the first

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			time and the next time the SureConnect alternative content window is displayed. The alternative content window is displayed only once during a session for the same browser accessing a configured URL, so this parameter determines the length of a session. Default value: 300 Minimum value = 1 Maximum value = 4294967294
vsr	<String>	Read-write	File containing the customized response to be displayed when the ACTION in the SureConnect policy is set to NS. Default value: "DEFAULT" Minimum length = 1
builtin	<String[]>	Read-only	Flag to determine if SC param is built-in or not. Possible values = MODIFIABLE, DELETABLE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/scparameter

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"scparameter":{

      "sessionlife":<Double_value>,

      "vsr":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/scparameter? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"scparameter":{
      "sessionlife":true,
      "vsr":true
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/scparameter

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "scparameter": [ {

      "sessionlife":<Double_value>,

      "vsr":<String_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>

}]}
```

scpolicy

Configuration for SureConnect policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the policy. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Minimum length = 1 Maximum length = 31

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
url	<String>	Read-write	URL against which to match incoming client request. Maximum length = 127
rule	<String>	Read-write	Expression against which the traffic is evaluated. Maximum length of a string literal in the expression is 255 characters. A longer string can be split into smaller strings of up to 255 characters each, and the smaller strings concatenated with the + operator. For example, you can create a 500-character string as follows: '"<string of 255 characters>" + "<string of 245 characters>"' The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape the double quotation marks. Maximum length = 1499
delay	<Double>	Read-write	Delay threshold, in microseconds, for requests that match the policy's URL or rule. If the delay statistics gathered for the matching request exceed the specified delay, SureConnect is triggered for that request. Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 599999999
maxconn	<Double>	Read-write	Maximum number of concurrent connections that can be open for requests that match the policy's URL or rule. Minimum value = 1 Maximum value = 4294967294
action	<String>	Read-write	Action to be taken when the delay or maximum-connections threshold is reached. Available settings function as follows: ACS - Serve content from an alternative content service. NS - Serve alternative content from the Citrix ADC. NO ACTION - Serve no alternative content. However, delay statistics are still collected for the configured URLs, and, if the Maximum Client Connections parameter is set,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the number of connections is limited to the value specified by that parameter. (However, alternative content is not served even if the maxConn threshold is met). Possible values = ACS, NS, NOACTION
altcontentsvcname	<String>	Read-write	Name of the alternative content service to be used in the ACS action. Minimum length = 1 Maximum length = 127
altcontentpath	<String>	Read-write	Path to the alternative content service to be used in the ACS action. Minimum length = 1 Maximum length = 127
__count	<Double>	Read-only	count parameter

smpp

Smpp

All the commands associated with SMPP.

NAME	DESCRIPTION
smppparam	Configuration for SMPP configuration parameters
smppuser	Configuration for SMPP user

smppparam

Configuration for SMPP configuration parameters resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientmode	<String>	Read-write	Mode in which the client binds to the ADC. Applicable settings function as follows: * TRANSCEIVER - Client can send and receive messages to and from the message center. * TRANSMITTERONLY - Client can only send messages. * RECEIVERONLY - Client can only receive messages. Default value: TRANSCEIVER

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = TRANSCEIVER, TRANSMITTERONLY, RECEIVERONLY
msgqueue	<String>	Read-write	Queue SMPP messages if a client that is capable of receiving the destination address messages is not available. Default value: OFF Possible values = ON, OFF
msgqueuesize	<Double>	Read-write	Maximum number of SMPP messages that can be queued. After the limit is reached, the Citrix ADC sends a deliver_sm_resp PDU, with an appropriate error message, to the message center. Default value: 10000
addrton	<Double>	Read-write	Type of Number, such as an international number or a national number, used in the ESME address sent in the bind request.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 0 Minimum value = 0 Maximum value = 256
addrnpi	<Double>	Read-write	Numbering Plan Indicator, such as landline, data, or WAP client, used in the ESME address sent in the bind request. Default value: 0 Minimum value = 0 Maximum value = 256
addrrange	<String>	Read-write	Set of SME addresses, sent in the bind request, serviced by the ESME. Default value: "\\d*"

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "smppuser": [ { "__count": "#no"} ] }
```

snmp

SNMP

SNMP(Simple Network Management Protocol) configuration.

NAME	DESCRIPTION
snmpalarm	Configuration for alarm
snmpcommunity	Configuration for community
snmpengineid	Configuration for SNMP engine id
snmpgroup	Configuration for SNMP group
snmpmanager	Configuration for manager
snmpmib	Configuration for SNMP mib
snmpoid	Configuration for SNMP Object Identifier
snmpoption	Configuration for SNMP option
snmptrap	Configuration for snmp trap
snmptrap_binding	Binding object showing the resources that can be bound to snmptrap
snmptrap_snmpuser_binding	Binding object showing the snmpuser that can be bound to snmptrap
snmpuser	Configuration for SNMP user

NAME	DESCRIPTION
snmpview	Configuration for view

snmpalarm

Configuration for alarm resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trapname	<String>	Read-write	Name of the SNMP alarm. This parameter is required for identifying the SNMP alarm and cannot be modified. Possible values = CPU-USAGE, AVERAGE-CPU, MEMORY, MGMT-CPU-USAGE, SYNFLOOD, TCP-SYNFLOOD, VSERVER-REQRATE, SERVICE-REQRATE, ENTITY-RXRATE, ENTITY-TXRATE, ENTITY-SYNFLOOD, SERVICE-MAXCLIENTS, HA-STATE-CHANGE, ENTITY-STATE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CONFIG-CHANGE, CONFIG-SAVE, SERVICEGROUP-MEMBER-REQRATE, SERVICEGROUP-MEMBER-MAXCLIENTS, MONITOR-RTO-THRESHOLD, LOGIN-FAILURE, SSL-CERT-EXPIRY, FAN-SPEED-LOW, VOLTAGE-LOW, VOLTAGE-HIGH, TEMPERATURE-HIGH, CPU-TEMPERATURE-HIGH, POWER-SUPPLY-FAILURE, DISK-USAGE-HIGH, INTERFACE-THROUGHPUT-LOW, MON_PROBE_FAILED, HA-VERSION-MISMATCH, HA-SYNC-FAILURE, HA-NO-HEARTBEATS, HA-BAD-SECONDARY-STATE, INTERFACE-BW-USAGE, RATE-LIMIT-THRESHOLD-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			EXCEEDED, ENTITY-NAME-CHANGE, HA-PROP-FAILURE, IP-CONFLICT, PF-RL-RATE-THRESHOLD, PF-RL-PPS-THRESHOLD, PF-RL-RATE-PKTS-DROPPED, PF-RL-PPS-PKTS-DROPPED, APPFW-START-URL, APPFW-DENY-URL, APPFW-VIOLATIONS-TYPE, APPFW-REFERER-HEADER, APPFW-CSRF-TAG, APPFW-COOKIE, APPFW-FIELD-CONSISTENCY, APPFW-BUFFER-OVERFLOW, APPFW-FIELD-FORMAT, APPFW-FILE-UPLOAD-TYPE, APPFW-JSON-DOS, APPFW-JSON-SQL, APPFW-JSON-XSS, APPFW-SAFE-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			COMMERCE, APPFW-SAFE-OBJECT, APPFW-SESSION-LIMIT, APPFW-SIGNATURE-MATCH, APPFW-POLICY-HIT, APPFW-XSS, APPFW-XML-XSS, APPFW-SQL, APPFW-XML-SQL, APPFW-XML-ATTACHMENT, APPFW-XML-DOS, APPFW-XML-VALIDATION, APPFW-XML-WSI, APPFW-XML-SCHEMA-COMPILE, APPFW-XML-SOAP-FAULT, APPFW-NEW-SIGNATURE-ADDED, APPFW-DEPLOY-RELAXATION-DP, APPFW-LEARNED-RULE-APPLIED-DYN-PROF, APPFW-CMD, APPFW-POSTBODYLIMIT, DNSKEY-EXPIRY, HA-LICENSE-MISMATCH, SSL-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CARD-FAILED, SSL-CARD-NORMAL, WARM-RESTART-EVENT, HARD-DISK-DRIVE-ERRORS, COMPACT-FLASH-ERRORS, CALLHOME-UPLOAD-EVENT, 1024KEY-EXCHANGE-RATE, 2048KEY-EXCHANGE-RATE, 4096KEY-EXCHANGE-RATE, SSL-CUR-SESSION-INUSE, CLUSTER-NODE-HEALTH, CLUSTER-NODE-QUORUM, CLUSTER-VERSION-MISMATCH, CLUSTER-CCO-CHANGE, CLUSTER-OVS-CHANGE, CLUSTER-SYNC-FAILURE, CLUSTER-SYNC-PARTIAL-SUCCESS, CLUSTER-PROP-FAILURE, HA-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			STICKY-PRIMARY, INBAND-PROTOCOL-VERSION-MISMATCH, SSL-CHIP-REINIT, VRID-STATE-CHANGE, PORT-ALLOC-FAILED, LLDP-REMOTE-CHANGE, DUPLICATE-IPV6, PARTITION-CONFIG-EVENT, PARTITION-SWITCHED, LSN-PORTALLOC-FAILED, LSN-PORTQUOTA-EXCEED, LSN-SESSIONQUOTA-EXCEED, LSN-MEM-RECOVERY-KICKEDIN, VSERVER-SPILLOVER, PARTITION-RATE-LIMIT, POOLED-LICENSE-ONGRACE, POOLED-LICENSE-PARTIAL, CLUSTER-BACKPLANE-HB-MISSING, GSLB-SITE-MEP-FLAP,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			DNS-MAXNEGCACHE-USAGE, DNS-MAXCACHE-USAGE, NS-LICENSE-EXPIRY, PKT-RATELIMITING-ATTACK, GSLB-SYNC-STATUS-FLIP, URLFILT-DB-UPDATE-STATUS, URLFILT-INIT-SDK, POOLED-LICENSE-CHECKOUT-FAILURE, MIGRATION-STARTED, MIGRATION-COMPLETE, ECDHE-EXCHANGE-RATE, BOT-SIGNATURE-UPDATE, APPFW-XMLPAYLOAD-CONTENT-TYPE-MISMATCH
thresholdvalue	<Double>	Read-write	Value for the high threshold. The Citrix ADC generates an SNMP trap message when the value of the attribute associated with the alarm is greater than

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or equal to the specified high threshold value. Minimum value = 1
normalvalue	<Double>	Read-write	Value for the normal threshold. A trap message is generated if the value of the respective attribute falls to or below this value after exceeding the high threshold. Minimum value = 1
time	<Double>	Read-write	Interval, in seconds, at which the Citrix ADC generates SNMP trap messages when the conditions specified in the SNMP alarm are met.Can be specified for the following alarms: SYNFLOOD, HA-VERSION-MISMATCH, HA-SYNC-FAILURE, HA-NO-HEARTBEATS,HA-BAD-SECONDARY-STATE, CLUSTER-NODE-HEALTH, CLUSTER-NODE-QUORUM, CLUSTER-VERSION-MISMATCH,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CLUSTER-BKHB-FAILED, PORT-ALLOC-FAILED, COMPACT-FLASH-ERRORS, HARD-DISK-DRIVE-ERRORS and APPFW traps. Default trap time intervals: SYNFLOOD and APPFW traps = 1sec, PORT-ALLOC-FAILED = 3600sec(1 hour), Other Traps = 86400sec(1 day). Default value: 1
state	<String>	Read-write	Current state of the SNMP alarm. The Citrix ADC generates trap messages only for SNMP alarms that are enabled. Some alarms are enabled by default, but you can disable them. Default value: ENABLED Possible values = ENABLED, DISABLED
severity	<String>	Read-write	Severity level assigned to trap messages generated by this alarm. The severity levels are, in increasing order of

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			severity, Informational, Warning, Minor, Major, and Critical. This parameter is useful when you want the Citrix ADC to send trap messages to a trap listener on the basis of severity level. Trap messages with a severity level lower than the specified level (in the trap listener entry) are not sent. Default value: Unknown Possible values = Critical, Major, Minor, Warning, Informational
logging	<String>	Read-write	Logging status of the alarm. When logging is enabled, the Citrix ADC logs every trap message that is generated for this alarm. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
timeout	<Double>	Read-only	If DB is enabled and clear config is fired, then to reset timeinterval of alarm, corresponding default time value is needed. This hidden argument holds the default time value for the corresponding alarm.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- UPDATE
- UNSET
- ENABLE
- DISABLE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpalarm":{

<b>      "trapname":<String_value>,

</b>      "thresholdvalue":<Double_value>,

      "normalvalue":<Double_value>,
```

```
      "time":<Double_value>,

      "state":<String_value>,

      "severity":<String_value>,

      "logging":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpalarm":{

<b>      "trapname":<String_value>,

</b>      "thresholdvalue":true,

      "normalvalue":true,

      "time":true,
```

```
        "state":true,

        "severity":true,

        "logging":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm? **action=enable**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpalarm":{

<b>      "trapname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DISABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm? **action=disable**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpalarm":{

<b>      "trapname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of snmpalarm resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm? **view=summary**

Use this query-parameter to get the summary output of snmpalarm resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm? **pagesize=#no;pageno=#no**

Use this query-parameter to get the snmpalarm resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "snmpalarm": [ {
      "trapname":<String_value>,
      "thresholdvalue":<Double_value>,
      "normalvalue":<Double_value>,
      "time":<Double_value>,
      "state":<String_value>,
      "severity":<String_value>,
      "logging":<String_value>,
      "timeout":<Double_value>
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm/ trapname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm/ trapname_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm/ trapname_value<String> ?**view=summary**

Use this query-parameter to get the summary output of snmpalarm resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "snmpalarm": [ {

      "trapname":<String_value>,

      "thresholdvalue":<Double_value>,

      "normalvalue":<Double_value>,

      "state":<String_value>,

      "severity":<String_value>,

      "logging":<String_value>,

      "timeout":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpalarm? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "snmpalarm": [ { "__count": "#no"} ] }
```

snmpcommunity

Configuration for community resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
communityname	<String>	Read-write	The SNMP community string. Can consist of 1 to 31 characters that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			include uppercase and lowercase letters,numbers and special characters. The following requirement applies only to the Citrix ADC CLI: If the string includes one or more spaces, enclose the name in double or single quotation marks (for example, "my string" or 'my string'). Minimum length = 1
permissions	<String>	Read-write	The SNMP V1 or V2 query-type privilege that you want to associate with this SNMP community. Possible values = GET, GET_NEXT, GET_BULK, SET, ALL
__count	<Double>	Read-only	count parameter

Operations

```

snmpengineid

Configuration for SNMP engine id resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
engineid	<String>	Read-write	A hexadecimal value of at least 10 characters, uniquely identifying the engineid. Minimum length = 10 Maximum length = 31
ownernode	<Double>	Read-write	ID of the cluster node for which you are setting the engineid. Default value: -1 Minimum value = 0 Maximum value = 31
defaultengineid	<String>	Read-only	Unique identifier to assign to the SNMPv3 engine.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Should be a hexadecimal value with a minimum length of 10 hex characters.
__count	<Double>	Read-only	count parameter

snmpgroup

Configuration for SNMP group resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SNMPv3 group. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the SNMPv3 group. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my name" or 'my name').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
securitylevel	<String>	Read-write	Security level required for communication between the Citrix ADC and the SNMPv3 users who belong to the group. Specify one of the following options: noAuthNoPriv. Require neither authentication nor encryption. authNoPriv. Require authentication but no encryption. authPriv. Require authentication and encryption. Note: If you specify authentication, you must specify an encryption algorithm when you assign an SNMPv3 user to the group. If you also specify encryption, you must assign both an authentication and an encryption

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			algorithm for each group member. Possible values = noAuthNoPriv, authNoPriv, authPriv
readviewname	<String>	Read-write	Name of the configured SNMPv3 view that you want to bind to this SNMPv3 group. An SNMPv3 user bound to this group can access the subtrees that are bound to this SNMPv3 view as type INCLUDED, but cannot access the ones that are type EXCLUDED. If the Citrix ADC has multiple SNMPv3 view entries with the same name, all such entries are associated with the SNMPv3 group. Minimum length = 1
storagetype	<String>	Read-only	The storage type for this group. Possible values = volatile, nonVolatile
status	<String>	Read-only	The status of this group. Possible values = active

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
__count	<Double>	Read-only	count parameter

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpgroup

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpgroup":{

<b>      "name":<String_value>,

</b><b>      "securitylevel":<String_value>,

</b><b>      "readviewname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpgroup/ name_value<String>

Query-parameters:

args= securitylevel:<String_value>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpgroup

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "snmpgroup": [ { "__count": "#no"} ] }
```

snmpmanager

Configuration for manager resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ipaddress	<String>	Read-write	IP address of the SNMP manager. Can be an IPv4 or IPv6 address. You can instead specify an IPv4 network address or IPv6 network prefix if you want the Citrix ADC to respond to SNMP queries from any device on the specified network. Alternatively, instead of an IPv4 address, you can specify a host name that has been assigned to an SNMP manager. If you do so, you must add a DNS name server that resolves the host name of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SNMP manager to its IP address. Note: The Citrix ADC does not support host names for SNMP managers that have IPv6 addresses. Minimum length = 1 Maximum length = 255
netmask	<String>	Read-write	Subnet mask associated with an IPv4 network address. If the IP address specifies the address or host name of a specific host, accept the default value of 255.255.255.255.
domainresolveretry	<Integer>	Read-write	Amount of time, in seconds, for which the Citrix ADC waits before sending another DNS query to resolve the host name of the SNMP manager if the last query failed. This parameter is valid for host-name based SNMP managers only. After a query succeeds, the TTL determines the wait time. The minimum

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and default value is 5. Minimum value = 5 Maximum value = 20939
ip	<String>	Read-only	The resolved IP address of the hostname manager.
domain	<String>	Read-only	IP address of manager. It will be zero for hostname manager.
__count	<Double>	Read-only	count parameter

snmpmib

Configuration for SNMP mib resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
contact	<String>	Read-write	Name of the administrator for this Citrix ADC. Along with the name, you can include information on how to contact this person, such as a phone number or an email address. Can consist of 1 to 127 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the information includes one or more spaces, enclose it in double or single quotation marks (for example, "my contact" or 'my contact'). Default value: "WebMaster (default)" Minimum length = 1
name	<String>	Read-write	Name for this Citrix ADC. Can consist of 1 to 127 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the Citrix ADC appliance. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my name" or 'my name'). Default value: "NetScaler" Minimum length = 1
location	<String>	Read-write	Physical location of the Citrix ADC. For example, you can specify building name, lab number, and rack number. Can consist of 1 to 127 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI: If the location includes one or more spaces,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enclose it in double or single quotation marks (for example, "my location" or 'my location'). Default value: "POP (default)" Minimum length = 1
customid	<String>	Read-write	Custom identification number for the Citrix ADC. Can consist of 1 to 127 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a custom identification that helps identify the Citrix ADC appliance. The following requirement applies only to the Citrix ADC CLI: If the ID includes one or more spaces, enclose it in double or single quotation marks (for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, "my ID" or 'my ID'). Default value: "Default" Minimum length = 1
ownernode	<Double>	Read-write	ID of the cluster node for which we are setting the mib. This is a mandatory argument to set snmp mib on CLIP. Default value: -1 Minimum value = 0 Maximum value = 31
sysdesc	<String>	Read-only	The description of the system.
sysuptime	<Double>	Read-only	The UP time of the system in 100th of a second.
sysservices	<Double>	Read-only	The services offered by the system.
sysoid	<String>	Read-only	The OID of the system's management system.
__count	<Double>	Read-only	count parameter

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
snmpset	<String>	Read-write	Accept SNMP SET requests sent to the Citrix ADC, and allow SNMP managers to write values to MIB objects that are configured for write access. Default value: DISABLED Possible values = ENABLED, DISABLED
snmptraplogging	<String>	Read-write	Log any SNMP trap events (for SNMP alarms in which

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			logging is enabled) even if no trap listeners are configured. With the default setting, SNMP trap events are logged if at least one trap listener is configured on the appliance. Default value: DISABLED Possible values = ENABLED, DISABLED
partitionnameintrap	<String>	Read-write	Send partition name as a varbind in traps. By default the partition names are not sent as a varbind. Default value: DISABLED Possible values = ENABLED, DISABLED
snmptraploggginglevel	<String>	Read-write	Audit log level of SNMP trap logs. The default value is INFORMATIONAL. Default value: INFORMATIONAL Possible values = EMERGENCY, ALERT, CRITICAL,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ERROR, WARNING, NOTICE, INFORMATIONAL, DEBUG

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpoption

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpoption":{

      "snmpset":<String_value>,

      "snmptraplogging":<String_value>,

      "partitionnameintrap":<String_value>,

      "snmptraploggginglevel":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpoption? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpoption":{
      "snmpset":true,
      "snmptraplogging":true,
      "partitionnameintrap":true,
      "snmptraploggginglevel":true
}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpoption

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "snmpoption": [ {

      "snmpset":<String_value>,

}]}
```

snmptrap

Configuration for snmp trap resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
trapclass	<String>	Read-write	Type of trap messages that the Citrix ADC sends to the trap listener: Generic or the enterprise-specific messages defined in the MIB file.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = generic, specific
trapdestination	<String>	Read-write	IPv4 or the IPv6 address of the trap listener to which the Citrix ADC is to send SNMP trap messages. Minimum length = 1
version	<String>	Read-write	SNMP version, which determines the format of trap messages sent to the trap listener. This setting must match the setting on the trap listener. Otherwise, the listener drops the trap messages. Default value: V2 Possible values = V1, V2, V3
td	<Double>	Read-write	Integer value that uniquely identifies the traffic domain in which you want to configure the entity. If you do not specify an ID, the entity becomes part of the default traffic domain, which has an ID of 0.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 4094
destport	<Integer>	Read-write	UDP port at which the trap listener listens for trap messages. This setting must match the setting on the trap listener. Otherwise, the listener drops the trap messages. Default value: 162 Minimum value = 1 Maximum value = 65534
communityname	<String>	Read-write	Password (string) sent with the trap messages, so that the trap listener can authenticate them. Can include 1 to 31 uppercase or lowercase letters, numbers, and hyphen (-), period (.) pound (#), space ( ), at (@), equals (=), colon (:), and underscore (_) characters. You must specify the same community string on the trap listener

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			device. Otherwise, the trap listener drops the trap messages. The following requirement applies only to the Citrix ADC CLI: If the string includes one or more spaces, enclose the name in double or single quotation marks (for example, "my string" or 'my string').
srcip	<String>	Read-write	IPv4 or IPv6 address that the Citrix ADC inserts as the source IP address in all SNMP trap messages that it sends to this trap listener. By default this is the appliance's NSIP or NSIP6 address, but you can specify an IPv4 MIP or SNIP/ SNIP6 address. In cluster setup, the default value is the individual node's NSIP, but it can be set to CLIP or Striped SNIP address. In non

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			default partition, this parameter must be set to the SNIP/ SNIP6 address. Minimum length = 1
severity	<String>	Read-write	Severity level at or above which the Citrix ADC sends trap messages to this trap listener. The severity levels, in increasing order of severity, are Informational, Warning, Minor, Major, Critical. This parameter can be set for trap listeners of type SPECIFIC only. The default is to send all levels of trap messages. Important: Trap messages are not assigned severity levels unless you specify severity levels when configuring SNMP alarms. Default value: Unknown Possible values = Critical, Major, Minor, Warning, Informational

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
allpartitions	<String>	Read-write	Send traps of all partitions to this destination. Default value: DISABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

snmpuser

Configuration for SNMP user resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SNMPv3 user. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my user" or 'my user'). Minimum length = 1
group	<String>	Read-write	Name of the configured SNMPv3 group to which to bind this SNMPv3 user. The access rights (bound SNMPv3 views) and security level set for this group are assigned to this user.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
authtype	<String>	Read-write	Authentication algorithm used by the Citrix ADC and the SNMPv3 user for authenticating the communication between them. You must specify the same authentication algorithm when you configure the SNMPv3 user in the SNMP manager. Possible values = MD5, SHA
authpasswd	<String>	Read-write	Plain-text pass phrase to be used by the authentication algorithm specified by the authType (Authentication Type) parameter. Can consist of 1 to 31 characters that include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only to the Citrix ADC CLI: If the pass phrase includes one or more spaces, enclose it in double or single quotation marks (for example, "my phrase" or 'my phrase'). Minimum length = 8
privtype	<String>	Read-write	Encryption algorithm used by the Citrix ADC and the SNMPv3 user for encrypting the communication between them. You must specify the same encryption algorithm when you configure the SNMPv3 user in the SNMP manager. Possible values = DES, AES
privpasswd	<String>	Read-write	Encryption key to be used by the encryption algorithm specified by the privType (Encryption Type) parameter. Can consist of 1 to 31 characters that include uppercase and lowercase

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. The following requirement applies only to the Citrix ADC CLI: If the key includes one or more spaces, enclose it in double or single quotation marks (for example, "my key" or 'my key'). Minimum length = 8
engineid	<String>	Read-only	The context engine ID of the user.
storagetype	<String>	Read-only	The storage type for this user. Possible values = volatile, nonVolatile
status	<String>	Read-only	The status of this user. Possible values = active
__count	<Double>	Read-only	count parameter

Operations

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpuser

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpuser":{

<b>      "name":<String_value>,

</b><b>      "group":<String_value>,

</b>      "authtype":<String_value>,

      "authpasswd":<String_value>,

      "privtype":<String_value>,

      "privpasswd":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpuser/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpuser

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpuser":{

<b>      "name":<String_value>,

</b>      "group":<String_value>,

      "authtype":<String_value>,

      "authpasswd":<String_value>,

      "privtype":<String_value>,

      "privpasswd":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpuser? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"snmpuser":{

<b>      "name":<String_value>,

</b>      "authtype":true,

      "privtype":true,

      "authpasswd":true,

      "privpasswd":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpuser

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/snmpuser? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/snmpuser? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of snmpuser resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/snmpuser? **view=summary**

Use this query-parameter to get the summary output of snmpuser resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/snmpuser? **pagesize=#no;pageno=#no**

Use this query-parameter to get the snmpuser resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "snmpuser": [ {

      "name":<String_value>,

      "group":<String_value>,

      "authtype":<String_value>,

      "privtype":<String_value>,

      "engineid":<String_value>,

      "storagetype":<String_value>,

      "status":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpuser/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/snmpuser/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/snmpuser/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of snmpuser resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "snmpuser": [ {

      "name":<String_value>,

      "group":<String_value>,

      "authtype":<String_value>,

      "privtype":<String_value>,

      "engineid":<String_value>,

      "storagetype":<String_value>,

      "status":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/snmpuser? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "snmpuser": [ { "__count": "#no"} ] }
```

snmpview

Configuration for view resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SNMPv3 view. Can consist of 1 to 31 characters that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			include uppercase and lowercase letters, numbers, and the hyphen (-), period (.) pound (#), space ( ), at sign (@), equals (=), colon (:), and underscore (_) characters. You should choose a name that helps identify the SNMPv3 view. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose it in double or single quotation marks (for example, "my view" or 'my view'). Minimum length = 1
subtree	<String>	Read-write	A particular branch (subtree) of the MIB tree that you want to associate with this SNMPv3 view. You must specify the subtree as an SNMP OID. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
type	<String>	Read-write	Include or exclude the subtree, specified by the subtree parameter, in or from this view. This setting can be useful when you have included a subtree, such as A, in an SNMPv3 view and you want to exclude a specific subtree of A, such as B, from the SNMPv3 view. Possible values = included, excluded
storagetype	<String>	Read-only	The storage type for this view. Possible values = volatile, nonVolatile
status	<String>	Read-only	The status of this view. Possible values = active
__count	<Double>	Read-only	count parameter

{ "snmpview": [ { "__count": "#no"} ] }
```

spillover

Spillover

Spillover policies and actions.

NAME	DESCRIPTION
spilloveraction	Configuration for Spillover action
spilloverpolicy	Configuration for Spillover policy
spilloverpolicy_binding	Binding object showing the resources that can be bound to spilloverpolicy
spilloverpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to spilloverpolicy
spilloverpolicy_gslbvserver_binding	Binding object showing the gslbvserver that can be bound to spilloverpolicy
spilloverpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to spilloverpolicy

spilloveraction

Configuration for Spillover action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the spillover action.
action	<String>	Read-write	Spillover action. Currently only type

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SPILLOVER is supported. Possible values = SPILLOVER
newname	<String>	Read-write	New name for the spillover action. Must begin with an ASCII alphabetic or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Choose a name that can be correlated with the function that the action performs. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			"my action" or 'my action'). Minimum length = 1
builtin	<String[]>	Read-only	Flag to determine whether compression is default or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

RENAME

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy? **action=rename**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"spilloverpolicy":{
```

```
<b>      "name":<String_value>,

</b><b>      "newname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of spilloverpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy? **view=summary**

Use this query-parameter to get the summary output of spilloverpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the spilloverpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "spilloverpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "action":<String_value>,

      "hits":<Double_value>,

      "undefhits":<Double_value>,

      "comment":<String_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>
```

```
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy/ name_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy/ name_value<String> ?**view=summary**

Use this query-parameter to get the summary output of spilloverpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "spilloverpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "action":<String_value>,

      "hits":<Double_value>,

      "undefhits":<Double_value>,

      "comment":<String_value>,

      "builtin":<String[]_value>,

      "feature":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "spilloverpolicy": [ { "__count": "#no"} ] }
```

spilloverpolicy_binding

Binding object which returns the resources bound to spilloverpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the spillover policy.
spilloverpolicy_gslbvserver_binding	<spilloverpolicy_gslbvserver_binding[]>	Read-only	gslbvserver that can be bound to spilloverpolicy.
spilloverpolicy_csvserver_binding	<spilloverpolicy_csvserver_binding[]>	Read-only	csvserver that can be bound to spilloverpolicy.
spilloverpolicy_lbvserver_binding	<spilloverpolicy_lbvserver_binding[]>	Read-only	lbvserver that can be bound to spilloverpolicy.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "spilloverpolicy_binding": [ {

      "name":<String_value>,

      "spilloverpolicy_csvserver_binding":<spilloverpolicy_csvserver_bindi
ng[]_value>,

      "spilloverpolicy_lbvserver_binding":<spilloverpolicy_lbvserver_bindi
ng[]_value>,

      "spilloverpolicy_gslbvserver_binding":<spilloverpolicy_gslbvserver_b
inding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/spilloverpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "spilloverpolicy_binding": [ {

      "name":<String_value>,

      "spilloverpolicy_csvserver_binding":<spilloverpolicy_csvserver_bindi
ng[]_value>,

      "spilloverpolicy_lbvserver_binding":<spilloverpolicy_lbvserver_bindi
ng[]_value>,

      "spilloverpolicy_gslbvserver_binding":<spilloverpolicy_gslbvserver_b
inding[]_value>

}]}
```

spilloverpolicy_csvserver_binding

Binding object showing the csvserver that can be bound to spilloverpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The name of the entity to which the policy is bound.
name	<String>	Read-write	Name of the spillover policy.
priority	<Double>	Read-only	Specifies the priority of the policy.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = reqvserver, resvserver, policylabel
activepolicy	<Double>	Read-only	Indicates whether policy is bound or not.
__count	<Double>	Read-only	count parameter

Operations

sslhsmkey	Configuration for HSM key
sslkeyfile	Configuration for Imported ssl key files
ssllogprofile	Configuration for SSL logging Profile
sslocspresponder	Configuration for OCSP responser
sslparameter	Configuration for SSL parameter

NAME	DESCRIPTION
sslpkcs12	Configuration for pkcs12
sslpkcs8	Configuration for pkcs8
sslpolicy	Configuration for SSL policy
sslpolicy_binding	Binding object showing the resources that can be bound to sslpolicy
sslpolicy_csvserver_binding	Binding object showing the csvserver that can be bound to sslpolicy
sslpolicy_lbvserver_binding	Binding object showing the lbvserver that can be bound to sslpolicy
sslpolicy_sslglobal_binding	Binding object showing the sslglobal that can be bound to sslpolicy
sslpolicy_sslpolicylabel_binding	Binding object showing the sslpolicylabel that can be bound to sslpolicy
sslpolicy_sslservice_binding	Binding object showing the sslservice that can be bound to sslpolicy
sslpolicy_sslvserver_binding	Binding object showing the sslvserver that can be bound to sslpolicy
sslpolicylabel	Configuration for SSL policy label
sslpolicylabel_binding	Binding object showing the resources that can be bound to sslpolicylabel

NAME	DESCRIPTION
sslpolicylabel_sslpolicy_binding	Binding object showing the sslpolicy that can be bound to sslpolicylabel
sslprofile	Configuration for SSL profile
sslprofile_binding	Binding object showing the resources that can be bound to sslprofile
sslprofile_ecccurve_binding	Binding object showing the ecccurve that can be bound to sslprofile
sslprofile_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslprofile
sslprofile_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslprofile
sslprofile_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslprofile
sslprofile_sslvserver_binding	Binding object showing the sslvserver that can be bound to sslprofile
sslrsakey	Configuration for RSA key
sslservice	Configuration for SSL service
sslservice_binding	Binding object showing the resources that can be bound to sslservice

NAME	DESCRIPTION
sslservice_ecccurve_binding	Binding object showing the ecccurve that can be bound to sslservice
sslservice_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslservice
sslservice_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslservice
sslservice_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslservice
sslservice_sslpolicy_binding	Binding object showing the sslpolicy that can be bound to sslservice
sslservicegroup	Configuration for SSL service group
sslservicegroup_binding	Binding object showing the resources that can be bound to sslservicegroup
sslservicegroup_ecccurve_binding	Binding object showing the ecccurve that can be bound to sslservicegroup
sslservicegroup_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslservicegroup
sslservicegroup_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslservicegroup
sslservicegroup_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslservicegroup

NAME	DESCRIPTION
sslvserver	Configuration for SSL virtual server
sslvserver_binding	Binding object showing the resources that can be bound to sslvserver
sslvserver_ecccurve_binding	Binding object showing the ecccurve that can be bound to sslvserver
sslvserver_sslcertkey_binding	Binding object showing the sslcertkey that can be bound to sslvserver
sslvserver_sslcipher_binding	Binding object showing the sslcipher that can be bound to sslvserver
sslvserver_sslciphersuite_binding	Binding object showing the sslciphersuite that can be bound to sslvserver
sslvserver_sslpolicy_binding	Binding object showing the sslpolicy that can be bound to sslvserver
sslwrapkey	Configuration for WRAP key

sslaction

Configuration for SSL action resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SSL action. Must begin with an ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the action is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my action" or 'my action'). Minimum length = 1
clientauth	<String>	Read-write	Perform client certificate authentication. Possible values = DOCLIENTAUTH, NOCLIENTAUTH
clientcertverification	<String>	Read-write	Client certificate verification is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			mandatory or optional. Default value: Mandatory Possible values = Mandatory, Optional
ssllogprofile	<String>	Read-write	The name of the ssllogprofile. Minimum length = 1 Maximum length = 127
clientcert	<String>	Read-write	Insert the entire client certificate into the HTTP header of the request being sent to the web server. The certificate is inserted in ASCII (PEM) format. Possible values = ENABLED, DISABLED
certheader	<String>	Read-write	Name of the header into which to insert the client certificate.
clientcertserialnumber	<String>	Read-write	Insert the entire client serial number into the HTTP header of the request being sent to the web server.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
certserialheader	<String>	Read-write	Name of the header into which to insert the client serial number.
clientcertsubject	<String>	Read-write	Insert the client certificate subject, also known as the distinguished name (DN), into the HTTP header of the request being sent to the web server. Possible values = ENABLED, DISABLED
certsubjectheader	<String>	Read-write	Name of the header into which to insert the client certificate subject.
clientcerthash	<String>	Read-write	Insert the certificate's signature into the HTTP header of the request being sent to the web server. The signature is the value extracted directly from the X.509 certificate signature field. All X.509 certificates contain a signature field.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
certhashheader	<String>	Read-write	Name of the header into which to insert the client certificate signature (hash).
clientcertfingerprint	<String>	Read-write	Insert the certificate's fingerprint into the HTTP header of the request being sent to the web server. The fingerprint is derived by computing the specified hash value (SHA256, for example) of the DER-encoding of the client certificate. Possible values = ENABLED, DISABLED
certfingerprintheader	<String>	Read-write	Name of the header into which to insert the client certificate fingerprint.
certfingerprintdigest	<String>	Read-write	Digest algorithm used to compute the fingerprint of the client certificate. Possible values = SHA1, SHA224, SHA256, SHA384, SHA512

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
clientcertissuer	<String>	Read-write	Insert the certificate issuer details into the HTTP header of the request being sent to the web server. Possible values = ENABLED, DISABLED
certissuerheader	<String>	Read-write	Name of the header into which to insert the client certificate issuer details.
sessionid	<String>	Read-write	Insert the SSL session ID into the HTTP header of the request being sent to the web server. Every SSL connection that the client and the Citrix ADC share has a unique ID that identifies the specific connection. Possible values = ENABLED, DISABLED
sessionidheader	<String>	Read-write	Name of the header into which to insert the Session ID.
cipher	<String>	Read-write	Insert the cipher suite that the client and the Citrix ADC negotiated for the SSL session into the HTTP header of the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			request being sent to the web server. The appliance inserts the cipher-suite name, SSL protocol, export or non-export string, and cipher strength bit, depending on the type of browser connecting to the SSL virtual server or service (for example, Cipher-Suite: RC4-MD5 SSLv3 Non-Export 128-bit). Possible values = ENABLED, DISABLED
cipherheader	<String>	Read-write	Name of the header into which to insert the name of the cipher suite.
clientcertnotbefore	<String>	Read-write	Insert the date from which the certificate is valid into the HTTP header of the request being sent to the web server. Every certificate is configured with the date and time from which it is valid. Possible values = ENABLED, DISABLED
certnotbeforeheader	<String>	Read-write	Name of the header into which to insert

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the date and time from which the certificate is valid.
clientcertnotafter	<String>	Read-write	Insert the date of expiry of the certificate into the HTTP header of the request being sent to the web server. Every certificate is configured with the date and time at which the certificate expires. Possible values = ENABLED, DISABLED
certnotafterheader	<String>	Read-write	Name of the header into which to insert the certificate's expiry date.
owasupport	<String>	Read-write	If the appliance is in front of an Outlook Web Access (OWA) server, insert a special header field, FRONT-END-HTTPS: ON, into the HTTP requests going to the OWA server. This header communicates to the server that the transaction is HTTPS and not HTTP.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
forward	<String>	Read-write	This action takes an argument a vserver name, to this vserver one will be able to forward all the packets. Minimum length = 1 Maximum length = 127
cacertgrpname	<String>	Read-write	This action will allow to pick CA(s) from the specific CA group, to verify the client certificate. Minimum length = 1 Maximum length = 31
hits	<Double>	Read-only	The number of times the action has been taken.
undefhits	<Double>	Read-only	The number of times the action resulted in UNDEF.
referencecount	<Double>	Read-only	The number of references to the action.
description	<String>	Read-only	Description of the action.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
builtin	<String[]>	Read-only	Flag to determine whether ssl action is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslaction

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslaction":{

<b>      "name":<String_value>,

</b>      "clientauth":<String_value>,

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslaction/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslaction

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslaction? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslaction? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslaction resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslaction? **view=summary**

Use this query-parameter to get the summary output of sslaction resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslaction? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslaction resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

```

sslcacertgroup

Configuration for Group of CA certificate-key pairs resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cacertgroupname	<String>	Read-write	Name given to the CA certificate group. The name will be used to add the CA certificates to the group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
cacertgroupreferences	<Double>	Read-only	Count for ssl actions referring to this ca certificate group.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcacertgroup":{

<b>      "cacertgroupname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup/ cacertgroupname_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcacertgroup resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup? **view=summary**

Use this query-parameter to get the summary output of sslcacertgroup resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcacertgroup resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup": [ {

      "cacertgroupname":<String_value>,

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup": [ { "__count": "#no"} ] }
```

sslcacertgroup_binding

Binding object which returns the resources bound to sslcacertgroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cacertgroupname	<String>	Read-write	Name of the CA certificate group for which to show detailed information. Minimum length = 1 Maximum length = 31
sslcacertgroup_sslcertkey_binding	<sslcacertgroup_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslcacertgroup.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_binding/ cacertgroupname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup_binding": [ {

      "cacertgroupname":<String_value>,

      "sslcacertgroup_sslcertkey_binding":<sslcacertgroup_sslcertkey_bindi
ng[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcacertgroup_binding": [ {

      "cacertgroupname":<String_value>,

      "sslcacertgroup_sslcertkey_binding":<sslcacertgroup_sslcertkey_binding[]_value>

}]}
```

sslcacertgroup_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslcacertgroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cacertgroupname	<String>	Read-write	Name given to the CA certificate group. The name will be used to add the CA certificates to the group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
certkeyname	<String>	Read-write	Name for the certkey added to the Citrix ADC. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the certificate-key pair is created.The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, "my cert" or 'my cert'). Minimum length = 1 Maximum length = 31
crlcheck	<String>	Read-write	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
ocspcheck	<String>	Read-write	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
__count	<Double>	Read-write	count parameter

Operations

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslcacertgroup_sslcertkey_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslcacertgroup_sslcertkey_binding":{

<b>      "cacertgroupname":<String_value>,
```

```
</b><b>      "certkeyname":<String_value>,

</b>      "crlcheck":<String_value>,

      "ocspcheck":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_sslcertkey_binding/cacertgroupname_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_sslcertkey_binding/cacertgroupname_value<String> ? **args= certkeyname:<String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_sslcertkey_binding/cacertgroupname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_sslcertkey_binding/ cacertgroupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcacertgroup_sslcertkey_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcacertgroup_sslcertkey_binding/ cacertgroupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcacertgroup_sslcertkey_binding resources in chunks.

HTTP Method: GET

Request Headers:

Response Payload:

```
{"sslcacertgroup_sslcertkey_binding": [ { "__count": "#no"} ] }
```

sslcert

Configuration for cerificate resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certfile	<String>	Read-write	Name for and, optionally, path to the generated certificate file. /nsconfig/ssl/ is the default path. Maximum length = 63
reqfile	<String>	Read-write	Name for and, optionally, path to the certificate-signing request (CSR). /nsconfig/ssl/ is the default path. Maximum length = 63
certtype	<String>	Read-write	Type of certificate to generate. Specify one of the following: * ROOT_CERT - Self-signed Root-CA certificate. You must specify the key file name. The generated Root-CA certificate can be used for signing end-user client or server certificates or

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to create Intermediate-CA certificates. * INTM_CERT - Intermediate-CA certificate. * CLNT_CERT - End-user client certificate used for client authentication. * SRVR_CERT - SSL server certificate used on SSL servers for end-to-end encryption. Possible values = ROOT_CERT, INTM_CERT, CLNT_CERT, SRVR_CERT
keyfile	<String>	Read-write	Name for and, optionally, path to the private key. You can either use an existing RSA or DSA key that you own or create a new private key on the Citrix ADC. This file is required only when creating a self-signed Root-CA certificate. The key

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			file is stored in the /nsconfig/ssl directory by default. If the input key specified is an encrypted key, you are prompted to enter the PEM pass phrase that was used for encrypting the key. Maximum length = 63
keyform	<String>	Read-write	Format in which the key is stored on the appliance. Default value: PEM Possible values = DER, PEM
pempassphrase	<String>	Read-write	. Minimum length = 1 Maximum length = 31
days	<Double>	Read-write	Number of days for which the certificate will be valid, beginning with the time and day (system time) of creation. Default value: 365 Minimum value = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 3650
subjectaltname	<String>	Read-write	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). Names include: 1. Email addresses 2. IP addresses 3. URIs 4. DNS names (This is usually also provided as the Common Name RDN within the Subject field of the main certificate.) 5. directory names (alternative Distinguished Names to that given in the Subject). Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certform	<String>	Read-write	Format in which the certificate is stored on the appliance. Default value: PEM Possible values = DER, PEM
cacert	<String>	Read-write	Name of the CA certificate file that issues and signs the Intermediate-CA certificate or the end-user client and server certificates. Maximum length = 63
cacertform	<String>	Read-write	Format of the CA certificate. Default value: PEM Possible values = DER, PEM
cakey	<String>	Read-write	Private key, associated with the CA certificate that is used to sign the Intermediate-CA certificate or the end-user client and server certificate. If the CA key file is password protected, the user is prompted to enter the pass phrase that was used to encrypt the key.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 63
cakeyform	<String>	Read-write	Format for the CA certificate. Default value: PEM Possible values = DER, PEM
caserial	<String>	Read-write	Serial number file maintained for the CA certificate. This file contains the serial number of the next certificate to be issued or signed by the CA. If the specified file does not exist, a new file is created, with /nsconfig/ssl/ as the default path. If you do not specify a proper path for the existing serial file, a new serial file is created. This might change the certificate serial numbers assigned by the CA certificate to each of the certificates it signs. Maximum length = 63

Operations

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcert? **action=create**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcert":{

<b>      "certfile":<String_value>,

</b><b>      "reqfile":<String_value>,

</b><b>      "certtype":<String_value>,

</b>      "keyfile":<String_value>,

      "keyform":<String_value>,

      "pempassphrase":<String_value>,

      "days":<Double_value>,

      "subjectaltname":<String_value>,

      "certform":<String_value>,

      "cacert":<String_value>,

      "cacertform":<String_value>,

      "cakey":<String_value>,

      "cakeyform":<String_value>,

      "caserial":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslcertbundle

Configuration for Imported Certbundle resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported certificate bundle. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name, to the certificate bundle to be imported or exported. For example, http://www.example.com/cert_bundle_file. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
inuse	<String>	Read-only	. Possible values = YES, NO
__count	<Double>	Read-only	count parameter

```

sslcertchain_binding

Binding object which returns the resources bound to sslcertchain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkeyname	<String>	Read-write	Name of the Certificate. Minimum length = 1
sslcertchain_sslcertkey_binding	<sslcertchain_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslcertchain.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain_binding/ certkeyname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertchain_binding": [ {

      "certkeyname":<String_value>,

      "sslcertchain_sslcertkey_binding":<sslcertchain_sslcertkey_binding[]
_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertchain_binding": [ {

      "certkeyname":<String_value>,

      "sslcertchain_sslcertkey_binding":<sslcertchain_sslcertkey_binding[]
_value>
```

```
}]}
```

sslcertchain_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslcertchain.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
linkcertkeyname	<String>	Read-write	Name of the Linked Certificate. Minimum length = 1
certkeyname	<String>	Read-write	Name of the Certificate. Minimum length = 1
isca	<Boolean>	Read-only	Used to find if certificate is a CA.
islinked	<Boolean>	Read-only	Used to find if certificate is linked.
addsubject	<Boolean>	Read-only	Used to find if certificate is linked.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain_sslcertkey_binding/ certkeyname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain_sslcertkey_binding/ certkeyname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcertchain_sslcertkey_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain_sslcertkey_binding/ certkeyname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertchain_sslcertkey_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertchain_sslcertkey_binding": [ {

      "linkcertkeyname":<String_value>,

      "certkeyname":<String_value>,

      "islinked":<Boolean_value>,

      "addsubject":<Boolean_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain_sslcertkey_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain_sslcertkey_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertchain_sslcertkey_binding": [ {

      "linkcertkeyname":<String_value>,

      "certkeyname":<String_value>,

      "isca":<Boolean_value>,

      "islinked":<Boolean_value>,
```

```
      "addsubject":<Boolean_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertchain_sslcertkey_binding/ certkeyname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcertchain_sslcertkey_binding": [ { "__count": "#no"} ] }
```

sslcertfile

Configuration for Imported Certfile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported certificate file. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the certificate file to be imported. For example, http://www.example.com/cert_file.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
__count	<Double>	Read-only	count parameter

Operations

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertfile? **action=Import**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertfile":{

<b>      "name":<String_value>,

</b><b>      "src":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertfile

Query-parameters:

args= name:<String_value>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertfile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslcertfile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcertfile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcertfile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslcertfile? **view=summary**

Use this query-parameter to get the summary output of sslcertfile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcertfile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertfile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertfile": [ {

      "name":<String_value>,

      "src":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertfile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertfile": [ { "__count": "#no"} ] }
```

sslcertificatechain

Configuration for linked certificate resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkeyname	<String>	Read-write	Name of the certificate-key pair.
chainlinked	<String[]>	Read-only	Certkeys which are currenlty in SSL certificate chain.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
chainpossiblelinks	<String[]>	Read-only	Certkeys which can be in SSL certificate chain.
chainissuer	<String>	Read-only	Name of the issuer.
chaincomplete	<Double>	Read-only	Is set to 1 if ssl certificate chain is complete.
__count	<Double>	Read-only	count parameter

sslcertkey

Configuration for certificate key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkey	<String>	Read-write	Name for the certificate and private-key pair. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate-key pair is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my cert" or 'my cert'). Minimum length = 1
cert	<String>	Read-write	Name of and, optionally, path to the X509 certificate file that is used to form the certificate-key pair. The certificate file should be present on the appliance's hard-disk drive or solid-state drive. Storing a certificate in any location other than the default might cause inconsistency in a high availability setup. /nsconfig/ssl/ is the default path. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
key	<String>	Read-write	Name of and, optionally, path to the private-key file that is used to form the certificate-key pair. The certificate file should be present on the appliance's hard-disk drive or solid-state drive. Storing a certificate in any location other than the default might cause inconsistency in a high availability setup. /nsconfig/ssl/ is the default path. Minimum length = 1
password	<Boolean>	Read-write	Passphrase that was used to encrypt the private-key. Use this option to load encrypted private-keys in PEM format.
fipskey	<String>	Read-write	Name of the FIPS key that was created inside the Hardware Security Module (HSM) of a FIPS appliance, or a key that was imported into the HSM. Minimum length = 1
hsmkey	<String>	Read-write	Name of the HSM key that was created in the External Hardware Security

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Module (HSM) of a FIPS appliance. Minimum length = 1
inform	<String>	Read-write	Input format of the certificate and the private-key files. The three formats supported by the appliance are: PEM - Privacy Enhanced Mail DER - Distinguished Encoding Rule PFX - Personal Information Exchange. Default value: PEM Possible values = DER, PEM, PFX
passplain	<String>	Read-write	Pass phrase used to encrypt the private-key. Required when adding an encrypted private-key in PEM format. Minimum length = 1
expirymonitor	<String>	Read-write	Issue an alert when the certificate is about to expire. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
notificationperiod	<Double>	Read-write	Time, in number of days, before certificate expiration, at which to generate an alert that the certificate is about to expire. Minimum value = 10 Maximum value = 100
bundle	<String>	Read-write	Parse the certificate chain as a single file after linking the server certificate to its issuer's certificate within the file. Default value: NO Possible values = YES, NO
deletefromdevice	<Boolean>	Read-write	Delete cert/key file from file system.
linkcertkeyname	<String>	Read-write	Name of the Certificate Authority certificate-key pair to which to link a certificate-key pair. Minimum length = 1
nodomaincheck	<Boolean>	Read-write	Override the check for matching domain names during a certificate update operation.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ocspstaplingcache	<Boolean>	Read-write	Clear cached ocspStapling response in certkey.
signaturealg	<String>	Read-only	Signature algorithm.
certificatetype	<String[]>	Read-only	Specifies whether the certificate is of type root-CA, intermediate-CA, server, client, or client and server. Possible values = ROOT_CERT, INTM_CERT, CLNT_CERT, SRVR_CERT, UNKNOWN_CERT
serial	<String>	Read-only	Serial number.
issuer	<String>	Read-only	Issuer name.
clientcertnotbefore	<String>	Read-only	Not-Before date.
clientcertnotafter	<String>	Read-only	Not-After date.
daystoexpiration	<Integer>	Read-only	Days remaining for the certificate to expire.
subject	<String>	Read-only	Subject name.
publickey	<String>	Read-only	Public key algorithm.
publickeysize	<Integer>	Read-only	Size of the public key.
version	<Integer>	Read-only	Version.
priority	<Double>	Read-only	ocsp priority.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
status	<String>	Read-only	Status of the certificate. Possible values = Valid, Not yet valid, Expired
passcrypt	<String>	Read-only	Passcrypt. Minimum length = 1
data	<Double>	Read-only	Vserver Id.
servicename	<String>	Read-only	Service name to which the certificate key pair is bound.
ocspresponsestatus	<String>	Read-only	Ocsp response status of the certificate. Possible values = NONE, EXPIRED, VALID
builtin	<String[]>	Read-only	Flag to determine if Cert key is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

{"sslcertkey":{

<b>      "certkey":<String_value>,

</b><b>      "linkcertkeyname":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

unlink

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **action=unlink**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>      "certkey":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

change

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **action=update**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>      "certkey":<String_value>,

</b>      "cert":<String_value>,

      "key":<String_value>,

      "password":<Boolean_value>,

      "fipskey":<String_value>,

      "inform":<String_value>,

      "passplain":<String_value>,

      "nodomaincheck":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

clear

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **action=clear**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertkey":{

<b>      "certkey":<String_value>,

</b>      "ocspstaplingcache":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

get (all)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcertkey resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **view=summary**

Use this query-parameter to get the summary output of sslcertkey resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertkey": [ {
```

```
        "certkey":<String_value>,

        "cert":<String_value>,

        "feature":<String_value>

  }]}
```

count

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertkey": [ { "__count": "#no"} ] }
```

sslcertkey_binding

Binding object which returns the resources bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkey	<String>	Read-write	Name of the certificate-key pair for which to show detailed information. Minimum length = 1
sslcertkey_crldistribution_binding	<sslcertkey_crldistribution_binding[]>	Read-only	crldistribution that can be bound to sslcertkey.
sslcertkey_sslvserver_binding	<sslcertkey_sslvserver_binding[]>	Read-only	sslvserver that can be bound to sslcertkey.
sslcertkey_sslocspresponder_binding	<sslcertkey_sslocspresponder_binding[]>	Read-only	sslocspresponder that can be bound to sslcertkey.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslcertkey_service_binding	<sslcertkey_service_binding[]>	Read-only	service that can be bound to sslcertkey.
sslcertkey_sslprofile_binding	<sslcertkey_sslprofile_binding[]>	Read-only	sslprofile that can be bound to sslcertkey.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_binding/ certkey_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertkey_binding": [ {

      "certkey":<String_value>,

      "sslcertkey_sslprofile_binding":<sslcertkey_sslprofile_binding[]_val
ue>,

      "sslcertkey_sslocspresponder_binding":<sslcertkey_sslocspresponder_b
inding[]_value>,

      "sslcertkey_service_binding":<sslcertkey_service_binding[]_value>,

      "sslcertkey_crldistribution_binding":<sslcertkey_crldistribution_bin
ding[]_value>,

      "sslcertkey_sslvserver_binding":<sslcertkey_sslvserver_binding[]_val
ue>
```

```
}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertkey_binding": [ {

      "certkey":<String_value>,

      "sslcertkey_sslprofile_binding":<sslcertkey_sslprofile_binding[]_val
```

```
ue>,

      "sslcertkey_sslocspresponder_binding":<sslcertkey_sslocspresponder_b
inding[]_value>,

      "sslcertkey_service_binding":<sslcertkey_service_binding[]_value>,

      "sslcertkey_crldistribution_binding":<sslcertkey_crldistribution_bin
ding[]_value>,

      "sslcertkey_sslvserver_binding":<sslcertkey_sslvserver_binding[]_val
ue>

}]}
```

sslcertkey_crldistribution_binding

Binding object showing the crldistribution that can be bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	The certificate-key pair being unbound is a Certificate Authority (CA) certificate. If you choose this option, the certificate-key pair is unbound from the list of CA certificates that were bound to the specified SSL virtual server or SSL service.
issuer	<String>	Read-write	Issuer name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkey	<String>	Read-write	Name of the certificate-key pair. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

sslcertkey_service_binding

Binding object showing the service that can be bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The name of the SSL service group to which the certificate-key pair needs to be bound. Use the "add servicegroup" command to create this service. Minimum length = 1
ca	<Boolean>	Read-write	The certificate-key pair being unbound is a Certificate Authority (CA) certificate. If you choose this option, the certificate-key pair is unbound from the list of CA certificates that were bound to the specified SSL virtual server or SSL service.
service	<Boolean>	Read-write	Bind the certificate to the named SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service or service group.
servicename	<String>	Read-write	Service name to which the certificate key pair is bound.
certkey	<String>	Read-write	Name of the certificate-key pair. Minimum length = 1
version	<Integer>	Read-only	Version.
data	<Double>	Read-only	Vserver Id.
__count	<Double>	Read-only	count parameter

Operations

Use this query-parameter to get the filtered set of sslcertkey_sslocspresponder_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslocspresponder_binding/ certkey_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey_sslocspresponder_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertkey_sslocspresponder_binding": [ {

      "priority":<Double_value>,

      "ca":<Boolean_value>,

      "certkey":<String_value>,
```

```
      "ocspresponder":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslocspresponder_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslocspresponder_binding?**bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertkey_sslocspresponder_binding": [ {
```

```
        "priority":<Double_value>,

        "ca":<Boolean_value>,

        "certkey":<String_value>,

        "ocspresponder":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslocspresponder_binding/ certkey_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcertkey_sslocspresponder_binding": [ { "__count": "#no"} ] }
```

sslcertkey_sslprofile_binding

Binding object showing the sslprofile that can be bound to sslcertkey.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	The certificate-key pair being unbound is a Certificate Authority (CA) certificate. If you choose this option, the certificate-key pair is unbound from the list of CA certificates that were bound to the specified SSL virtual server or SSL service.
sslprofile	<String>	Read-write	SSL profile name to which the certificate key pair is bound.
certkey	<String>	Read-write	Name of the certificate-key pair. Minimum length = 1
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslprofile_binding/ certkey_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslprofile_binding/ certkey_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcertkey_sslprofile_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslprofile_binding/ certkey_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertkey_sslprofile_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcertkey_sslprofile_binding": [ {

      "ca":<Boolean_value>,

      "sslprofile":<String_value>,

      "certkey":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslprofile_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcertkey_sslprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

```

sslcertlink

Configuration for linked certificate resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certkeyname	<String>	Read-write	Certificate key name.
linkcertkeyname	<String>	Read-write	Name of the Certificate-Authority.
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.
- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertlink

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslcertlink? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcertlink? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcertlink resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslcertlink? **view=summary**

Use this query-parameter to get the summary output of sslcertlink resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcertlink? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcertlink resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertlink": [ {

      "certkeyname":<String_value>,

      "linkcertkeyname":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertlink? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcertlink": [ { "__count": "#no"} ] }
```

sslcertreq

Configuration for certificate request resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
reqfile	<String>	Read-write	Name for and, optionally, path to the certificate signing request (CSR). /nsconfig/ssl/ is the default path. Maximum length = 63
keyfile	<String>	Read-write	Name of and, optionally, path to the private key used to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			create the certificate signing request, which then becomes part of the certificate-key pair. The private key can be either an RSA or a DSA key. The key must be present in the appliance's local storage. /nsconfig/ssl is the default path. Maximum length = 63
subjectaltname	<String>	Read-write	Subject Alternative Name (SAN) is an extension to X.509 that allows various values to be associated with a security certificate using a subjectAltName field. These values are called "Subject Alternative Names" (SAN). Names include: 1. Email addresses 2. IP addresses 3. URIs 4. DNS names (this is usually also provided as the Common Name RDN within the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Subject field of the main certificate.) 5. Directory names (alternative Distinguished Names to that given in the Subject). Minimum length = 1
fipskeyname	<String>	Read-write	Name of the FIPS key used to create the certificate signing request. FIPS keys are created inside the Hardware Security Module of the FIPS card. Minimum length = 1 Maximum length = 31
keyform	<String>	Read-write	Format in which the key is stored on the appliance. Default value: PEM Possible values = DER, PEM
pempassphrase	<String>	Read-write	. Minimum length = 1 Maximum length = 31
countryname	<String>	Read-write	Two letter ISO code for your country. For

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			example, US for United States. Minimum length = 2 Maximum length = 2
statename	<String>	Read-write	Full name of the state or province where your organization is located. Do not abbreviate. Minimum length = 1
organizationname	<String>	Read-write	Name of the organization that will use this certificate. The organization name (corporation, limited partnership, university, or government agency) must be registered with some authority at the national, state, or city level. Use the legal name under which the organization is registered. Do not abbreviate the organization name and do not use the following characters in the name:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Angle brackets (< >) tilde (~), exclamation mark, at (@), pound (#), zero (0), caret (\^), asterisk (*), forward slash (/), square brackets ([ ]), question mark (?). Minimum length = 1
organizationunitname	<String>	Read-write	Name of the division or section in the organization that will use the certificate. Minimum length = 1
localityname	<String>	Read-write	Name of the city or town in which your organization's head office is located. Minimum length = 1
commonname	<String>	Read-write	Fully qualified domain name for the company or web site. The common name must match the name used by DNS servers to do a DNS lookup of your server. Most browsers use this information for authenticating the server's certificate during the SSL handshake. If the server name in the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			URL does not match the common name as given in the server certificate, the browser terminates the SSL handshake or prompts the user with a warning message. Do not use wildcard characters, such as asterisk (*) or question mark (?), and do not use an IP address as the common name. The common name must not contain the protocol specifier <http://> or <https://>. Minimum length = 1
emailaddress	<String>	Read-write	Contact person's e-mail address. This address is publically displayed as part of the certificate. Provide an e-mail address that is monitored by an administrator who can be contacted about the certificate. Minimum length = 1
challengepassword	<String>	Read-write	Pass phrase, embedded in the certificate signing

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			request that is shared only between the client or server requesting the certificate and the SSL certificate issuer (typically the certificate authority). This pass phrase can be used to authenticate a client or server that is requesting a certificate from the certificate authority. Minimum length = 4
companyname	<String>	Read-write	Additional name for the company or web site. Minimum length = 1
digestmethod	<String>	Read-write	Digest algorithm used in creating CSR. Possible values = SHA1, SHA256

Operations

(click to see Properties)

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcertreq? **action=create**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcertreq":{

<b>      "reqfile":<String_value>,

</b>      "keyfile":<String_value>,

      "subjectaltname":<String_value>,
```

```
      "fipskeyname":<String_value>,

      "keyform":<String_value>,

      "pempassphrase":<String_value>,

<b>      "countryname":<String_value>,

</b><b>      "statename":<String_value>,

</b><b>      "organizationname":<String_value>,

</b>      "organizationunitname":<String_value>,

      "localityname":<String_value>,

      "commonname":<String_value>,

      "emailaddress":<String_value>,

      "challengepassword":<String_value>,

      "companyname":<String_value>,

      "digestmethod":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslcipher

Configuration for cipher resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphergroupname	<String>	Read-write	Name for the user-defined cipher group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the cipher group is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ciphergroup" or 'my ciphergroup'). Minimum length = 1
ciphgrpalias	<String>	Read-write	The individual cipher name(s), a user-defined cipher group, or a system predefined cipher alias that will be

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			added to the predefined cipher alias that will be added to the group cipherGroupName. If a cipher alias or a cipher group is specified, all the individual ciphers in the cipher alias or group will be added to the user-defined cipher group. Minimum length = 1
ciphername	<String>	Read-write	Cipher name.
cipherpriority	<Double>	Read-write	This indicates priority assigned to the particular cipher. Minimum value = 1
sslprofile	<String>	Read-write	Name of the profile to which cipher is attached.
__count	<Double>	Read-only	count parameter

Use this query-parameter to get sslcipher resources based on additional properties.

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcipher resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **view=summary**

Use this query-parameter to get the summary output of sslcipher resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcipher resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcipher": [ {

ciphergroupname:<String_value>,sslprofile:<String_value>      "ciphername"
:<String_value>,

      "cipherpriority":<Double_value>

}]}
```

get
URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher/ ciphergroupname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher/ ciphergroupname_value<String> ?
attrs=property-name1,property-name2

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher/ ciphergroupname_value<String> ? **view=summary**

Use this query-parameter to get the summary output of sslcipher resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcipher": [ {

ciphergroupname:<String_value>,sslprofile:<String_value>      "ciphername"
:<String_value>,

      "cipherpriority":<Double_value>

}]}
```

count

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcipher": [ { "__count": "#no"} ] }
```

sslciphersuite

Configuration for ciphersuite resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphername	<String>	Read-write	Name of the cipher suite for which to show detailed information.
description	<String>	Read-only	Cipher suite description.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslciphersuite resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite? **view=summary**

Use this query-parameter to get the summary output of sslciphersuite resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslciphersuite resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslciphersuite": [ {
      "ciphername":<String_value>,
      "description":<String_value>
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite/ ciphername_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite/ ciphername_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite/ ciphername_value<String> ? **view=summary**

Use this query-parameter to get the summary output of sslciphersuite resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslciphersuite": [ {

      "ciphername":<String_value>,

      "description":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslciphersuite? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslciphersuite": [ { "__count": "#no"} ] }
```

sslcipher_binding

Binding object which returns the resources bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphergroupname	<String>	Read-write	Name of the cipher group for which to show detailed information. Minimum length = 1
sslcipher_sslprofile_binding	<sslcipher_sslprofile_binding[]>	Read-only	sslprofile that can be bound to sslcipher.
sslcipher_individualcipher_binding	<sslcipher_individualcipher_binding[]>	Read-only	individualcipher that can be bound to sslcipher.
sslcipher_sslciphersuite_binding	<sslcipher_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslcipher.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_binding/ciphergroupname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcipher_binding": [ {

      "ciphergroupname":<String_value>,

      "sslcipher_sslciphersuite_binding":<sslcipher_sslciphersuite_binding
[]_value>,

      "sslcipher_individualcipher_binding":<sslcipher_individualcipher_bin
ding[]_value>,

      "sslcipher_sslprofile_binding":<sslcipher_sslprofile_binding[]_value
>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcipher_binding": [ {

      "ciphergroupname":<String_value>,

      "sslcipher_sslciphersuite_binding":<sslcipher_sslciphersuite_binding
[]_value>,

      "sslcipher_individualcipher_binding":<sslcipher_individualcipher_bin
ding[]_value>,

      "sslcipher_sslprofile_binding":<sslcipher_sslprofile_binding[]_value
>

}]}
```

sslcipher_individualcipher_binding

Binding object showing the individualcipher that can be bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphername	<String>	Read-write	Cipher name.
ciphgrpals	<String>	Read-write	A cipher-suite can consist of an individual cipher name, the system predefined cipher-alias name, or user defined cipher-group name. Minimum length = 1
cipherpriority	<Double>	Read-write	This indicates priority assigned to the particular cipher. Minimum value = 1
description	<String>	Read-write	Cipher suite description.
ciphergroupname	<String>	Read-write	Name of the user-defined cipher group. Minimum length = 1
cipheroperation	<String>	Read-write	The operation that is performed when adding the cipher-suite.

Possible cipher operations are: ADD - Appends the given cipher-suite to the existing one configured for the virtual server. REM - Removes the given cipher-suite from the existing one configured for the virtual server. ORD - Overrides the current configured cipher-suite for the virtual server with the given cipher-suite.

Default value: 0

Possible values = ADD, REM, ORD

Operations

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

sslcipher_sslciphersuite_binding

Binding object showing the sslciphersuite that can be bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ciphername	<String>	Read-write	Cipher name.
ciphgrpals	<String>	Read-write	A cipher-suite can consist of an individual cipher name, the system predefined cipher-alias name, or user defined cipher-group name. Minimum length = 1
cipherpriority	<Double>	Read-write	This indicates priority assigned to the particular cipher. Minimum value = 1
description	<String>	Read-write	Cipher suite description.
ciphergroupname	<String>	Read-write	Name for the user-defined cipher group. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the cipher group is created.

The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my ciphergroup" or 'my ciphergroup').

Minimum length = 1

Possible cipher operations are: ADD - Appends the given cipher-suite to the existing one configured for the virtual server. REM - Removes the given cipher-suite from the existing one configured for the virtual server. ORD - Overrides the current configured cipher-suite for the virtual server with the given cipher-suite.

Default value: 0

Possible values = ADD, REM, ORD

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslciphersuite_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcipher_sslciphersuite_binding": [ {

      "ciphername":<String_value>,

      "ciphgrpals":<String_value>,

      "cipherpriority":<Double_value>,
```

```
        "description":<String_value>,

        "ciphergroupname":<String_value>,

        "cipheroperation":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslciphersuite_binding?**args=;count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcipher_sslciphersuite_binding": [ { "__count": "#no"} ] }
```

sslcipher_sslprofile_binding

Binding object showing the sslprofile that can be bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherpriority	<Double>	Read-write	Priority of the cipher to be added. Minimum value = 1 Maximum value = 1000
ciphgrpals	<String>	Read-write	A cipher-suite can consist of an individual cipher name, the system predefined cipher-alias name, or user defined cipher-group name. Minimum length = 1
description	<String>	Read-write	Cipher suite description.
sslprofile	<String>	Read-write	Name of the profile to which cipher is attached.
ciphergroupname	<String>	Read-write	Name of the user-defined cipher group. Minimum length = 1
cipheroperation	<String>	Read-write	The operation that is performed when adding the cipher-suite.

Possible cipher operations are: ADD - Appends the given cipher-suite to the existing one configured for the virtual server. REM - Removes the given cipher-suite from the existing one

configured for the virtual server. ORD - Overrides the current configured cipher-suite for the virtual server with the given cipher-suite.

Default value: 0

Possible values = ADD, REM, ORD

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslprofile_binding/ciphergroupname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslprofile_binding/ciphergroupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcipher_sslprofile_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslprofile_binding/ciphergroupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcipher_sslprofile_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcipher_sslprofile_binding": [ {

      "cipherpriority":<Double_value>,

      "ciphgrpals":<String_value>,

      "description":<String_value>,

      "sslprofile":<String_value>,

      "ciphergroupname":<String_value>,

      "cipheroperation":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslprofile_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcipher_sslprofile_binding": [ {

      "cipherpriority":<Double_value>,

      "ciphgrpals":<String_value>,

      "description":<String_value>,

      "sslprofile":<String_value>,

      "ciphergroupname":<String_value>,

      "cipheroperation":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcipher_sslprofile_binding/ciphergroupname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcipher_sslprofile_binding": [ { "__count": "#no"} ] }
```

sslcipher_sslvserver_binding

Binding object showing the sslvserver that can be bound to sslcipher.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherpriority	<Double>	Read-write	Priority of the cipher to be added. Minimum value = 1 Maximum value = 1000
ciphgrpals	<String>	Read-write	A cipher-suite can consist of an individual cipher name, the system predefined cipher-alias name, or user defined cipher-group name. Minimum length = 1
vserver	<Boolean>	Read-write	Select the -vServer flag when the cipher operation is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			performed on an SSL virtual server.

Note: By default the bind ssl cipher command internally assumes the flag of -vServer argument. Hence, while working with the SSL vserver, you need not specify this flag.

Minimum length = 1

Minimum length = 1

Possible cipher operations are: ADD - Appends the given cipher-suite to the existing one configured for the virtual server. REM - Removes the given cipher-suite from the existing one configured for the virtual server. ORD - Overrides the current configured cipher-suite for the virtual server with the given cipher-suite.

Default value: 0

Possible values = ADD, REM, ORD

Operations

(click to see Properties)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

sslcrl

Configuration for Certificate Revocation List resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crlname	<String>	Read-write	Name for the Certificate Revocation List (CRL). Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the CRL is created. The following requirement applies only to the Citrix ADC CLI:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my crl" or 'my crl'). Minimum length = 1
crlpath	<String>	Read-write	Path to the CRL file. /var/netscaler/ssl/ is the default path. Minimum length = 1
inform	<String>	Read-write	Input format of the CRL file. The two formats supported on the appliance are: PEM - Privacy Enhanced Mail. DER - Distinguished Encoding Rule. Default value: PEM Possible values = DER, PEM
refresh	<String>	Read-write	Set CRL auto refresh. Possible values = ENABLED, DISABLED
cacert	<String>	Read-write	CA certificate that has issued the CRL. Required if CRL Auto

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Refresh is selected. Install the CA certificate on the appliance before adding the CRL. Minimum length = 1
method	<String>	Read-write	Method for CRL refresh. If LDAP is selected, specify the method, CA certificate, base DN, port, and LDAP server name. If HTTP is selected, specify the CA certificate, method, URL, and port. Cannot be changed after a CRL is added. Possible values = HTTP, LDAP
server	<String>	Read-write	IP address of the LDAP server from which to fetch the CRLs. Minimum length = 1
url	<String>	Read-write	URL of the CRL distribution point.
port	<Integer>	Read-write	Port for the LDAP server. Minimum value = 1
basedn	<String>	Read-write	Base distinguished name (DN), which is used in an LDAP search to search for a CRL. Citrix

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			recommends searching for the Base DN instead of the Issuer Name from the CA certificate, because the Issuer Name field might not exactly match the LDAP directory structure's DN. Minimum length = 1
scope	<String>	Read-write	Extent of the search operation on the LDAP server. Available settings function as follows: One - One level below Base DN. Base - Exactly the same level as Base DN. Default value: One Possible values = Base, One
interval	<String>	Read-write	CRL refresh interval. Use the NONE setting to unset this parameter. Possible values = MONTHLY, WEEKLY, DAILY, NOW, NONE

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
day	<Double>	Read-write	Day on which to refresh the CRL, or, if the Interval parameter is not set, the number of days after which to refresh the CRL. If Interval is set to MONTHLY, specify the date. If Interval is set to WEEKLY, specify the day of the week (for example, Sun=0 and Sat=6). This parameter is not applicable if the Interval is set to DAILY. Minimum value = 0 Maximum value = 31
time	<String>	Read-write	Time, in hours (1-24) and minutes (1-60), at which to refresh the CRL.
binddn	<String>	Read-write	Bind distinguished name (DN) to be used to access the CRL object in the LDAP repository if access to the LDAP repository is restricted or anonymous access is not allowed. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
password	<String>	Read-write	Password to access the CRL in the LDAP repository if access to the LDAP repository is restricted or anonymous access is not allowed. Minimum length = 1
binary	<String>	Read-write	Set the LDAP-based CRL retrieval mode to binary. Default value: NO Possible values = YES, NO
cacertfile	<String>	Read-write	Name of and, optionally, path to the CA certificate file. /nsconfig/ssl/ is the default path. Maximum length = 63
cakeyfile	<String>	Read-write	Name of and, optionally, path to the CA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
indexfile	<String>	Read-write	Name of and, optionally, path to the file containing the serial numbers of all the certificates that

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			are revoked. Revoked certificates are appended to the file. /nsconfig/ssl/ is the default path. Maximum length = 63
revoke	<String>	Read-write	Name of and, optionally, path to the certificate to be revoked. /nsconfig/ssl/ is the default path. Maximum length = 63
gencrl	<String>	Read-write	Name of and, optionally, path to the CRL file to be generated. The list of certificates that have been revoked is obtained from the index file. /nsconfig/ssl/ is the default path. Maximum length = 63
flags	<Integer>	Read-only	CRL status flag.
lastupdatetime	<Integer>	Read-only	Last CRL refresh time.
version	<Integer>	Read-only	CRL version.
signaturealgo	<String>	Read-only	Signature algorithm.
issuer	<String>	Read-only	Issuer name.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
lastupdate	<String>	Read-only	Last update time.
nextupdate	<String>	Read-only	Next update time.
daystoexpiration	<Integer>	Read-only	Number of days remaining for the CRL to expire.
__count	<Double>	Read-only	count parameter

Operations

sslcrlfile

Configuration for Imported crl files resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported CRL file. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name to the CRL file to be imported. For example, http://www.example.com/crl_file. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- IMPORT
- DELETE
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **action=Import**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslcrlfile":{

<b>      "name":<String_value>,

</b><b>      "src":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile

Query-parameters:

args= name:<String_value>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslcrlfile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **view=summary**

Use this query-parameter to get the summary output of sslcrlfile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcrlfile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcrlfile": [ {

      "name":<String_value>,

      "src":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrlfile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcrlfile": [ { "__count": "#no"} ] }
```

sslcrl_binding

Binding object which returns the resources bound to sslcrl.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
crlname	<String>	Read-write	Name of the CRL for which to show detailed information.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1
sslcrl_serialnumber_binding	<sslcrl_serialnumber_binding[]>	Read-only	serialnumber that can be bound to sslcrl.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_binding/ crlname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcrl_binding": [ {

      "crlname":<String_value>,

      "sslcrl_serialnumber_binding":<sslcrl_serialnumber_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslcrl_binding": [ {

      "crlname":<String_value>,

      "sslcrl_serialnumber_binding":<sslcrl_serialnumber_binding[]_value>

}]}
```

sslcrl_serialnumber_binding

Binding object showing the serialnumber that can be bound to sslcrl.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
number	<String>	Read-write	Certificate Serial number.
crlname	<String>	Read-write	Name of the CRL for which to show detailed information. Minimum length = 1
date	<String>	Read-only	Certificate Revocation date.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding/ crlname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding/ crlname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslcrl_serialnumber_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding/ crlname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslcrl_serialnumber_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcrl_serialnumber_binding": [ {

      "number":<String_value>,

      "crlname":<String_value>,

      "date":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslcrl_serialnumber_binding": [ {

      "number":<String_value>,

      "crlname":<String_value>,

      "date":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslcrl_serialnumber_binding/ crlname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslcrl_serialnumber_binding": [ { "__count": "#no"} ] }
```

ssldhfile

Configuration for dh imported file resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported DH file. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file').

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the DH file to be imported. For example, http://www.example.com/dh_file. NOTE: The import fails if the file is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- IMPORT
- DELETE
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

IMPORT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldhfile? **action=Import**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ssldhfile":{
```

```
<b>      "name":<String_value>,

</b><b>      "src":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldhfile

Query-parameters:

args= name:<String_value>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldhfile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/ssldhfile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/ssldhfile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of ssldhfile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/ssldhfile? **view=summary**

Use this query-parameter to get the summary output of ssldhfile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ssldhfile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the ssldhfile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ssldhfile": [ {
      "name":<String_value>,
      "src":<String_value>
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldhfile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ssldhfile": [ { "__count": "#no"} ] }
```

ssldhparam

Configuration for dh Parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dhfile	<String>	Read-write	Name of and, optionally, path to the DH key file. /nsconfig/ssl/ is the default path. Maximum length = 63
bits	<Double>	Read-write	Size, in bits, of the DH key being generated. Minimum value = 512 Maximum value = 2048
gen	<String>	Read-write	Random number required for generating the DH key. Required as part of the DH key generation algorithm. Default value: 2 Possible values = 2, 5

Operations

(click to see Properties)

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldhparam? **action=create**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ssldhparam":{
```

```
<b>      "dhfile":<String_value>,

</b>      "bits":<Double_value>,

      "gen":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ssldsakey

Configuration for dsa key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyfile	<String>	Read-write	Name for and, optionally, path to the DSA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
bits	<Double>	Read-write	Size, in bits, of the DSA key. Minimum value = 512 Maximum value = 2048

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyform	<String>	Read-write	Format in which the DSA key file is stored on the appliance. Default value: PEM Possible values = DER, PEM
des	<Boolean>	Read-write	Encrypt the generated DSA key by using the DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that will be used to encrypt the key.
des3	<Boolean>	Read-write	Encrypt the generated DSA key by using the Triple-DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that will be used to encrypt the key.
aes256	<Boolean>	Read-write	Encrypt the generated DSA key by using the AES algorithm.
password	<String>	Read-write	Pass phrase to use for encryption if DES or DES3 option is selected. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 31
pkcs8	<Boolean>	Read-write	Create the private key in PKCS#8 format.

Operations

(click to see Properties)

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldsakey? **action=create**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ssldsakey":{

<b>      "keyfile":<String_value>,

</b><b>      "bits":<Double_value>,

</b>      "keyform":<String_value>,

      "des":<Boolean_value>,

      "des3":<Boolean_value>,

      "aes256":<Boolean_value>,

      "password":<String_value>,

      "pkcs8":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

ssldtlsprofile

Configuration for DTLS profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the DTLS profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),equals sign (=), and hyphen (-) characters. Cannot be changed after the profile is created. Minimum length = 1 Maximum length = 127
pmtudiscovery	<String>	Read-write	Source for the maximum record size value. If ENABLED, the value is taken from the PMTU table. If DISABLED, the value is taken from the profile. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
maxrecordsize	<Double>	Read-write	Maximum size of records that can be sent if PMTU is disabled. Default value: 1459 Minimum value = 250 Maximum value = 1459
maxretrytime	<Double>	Read-write	Wait for the specified time, in seconds, before resending the request. Default value: 3
helloverifyrequest	<String>	Read-write	Send a Hello Verify request to validate the client. Default value: DISABLED Possible values = ENABLED, DISABLED
terminatesession	<String>	Read-write	Terminate the session if the message authentication code (MAC) of the client and server do not match.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
maxpacketsize	<Double>	Read-write	Maximum number of packets to reassemble. This value helps protect against a fragmented packet attack. Default value: 120 Minimum value = 0 Maximum value = 86400
builtin	<String[]>	Read-only	Flag to determine whether dtls profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

Operations

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldtlsprofile? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ssldtlsprofile":{

<b>      "name":<String_value>,

</b>      "pmtudiscovery":true,

      "maxrecordsize":true,

      "maxretrytime":true,

      "helloverifyrequest":true,

      "terminatesession":true,

      "maxpacketsize":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldtlsprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/ssldtlsprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/ssldtlsprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of ssldtlsprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/ssldtlsprofile? **view=summary**

Use this query-parameter to get the summary output of ssldtlsprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ssldtlsprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the ssldtlsprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ssldtlsprofile": [ {

      "name":<String_value>,

      "pmtudiscovery":<String_value>,

      "maxrecordsize":<Double_value>,

        "feature":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssldtlsprofile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ssldtlsprofile": [ { "__count": "#no"} ] }
```

sslecdsakey

Configuration for ecdsa key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyfile	<String>	Read-write	Name for and, optionally, path to the ECDSA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
curve	<String>	Read-write	Curve id to generate ECDSA key. Only P_256 and P_384 are supported. Default value: FIPSEXP_F4 Possible values = P_256, P_384
keyform	<String>	Read-write	Format in which the ECDSA key file is stored on the appliance. Default value: PEM Possible values = DER, PEM
des	<Boolean>	Read-write	Encrypt the generated ECDSA key by using the DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
des3	<Boolean>	Read-write	Encrypt the generated ECDSA key by using the Triple-DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
aes256	<Boolean>	Read-write	Encrypt the generated ECDSA key by using the AES algorithm.
password	<String>	Read-write	Pass phrase to use for encryption if DES or DES3 option is selected. Minimum length = 1 Maximum length = 31
pkcs8	<Boolean>	Read-write	Create the private key in PKCS#8 format.

Operations

(click to see Properties)

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslecdsakey? **action=create**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslecdsakey":{

<b>      "keyfile":<String_value>,

</b><b>      "curve":<String_value>,
```

```
</b>      "keyform":<String_value>,

      "des":<Boolean_value>,

      "des3":<Boolean_value>,

      "aes256":<Boolean_value>,

      "password":<String_value>,

      "pkcs8":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslfips

Configuration for fips resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
inithsm	<String>	Read-write	FIPS initialization level. The appliance currently supports Level-2 (FIPS 140-2). Possible values = Level-2
sopassword	<String>	Read-write	Security officer password that will be in effect after you

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			have configured the HSM. Minimum length = 1
oldsopassword	<String>	Read-write	Old password for the security officer. Minimum length = 1
userpassword	<String>	Read-write	The Hardware Security Module's (HSM) User password. Minimum length = 1
hsmlabel	<String>	Read-write	Label to identify the Hardware Security Module (HSM). Minimum length = 1
fipsfw	<String>	Read-write	Path to the FIPS firmware file. Minimum length = 1
erasedata	<String>	Read-only	Erase data. Default value: FIPS_ERASE Minimum length = 1
serial	<Integer>	Read-only	FIPS card serial number.
majorversion	<Integer>	Read-only	Firmware major version.
minorversion	<Integer>	Read-only	Firmware minor version.
fipshwmajorversion	<Integer>	Read-only	FIPS card hardware major version.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fipshwminorversion	<Integer>	Read-only	FIPS card hardware minor version.
fipshwversionstring	<String>	Read-only	FIPS card hardware extended version string.
flashmemorytotal	<Integer>	Read-only	Total size of the flash memory on card.
flashmemoryfree	<Integer>	Read-only	Total size of free flash memory.
sramtotal	<Integer>	Read-only	Total size of the SRAM memory on card.
sramfree	<Integer>	Read-only	Total size of free SRAM memory.
status	<Integer>	Read-only	Status.
flag	<Integer>	Read-only	Internal Flags.
serialno	<String>	Read-only	FIPS card serial number.
model	<String>	Read-only	FIPS card model info.
state	<Integer>	Read-only	FIPS card state.
firmwarereleasedate	<String>	Read-only	FIPS card firmware revision date.
coresmax	<Integer>	Read-only	Maximum number of crypto cores present in the FIPS card.
coresenabled	<Integer>	Read-only	Number of crypto cores enabled in the FIPS card.

```

sslfipskey

Configuration for FIPS key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
fipskeyname	<String>	Read-write	Name for the FIPS key. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			hyphen (-) characters. Cannot be changed after the FIPS key is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my fipskey" or 'my fipskey'). Minimum length = 1
keytype	<String>	Read-write	Only RSA key and ECDSA Key are supported. Default value: RSA Possible values = RSA, ECDSA
exponent	<String>	Read-write	Exponent value for the FIPS key to be created. Available values function as follows: 3=3 (hexadecimal) F4=10001 (hexadecimal). Default value: 3

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = 3, F4
modulus	<Double>	Read-write	Modulus, in multiples of 64, of the FIPS key to be created. Minimum value = 0 Maximum value = 4096
curve	<String>	Read-write	Only p_256 (prime256v1) and P_384 (secp384r1) are supported. Default value: P_256 Possible values = P_256, P_384
key	<String>	Read-write	Name of and, optionally, path to the key file to be imported. /nsconfig/ssl/ is the default path. Minimum length = 1
inform	<String>	Read-write	Input format of the key file. Available formats are: SIM - Secure Information Management; select when importing a FIPS key. If the external FIPS key is encrypted, first

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			decrypt it, and then import it. PEM - Privacy Enhanced Mail; select when importing a non-FIPS key. Default value: SIM Possible values = SIM, DER, PEM
wrapkeyname	<String>	Read-write	Name of the wrap key to use for importing the key. Required for importing a non-FIPS key. Minimum length = 1
iv	<String>	Read-write	Initialization Vector (IV) to use for importing the key. Required for importing a non-FIPS key. Minimum length = 1
size	<Double>	Read-only	Size.
__count	<Double>	Read-only	count parameter

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ENABLE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslfipssimsource? **action=enable**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslfipssimsource":{

<b>      "targetsecret":<String_value>,

</b><b>      "sourcesecret":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

INIT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslfipssimsource? **action=init**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslfipssimsource":{

<b>      "certfile":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslfipssimtarget

Configuration for FIPS SIM Target resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyvector	<String>	Read-write	Name of and, optionally, path to the target FIPS appliance's key vector. /nsconfig/ssl/ is the default path. Minimum length = 1
sourcesecret	<String>	Read-write	Name of and, optionally, path to the source FIPS appliance's secret data. /nsconfig/ssl/ is the default path. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
certfile	<String>	Read-write	Name of and, optionally, path to the source FIPS appliance's certificate file. /nsconfig/ssl/ is the default path. Minimum length = 1
targetsecret	<String>	Read-write	Name for and, optionally, path to the target FIPS appliance's secret data. The default input path for the secret data is /nsconfig/ssl/. Minimum length = 1

Operations

Content-Type:application/json

Request Payload:

```
{"sslfipssimtarget":{

<b>      "keyvector":<String_value>,

</b><b>      "sourcesecret":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

INIT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslfipssimtarget? **action=init**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslfipssimtarget":{

<b>      "certfile":<String_value>,

</b><b>      "keyvector":<String_value>,

</b><b>      "targetsecret":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslglobal_binding

Binding object which returns the resources bound to sslglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslglobal_sslpolicy_binding	<sslglobal_sslpolicy_binding[]>	Read-write	sslpolicy that can be bound to sslglobal.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslglobal_binding": [ {

      "sslglobal_sslpolicy_binding":<sslglobal_sslpolicy_binding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslglobal_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslglobal_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslglobal_binding": [ {

      "sslglobal_sslpolicy_binding":<sslglobal_sslpolicy_binding[]_value>

}]}
```

sslglobal_sslpolicy_binding

Binding object showing the sslpolicy that can be bound to sslglobal.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policy binding.
globalbindtype	<String>	Read-write	.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: SYSTEM_GLOBAL Possible values = SYSTEM_GLOBAL, VPN_GLOBAL, RNAT_GLOBAL
policyname	<String>	Read-write	The name for the SSL policy.
labelname	<String>	Read-write	Name of the virtual server or user-defined policy label to invoke if the policy evaluates to TRUE.
gotopriorityexpression	<String>	Read-write	Expression or other value specifying the next policy to be evaluated if the current policy evaluates to TRUE. Specify one of the following values: - NEXT - Evaluate the policy with the next higher priority number. - END - End policy evaluation. - USE_INVOCATION_RESULT - Applicable if this policy invokes another policy label. If the final goto in the invoked policy label has a value of END, the evaluation stops. If the final goto is anything other than END, the current

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policy label performs a NEXT. - An expression that evaluates to a number. If you specify an expression, the number to which it evaluates determines the next policy to evaluate, as follows: - If the expression evaluates to a higher numbered priority, the policy with that priority is evaluated next. - If the expression evaluates to the priority of the current policy, the policy with the next higher numbered priority is evaluated next. - If the expression evaluates to a number that is larger than the largest numbered priority, policy evaluation ends. An UNDEF event is triggered if: - The expression is invalid. - The expression evaluates to a priority number that is numerically lower than the current policy's priority. - The expression evaluates

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			to a priority number that is between the current policy's priority number (say, 30) and the highest priority number (say, 100), but does not match any configured priority number (for example, the expression evaluates to the number 85). This example assumes that the priority number increments by 10 for every successive policy, and therefore a priority number of 85 does not exist in the policy label. Default value: "END"
invoke	<Boolean>	Read-write	Invoke policies bound to a virtual server, service, or policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority.
type	<String>	Read-write	Global bind point to which the policy is bound. Possible values = CONTROL_OVERRIDE,

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			CONTROL_DEFAULT, DATA_OVERRIDE, DATA_DEFAULT
labeltype	<String>	Read-write	Type of policy label to invoke. Specify virtual server for a policy label associated with a virtual server, or policy label for a user-defined policy label. Possible values = vserver, service, policylabel
__count	<Double>	Read-write	count parameter

sslkeyfile

Configuration for Imported ssl key files resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name to assign to the imported key file. Must begin with an ASCII alphanumeric or underscore(_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@),equals (=), and hyphen (-) characters. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my file" or 'my file'). Minimum length = 1 Maximum length = 31
src	<String>	Read-write	URL specifying the protocol, host, and path, including file name, to the key file to be imported. For example, http://

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			www.example.com/key_file. NOTE: The import fails if the object to be imported is on an HTTPS server that requires client certificate authentication for access. Minimum length = 1 Maximum length = 2047
password	<String>	Read-write	.
__count	<Double>	Read-only	count parameter

view

http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile? **view=summary**

Use this query-parameter to get the summary output of sslkeyfile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslkeyfile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslkeyfile": [ {

      "name":<String_value>,
```

```
      "src":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslkeyfile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslkeyfile": [ { "__count": "#no"} ] }
```

ssllogprofile

Configuration for SSL logging Profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	The name of the ssllogprofile. Minimum length = 1 Maximum length = 127
ssllogclauth	<String>	Read-write	log all SSL ClAuth events. Default value: DISABLED Possible values = ENABLED, DISABLED
ssllogclauthfailures	<String>	Read-write	log all SSL ClAuth error events. Default value: DISABLED Possible values = ENABLED, DISABLED
sslloghs	<String>	Read-write	log all SSL HS events. Default value: DISABLED Possible values = ENABLED, DISABLED
sslloghsfailures	<String>	Read-write	log all SSL HS error events. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- UPDATE
- UNSET
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ssllogprofile":{

<b>      "name":<String_value>,

</b>      "ssllogclauth":<String_value>,

      "ssllogclauthfailures":<String_value>,

      "sslloghs":<String_value>,

      "sslloghsfailures":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ssllogprofile":{

<b>      "name":<String_value>,

</b>      "ssllogclauth":<String_value>,

      "ssllogclauthfailures":<String_value>,

      "sslloghs":<String_value>,

      "sslloghsfailures":<String_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"ssllogprofile":{

<b>      "name":<String_value>,

</b>      "ssllogclauth":true,

      "ssllogclauthfailures":true,

      "sslloghs":true,

      "sslloghsfailures":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile/ name_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of ssllogprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile? **view=summary**

Use this query-parameter to get the summary output of ssllogprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the ssllogprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ssllogprofile": [ {

      "name":<String_value>,

      "ssllogclauth":<String_value>,

      "ssllogclauthfailures":<String_value>,

      "sslloghs":<String_value>,

      "sslloghsfailures":<String_value>

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of ssllogprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "ssllogprofile": [ {

      "name":<String_value>,

      "ssllogclauth":<String_value>,

      "ssllogclauthfailures":<String_value>,

      "sslloghs":<String_value>,

      "sslloghsfailures":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/ssllogprofile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "ssllogprofile": [ { "__count": "#no"} ] }
```

sslocspresponder

Configuration for OCSP responser resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the OCSP responder. Cannot begin with a hash (#) or space character and must contain only ASCII

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			alphanumeric, underscore (_), hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the responder is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my responder" or 'my responder'). Minimum length = 1 Maximum length = 127
url	<String>	Read-write	URL of the OCSP responder. Minimum length = 1 Maximum length = 127
cache	<String>	Read-write	Enable caching of responses. Caching of responses received from the OCSP responder

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enables faster responses to the clients and reduces the load on the OCSP responder. Default value: DISABLED Possible values = ENABLED, DISABLED
cachetimeout	<Double>	Read-write	Timeout for caching the OCSP response. After the timeout, the Citrix ADC sends a fresh request to the OCSP responder for the certificate status. If a timeout is not specified, the timeout provided in the OCSP response applies. Default value: 1 Minimum value = 1 Maximum value = 43200
batchingdepth	<Double>	Read-write	Number of client certificates to batch together into one OCSP request. Batching avoids overloading the OCSP responder. A value of 1 signifies that each request is queried

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			independently. For a value greater than 1, specify a timeout (batching delay) to avoid inordinately delaying the processing of a single certificate. Minimum value = 1 Maximum value = 8
batchingdelay	<Double>	Read-write	Maximum time, in milliseconds, to wait to accumulate OCSP requests to batch. Does not apply if the Batching Depth is 1. Minimum value = 1 Maximum value = 10000
resptimeout	<Double>	Read-write	Time, in milliseconds, to wait for an OCSP response. When this time elapses, an error message appears or the transaction is forwarded, depending on the settings on the virtual server. Includes Batching Delay time. Minimum value = 100

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum value = 120000
ocspurlresolvetimeout	<Double>	Read-write	Time, in milliseconds, to wait for an OCSP URL Resolution. When this time elapses, an error message appears or the transaction is forwarded, depending on the settings on the virtual server. Minimum value = 100 Maximum value = 2000
respondercert	<String>	Read-write	. Minimum length = 1
trustresponder	<Boolean>	Read-write	A certificate to use to validate OCSP responses. Alternatively, if -trustResponder is specified, no verification will be done on the reponse. If both are omitted, only the response times (producedAt, lastUpdate, nextUpdate) will be verified.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
producedattimeskew	<Double>	Read-write	Time, in seconds, for which the Citrix ADC waits before considering the response as invalid. The response is considered invalid if the Produced At time stamp in the OCSP response exceeds or precedes the current Citrix ADC clock time by the amount of time specified. Default value: 300 Minimum value = 0 Maximum value = 86400
signingcert	<String>	Read-write	Certificate-key pair that is used to sign OCSP requests. If this parameter is not set, the requests are not signed. Minimum length = 1
usenonce	<String>	Read-write	Enable the OCSP nonce extension, which is designed to prevent replay attacks. Possible values = YES, NO
insertclientcert	<String>	Read-write	Include the complete client certificate in the OCSP request.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
httpmethod	<String>	Read-write	HTTP method used to send ocsp request. POST is the default httpmethod. If request length is > 255, POST wil be used even if GET is set as httpMethod. Default value: POST Possible values = GET, POST
ocspaiarefcount	<Double>	Read-only	No of CA certs referencing this AIA responder.
ocspipaddrstr	<String>	Read-only	DNS resolved IP address.
port	<Integer>	Read-only	Port number on which OCSP Server listens. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD

- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslocspresponder": [ { "__count": "#no"} ] }
```

sslparameter

Configuration for SSL parameter resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
quantumsize	<String>	Read-write	Amount of data to collect before the data is pushed to the crypto hardware for encryption. For large downloads, a larger quantum size better utilizes the crypto resources. Default value: 8192 Possible values = 4096, 8192, 16384
crlmemorysizemb	<Double>	Read-write	Maximum memory size to use for certificate revocation lists (CRLs). This parameter reserves memory for a CRL but sets a limit to the maximum memory that the CRLs loaded on the appliance can consume. Default value: 256 Minimum value = 10 Maximum value = 1024
strictcachecks	<String>	Read-write	Enable strict CA certificate checks on the appliance. Default value: NO

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = YES, NO
ssltriggertimeout	<Double>	Read-write	Time, in milliseconds, after which encryption is triggered for transactions that are not tracked on the Citrix ADC because their length is not known. There can be a delay of up to 10ms from the specified timeout value before the packet is pushed into the queue. Default value: 100 Minimum value = 1 Maximum value = 200
sendclosenotify	<String>	Read-write	Send an SSL Close-Notify message to the client at the end of a transaction. Default value: YES Possible values = YES, NO
encrypttriggerpktcount	<Double>	Read-write	Maximum number of queued packets after which encryption is triggered. Use this setting for SSL transactions that send small packets

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			from server to Citrix ADC. Default value: 45 Minimum value = 10 Maximum value = 50
denysslreneg	<String>	Read-write	Deny renegotiation in specified circumstances. Available settings function as follows: * NO - Allow SSL renegotiation. * FRONTEND_CLIENT - Deny secure and nonsecure SSL renegotiation initiated by the client. * FRONTEND_CLIENTSERVER - Deny secure and nonsecure SSL renegotiation initiated by the client or the Citrix ADC during policy-based client authentication.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* ALL - Deny all secure and nonsecure SSL renegotiation. * NONSECURE - Deny nonsecure SSL renegotiation. Allows only clients that support RFC 5746. Default value: ALL Possible values = NO, FRONTEND_CLIENT, FRONTEND_CLIENTSERVER, ALL, NONSECURE
insertionencoding	<String>	Read-write	Encoding method used to insert the subject or issuer's name in HTTP requests to servers. Default value: Unicode Possible values = Unicode, UTF-8
ocspcachesize	<Double>	Read-write	Size, per packet engine, in megabytes, of the OCSP cache. A maximum of 10% of the packet engine

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			memory can be assigned. Because the maximum allowed packet engine memory is 4GB, the maximum value that can be assigned to the OCSP cache is approximately 410 MB. Default value: 10 Minimum value = 0 Maximum value = 512
pushflag	<Double>	Read-write	Insert PUSH flag into decrypted, encrypted, or all records. If the PUSH flag is set to a value other than 0, the buffered records are forwarded on the basis of the value of the PUSH flag. Available settings function as follows: 0 - Auto (PUSH flag is not set.) 1 - Insert PUSH flag into every decrypted record. 2 -Insert PUSH flag into every encrypted record.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			3 - Insert PUSH flag into every decrypted and encrypted record. Minimum value = 0 Maximum value = 3
dropreqwithnohostheader	<String>	Read-write	Host header check for SNI enabled sessions. If this check is enabled and the HTTP request does not contain the host header for SNI enabled sessions(i.e vserver or profile bound to vserver has SNI enabled and 'Client Hello' arrived with SNI extension), the request is dropped. Default value: NO Possible values = YES, NO
snihttphostmatch	<String>	Read-write	Controls how the HTTP 'Host' header value is validated. These checks are performed only if the session is SNI enabled (i.e when vserver or profile bound to vserver has SNI enabled and 'Client Hello' arrived with SNI extension)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			and HTTP request contains 'Host' header. Available settings function as follows: CERT - Request is forwarded if the 'Host' value is covered by the certificate used to establish this SSL session. Note: 'CERT' matching mode cannot be applied in TLS 1.3 connections established by resuming from a previous TLS 1.3 session. On these connections, 'STRICT' matching mode will be used instead. STRICT - Request is forwarded only if value of 'Host' header

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			in HTTP is identical to the 'Server name' value passed in 'Client Hello' of the SSL connection. NO - No validation is performed on the HTTP 'Host' header value. Default value: CERT Possible values = NO, CERT, STRICT
pushenctriggertimeout	<Double>	Read-write	PUSH encryption trigger timeout value. The timeout value is applied only if you set the Push Encryption Trigger parameter to Timer in the SSL virtual server settings. Default value: 1 Minimum value = 1 Maximum value = 200
cryptodevdisablelimit	<Double>	Read-write	Limit to the number of disabled SSL chips after which the ADC restarts. A value of zero implies that the ADC does

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			not automatically restart. Default value: 0
undefactioncontrol	<String>	Read-write	Name of the undefined built-in control action: CLIENTAUTH, NOCLIENTAUTH, NOOP, RESET, or DROP. Default value: "CLIENTAUTH"
undefactiondata	<String>	Read-write	Name of the undefined built-in data action: NOOP, RESET or DROP. Default value: "NOOP"
defaultprofile	<String>	Read-write	Global parameter used to enable default profile feature. Default value: DISABLED Possible values = ENABLED, DISABLED
softwarecryptothreshold	<Double>	Read-write	Citrix ADC CPU utilization threshold (in percentage) beyond which crypto operations are not done in software.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			A value of zero implies that CPU is not utilized for doing crypto in software. Default value: 0 Minimum value = 0 Maximum value = 100
hybridfipsmode	<String>	Read-write	When this mode is enabled, system will use additional crypto hardware to accelerate symmetric crypto operations. Default value: DISABLED Possible values = ENABLED, DISABLED
sigdigesttype	<String[]>	Read-write	Signature Digest Algorithms that are supported by appliance. Default value is "ALL" and it will enable the following algorithms depending on the platform. On VPX: ECDSA-SHA1 ECDSA-SHA224 ECDSA-SHA256 ECDSA-SHA384 ECDSA-SHA512 RSA-SHA1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-SHA512 DSA-SHA1 DSA-SHA224 DSA-SHA256 DSA-SHA384 DSA-SHA512 On MPX with Nitrox-III and coleto cards: RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-SHA512 ECDSA-SHA1 ECDSA-SHA224 ECDSA-SHA256 ECDSA-SHA384 ECDSA-SHA512 Others: RSA-SHA1 RSA-SHA224 RSA-SHA256 RSA-SHA384 RSA-SHA512. Note:ALL doesnot include RSA-MD5 for any platform. Default value: ALL Possible values = ALL, RSA-MD5, RSA-SHA1, RSA-SHA224, RSA-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SHA256, RSA-SHA384, RSA-SHA512, DSA-SHA1, DSA-SHA224, DSA-SHA256, DSA-SHA384, DSA-SHA512, ECDSA-SHA1, ECDSA-SHA224, ECDSA-SHA256, ECDSA-SHA384, ECDSA-SHA512
sslierrorcache	<String>	Read-write	Enable or disable dynamically learning and caching the learned information to make the subsequent interception or bypass decision. When enabled, NS does the lookup of this cached data to do early bypass. Default value: DISABLED Possible values = ENABLED, DISABLED
sslimaxerrorcachemem	<Double>	Read-write	Specify the maximum memory that can be used for caching the learned data. This memory is used as a LRU

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cache so that the old entries gets replaced with new entry once the set memory limit is fully utilised. A value of 0 decides the limit automatically. Default value: 0 Minimum value = 0 Maximum value = 4294967294
insertcertspace	<String>	Read-write	To insert space between lines in the certificate header of request. Default value: YES Possible values = YES, NO
ndcppcompliancecertcheck	<String>	Read-write	Applies when the Citrix ADC appliance acts as a client (back-end connection). Settings apply as follows: YES - During certificate verification, ignore the common name if SAN is present in the certificate.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			NO - Do not ignore common name. Default value: NO Possible values = YES, NO
heterogeneoussslhw	<String>	Read-write	To support both cavium and coleto based platforms in cluster environment, this mode has to be enabled. Default value: DISABLED Possible values = ENABLED, DISABLED
operationqueuelimit	<Double>	Read-write	Limit in percentage of capacity of the crypto operations queue beyond which new SSL connections are not accepted until the queue is reduced. Default value: 150 Minimum value = 0 Maximum value = 10000
svctls1112disable	<String>	Read-only	Disable TLS 1.1 and 1.2 for dynamic and VPN created services.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
montls1112disable	<String>	Read-only	Disable TLS 1.1 and 1.2 for secure (https) monitors bound to SSL_BRIDGE services. Default value: NO Possible values = YES, NO

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslparameter

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslparameter":{
      "quantumsize":<String_value>,

sslpkcs12

Configuration for pkcs12 resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
outfile	<String>	Read-write	Name for and, optionally, path to, the output file that contains the certificate and the private key after converting from PKCS#12 to PEM format. /nsconfig/ssl/ is the default path. If importing, the certificate-key pair is stored in PEM format. If exporting, the certificate-key pair is stored in PKCS#12 format. Maximum length = 63
Import	<Boolean>	Read-write	Convert the certificate and private-key from PKCS#12 format to PEM format.
pkcs12file	<String>	Read-write	Name for and, optionally, path to, the PKCS#12 file. If importing, specify the input file name that contains the certificate and the private key in PKCS#12 format. If exporting, specify the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			output file name that contains the certificate and the private key after converting from PEM to PKCS#12 format. /nsconfig/ssl/ is the default path. During the import operation, if the key is encrypted, you are prompted to enter the pass phrase used for encrypting the key. Maximum length = 63
des	<Boolean>	Read-write	Encrypt the private key by using the DES algorithm in CBC mode during the import operation. On the command line, you are prompted to enter the pass phrase.
des3	<Boolean>	Read-write	Encrypt the private key by using the Triple-DES algorithm in EDE CBC mode (168-bit key) during the import operation. On the command line, you are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			prompted to enter the pass phrase.
aes256	<Boolean>	Read-write	Encrypt the private key by using the AES algorithm (256-bit key) during the import operation. On the command line, you are prompted to enter the pass phrase.
export	<Boolean>	Read-write	Convert the certificate and private key from PEM format to PKCS#12 format. On the command line, you are prompted to enter the pass phrase.
certfile	<String>	Read-write	Certificate file to be converted from PEM to PKCS#12 format. Maximum length = 63
keyfile	<String>	Read-write	Name of the private key file to be converted from PEM to PKCS#12 format. If the key file is encrypted, you are prompted to enter the pass phrase used for encrypting the key.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 63
password	<String>	Read-write	. Minimum length = 1 Maximum length = 31
pempassphrase	<String>	Read-write	. Minimum length = 1 Maximum length = 31

sslpolicy

Configuration for SSL policy resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the new SSL policy. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			name in double or single quotation marks (for example, "my policy" or 'my policy'). Minimum length = 1
rule	<String>	Read-write	Expression, against which traffic is evaluated. The following requirements apply only to the Citrix ADC CLI: * If the expression includes one or more spaces, enclose the entire expression in double quotation marks. * If the expression itself includes double quotation marks, escape the quotations by using the character. * Alternatively, you can use single quotation marks to enclose the rule, in which case you do not have to escape

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the double quotation marks.
reqaction	<String>	Read-write	The name of the action to be performed on the request. Refer to 'add ssl action' command to add a new action. Builtin actions like NOOP, RESET, DROP, CLIENTAUTH and NOCLIENTAUTH are also allowed. Minimum length = 1
action	<String>	Read-write	Name of the built-in or user-defined action to perform on the request. Available built-in actions are NOOP, RESET, DROP, CLIENTAUTH, NOCLIENTAUTH, INTERCEPT AND BYPASS.
undefaction	<String>	Read-write	Name of the action to be performed when the result of rule evaluation is undefined. Possible values for control policies: CLIENTAUTH, NOCLIENTAUTH, NOOP, RESET, DROP. Possible values for data

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			policies: NOOP, RESET, DROP and BYPASS.
comment	<String>	Read-write	Any comments associated with this policy.
hits	<Double>	Read-only	Number of hits for this policy.
undefhits	<Double>	Read-only	Number of Undef hits.
description	<String>	Read-only	Description of the policy.
policytype	<String>	Read-only	. Possible values = Classic Policy, Advanced Policy
builtin	<String[]>	Read-only	Flag to determine if SSL policy is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
__count	<Double>	Read-only	count parameter

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslpolicy resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **view=summary**

Use this query-parameter to get the summary output of sslpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslpolicy resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy/ name_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy/ name_value<String> ? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy/ name_value<String> ? **view=summary**

Use this query-parameter to get the summary output of sslpolicy resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslpolicy": [ {

      "name":<String_value>,

      "rule":<String_value>,

      "action":<String_value>,

      "undefaction":<String_value>,

      "hits":<Double_value>,

      "undefhits":<Double_value>,

      "description":<String_value>,
```

```
        "comment":<String_value>,

        "policytype":<String_value>,

        "builtin":<String[]_value>,

        "feature":<String_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslpolicy": [ { "__count": "#no"} ] }
```

sslpolicylabel

Configuration for SSL policy label resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name for the SSL policy label. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the policy label is created. The following requirement applies only to the Citrix ADC CLI: If the name includes one or more spaces, enclose the name in double or single quotation marks (for example, "my label" or 'my label').
type	<String>	Read-write	Type of policies that the policy label can contain.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = CONTROL, DATA
numpol	<Double>	Read-only	Number of polices bound to label.
hits	<Double>	Read-only	Number of times policy label was invoked.
policyname	<String>	Read-only	Name of the SSL policy to bind to the policy label.
priority	<Double>	Read-only	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-only	Invoke flag.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel
invoke_labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
flowtype	<Double>	Read-only	Flowtype of the bound SSL policy.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
description	<String>	Read-only	Description of the policylabel.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslpolicylabel":{

<b>      "labelname":<String_value>,

</b><b>      "type":<String_value>

</b>}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel/ labelname_value<String>

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslpolicylabel resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel? **view=summary**

Use this query-parameter to get the summary output of sslpolicylabel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslpolicylabel resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslpolicylabel": [ {

      "labelname":<String_value>,

      "type":<String_value>,

      "numpol":<Double_value>,

      "hits":<Double_value>,

      "policyname":<String_value>,

      "priority":<Double_value>,

      "gotopriorityexpression":<String_value>,

      "invoke":<Boolean_value>,

      "labeltype":<String_value>,

      "invoke_labelname":<String_value>,

      "flowtype":<Double_value>,

      "description":<String_value>
```

```
}]}
```

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel/ labelname_value<String>

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel/ labelname_value<String> ?**attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel/ labelname_value<String> ?**view=summary**

Use this query-parameter to get the summary output of sslpolicylabel resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslpolicylabel": [ {
      "labelname":<String_value>,
      "type":<String_value>,
      "numpol":<Double_value>,
      "hits":<Double_value>,
      "policyname":<String_value>,
      "priority":<Double_value>,
      "gotopriorityexpression":<String_value>,
      "invoke":<Boolean_value>,
      "labeltype":<String_value>,
      "invoke_labelname":<String_value>,
      "flowtype":<Double_value>,
      "description":<String_value>
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslpolicylabel": [ { "__count": "#no"} ] }
```

sslpolicylabel_binding

Binding object which returns the resources bound to sslpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the SSL policy label for which to show detailed information.
sslpolicylabel_sslpolicy_binding	<sslpolicylabel_sslpolicy_binding[]>	Read-only	sslpolicy that can be bound to sslpolicylabel.

Operations

{ "sslpolicylabel_binding": [ {

      "labelname":<String_value>,

      "sslpolicylabel_sslpolicy_binding":<sslpolicylabel_sslpolicy_binding
[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicylabel_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslpolicylabel_binding": [ {

      "labelname":<String_value>,

      "sslpolicylabel_sslpolicy_binding":<sslpolicylabel_sslpolicy_binding
[]_value>

}]}
```

sslpolicylabel_sslpolicy_binding

Binding object showing the sslpolicy that can be bound to sslpolicylabel.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	Specifies the priority of the policy.
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
policyname	<String>	Read-write	Name of the SSL policy to bind to the policy label.
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = vserver, service, policylabel
labelname	<String>	Read-write	Name of the SSL policy label to which to bind policies.
invoke_labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke policies bound to a policy label. After the invoked policies are evaluated, the flow returns to the policy with the next priority.
__count	<Double>	Read-write	count parameter

Operations

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_csvserver_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_csvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslpolicy_csvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_csvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslpolicy_csvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslpolicy_csvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_csvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_csvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslpolicy_csvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,
```

```
        "labelname":<String_value>,

        "gotopriorityexpression":<String_value>,

        "labeltype":<String_value>,

        "activepolicy":<Double_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_csvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslpolicy_csvserver_binding": [ { "__count": "#no"} ] }
```

sslpolicy_lbvserver_binding

Binding object showing the lbvserver that can be bound to sslpolicy.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
boundto	<String>	Read-write	The entity name to which policy is bound.
name	<String>	Read-write	Name of the SSL policy for which to display detailed information. Minimum length = 1
priority	<Double>	Read-only	.
labelname	<String>	Read-only	Name of the label to invoke if the current policy rule evaluates to TRUE.
gotopriorityexpression	<String>	Read-only	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel
activepolicy	<Double>	Read-only	.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_lbvserver_binding/name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_lbvserver_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslpolicy_lbvserver_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_lbvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslpolicy_lbvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslpolicy_lbvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,
```

```
        "labelname":<String_value>,

        "gotopriorityexpression":<String_value>,

        "labeltype":<String_value>,

        "activepolicy":<Double_value>

  }]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_lbvserver_binding

HTTP Method: GET

Request Headers:

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_sslvserver_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslpolicy_sslvserver_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslpolicy_sslvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_sslvserver_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_sslvserver_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslpolicy_sslvserver_binding": [ {

      "boundto":<String_value>,

      "name":<String_value>,

      "priority":<Double_value>,

      "labelname":<String_value>,

      "gotopriorityexpression":<String_value>,

      "labeltype":<String_value>,

      "activepolicy":<Double_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslpolicy_sslvserver_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslpolicy_sslvserver_binding": [ { "__count": "#no"} ] }
```

sslprofile

Configuration for SSL profile resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name for the SSL profile. Must begin with an ASCII alphanumeric or underscore (_) character, and must contain only ASCII alphanumeric, underscore, hash (#), period (.), space, colon (:), at (@), equals (=), and hyphen (-) characters. Cannot be changed after the profile is created.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum length = 1 Maximum length = 127
sslprofiletype	<String>	Read-write	Type of profile. Front end profiles apply to the entity that receives requests from a client. Backend profiles apply to the entity that sends client requests to a server. Default value: FrontEnd Possible values = BackEnd, FrontEnd
ssllogprofile	<String>	Read-write	The name of the ssllogprofile. Minimum length = 1 Maximum length = 127
dhcount	<Double>	Read-write	Number of interactions, between the client and the Citrix ADC, after which the DH private-public pair is regenerated. A value of zero (0) specifies infinite use (no refresh). This parameter is not applicable when configuring a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			backend profile. Allowed DH count values are 0 and >= 500. Minimum value = 0 Maximum value = 65534
dh	<String>	Read-write	State of Diffie-Hellman (DH) key exchange. This parameter is not applicable when configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
dhfile	<String>	Read-write	The file name and path for the DH parameter. Minimum length = 1
ersa	<String>	Read-write	State of Ephemeral RSA (eRSA) key exchange. Ephemeral RSA allows clients that support only export ciphers to communicate with the secure server even if the server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate does not support export clients. The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted. It is reused at a later date when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when the appliance restarts. This parameter is not applicable when configuring a backend profile. Default value: ENABLED Possible values = ENABLED, DISABLED
ersacount	<Double>	Read-write	The refresh count for the re-generation of RSA public-key and private-key pair.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 0 Maximum value = 65534
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Double>	Read-write	The Session timeout value in seconds. Minimum value = 0 Maximum value = 4294967294
cipherredirect	<String>	Read-write	State of Cipher Redirect. If this parameter is set to ENABLED, you can configure an SSL virtual server or service to display meaningful error

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			messages if the SSL handshake fails because of a cipher mismatch between the virtual server or service and the client. This parameter is not applicable when configuring a backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-write	The redirect URL to be used with the Cipher Redirect feature.
clientauth	<String>	Read-write	State of client authentication. In service-based SSL offload, the service terminates the SSL handshake if the SSL client does not provide a valid certificate. This parameter is not applicable when configuring a backend profile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
clientcert	<String>	Read-write	The rule for client certificate requirement in client authentication. Possible values = Mandatory, Optional
dhkeyexpsizelimit	<String>	Read-write	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Default value: DISABLED Possible values = ENABLED, DISABLED
sslredirect	<String>	Read-write	State of HTTPS redirects for the SSL service.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			For an SSL session, if the client browser receives a redirect message, the browser tries to connect to the new location. However, the secure SSL session breaks if the object has moved from a secure site (https://) to an unsecure site (http://). Typically, a warning message appears on the screen, prompting the user to continue or disconnect. If SSL Redirect is ENABLED, the redirect message is automatically converted from http:// to https:// and the SSL session does not break. This parameter is not applicable when configuring a backend profile. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-write	State of the port rewrite while performing HTTPS redirect. If this parameter is set to ENABLED, and the URL from the server does not contain the standard port, the port is rewritten to the standard. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL profile. Note: On platforms with SSL acceleration chips, if the SSL chip does not support SSLv3, this parameter cannot be set to ENABLED. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL profile. Default value: ENABLED Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL profile. Default value: ENABLED Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL profile. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL profile.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the virtual server and service-based offload. SNI helps to enable SSL encryption on multiple domains on a single virtual server or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL handshake with the client, the OCSP-based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. . Default value: DISABLED Possible values = ENABLED, DISABLED
serverauth	<String>	Read-write	State of server authentication

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			support for the SSL Backend profile. Default value: DISABLED Possible values = ENABLED, DISABLED
commonname	<String>	Read-write	Name to be checked against the CommonName (CN) field in the server certificate bound to the SSL server. Minimum length = 1
pushenctrigger	<String>	Read-write	Trigger encryption on the basis of the PUSH flag value. Available settings function as follows: * ALWAYS - Any PUSH packet triggers encryption. * IGNORE - Ignore PUSH packet for triggering encryption. * MERGE - For a consecutive sequence of PUSH packets, the last PUSH packet triggers encryption.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			* TIMER - PUSH packet triggering encryption is delayed by the time defined in the set ssl parameter command or in the Change Advanced SSL Settings dialog box. Possible values = Always, Merge, Ignore, Timer
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
cleartextport	<Integer>	Read-write	Port on which clear-text data is sent by the appliance to the server. Do not specify this parameter for SSL offloading with end-to-end encryption. Range 1 - 65535 * in CLI is represented as 65535 in NITRO API

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
insertionencoding	<String>	Read-write	Encoding method used to insert the subject or issuer's name in HTTP requests to servers. Default value: Unicode Possible values = Unicode, UTF-8
denysslreneg	<String>	Read-write	Deny renegotiation in specified circumstances. Available settings function as follows: * NO - Allow SSL renegotiation. * FRONTEND_CLIENT - Deny secure and nonsecure SSL renegotiation initiated by the client. * FRONTEND_CLIENTSERVER - Deny secure and nonsecure SSL renegotiation initiated by the client or the Citrix ADC during policy-

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			based client authentication. * ALL - Deny all secure and nonsecure SSL renegotiation. * NONSECURE - Deny nonsecure SSL renegotiation. Allows only clients that support RFC 5746. Default value: ALL Possible values = NO, FRONTEND_CLIENT, FRONTEND_CLIENTSERVER, ALL, NONSECURE
quantumsize	<String>	Read-write	Amount of data to collect before the data is pushed to the crypto hardware for encryption. For large downloads, a larger quantum size better utilizes the crypto resources. Default value: 8192 Possible values = 4096, 8192, 16384

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
strictcachecks	<String>	Read-write	Enable strict CA certificate checks on the appliance. Default value: NO Possible values = YES, NO
encrypttriggerpktcount	<Double>	Read-write	Maximum number of queued packets after which encryption is triggered. Use this setting for SSL transactions that send small packets from server to Citrix ADC. Default value: 45 Minimum value = 10 Maximum value = 50
pushflag	<Double>	Read-write	Insert PUSH flag into decrypted, encrypted, or all records. If the PUSH flag is set to a value other than 0, the buffered records are forwarded on the basis of the value of the PUSH flag. Available settings function as follows: 0 - Auto (PUSH flag is not set.)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			1 - Insert PUSH flag into every decrypted record. 2 -Insert PUSH flag into every encrypted record. 3 - Insert PUSH flag into every decrypted and encrypted record. Minimum value = 0 Maximum value = 3
dropreqwithnohostheader	<String>	Read-write	Host header check for SNI enabled sessions. If this check is enabled and the HTTP request does not contain the host header for SNI enabled sessions(i.e vserver or profile bound to vserver has SNI enabled and 'Client Hello' arrived with SNI extension), the request is dropped. Default value: NO Possible values = YES, NO
snihttphostmatch	<String>	Read-write	Controls how the HTTP 'Host' header value is validated. These checks are

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			performed only if the session is SNI enabled (i.e when vserver or profile bound to vserver has SNI enabled and 'Client Hello' arrived with SNI extension) and HTTP request contains 'Host' header. Available settings function as follows: CERT - Request is forwarded if the 'Host' value is covered by the certificate used to establish this SSL session. Note: 'CERT' matching mode cannot be applied in TLS 1.3 connections established by resuming from a previous TLS 1.3 session. On these connections, 'STRICT' matching mode will be used instead.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			STRICT - Request is forwarded only if value of 'Host' header in HTTP is identical to the 'Server name' value passed in 'Client Hello' of the SSL connection. NO - No validation is performed on the HTTP 'Host' header value. Default value: CERT Possible values = NO, CERT, STRICT
pushenctriggertimeout	<Double>	Read-write	PUSH encryption trigger timeout value. The timeout value is applied only if you set the Push Encryption Trigger parameter to Timer in the SSL virtual server settings. Default value: 1 Minimum value = 1 Maximum value = 200

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ssltriggertimeout	<Double>	Read-write	Time, in milliseconds, after which encryption is triggered for transactions that are not tracked on the Citrix ADC because their length is not known. There can be a delay of up to 10ms from the specified timeout value before the packet is pushed into the queue. Default value: 100 Minimum value = 1 Maximum value = 200
clientauthuseboundcachain	<String>	Read-write	Certficates bound on the VIP are used for validating the client cert. Certficates came along with client cert are not used for validating the client cert. Default value: DISABLED Possible values = ENABLED, DISABLED
sslinterception	<String>	Read-write	Enable or disable transparent

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			interception of SSL sessions. Default value: DISABLED Possible values = ENABLED, DISABLED
sslireneg	<String>	Read-write	Enable or disable triggering the client renegotiation when renegotiation request is received from the origin server. Default value: ENABLED Possible values = ENABLED, DISABLED
ssliocspcheck	<String>	Read-write	Enable or disable OCSP check for origin server certificate. Default value: ENABLED Possible values = ENABLED, DISABLED
sslimaxsessperserver	<Double>	Read-write	Maximum ssl session to be cached per dynamic origin server. A unique ssl session is created for each SNI received from the client on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			ClientHello and the matching session is used for server session reuse. Default value: 10 Minimum value = 1 Maximum value = 1000
sessionticket	<String>	Read-write	This option enables the use of session tickets, as per the RFC 5077. Default value: DISABLED Possible values = ENABLED, DISABLED
sessionticketlifetime	<Double>	Read-write	This option sets the life time of session tickets issued by NS in secs. Default value: 300 Minimum value = 0 Maximum value = 172800
sessionticketkeyrefresh	<String>	Read-write	This option enables the use of session tickets, as per the RFC 5077. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
sessionticketkeydata	<String>	Read-write	Session ticket enc/dec key , admin can set it.
sessionkeylifetime	<Double>	Read-write	This option sets the life time of symm key used to generate session tickets issued by NS in secs. Default value: 3000 Minimum value = 600 Maximum value = 86400
prevsessionkeylifetime	<Double>	Read-write	This option sets the life time of symm key used to generate session tickets issued by NS in secs. Default value: 0 Minimum value = 0 Maximum value = 172800
hsts	<String>	Read-write	State of HSTS protocol support for the SSL profile. Using HSTS, a server can enforce the use of an HTTPS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connection for all communication with a client. Default value: DISABLED Possible values = ENABLED, DISABLED
maxage	<Double>	Read-write	Set the maximum time, in seconds, in the strict transport security (STS) header during which the client must send only HTTPS requests to the server. Default value: 0 Minimum value = 0 Maximum value = 4294967294
includesubdomains	<String>	Read-write	Enable HSTS for subdomains. If set to Yes, a client must send only HTTPS requests for subdomains. Default value: NO Possible values = YES, NO
preload	<String>	Read-write	Flag indicates the consent of the site owner to have their domain preloaded.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: NO Possible values = YES, NO
skipclientcertpolicycheck	<String>	Read-write	This flag controls the processing of X509 certificate policies. If this option is Enabled, then the policy check in Client authentication will be skipped. This option can be used only when Client Authentication is Enabled and ClientCert is set to Mandatory. Default value: DISABLED Possible values = ENABLED, DISABLED
zerorttearlydata	<String>	Read-write	State of TLS 1.3 0-RTT early data support for the SSL Virtual Server. This setting only has an effect if resumption is enabled, as early data cannot be sent along with an initial handshake. Early application data has significantly different security

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			properties - in particular there is no guarantee that the data cannot be replayed. Default value: DISABLED Possible values = ENABLED, DISABLED
tls13sessionticketsperauthcontext	<Double>	Read-write	Number of tickets the SSL Virtual Server will issue anytime TLS 1.3 is negotiated, ticket-based resumption is enabled, and either (1) a handshake completes or (2) post-handhsake client auth completes. This value can be increased to enable clients to open multiple parallel connections using a fresh ticket for each connection. No tickets are sent if resumption is disabled. Default value: 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 10
dhekeyexchangewithpsk	<String>	Read-write	Whether or not the SSL Virtual Server will require a DHE key exchange to occur when a PSK is accepted during a TLS 1.3 resumption handshake. A DHE key exchange ensures forward secrecy even in the event that ticket keys are compromised, at the expense of an additional round trip and resources required to carry out the DHE key exchange. If disabled, a DHE key exchange will be performed when a PSK is accepted but only if requested by the client. If enabled, the server will require a DHE key exchange when a PSK is accepted regardless

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			of whether the client supports combined PSK-DHE key exchange. This setting only has an effect when resumption is enabled. Default value: NO Possible values = YES, NO
allowextendedmaster secret	<String>	Read-write	When set to YES, attempt to use the TLS Extended Master Secret (EMS, as described in RFC 7627) when negotiating TLS 1.0, TLS 1.1 and TLS 1.2 connection parameters. EMS must be supported by both the TLS client and server in order to be enabled during a handshake. This setting applies to both

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			frontend and backend SSL profiles. Default value: NO Possible values = YES, NO
alpnprotocol	<String>	Read-write	Protocol to negotiate with client and then send as part of the ALPN extension in the server hello message. Possible values are HTTP1.1, HTTP2 and NONE. Default is none i.e. ALPN extension will not be sent. This parameter is relevant only if ssl connection is handled by the virtual server of type SSL_TCP. This parameter has no effect if TLSv1.3 is negotiated. Default value: NONE Possible values = NONE, HTTP1.1, HTTP2
ciphername	<String>	Read-write	The cipher group/ alias/individual cipher configuration.
cipherpriority	<Double>	Read-write	cipher priority.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer entity certificate during TLS1.2 handshake is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
nonfipsciphers	<String>	Read-only	State of usage of ciphers that are not FIPS approved. Valid only for an SSL service bound with a FIPS key and certificate. Default value: DISABLED Possible values = ENABLED, DISABLED
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
snicert	<Boolean>	Read-only	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
skipcaname	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
invoke	<Boolean>	Read-only	Invoke flag. This attribute is relevant only for ADVANCED policies.
labeltype	<String>	Read-only	Type of policy label invocation. Possible values = vserver, service, policylabel

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
service	<Double>	Read-only	Service.
builtin	<String[]>	Read-only	Flag to determine whether ssl profile is built-in or not. Possible values = MODIFIABLE, DELETABLE, IMMUTABLE, PARTITION_ALL
feature	<String>	Read-only	The feature to be checked while applying this config.
sslpfobjecttype	<Double>	Read-only	Internal flag to indicate what type of object binds this profile: monitor or service.
ssliverifyservercertforreuse	<String>	Read-only	Verify the origin server's certificate before reusing the front-end SSL session. Making it hidden since we always verify for now. Default value: ENABLED Possible values = ENABLED, DISABLED
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslprofile resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile? **view=summary**

Use this query-parameter to get the summary output of sslprofile resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslprofile resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslprofile": [ { "__count": "#no"} ] }
```

sslprofile_binding

Binding object which returns the resources bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
name	<String>	Read-write	Name of the SSL profile for which to show detailed information. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Maximum length = 127
sslprofile_sslcipher_binding	<sslprofile_sslcipher_binding[]>	Read-only	sslcipher that can be bound to sslprofile.
sslprofile_ecccurve_binding	<sslprofile_ecccurve_binding[]>	Read-only	ecccurve that can be bound to sslprofile.
sslprofile_sslvserver_binding	<sslprofile_sslvserver_binding[]>	Read-only	sslvserver that can be bound to sslprofile.
sslprofile_sslciphersuite_binding	<sslprofile_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslprofile.
sslprofile_sslcertkey_binding	<sslprofile_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslprofile.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of

creating a NITRO session (using the login object) and then using that session to perform all operations,

To do this, you must specify the username and password in the request header of the NITRO request as follows:

X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_binding/ name_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslprofile_binding": [ {
```

```
      "name":<String_value>,

      "sslprofile_ecccurve_binding":<sslprofile_ecccurve_binding[]_value>,

      "sslprofile_sslcertkey_binding":<sslprofile_sslcertkey_binding[]_val
ue>,

      "sslprofile_sslciphersuite_binding":<sslprofile_sslciphersuite_bindi
ng[]_value>,

      "sslprofile_sslvserver_binding":<sslprofile_sslvserver_binding[]_val
ue>,

      "sslprofile_sslcipher_binding":<sslprofile_sslcipher_binding[]_value
>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslprofile_binding": [ {

      "name":<String_value>,

      "sslprofile_ecccurve_binding":<sslprofile_ecccurve_binding[]_value>,

      "sslprofile_sslcertkey_binding":<sslprofile_sslcertkey_binding[]_val
ue>,

      "sslprofile_sslciphersuite_binding":<sslprofile_sslciphersuite_bindi
ng[]_value>,

      "sslprofile_sslvserver_binding":<sslprofile_sslvserver_binding[]_val
ue>,

      "sslprofile_sslcipher_binding":<sslprofile_sslcipher_binding[]_value
>

}]}
```

sslprofile_ecccurve_binding

Binding object showing the ecccurve that can be bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherpriority	<Double>	Read-write	Priority of the cipher binding.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Minimum value = 1 Maximum value = 1000
name	<String>	Read-write	Name of the SSL profile. Minimum length = 1 Maximum length = 127
ecccurvename	<String>	Read-write	Named ECC curve bound to vserver/ service. Possible values = ALL, P_224, P_256, P_384, P_521
__count	<Double>	Read-write	count parameter

Operations

```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_ecccurve_binding/ name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_ecccurve_binding/ name_value<String> ? **args=ecccurvename: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_ecccurve_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_ecccurve_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslprofile_ecccurve_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_ecccurve_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslprofile_ecccurve_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslprofile_ecccurve_binding": [ {

      "cipherpriority":<Double_value>,

      "name":<String_value>,

      "ecccurvename":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_ecccurve_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_ecccurve_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslprofile_ecccurve_binding": [ {

      "cipherpriority":<Double_value>,

      "name":<String_value>,

      "ecccurvename":<String_value>
```

```
}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_ecccurve_binding/ name_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslprofile_ecccurve_binding": [ { "__count": "#no"} ] }
```

sslprofile_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslprofile.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
cipherpriority	<Double>	Read-write	Priority of the cipher binding. Minimum value = 1 Maximum value = 1000
sslicacertkey	<String>	Read-write	The certkey (CA certificate + private key) to be used for SSL interception.
name	<String>	Read-write	Name of the SSL profile. Minimum length = 1 Maximum length = 127
__count	<Double>	Read-write	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslprofile_sslcertkey_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslprofile_sslcertkey_binding":{

<b>      "name":<String_value>,

</b>      "cipherpriority":<Double_value>,
```

```
        "sslicacertkey":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding/ name_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding/ name_value<String> ? **args=sslicacertkey: <String_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding/ name_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding/ name_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslprofile_sslcertkey_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding/ name_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslprofile_sslcertkey_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslprofile_sslcertkey_binding": [ {

      "cipherpriority":<Double_value>,

      "sslicacertkey":<String_value>,

      "name":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslprofile_sslcertkey_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslrsakey

Configuration for RSA key resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
keyfile	<String>	Read-write	Name for and, optionally, path to the RSA key file. /nsconfig/ssl/ is the default path. Maximum length = 63
bits	<Double>	Read-write	Size, in bits, of the RSA key. Minimum value = 512 Maximum value = 4096
exponent	<String>	Read-write	Public exponent for the RSA key. The exponent is part of the cipher algorithm and is required for creating the RSA key. Default value: F4 Possible values = 3, F4
keyform	<String>	Read-write	Format in which the RSA key file is stored on the appliance. Default value: PEM Possible values = DER, PEM
des	<Boolean>	Read-write	Encrypt the generated RSA key by using the DES algorithm. On the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
des3	<Boolean>	Read-write	Encrypt the generated RSA key by using the Triple-DES algorithm. On the command line, you are prompted to enter the pass phrase (password) that is used to encrypt the key.
aes256	<Boolean>	Read-write	Encrypt the generated RSA key by using the AES algorithm.
password	<String>	Read-write	Pass phrase to use for encryption if DES or DES3 option is selected. Minimum length = 1 Maximum length = 31
pkcs8	<Boolean>	Read-write	Create the private key in PKCS#8 format.

Operations

(click to see Properties)

- CREATE

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

CREATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslrsakey? **action=create**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslrsakey":{

<b>      "keyfile":<String_value>,

</b><b>      "bits":<Double_value>,

</b>      "exponent":<String_value>,

      "keyform":<String_value>,

      "des":<Boolean_value>,

      "des3":<Boolean_value>,

      "aes256":<Boolean_value>,

      "password":<String_value>,

      "pkcs8":<Boolean_value>

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

sslservice

Configuration for SSL service resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicename	<String>	Read-write	Name of the SSL service. Minimum length = 1
dh	<String>	Read-write	State of Diffie-Hellman (DH) key exchange. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
dhfile	<String>	Read-write	Name for and, optionally, path to the PEM-format DH parameter file to be installed. /nsconfig/ssl/ is the default path. This parameter is not applicable when configuring a backend service. Minimum length = 1
dhcount	<Double>	Read-write	Number of interactions, between the client and the Citrix ADC, after which the DH private-public pair is regenerated. A value of zero (0) specifies infinite use (no refresh). This

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			parameter is not applicable when configuring a backend service. Allowed DH count values are 0 and >= 500. Minimum value = 0 Maximum value = 65534
dhkeyexpsizelimit	<String>	Read-write	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Default value: DISABLED Possible values = ENABLED, DISABLED
ersa	<String>	Read-write	State of Ephemeral RSA (eRSA) key exchange. Ephemeral RSA allows clients that support only export ciphers to communicate with

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the secure server even if the server certificate does not support export clients. The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted. It is reused at a later date when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when the appliance restarts. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
ersacount	<Double>	Read-write	Refresh count for regeneration of RSA public-key and private-key pair. Zero

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(0) specifies infinite usage (no refresh). This parameter is not applicable when configuring a backend service. Minimum value = 0 Maximum value = 65534
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Double>	Read-write	Time, in seconds, for which to keep the session active. Any session resumption request received after the timeout period will require a fresh SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			handshake and establishment of a new SSL session. Default value: 300 Minimum value = 0 Maximum value = 4294967294
cipherredirect	<String>	Read-write	State of Cipher Redirect. If this parameter is set to ENABLED, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a cipher mismatch between the virtual server or service and the client. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-write	URL of the page to which to redirect the client in case of a cipher mismatch.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Typically, this page has a clear explanation of the error or an alternative location that the transaction can continue from. This parameter is not applicable when configuring a backend service.
sslv2redirect	<String>	Read-write	State of SSLv2 Redirect. If this parameter is set to ENABLED, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a protocol version mismatch between the virtual server or service and the client. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslv2url	<String>	Read-write	URL of the page to which to redirect the client in case of a protocol version mismatch. Typically, this page has a clear explanation of the error or an alternative location that the transaction can continue from. This parameter is not applicable when configuring a backend service.
clientauth	<String>	Read-write	State of client authentication. In service-based SSL offload, the service terminates the SSL handshake if the SSL client does not provide a valid certificate. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
clientcert	<String>	Read-write	Type of client authentication. If this parameter is set to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			MANDATORY, the appliance terminates the SSL handshake if the SSL client does not provide a valid certificate. With the OPTIONAL setting, the appliance requests a certificate from the SSL clients but proceeds with the SSL transaction even if the client presents an invalid certificate. This parameter is not applicable when configuring a backend SSL service. Caution: Define proper access control policies before changing this setting to Optional. Possible values = Mandatory, Optional
sslredirect	<String>	Read-write	State of HTTPS redirects for the SSL service. For an SSL session, if the client browser receives a redirect message, the browser tries to connect to the new

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			location. However, the secure SSL session breaks if the object has moved from a secure site (https://) to an unsecure site (http://). Typically, a warning message appears on the screen, prompting the user to continue or disconnect. If SSL Redirect is ENABLED, the redirect message is automatically converted from http:// to https:// and the SSL session does not break. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-write	State of the port rewrite while performing HTTPS

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			redirect. If this parameter is set to ENABLED, and the URL from the server does not contain the standard port, the port is rewritten to the standard. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl2	<String>	Read-write	State of SSLv2 protocol support for the SSL service. This parameter is not applicable when configuring a backend service. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL service. Note: On platforms with SSL acceleration chips, if the SSL chip does not support SSLv3, this parameter

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			cannot be set to ENABLED. Default value: ENABLED Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL service. Default value: DISABLED Possible values = ENABLED, DISABLED
dtls1	<String>	Read-write	State of DTLSv1.0 protocol support for the SSL service. Default value: ENABLED Possible values = ENABLED, DISABLED
dtls12	<String>	Read-write	State of DTLSv1.2 protocol support for the SSL service. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the virtual server and service-based offload. SNI helps to enable SSL encryption on multiple domains on a single virtual server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL handshake with the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			client, the OCSP-based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. . Default value: DISABLED Possible values = ENABLED, DISABLED
serverauth	<String>	Read-write	State of server authentication support for the SSL service. Default value: DISABLED Possible values = ENABLED, DISABLED
commonname	<String>	Read-write	Name to be checked against the CommonName (CN) field in the server certificate bound to the SSL server. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
pushenctrigger	<String>	Read-write	Trigger encryption on the basis of the PUSH flag value. Available settings function as follows: * ALWAYS - Any PUSH packet triggers encryption. * IGNORE - Ignore PUSH packet for triggering encryption. * MERGE - For a consecutive sequence of PUSH packets, the last PUSH packet triggers encryption. * TIMER - PUSH packet triggering encryption is delayed by the time defined in the set ssl parameter command or in the Change Advanced SSL Settings dialog box. Possible values = Always, Merge, Ignore, Timer

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
dtlsprofilename	<String>	Read-write	Name of the DTLS profile that contains DTLS settings for the service. Minimum length = 1 Maximum length = 127
sslprofile	<String>	Read-write	Name of the SSL profile that contains SSL settings for the service. Minimum length = 1 Maximum length = 127
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer's certificate during TLS1.2 handshake is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
nonfipsciphers	<String>	Read-only	The state of usage of non FIPS approved ciphers. Default value: DISABLED Possible values = ENABLED, DISABLED
service	<Double>	Read-only	.
skipcaname	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
dtlsflag	<Boolean>	Read-only	The flag is used to indicate whether DTLS is set or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)

- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslservice? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslservice? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslservice resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslservice? **view=summary**

Use this query-parameter to get the summary output of sslservice resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslservice? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservice resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

			Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL service group. Default value: ENABLED Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL service group. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for the SSL service group. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			service. SNI helps to enable SSL encryption on multiple domains on a single virtual server or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			specified time. If the response is valid at the time of SSL handshake with the client, the OCSP-based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. Default value: DISABLED Possible values = ENABLED, DISABLED
serverauth	<String>	Read-write	State of server authentication support for the SSL service group. Default value: DISABLED Possible values = ENABLED, DISABLED
commonname	<String>	Read-write	Name to be checked against the CommonName (CN) field in the server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			certificate bound to the SSL server. Minimum length = 1
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer's certificate is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
dh	<String>	Read-only	The state of DH key exchange support for the SSL service group. Possible values = ENABLED, DISABLED
dhfile	<String>	Read-only	The file name and path for the DH parameter.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dhcount	<Double>	Read-only	The refresh count for the re-generation of DH public-key and private-key from the DH parameter. Minimum value = 0 Maximum value = 65534
dhkeyexpsizelimit	<String>	Read-only	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Possible values = ENABLED, DISABLED
ersa	<String>	Read-only	The state of Ephemeral RSA key exchange support for the SSL service group.Ephemeral RSA is used for export ciphers. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ersacount	<Double>	Read-only	The refresh count for the re-generation of RSA public-key and private-key pair. Minimum value = 0 Maximum value = 65534
cipherredirect	<String>	Read-only	The state of Cipher Redirect feature. Cipher Redirect feature can be used to provide more readable information to SSL clients about mismatch in ciphers between the client and the SSL vserver. Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-only	The redirect URL to be used with the Cipher Redirect feature.
sslv2redirect	<String>	Read-only	The state of SSLv2 Redirect feature.SSLv2 Redirect feature can be used to provide more readable information to SSL client about non-support of SSLv2 protocol on the SSL vserver.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
sslv2url	<String>	Read-only	The redirect URL to be used with SSLv2 Redirect feature.
clientauth	<String>	Read-only	The state of Client-Authentication support for the SSL service group. Possible values = ENABLED, DISABLED
clientcert	<String>	Read-only	The rule for client certificate requirement in client authentication. Possible values = Mandatory, Optional
sslredirect	<String>	Read-only	The state of HTTPS redirects for the SSL service group. This is required for the proper functioning of the redirect messages from the server. The redirect message from the server provides the new location for the moved object. This is contained in the HTTP header field:

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Location, e.g. Location: http://www.moved.org/here.html For the SSL session, if the client browser receives this message, the browser will try to connect to the new location. This will break the secure SSL session, as the object has moved from a secure site (https://) to an un-secure one (http://). Generally browsers flash a warning message on the screen and prompt the user, either to continue or disconnect. The above feature, when enabled will automatically convert all such http:// redirect message to https://. This will not break the client SSL session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Note: The set ssl service command can be used for configuring a front-end SSL service for service based SSL Off-Loading, or a backend SSL service for backend-encryption setup. Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-only	The state of port-rewrite feature. Possible values = ENABLED, DISABLED
nonfipsciphers	<String>	Read-only	The state of usage of non FIPS approved ciphers. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl2	<String>	Read-only	The state of SSLv2 protocol support for the SSL service group. Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
cleartextport	<Integer>	Read-only	The port on the back-end web-servers where the clear-text data is sent by system. Use this setting for the wildcard IP based SSL Acceleration configuration (*:443). Minimum value = 0 Maximum value = 65534 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
servicename	<String>	Read-only	The service name.
ca	<Boolean>	Read-only	CA certificate.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
snicert	<Boolean>	Read-only	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

X-NITRO-PASS: <password>

Note: In such cases, make sure that the request header DOES not include the following:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslservicegroup":{

<b>      "servicegroupname":<String_value>,

</b>      "sslprofile":<String_value>,

      "sessreuse":<String_value>,

      "sesstimeout":<Double_value>,

      "ssl3":<String_value>,

      "tls1":<String_value>,

      "tls11":<String_value>,

      "tls12":<String_value>,

      "tls13":<String_value>,
```

```
        "snienable":<String_value>,

        "ocspstapling":<String_value>,

        "serverauth":<String_value>,

        "commonname":<String_value>,

        "sendclosenotify":<String_value>,

        "strictsigdigestcheck":<String_value>

  }}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

UNSET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **action=unset**

HTTP Method: POST

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{"sslservicegroup":{

<b>      "servicegroupname":<String_value>,

</b>      "sslprofile":true,
```

```
        "sessreuse":true,

        "sesstimeout":true,

        "ssl3":true,

        "tls1":true,

        "tls11":true,

        "tls12":true,

        "tls13":true,

        "snienable":true,

        "ocspstapling":true,

        "serverauth":true,

        "commonname":true,

        "sendclosenotify":true,

        "strictsigdigestcheck":true

}}
```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslservicegroup resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **view=summary**

Use this query-parameter to get the summary output of sslservicegroup resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservicegroup resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

Response Payload:

```
{ "sslservicegroup": [ { "__count": "#no"} ] }
```

sslservicegroup_binding

Binding object which returns the resources bound to sslservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	Name of the SSL service group for which to show detailed information. Minimum length = 1
sslservicegroup_sslcipher_binding	<sslservicegroup_sslcipher_binding[]>	Read-only	sslcipher that can be bound to sslservicegroup.
sslservicegroup_eccurve_binding	<sslservicegroup_eccurve_binding[]>	Read-only	ecccurve that can be bound to sslservicegroup.
sslservicegroup_sslcertkey_binding	<sslservicegroup_sslcertkey_binding[]>	Read-only	sslcertkey that can be bound to sslservicegroup.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
sslservicegroup_sslciphersuite_binding	<sslservicegroup_sslciphersuite_binding[]>	Read-only	sslciphersuite that can be bound to sslservicegroup.

Operations

(click to see Properties)

- GET
- GET (ALL)

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_binding/ servicegroupname_value<String>

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslservicegroup_binding": [ {

      "servicegroupname":<String_value>,

      "sslservicegroup_sslcipher_binding":<sslservicegroup_sslcipher_bindi
ng[]_value>,

      "sslservicegroup_sslciphersuite_binding":<sslservicegroup_sslciphers
uite_binding[]_value>,

      "sslservicegroup_ecccurve_binding":<sslservicegroup_ecccurve_binding
[]_value>,

      "sslservicegroup_sslcertkey_binding":<sslservicegroup_sslcertkey_bin
ding[]_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{ "sslservicegroup_binding": [ {

ng[]_value>,
```

```
      "sslservicegroup_sslciphersuite_binding":<sslservicegroup_sslciphers
uite_binding[]_value>,

      "sslservicegroup_ecccurve_binding":<sslservicegroup_ecccurve_binding
[]_value>,

      "sslservicegroup_sslcertkey_binding":<sslservicegroup_sslcertkey_bin
ding[]_value>

}]}
```

sslservicegroup_ecccurve_binding

Binding object showing the ecccurve that can be bound to sslservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The name of the SSL service to which the SSL policy needs to be bound. Minimum length = 1
ecccurvename	<String>	Read-write	Named ECC curve bound to servicegroup. Possible values = ALL, P_224, P_256, P_384, P_521
__count	<Double>	Read-write	count parameter

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_ecccurve_binding/servicegroupname_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslservicegroup_ecccurve_binding": [ { "__count": "#no"} ] }
```

sslservicegroup_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslservicegroup.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
servicegroupname	<String>	Read-write	The name of the SSL service to which the SSL policy needs to be bound. Minimum length = 1
ca	<Boolean>	Read-write	CA certificate.
crlcheck	<String>	Read-write	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
certkeyname	<String>	Read-write	The name of the certificate bound to the SSL service group.
snicert	<Boolean>	Read-write	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
ocspcheck	<String>	Read-write	The state of the OCSP check parameter. (Mandatory/ Optional).

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = Mandatory, Optional
__count	<Double>	Read-write	count parameter

Operations

- ADD
- DELETE
- GET
- GET (ALL)
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslservicegroup_sslcertkey_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslservicegroup_sslcertkey_binding":{

<b>      "servicegroupname":<String_value>,

</b>      "certkeyname":<String_value>,

      "ca":<Boolean_value>,

      "crlcheck":<String_value>,

      "snicert":<Boolean_value>,

      "ocspcheck":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding/servicegroupname_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding/servicegroupname_value<String> ? **args=certkeyname: <String_value> ,ca: <Boolean_value> ,crlcheck: <String_value> ,snicert: <Boolean_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding/servicegroupname_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding/servicegroupname_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslservicegroup_sslcertkey_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslservicegroup_sslcertkey_binding/servicegroupname_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservicegroup_sslcertkey_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservicegroup_sslcertkey_binding": [ {

      "servicegroupname":<String_value>,

      "ca":<Boolean_value>,

      "crlcheck":<String_value>,

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_ecccurve_binding/servicename_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslservice_ecccurve_binding/servicename_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslservice_ecccurve_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslservice_ecccurve_binding/ servicename_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservice_ecccurve_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservice_ecccurve_binding": [ {

      "ecccurvename":<String_value>,

      "servicename":<String_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_ecccurve_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslservice_ecccurve_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservice_ecccurve_binding": [ {

      "ecccurvename":<String_value>,

      "servicename":<String_value>

}]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_ecccurve_binding/ servicename_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslservice_ecccurve_binding": [ { "__count": "#no"} ] }
```

sslservice_sslcertkey_binding

Binding object showing the sslcertkey that can be bound to sslservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
ca	<Boolean>	Read-write	CA certificate.
crlcheck	<String>	Read-write	The state of the CRL check parameter.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(Mandatory/ Optional). Possible values = Mandatory, Optional
servicename	<String>	Read-write	Name of the SSL service for which to set advanced configuration. Minimum length = 1
certkeyname	<String>	Read-write	The certificate key pair binding.
skipcaname	<Boolean>	Read-write	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
snicert	<Boolean>	Read-write	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
ocspcheck	<String>	Read-write	Rule to use for the OCSP responder associated with the CA certificate during client authentication. If MANDATORY is specified, deny all SSL clients if the OCSP check fails

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			because of connectivity issues with the remote OCSP server, or any other reason that prevents the OCSP check. With the OPTIONAL setting, allow SSL clients even if the OCSP check fails except when the client certificate is revoked. Possible values = Mandatory, Optional
cleartextport	<Integer>	Read-only	The clearTextPort settings. Minimum value = 0 Maximum value = 65534 Range 1 - 65535 * in CLI is represented as 65535 in NITRO API
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- ADD
- DELETE
- GET
- GET (ALL)

- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

ADD

URL: http:// <netscaler-ip-address /nitro/v1/config/sslservice_sslcertkey_binding

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Content-Type:application/json

Request Payload:

```
{

"sslservice_sslcertkey_binding":{

<b>      "servicename":<String_value>,

</b>      "certkeyname":<String_value>,

      "ca":<Boolean_value>,

      "crlcheck":<String_value>,

      "skipcaname":<Boolean_value>,

      "snicert":<Boolean_value>,

      "ocspcheck":<String_value>

}}
```

Response:

HTTP Status Code on Success: 201 Created

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

DELETE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcertkey_binding/ servicename_value<String>

Query-parameters:

args

http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcertkey_binding/ servicename_value<String> ? **args=certkeyname: <String_value> ,ca: <Boolean_value> ,crlcheck: <String_value> ,snicert: <Boolean_value>**

HTTP Method: DELETE

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcertkey_binding/servicename_value<String>

Query-parameters:

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcertkey_binding/servicename_value<String> ? **filter=property-name1:property-value1,property-name2:property-value2**

Use this query-parameter to get the filtered set of sslservice_sslcertkey_binding resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslcertkey_binding/servicename_value<String> ? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslservice_sslcertkey_binding resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```

sslservice_sslpolicy_binding

Binding object showing the sslpolicy that can be bound to sslservice.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
priority	<Double>	Read-write	The priority of the policies bound to this SSL service. Minimum value = 0 Maximum value = 65534
policyname	<String>	Read-write	The SSL policy binding.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
labelname	<String>	Read-write	Name of the label to invoke if the current policy rule evaluates to TRUE.
servicename	<String>	Read-write	Name of the SSL service for which to set advanced configuration. Minimum length = 1
gotopriorityexpression	<String>	Read-write	Expression specifying the priority of the next policy which will get evaluated if the current policy rule evaluates to TRUE.
invoke	<Boolean>	Read-write	Invoke flag. This attribute is relevant only for ADVANCED policies.
labeltype	<String>	Read-write	Type of policy label invocation. Possible values = vserver, service, policylabel
polinherit	<Double>	Read-only	Whether the bound policy is a inherited policy or not. Minimum value = 0 Maximum value = 254
__count	<Double>	Read-only	count parameter

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservice_sslpolicy_binding": [ {

      "priority":<Double_value>,

      "policyname":<String_value>,

      "labelname":<String_value>,

      "servicename":<String_value>,

      "gotopriorityexpression":<String_value>,

      "invoke":<Boolean_value>,

      "labeltype":<String_value>,

      "polinherit":<Double_value>

}]}
```

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslpolicy_binding

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Query-parameters:

bulkbindings

http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslpolicy_binding? **bulkbindings=yes**

NITRO allows you to fetch bindings in bulk.

Note: get (all) method can be used only in conjuction with bulkbindings query parameter.

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{  "sslservice_sslpolicy_binding": [ {

      "priority":<Double_value>,

      "policyname":<String_value>,

      "labelname":<String_value>,

      "servicename":<String_value>,

      "gotopriorityexpression":<String_value>,

      "invoke":<Boolean_value>,
```

```
        "labeltype":<String_value>,

        "polinherit":<Double_value>

  }]}
```

COUNT

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslservice_sslpolicy_binding/ servicename_value<String> ? **count=yes**

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

Response Header:

Content-Type:application/json

Response Payload:

```
{"sslservice_sslpolicy_binding": [ { "__count": "#no"} ] }
```

sslvserver

Configuration for SSL virtual server resource.

Properties

(click to see Operations)

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
vservername	<String>	Read-write	Name of the SSL virtual server for which to set advanced configuration. Minimum length = 1
cleartextport	<Integer>	Read-write	Port on which clear-text data is sent by the appliance to the server. Do not specify this parameter for SSL offloading with end-to-end encryption. Default value: 0 Minimum value = 0 Maximum value = 65534
dh	<String>	Read-write	State of Diffie-Hellman (DH) key exchange. Default value: DISABLED Possible values = ENABLED, DISABLED
dhfile	<String>	Read-write	Name of and, optionally, path to the DH parameter file, in PEM format, to be installed. /nsconfig/ssl/ is the default path. Minimum length = 1

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
dhcount	<Double>	Read-write	Number of interactions, between the client and the Citrix ADC, after which the DH private-public pair is regenerated. A value of zero (0) specifies infinite use (no refresh). Minimum value = 0 Maximum value = 65534
dhkeyexpsizelimit	<String>	Read-write	This option enables the use of NIST recommended (NIST Special Publication 800-56A) bit size for private-key size. For example, for DH params of size 2048bit, the private-key size recommended is 224bits. This is rounded-up to 256bits. Default value: DISABLED Possible values = ENABLED, DISABLED
ersa	<String>	Read-write	State of Ephemeral RSA (eRSA) key exchange. Ephemeral RSA

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			allows clients that support only export ciphers to communicate with the secure server even if the server certificate does not support export clients. The ephemeral RSA key is automatically generated when you bind an export cipher to an SSL or TCP-based SSL virtual server or service. When you remove the export cipher, the eRSA key is not deleted. It is reused at a later date when another export cipher is bound to an SSL or TCP-based SSL virtual server or service. The eRSA key is deleted when the appliance restarts. Default value: ENABLED Possible values = ENABLED, DISABLED
ersacount	<Double>	Read-write	Refresh count for regeneration of the RSA public-key and private-key pair. Zero

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			(0) specifies infinite usage (no refresh). Minimum value = 0 Maximum value = 65534
sessreuse	<String>	Read-write	State of session reuse. Establishing the initial handshake requires CPU-intensive public key encryption operations. With the ENABLED setting, session key exchange is avoided for session resumption requests received from the client. Default value: ENABLED Possible values = ENABLED, DISABLED
sesstimeout	<Double>	Read-write	Time, in seconds, for which to keep the session active. Any session resumption request received after the timeout period will require a fresh SSL handshake and establishment of a new SSL session.

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Default value: 120 Minimum value = 0 Maximum value = 4294967294
cipherredirect	<String>	Read-write	State of Cipher Redirect. If cipher redirect is enabled, you can configure an SSL virtual server or service to display meaningful error messages if the SSL handshake fails because of a cipher mismatch between the virtual server or service and the client. Default value: DISABLED Possible values = ENABLED, DISABLED
cipherurl	<String>	Read-write	The redirect URL to be used with the Cipher Redirect feature.
sslv2redirect	<String>	Read-write	State of SSLv2 Redirect. If SSLv2 redirect is enabled, you can configure an SSL virtual server or service to display meaningful error messages if the SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			handshake fails because of a protocol version mismatch between the virtual server or service and the client. Default value: DISABLED Possible values = ENABLED, DISABLED
sslv2url	<String>	Read-write	URL of the page to which to redirect the client in case of a protocol version mismatch. Typically, this page has a clear explanation of the error or an alternative location that the transaction can continue from.
clientauth	<String>	Read-write	State of client authentication. If client authentication is enabled, the virtual server terminates the SSL handshake if the SSL client does not provide a valid certificate. Default value: DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
clientcert	<String>	Read-write	Type of client authentication. If this parameter is set to MANDATORY, the appliance terminates the SSL handshake if the SSL client does not provide a valid certificate. With the OPTIONAL setting, the appliance requests a certificate from the SSL clients but proceeds with the SSL transaction even if the client presents an invalid certificate. Caution: Define proper access control policies before changing this setting to Optional. Possible values = Mandatory, Optional
sslredirect	<String>	Read-write	State of HTTPS redirects for the SSL virtual server. For an SSL session, if the client browser receives a redirect message, the browser tries to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			connect to the new location. However, the secure SSL session breaks if the object has moved from a secure site (https://) to an unsecure site (http://). Typically, a warning message appears on the screen, prompting the user to continue or disconnect. If SSL Redirect is ENABLED, the redirect message is automatically converted from http:// to https:// and the SSL session does not break. Default value: DISABLED Possible values = ENABLED, DISABLED
redirectportrewrite	<String>	Read-write	State of the port rewrite while performing HTTPS redirect. If this parameter is ENABLED and the URL from the server

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			does not contain the standard port, the port is rewritten to the standard. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl2	<String>	Read-write	State of SSLv2 protocol support for the SSL Virtual Server. Default value: DISABLED Possible values = ENABLED, DISABLED
ssl3	<String>	Read-write	State of SSLv3 protocol support for the SSL Virtual Server. Note: On platforms with SSL acceleration chips, if the SSL chip does not support SSLv3, this parameter cannot be set to ENABLED. Default value: ENABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Possible values = ENABLED, DISABLED
tls1	<String>	Read-write	State of TLSv1.0 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
tls11	<String>	Read-write	State of TLSv1.1 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
tls12	<String>	Read-write	State of TLSv1.2 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
tls13	<String>	Read-write	State of TLSv1.3 protocol support for

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			the SSL Virtual Server. Default value: DISABLED Possible values = ENABLED, DISABLED
dtls1	<String>	Read-write	State of DTLSv1.0 protocol support for the SSL Virtual Server. Default value: ENABLED Possible values = ENABLED, DISABLED
dtls12	<String>	Read-write	State of DTLSv1.2 protocol support for the SSL Virtual Server. Default value: DISABLED Possible values = ENABLED, DISABLED
snienable	<String>	Read-write	State of the Server Name Indication (SNI) feature on the virtual server and service-based offload. SNI helps to enable SSL encryption on multiple domains on

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			a single virtual server or service if the domains are controlled by the same organization and share the same second-level domain name. For example, *.sports.net can be used to secure domains such as login.sports.net and help.sports.net. Default value: DISABLED Possible values = ENABLED, DISABLED
ocspstapling	<String>	Read-write	State of OCSP stapling support on the SSL virtual server. Supported only if the protocol used is higher than SSLv3. Possible values: ENABLED: The appliance sends a request to the OCSP responder to check the status of the server certificate and caches the response for the specified time. If the response is valid at the time of SSL

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			handshake with the client, the OCSP-based server certificate status is sent to the client during the handshake. DISABLED: The appliance does not check the status of the server certificate. . Default value: DISABLED Possible values = ENABLED, DISABLED
pushenctrigger	<String>	Read-write	Trigger encryption on the basis of the PUSH flag value. Available settings function as follows: * ALWAYS - Any PUSH packet triggers encryption. * IGNORE - Ignore PUSH packet for triggering encryption. * MERGE - For a consecutive sequence of PUSH packets, the last

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			PUSH packet triggers encryption. * TIMER - PUSH packet triggering encryption is delayed by the time defined in the set ssl parameter command or in the Change Advanced SSL Settings dialog box. Possible values = Always, Merge, Ignore, Timer
sendclosenotify	<String>	Read-write	Enable sending SSL Close-Notify at the end of a transaction. Default value: YES Possible values = YES, NO
dtlsprofilename	<String>	Read-write	Name of the DTLS profile whose settings are to be applied to the virtual server. Minimum length = 1 Maximum length = 127
sslprofile	<String>	Read-write	Name of the SSL profile that contains

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			SSL settings for the virtual server. Minimum length = 1 Maximum length = 127
hsts	<String>	Read-write	State of HSTS protocol support for the SSL Virtual Server. Using HSTS, a server can enforce the use of an HTTPS connection for all communication with a client. Default value: DISABLED Possible values = ENABLED, DISABLED
maxage	<Double>	Read-write	Set the maximum time, in seconds, in the strict transport security (STS) header during which the client must send only HTTPS requests to the server. Default value: 0 Minimum value = 0 Maximum value = 4294967294
includesubdomains	<String>	Read-write	Enable HSTS for subdomains. If set to

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			Yes, a client must send only HTTPS requests for subdomains. Default value: NO Possible values = YES, NO
preload	<String>	Read-write	Flag indicates the consent of the site owner to have their domain preloaded. Default value: NO Possible values = YES, NO
strictsigdigestcheck	<String>	Read-write	Parameter indicating to check whether peer entity certificate during TLS1.2 handshake is signed with one of signature-hash combination supported by Citrix ADC. Default value: DISABLED Possible values = ENABLED, DISABLED
zerorttearlydata	<String>	Read-write	State of TLS 1.3 0-RTT early data support for the SSL Virtual Server. This setting only has an effect if resumption is

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			enabled, as early data cannot be sent along with an initial handshake. Early application data has significantly different security properties - in particular there is no guarantee that the data cannot be replayed. Default value: DISABLED Possible values = ENABLED, DISABLED
tls13sessionticketsperauthcontext	<Double>	Read-write	Number of tickets the SSL Virtual Server will issue anytime TLS 1.3 is negotiated, ticket-based resumption is enabled, and either (1) a handshake completes or (2) post-handhsake client auth completes. This value can be increased to enable clients to open multiple parallel connections using a

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			fresh ticket for each connection. No tickets are sent if resumption is disabled. Default value: 1 Minimum value = 1 Maximum value = 10
dhekeyexchangewithpsk	<String>	Read-write	Whether or not the SSL Virtual Server will require a DHE key exchange to occur when a PSK is accepted during a TLS 1.3 resumption handshake. A DHE key exchange ensures forward secrecy even in the event that ticket keys are compromised, at the expense of an additional round trip and resources required to carry out the DHE key exchange. If disabled, a DHE key exchange will be performed when a PSK is accepted

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
			but only if requested by the client. If enabled, the server will require a DHE key exchange when a PSK is accepted regardless of whether the client supports combined PSK-DHE key exchange. This setting only has an effect when resumption is enabled. Default value: NO Possible values = YES, NO
crlcheck	<String>	Read-only	The state of the CRL check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
nonfipsciphers	<String>	Read-only	The state of usage of non FIPS approved ciphers. Default value: DISABLED Possible values = ENABLED, DISABLED

NAME	DATA TYPE	PERMISSIONS	DESCRIPTION
service	<Double>	Read-only	Service. Minimum value = 0 Maximum value = 65534
ocspcheck	<String>	Read-only	The state of the OCSP check parameter. (Mandatory/ Optional). Possible values = Mandatory, Optional
ca	<Boolean>	Read-only	CA certificate.
snicert	<Boolean>	Read-only	The name of the CertKey. Use this option to bind Certkey(s) which will be used in SNI processing.
skipcaname	<Boolean>	Read-only	The flag is used to indicate whether this particular CA certificate's CA_Name needs to be sent to the SSL client while requesting for client certificate in a SSL handshake.
dtlsflag	<Boolean>	Read-only	The flag is used to indicate whether DTLS is set or not.
__count	<Double>	Read-only	count parameter

Operations

(click to see Properties)

- UPDATE
- UNSET
- GET (ALL)
- GET
- COUNT

Some options that you can use for each operations:

- **Getting warnings in response:** NITRO allows you to get warnings in an operation by specifying the 'warning' query parameter as 'yes'. For example, to get warnings while connecting to the NetScaler appliance, the URL is as follows:

  http:// <netscaler-ip-address> /nitro/v1/config/login?warning=yes

  If any, the warnings are displayed in the response payload with the HTTP code '209 X-NITRO-WARNING'.

- **Authenticated access for individual NITRO operations:** NITRO allows you to logon to the NetScaler appliance to perform individual operations. You can use this option instead of creating a NITRO session (using the login object) and then using that session to perform all operations,

  To do this, you must specify the username and password in the request header of the NITRO request as follows:

  X-NITRO-USER: <username>

  X-NITRO-PASS: <password>

  Note: In such cases, make sure that the request header DOES not include the following:

  Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

`*Note:` *

Mandatory parameters are marked in red and placeholder content is marked in green

UPDATE

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver

HTTP Method: PUT

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

```

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error

GET (ALL)

URL: http:// <netscaler-ip-address> /nitro/v1/config/sslvserver

Query-parameters:

attrs

http:// <netscaler-ip-address> /nitro/v1/config/sslvserver? **attrs=property-name1,property-name2**

Use this query parameter to specify the resource details that you want to retrieve.

filter

http:// <netscaler-ip-address> /nitro/v1/config/sslvserver? **filter=property-name1:property-val1,property-name2:property-val2**

Use this query-parameter to get the filtered set of sslvserver resources configured on NetScaler.Filtering can be done on any of the properties of the resource.

view

http:// <netscaler-ip-address> /nitro/v1/config/sslvserver? **view=summary**

Use this query-parameter to get the summary output of sslvserver resources configured on NetScaler.

Note: By default, the retrieved results are displayed in detail view (?view=detail).

pagination

http:// <netscaler-ip-address> /nitro/v1/config/sslvserver? **pagesize=#no;pageno=#no**

Use this query-parameter to get the sslvserver resources in chunks.

HTTP Method: GET

Request Headers:

Cookie:NITRO_AUTH_TOKEN= <tokenvalue>

Accept:application/json

Response:

HTTP Status Code on Success: 200 OK

HTTP Status Code on Failure: 4xx <string> (for general HTTP errors) or 5xx <string> (for NetScaler-specific errors). The response payload provides details of the error
